1. Introduction

This report documents comments and recommendations gathered from the public scoping meeting and other outreach activities conducted by the Maritime Administration and the U.S. Coast Guard (USCG) on the Port Dolphin LNG Environmental Impact Statement (EIS).

Port Dolphin Energy LLC, proposes to own, construct, and operate a deepwater port, named Port Dolphin, in the Federal waters of the Outer Continental Shelf in the St. Petersburg (PB) blocks: PB545, PB589 and PB590, approximately 28 miles off the west coast of Florida to the southwest of Tampa Bay, in a water depth of approximately 100 feet. Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately three miles. Each unloading buoy would be permanently secured to eight mooring lines, consisting of wire rope, chain, and buoyancy elements, each attached to anchor points on the seabed. Anchor points will most likely consist of driven piles. The buoys would be designed to moor a specialized type of LNG vessel called a Shuttle and Regasification Vessel (SRV) of between 145,000 and 217,000 cubic meter capacity.

SRV vessels are equipped to vaporize cryogenic LNG cargo to natural gas through an onboard closed loop vaporization system, and to odorize and meter gas for send-out by means of the unloading buoy to conventional subsea pipelines. The SRVs would moor to the unloading buoys which connect through the hull of the vessels to specially designed turrets that would enable the vessels to weathervane or rotate in response to prevailing wind, wave, and current directions. When the vessels are not present, the buoys would be submerged on a special landing pad on the seabed, 60–70 feet below the sea surface. Each unloading buoy would connect through a 16-inch flexible riser and a 36-inch flowline to a Y intersection and then a 36-inch pipeline approximately 42 miles in length that would connect onshore in Port Manatee, Manatee County, Florida.

The pipeline would connect with the Gulfstream Natural Gas System, LLC and Tampa Electric Company (TECO) System. The 36-inch gas transmission line would make landfall on Port Manatee property. From there, the transmission pipeline would proceed in a generally easterly direction to the first interconnection point with the Gulfstream system at 3.6-miles. The Gulfstream Interconnection Station would occupy an approximately two acre site. Up to approximately 80 percent of the natural gas or 800 million standard cubic feet per day (mmscfd) is expected to be delivered to the Gulfstream Pipeline. The remaining portion of the natural gas, up to approximately 360 mmscfd, would be transported by 14-inch line to the TECO interconnection station; located 2.1-miles east of the Gulfstream interconnect. Only SRVs will call on Port Dolphin. Offloading would require between 4–8 days and when empty the SRV would disconnect from the buoy and leave the port. Initially it is expected that Port Dolphin would be capable of a natural gas throughput of 400 mmscfd and would eventually be capable of 800 mmscfd with a peak capacity of 1200 mmscfd by having at least one SRV regasifying and discharging at all times. The system would be designed so that two SRVs can be moored simultaneously for continuous unloading of natural gas.

Port Dolphin Energy LLC is seeking Federal Energy Regulatory Commission (FERC) approval for the onshore pipelines concurrent with this deepwater port application. As required by FERC regulations, FERC will also maintain a docket for the FERC portion of the project. The docket numbers are CP07–191–000 and CP07–192–000. The filing may also be viewed on the Web at http://www.ferc.gov using the ‘‘eLibrary’’ link. Enter the docket number excluding the last three digits in the docket number field to access the document. For assistance, call (866) 208–3767 or TYY, (202) 502–8659. In addition, pipelines and structures such as the moorings may require permits under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act which are administered by the U.S. Army Corps of Engineers (USACE). Port Dolphin will also require permits from the Environmental Protection Agency (EPA) pursuant to the provisions of the Clean Air Act, as amended, and the Clean Water Act, as amended.

The new pipeline will be included in the National Environmental Policy Act (NEPA) review as part of the deepwater port application process. FERC, EPA, and the USACE among others, are cooperating agencies and will assist in the NEPA process as described in 40 CFR 1501.6; will be participating in the scoping meetings; and will incorporate the EIS into their permitting processes. Comments sent to the FERC docket, EPA or USACE will also be incorporated into the DOT docket and EIS to ensure consistency with the NEPA Process.

Construction of the deepwater port would be expected to take approximately 22 months with startup of commercial operations following construction, should a license be issued by the Maritime Administration. The deepwater port would be designed, constructed, and operated in accordance with applicable codes and standards.

An EIS as part of the National Environmental Policy Act (NEPA) process is being prepared to provide the public and the Maritime Administration/USCG decision-makers an assessment of the environmental impacts associated with the construction and operation of Port Dolphin. The EIS will evaluate the proposed construction and operation of the proposed Deepwater Port and associated actions. Completion of the EIS is expected by February 2008.

2. The NEPA Process and the EIS

NEPA requires Federal agencies to evaluate the potential environmental impacts of proposed projects and policies. The primary goal of NEPA is to provide sufficient information for the decision-maker(s) to make an informed decision. During the NEPA process, agencies consider issues ranging from air quality and biological impacts to cultural resources and socioeconomic impacts. USCG has determined that the most appropriate NEPA process for the Port Dolphin deepwater port license application is an EIS, which is the most detailed analysis prescribed by the Council on Environmental Quality (CEQ). Public involvement is a vital component of the NEPA for vesting the public in the decision-making process and allowing for full environmental disclosure. Guidance for implementing public involvement is codified in Title 40 Code of Federal Regulations (CFR) 1506.6, thereby ensuring that Federal agencies make a diligent effort to involve the public in preparing NEPA documents. The public involvement process for this proposed project is outlined in the following steps:

- ***Conduct Public Scoping.*** In this phase of the process, the USCG and the Maritime Administration will ask the public to provide feedback on the proposed project, potential environmental impacts, and analysis methods. Public scoping is critical for determining the issues to be discussed in the EIS and the methods for conducting the study. Outreach efforts will include a Notice of Intent (NOI) to prepare an EIS and announcements of public scoping meetings in the *Federal Register* and local newspapers.
- ***Prepare a Draft EIS (DEIS)***. The DEIS is the first version of the formal document. The DEIS will be distributed to the public libraries throughout the affected area; Federal, state, regional and local agencies; private citizens; and local organizations. The USCG and the Maritime Administration will hold public meetings to provide citizens an opportunity to make formal oral and written comments concerning the DEIS. Outreach efforts will include Notice of Availability (NOA) of the DEIS and announcement of public review meetings in the *Federal Register* and local newspapers. Resource experts will be present to answer questions, and the public will have this additional opportunity to enter comments and concerns into the official record.
- ***Prepare a Final EIS (FEIS)***. After the close of the comment period on the DEIS, e^2M will prepare the FEIS on behalf of USCG and the Maritime Administration to document the manner in which comments have been resolved. A NOA of the FEIS will appear in the *Federal Register* and local papers. The public will have 30 days to comment on the FEIS.
- ***Conduct a license hearing.*** A public hearing on the license application is mandated by the Deepwater Port Act and by USCG policy. Comments received at the Public Hearing will be addressed as appropriate in the preparation of the decision. Federal agencies and the Governor of Florida, the designated adjacent coastal state, have 45 days after the final public hearing to make their final comments on the application. The Secretary (as delegated to the Administrator of the Maritime Administration) has a subsequent 45 days to make a decision.

3. Purpose of Scoping

An important activity in EIS preparation is the description of what topics the environmental review will cover, known as the scope. The EIS scope is based on the nature of the proposed action and the issues to be evaluated. During the scoping process, the general public, potentially affected parties, various scientists and resource experts, and other governmental agencies are asked to help identify the issues to be evaluated and to help define the alternative actions to be considered in the EIS. To ensure that the most appropriate alternatives are selected from numerous options, the Maritime Administration and the USCG consider agency and public input essential to the EIS process. This report describes the scoping process used by USCG and the Maritime Administration to determine the issues to be evaluated and the scope of the EIS based on the public input.

4. Public Involvement Process

USCG and the Maritime Administration invited comments from the public to help determine the scope of the EIS by publishing a NOI in the *Federal Register* (72 FR 133) on July 12, 2007. The NOI provided background information on the Proposed Action, the EIS, a description of the scoping process, date and location for the public meeting, and a discussion of commenting alternatives. A copy of the NOI and the FERC Notice of Amendment are included in Appendix A of this Scoping Report.

An open house and a public meeting were held in conjunction with this scoping process in Palmetto, Florida (see Table 4.1). Advertisements to inform the public of the scoping meetings were posted in two major newspapers in the area where the meeting was held. The USCG also mailed a letter of invitation to the public scoping meeting to approximately 190 potentially interested parties including Federal, state and local agencies, elected officials, stakeholders, and individuals. The "Interested Party" letters included the NOI, a fact sheet outlining the Proposed Action and map illustrating the location of Port Dolphin and associated pipelines (Appendix B). The announcements and the advertisements both stated where and when the public scoping meeting was being held to obtain public input on the Proposed Action for Port Dolphin. Copies of newspaper advertisements are located in Appendix C.

Table 4.1. Open House and Public Meeting Information for the Port Dolphin Deepwater Port License Application

City, State	Location	Newspaper Advertisement	Stakeholder Attendance
Palmetto, FL	The Manatee Convention Center July 25, 2007	*Tampa Tribune* and *Bradenton Herald* (July 24 and 25, 2007)	23

An Open House was held before the public meeting. Representatives from the Maritime Administration, USCG, and other agencies were available to talk to public about the project. USCG supplied fact sheets to the public on various topics including the Deepwater Port Act, the NEPA Process, and directions for making comments on the Proposed Action. A complete copy of the fact sheets were distributed at the public scoping meetings are attached in Appendix D. Representatives from Port Dolphin Energy LLC were also available at the open house and provided an audio/video description of the project as well as handouts.

Examples of the registration cards and comment forms provided during the scoping process can be found in Appendix D. Comments received during the public meetings were noted and reviewed to help identify environmental issues that should be addressed in the EIS as well as those issues which do not warrant detailed evaluation. In addition to the comments provided at the public meetings, the public and other government agencies were invited to provide written comments at the meeting, by mail, hand delivery, fax, or by e-mail to either the Docket Management System or the Federal eRulemaking Portal. Although the comment period for public scoping ended on August 13, 2007, this scoping report includes public comments received to the date of this report. Appendix E includes all the comments that were received, as well as the public meeting transcript.

5. Public Scoping Results

5.1 Issues and Concerns

Four oral comments were received from stakeholders at the public meeting. In addition, a letter from the National Oceanic and Atmospheric Administration was received on August 9, 2007. Table 5-2 presents the comments received during the public scoping period.

Table 5.1. List of Comments During Scoping Meetings For the Port Dolphin Deepwater Port License Application

Theme	Comments
Economy	Supports the Port Dolphin project because it would provide diversity for LNG resources in Florida.
Siting Location	Requests that the pipelines will be collocated with existing (onshore and offshore) pipelines to reduce environmental and economic impacts to local residents.
Biological Impacts	Concerned with seawater intake and the resulting discharge affecting ichthyoplankton.
Biological Resources	Concerned with the impacts to essential fish habitat, marine fishery species, estuarine and marine habitats, and threatened and endangered species
Risk Management	Concerned that because of the proposed co-location of the pipelines, natural gas supply for the area could be interrupted in a natural or calculated disaster scenario.
General	Concerned with the cost of writing the EIS.

6. Next Steps

The Maritime Administration/USCG and their contractor (e²M, Inc.) are working with resource agencies and stakeholders to prepare a DEIS for review. The DEIS will incorporate those issues discussed during the public scoping meetings and comments made to the Department of Transportation (DOT) docket during the 30-day comment period.

Following the publication of the NOA in the *Federal Register* for the DEIS, there will be a 45-day comment period and another round of public meetings. The public meetings will allow the general public to interface with resource agencies and other stakeholder groups. Comments pertaining to the DEIS during that time will be reviewed and incorporated into the FEIS.

A final 30-day comment period and a final hearing will follow the *Federal Register* publication of the NOA for the FEIS. Public comments during this time will be considered by the Maritime Administration/USCG decision makers along with final comments by resource agencies. Following the public comment period, the Maritime Administration/USCG decision-makers will review all materials applicable to the Port Dolphin Deepwater Port Licensing Application and prepare a Record of Decision. Table 6.1 outlines the three phases of the EIS process that involve public participation.

7. List of Participants

The following persons participated in the open house and/or public meeting held in Palmetto, Florida on July 25, 2007.

7.1 Federal Agency Participants

Nathalie Jacque – USCG
Ray Martin – USCG
LCDR Brian Moore– USCG
Ed Morris – USCG
Mark Prescott – USCG
Patience Whitten – USCG
Chris Hanan – Maritime Administration
Dave Swearingen – FERC
Mark Sramek – NMFS
Mark Peterson – USACE

7.2 State and Local Participants

Ilsa Johansson – FDEP
Donna Kendall – FDEP
Charles Kovach – FDEP
Randy Runnels – FDEP
Debby Tucker – FDEP
Lisa Gregg – FWC
Mark Leiby – FWC

7.3 Individual/Group Participant

Glen Brooks
Chris Calvert
Don Chaney
Cody Driggers
Steven L. Fidler
Denise Greer
Geoff Hornby
Michael Jepson
Sara Kennedy
Jim Kimbrell
Joan Perry
Eric Raymond
Susan Redmond
Betsy Roberts
Sarah A. Schenk
John Seip
Mary E. Sheppard
Rand Snell
Marilyn Stasica
Jill Vanderpol
Kit Werremeyer
Daniel R. White

7.4 USCG Contractor Personnel

Don Beckham – e²M
George Greczmiel – e²M
Andrea Poole – e²M

7.5 Applicant Personnel

German Castro
Jeff Oetting
Kim Olsen
John Teter
Ragnar Wisloff

APPENDIX A

FEDERAL REGISTER NOTICE OF INTENT AND FERC NOTICE OF AMENDMENT

2. Statutory Basis

The Exchange believes that the proposed rule change is consistent with and furthers the objectives of Section 6(b)(5) of the Act,[9] in that it is designed to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the forgoing rule change does not: (1) Significantly affect the protection of investors or the public interest; (2) impose any significant burden on competition; and (3) become operative for 30 days after the date of this filing, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A) of the Act [10] and Rule 19b–4(f)(6) thereunder.[11]

A proposed rule change filed under 19b–4(f)(6) normally may not become operative prior to 30 days after the date of filing.[12] However, Rule 19b–4(f)(6)(iii) [13] permits the Commission to designate a shorter time if such action is consistent with the protection of investors and the public interest. The Exchange has requested that the Commission waive the 30-day operative delay. The Commission believes that waiving the 30-day operative delay is consistent with the protection of investors and the public interest because such waiver would permit position and exercise limits for options on IWM to continue at 500,000 option contracts for an approximately six-month pilot period. For this reason, the Commission designates the proposed rule change to be operative upon filing with the Commission.[14]

At any time within 60 days of the filing of such proposed rule change the Commission may summarily abrogate such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors or otherwise in furtherance of the purposes of the Act.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml*); or
- Send an e-mail to *rule-comments@sec.gov*. Please include File Number SR–NYSEArca-2007–58 on the subject line.

Paper Comments

- Send paper comments in triplicate to Nancy M. Morris, Secretary, Securities and Exchange Commission, 100 F Street, NE., Washington, DC 20549–1090.

All submissions should refer to File Number SR–NYSEArca-2007–58. This file number should be included on the subject line if e-mail is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (*http://www.sec.gov/rules/sro.shtml*). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549, on official business days between the hours of 10 a.m. and 3 p.m. Copies of the filing also will be available for inspection and copying at the principal office of NYSE Arca. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR–NYSEArca-2007–58 and should be submitted on or before August 2, 2007.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.[15]

Florence E. Harmon,

Deputy Secretary.

BILLING CODE 8010–01–P

[9] 15 U.S.C. 78f(b)(5).

[10] 15 U.S.C. 78s(b)(3)(A).

[11] 17 CFR 240.19b–4(f)(6).

[12] 17 CFR 240.19b–4(f)(6)(iii). In addition, Rule 19b-4(f)(6)(iii) requires that a self-regulatory organization submit to the Commission written notice of its intent to file the proposed rule change, along with a brief description and text of the proposed rule change, at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission. The Exchange has satisfied the five-day pre-filing notice requirement.

[13] *Id.*

[14] For the purposes only of waiving the 30-day operative delay, the Commission has considered the proposed rule's impact on efficiency, competition, and capital formation. *See* 15 U.S.C. 78c(f).

DEPARTMENT OF TRANSPORTATION

Maritime Administration

[USCG–2007–28532]

Port Dolphin Energy LLC, Port Dolphin Energy Liquefied Natural Gas Deepwater Port License Application

AGENCY: Maritime Administration, DOT.

ACTION: Notice of intent; notice of public meeting; request for comments.

SUMMARY: The Maritime Administration announces that the Coast Guard, in coordination with the Maritime Administration, will prepare an Environmental Impact Statement (EIS) as part of the environmental review of this license application. The application describes a project that would be located approximately 28 miles off the western coast of Florida, and approximately 42 miles from Port Manatee, Manatee County, Florida. Publication of this notice begins a scoping process that will help identify and determine the scope of environmental issues to be addressed in the EIS. This notice requests public participation in the scoping process and provides information on how to participate.

DATES: The public meeting in Palmetto, FL will be held on July 25, 2007. The public meeting will be held from 6 p.m. to 8 p.m. and will be preceded by an open house from 4:30 p.m. to 5:30 p.m. The public meeting may end later than the stated time, depending on the

number of persons wishing to speak. Material submitted in response to the request for comments must reach the Docket Management Facility by August 13, 2007.

ADDRESSES: Public open house and meeting: The Manatee Convention Center, Conference Center, One Haben Blvd., Palmetto, Florida 34221. (941) 722–3244.

Address docket submissions for USCG–2007–28532 to: Docket Management Facility, U.S. Department of Transportation, West Building, Ground Floor, Room W12–140, 1200 New Jersey Avenue, SE., Washington, DC 20590.

The Docket Management Facility accepts hand-delivered submissions, and makes docket contents available for public inspection and copying at this address, in room W12–140, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The Facility's telephone is 202–366–9329, its fax is 202–493–2251, and its Web site for electronic submissions or for electronic access to docket contents is *http://dms.dot.gov*.

FOR FURTHER INFORMATION CONTACT: Ray Martin, U.S. Coast Guard, telephone: 202–372–1449, e-mail: *raymond.w.martin@uscg.mil*, Lieutenant Commander Brian Moore, U.S. Coast Guard, telephone: 202–372–1442, e-mail: *brian.e.moore@uscg.mil*, or Chris Hanan, U.S. Maritime Administration, telephone: 202–366–1900, e-mail: *Christopher.Hanan@dot.gov*. If you have questions on viewing the docket, call Renee V. Wright, Program Manager, Docket Operations, telephone 202–493–0402.

SUPPLEMENTARY INFORMATION:

Public Meeting and Open House

We invite you to learn about the proposed deepwater port at an informational open house, and to comment at a public meeting on environmental issues related to the proposed deepwater port. Your comments will help us identify and refine the scope of the environmental issues to be addressed in the EIS.

In order to allow everyone a chance to speak at the public meeting, we may limit speaker time, or extend the meeting hours, or both. You must identify yourself, and any organization you represent, by name. Your remarks will be recorded or transcribed for inclusion in the public docket.

You may submit written material at the public meeting, either in place of or in addition to speaking. Written material must include your name and address, and will be included in the public docket.

Public docket materials will be made available to the public on the Docket Management Facility's Docket Management System (DMS). See "Request for Comments" for information about DMS and your rights under the Privacy Act.

Our public meeting location is wheelchair-accessible. If you plan to attend the open house or public meeting, and need special assistance such as sign language interpretation or other reasonable accommodation, please notify the Coast Guard (see **FOR FURTHER INFORMATION CONTACT**) at least 3 business days in advance. Include your contact information as well as information about your specific needs.

Request for Comments

We request public comments or other relevant information on environmental issues related to the proposed deepwater port. The public meeting is not the only opportunity you have to comment. In addition to or in place of attending a meeting, you can submit comments to the Docket Management Facility during the public comment period (see **DATES**). We will consider all comments and material received during the comment period.

Submissions should include:

- Docket number USCG–2007–28532.
- Your name and address.
- Your reasons for making each comment or for bringing information to our attention.

Submit comments or material using only one of the following methods:

- Electronic submission to DMS, *http://dms.dot.gov*.
- Fax, mail, or hand delivery to the Docket Management Facility (see **ADDRESSES**). Faxed or hand delivered submissions must be unbound, no larger than 8½ by 11 inches, and suitable for copying and electronic scanning. If you mail your submission and want to know when it reaches the Facility, include a stamped, self-addressed postcard or envelope.

Regardless of the method used for submitting comments or material, all submissions will be posted, without change, to the DMS website (*http://dms.dot.gov*), and will include any personal information you provide. Therefore, submitting this information makes it public. You may wish to read the Privacy Act notice that is available on the DMS website, or the Department of Transportation Privacy Act Statement that appeared in the Federal Register on April 11, 2000 (65 FR 19477).

You may view docket submissions at the Docket Management Facility (see **ADDRESSES**), or electronically on the DMS Web site.

Background

Information about deepwater ports, the statutes and regulations governing their licensing, and the receipt of the current application for the proposed Port Dolphin liquefied natural gas (LNG) deepwater port appeared in the Federal Register on June 25, 2007 (72 FR 34741). The "Summary of the Application" from that publication is reprinted below for your convenience.

Consideration of a deepwater port license application includes review of the proposed deepwater port's natural and human environmental impacts. The Coast Guard, in coordination with the Maritime Administration, is the lead agency for determining the scope of this review, and in this case has determined that review must include preparation of an EIS. This notice of intent is required by 40 CFR 1501.7, and briefly describes the proposed action and possible alternatives and the proposed scoping process. You can address any questions about the proposed action, the scoping process, or the EIS to the Coast Guard project manager identified in **FOR FURTHER INFORMATION CONTACT**.

Proposed Action and Alternatives

The proposed action requiring environmental review is the Federal licensing of the proposed deepwater port described in "Summary of the Application" below. The alternatives to licensing the proposed port are: (1) Licensing with conditions (including conditions designed to mitigate environmental impact), and (2) denying the application, which for purposes of environmental review is the "no-action" alternative.

Scoping Process

Public scoping is an early and open process for identifying and determining the scope of issues to be addressed in the EIS. Scoping begins with this notice, continues through the public comment period (see **DATES**), and ends when the Coast Guard has completed the following actions:

- Invites the participation of Federal, State, and local agencies, any affected Indian tribe, the applicant, and other interested persons;
- Determines the actions, alternatives, and impacts described in 40 CFR 1508.25;
- Identifies and eliminates, from detailed study, those issues that are not significant or that have been covered elsewhere;
- Allocates responsibility for preparing EIS components;

• Indicates any related environmental assessments or environmental impact statements that are not part of the EIS;

• Identifies other relevant environmental review and consultation requirements;

• Indicates the relationship between timing of the environmental review and other aspects of the application process; and

• At its discretion, exercises the options provided in 40 CFR 1501.7(b).

Once the scoping process is complete, the Coast Guard will prepare a draft EIS, and publish a **Federal Register** notice announcing its public availability. (If you want that notice to be sent to you, please contact the Coast Guard project manager identified in **FOR FURTHER INFORMATION CONTACT**). You will have an opportunity to review and comment on the draft EIS. The Coast Guard will consider those comments in the preparation of the final EIS. As with the draft EIS, the availability of the final EIS will be announced and an opportunity for review and comment will again be provided.

Summary of the Application

Port Dolphin Energy LLC, proposes to own, construct, and operate a deepwater port, named Port Dolphin, in the Federal waters of the Outer Continental Shelf in the St. Petersburg (PB) blocks: PB545, PB589 and PB590, approximately 28 miles off the west coast of Florida to the southwest of Tampa Bay, in a water depth of approximately 100 feet. Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately three miles. Each unloading buoy would be permanently secured to eight mooring lines, consisting of wire rope, chain, and buoyancy elements, each attached to anchor points on the seabed. Anchor points will most likely consist of driven piles.

The buoys would be designed to moor a specialized type of LNG vessel called a Shuttle and Regasification Vessel (SRV) of between 145,000 and 217,000 cubic meter capacity. SRV vessels are equipped to vaporize cryogenic LNG cargo to natural gas through an onboard closed loop vaporization system, and to odorize and meter gas for send-out by means of the unloading buoy to conventional subsea pipelines. The SRVs would moor to the unloading buoys which connect through the hull of the vessels to specially designed turrets that would enable the vessels to weathervane or rotate in response to prevailing wind, wave, and current directions. When the vessels are not present, the buoys would be submerged on a special landing pad on the seabed, 60–70 feet below the sea surface.

Each unloading buoy would connect through a 16-inch flexible riser and a 36-inch flowline to a Y intersection and then a 36-inch pipeline approximately 42 miles in length that would connect onshore in Port Manatee, Manatee County, Florida. The pipeline would connect with the Gulfstream Natural Gas System, LLC and Tampa Electric Company (TECO) System.

The 36-inch gas transmission line would make landfall on Port Manatee property. From there, the transmission pipeline would proceed in a generally easterly direction to the first interconnection point with the Gulfstream system at 3.6-miles. The Gulfstream Interconnection Station would occupy an approximately two-acre site. Up to approximately 80 percent of the natural gas or 800 million standard cubic feet per day (mmscfd) is expected to be delivered to the Gulfstream Pipeline.

The remaining portion of the natural gas, up to approximately 360 mmscfd, would be transported by 14-inch line to the TECO interconnection station; located 2.1-miles east of the Gulfstream interconnect. Only shuttle and regasification vessels (SRVs) will call on Port Dolphin. Offloading would require between 4–8 days and when empty the SRV would disconnect from the buoy and leave the port.

Initially it is expected that Port Dolphin would be capable of a natural gas throughput of 400 mmscfd and would eventually be capable of 800 mmscfd with a peak capacity of 1200 mmscfd by having at least one SRV regasifying and discharging at all times. The system would be designed so that two SRVs can be moored simultaneously for continuous unloading of natural gas.

Port Dolphin Energy LLC is seeking Federal Energy Regulatory Commission (FERC) approval for the onshore pipelines concurrent with this deepwater port application. As required by FERC regulations, FERC will also maintain a docket for the FERC portion of the project. The docket numbers are CP07–191–000 and CP07–192–000. The filing may also be viewed on the Web at *http://www.ferc.gov* using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document. For assistance, call (866) 208–3767 or TYY, (202) 502–8659.

In addition, pipelines and structures such as the moorings may require permits under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act which are administered by the U.S. Army Corps of Engineers (USACE).

Port Dolphin will also require permits from the Environmental Protection Agency (EPA) pursuant to the provisions of the Clean Air Act, as amended, and the Clean Water Act, as amended.

The new pipeline will be included in the National Environmental Policy Act (NEPA) review as part of the deepwater port application process. FERC, EPA, and the USACE among others, are cooperating agencies and will assist in the NEPA process as described in 40 CFR 1501.6; will be participating in the scoping meetings; and will incorporate the EIS into their permitting processes. Comments sent to the FERC docket, EPA or USACE will also be incorporated into the DOT docket and EIS to ensure consistency with the NEPA Process.

Construction of the deepwater port would be expected to take approximately 22 months with startup of commercial operations following construction, should a license be issued by the Maritime Administration. The deepwater port would be designed, constructed and operated in accordance with applicable codes and standards.

Privacy Act

The electronic form of all comments received into the DOT docket are available to any person and may be searched by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (Volume 65, Number 70; Pages 19477–78) or you may visit *http://dms.dot.gov.*

(Authority 49 CFR 1.66)

Dated: July 6, 2007.

By order of the Maritime Administrator.

Daron T. Threet,

Secretary, Maritime Administration.

NOTICE OF FILING COMMENTS OF MANATEE COUNTY STAFF RE: AMENDED APPLICATION FILED BY PORT DOLPHIN ENERGY, LLC

In response to the Notice of Limited Scoping for the proposed Port Dolphin project and Request for Comments on Environmental Issues, Manatee County hereby gives Notice of Filing a copy of comments from the Environmental Manager of Manatee County, attached hereto as Exhibit A and made a part hereof by reference. The comments in Exhibit A are limited to the proposed on-shore pipeline and related facilities and are based upon a preliminary review of the Amended Application submitted within the limit period of time allowed for the comment period.

As an interested party in the above-captioned proceedings, Manatee County reserves its right to submit further comments and review as additional information is submitted by the applicant, Port Dolphin.

Respectfully submitted,

MANATEE COUNTY, FLORIDA

Sarah A. Schenk, Esq.
Assistant County Attorney

16613
July 16, 2007

Dear Interested Party:

The U.S. Coast Guard (USCG) and the Maritime Administration announce their intent to prepare an Environmental Impact Statement (EIS) to assist in the evaluation of a deepwater port license application submitted by Port Dolphin Energy LLC (Port Dolphin). Port Dolphin proposes to own, construct, and operate the Port Dolphin Energy Liquefied Natural Gas (LNG) Deepwater Port located in the Gulf of Mexico approximately 28 miles offshore of Tampa Bay, Florida. A description of the proposed project is presented in Enclosure 1, and the Application may be viewed at the U.S. Department of Transportation (DOT) Docket Management System web page *http://dms.dot.gov* (Docket Number USCG-2007-28532).

The EIS will be prepared in accordance within the provisions of the Deepwater Port Act of 1974, as amended (33 United States Code [U.S.C.] 1501 *et seq.*); the National Environmental Policy Act (NEPA) (Section 102(2)(c)), as implemented by the Council on Environmental Quality (CEQ) regulations (40 Code of Federal Regulations [CFR] Parts 1500–1508); Department of Transportation (DOT) 5610.1C (*Procedures for Considering Environmental Impacts*); USCG Commandant Instruction M16475.1D (*National Environmental Policy Act Implementing Procedures and Policy for Considering Environmental Impacts*); and other appropriate and applicable regulations. The Maritime Administrator will use the EIS and other information to 1) to approve the application, 2) approve the application with conditions, or 3) deny the application. USCG and the Maritime Administration are now in the scoping period that precedes preparation of the EIS and invite public comments relating to the scope of the EIS. As part of the scoping process, we will hold an informational open house at the location listed below. The open house and public meeting are open to the public and all interested parties are encouraged to attend. Written and oral comments will be accepted at the public meeting as well as throughout the scoping process. The Notice of Intent, initiating the comment process, was published in the *Federal Register* on July 12, 2007 (72 FR 38116). Notices for the open house/public meeting will be published in the Tampa Tribune and Bradenton Herald during the week of July 22, 2007.

- The open house and public meeting will be held on July 25, 2007. Open House: 4:30 PM to 5:30 PM; Public Meeting 6:00 PM to 8:00 PM. These events will be held at: The Manatee Convention Center, Conference Center, One Haben Blvd., Palmetto, Florida 34221; 941-722-3244.

We encourage you to submit comments and related materials regarding this project. If you do so, please include your name and address, this notice reference number (USCG-2007-28532), and the reasons for each comment. You may submit your comments and materials by mail, hand delivery, fax, or electronic means to the Docket Management Facility. To make sure your comments and related materials are not entered more than once in the docket, please submit them by only one of the following means:

1. By Mail: Docket Management Facility (USCG-2007-28532), U.S. Department of Transportation, West Building, Ground Floor, Room W12-140, 1200 New Jersey Avenue, SE, Washington, DC 20590
2. By Personal Delivery: to the room and address listed above
3. By FAX: To the Docket Management Facility at (202) 493-2251.
4. Electronically: Through the Web Site for the Docket Management System at http://dms.dot.gov.

To ensure your comments are considered, we request that all comments be submitted by August 13, 2007. Comments and material received from the public will become part of the official record (or docket) and will be available for inspection or copying at the Docket Management Facility between 9:00 a.m. and 5:00 p.m., Monday through Friday, except Federal holidays. You may also view this information, including this notice and comments, on the Internet at *http://dms.dot.gov* (Docket Number USCG-2007-28532).

If you have questions about the proposed Port Dolphin Deepwater Port License Application EIS, you may contact Mr. Ray Martin, USCG, at (202) 372-1449 or Raymond.W.Martin@uscg.mil or Mr. Chris Hanan, Maritime Administration, at (202) 366-1900 or Christopher.Hanan@dot.gov. If you have questions about the NEPA process or about this EIS, please contact Ms. Patience Whitten at (202) 372-1453 or Patience.K.Whitten@uscg.mil.

Sincerely,

M.A. PRESCOTT
Chief, Deepwater Ports Standards Division
U.S. Coast Guard

3. Notice of Intent

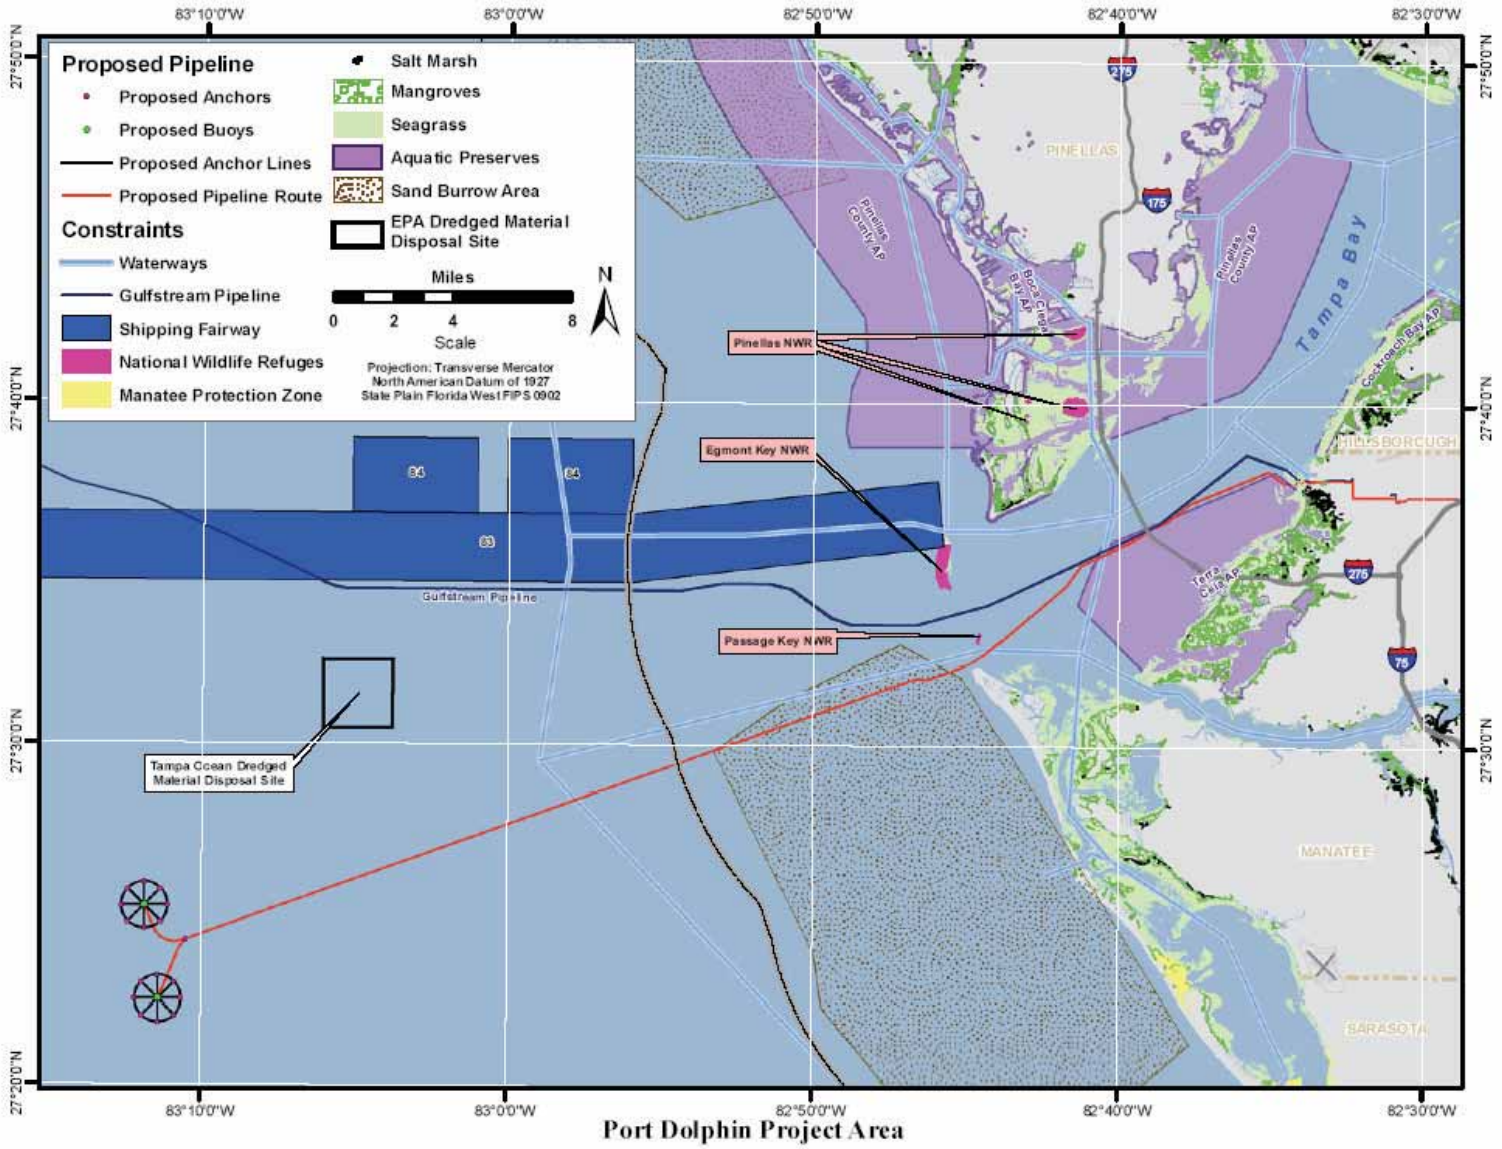
Port Dolphin LNG Deepwater Port Environmental Impact Statement (USCG-2007-28532)

Proposed Action Fact Sheet

Introduction

In accordance with the Deepwater Port Act of 1974, as amended (the Act, 33 U.S. Code [U.S.C.] 1501 et seq.), the National Environmental Policy Act (NEPA) (Section 102(2)(c)), as implemented by the Council on Environmental Quality (CEQ) regulations (40 Code of Federal Regulations [CFR] Parts 1500-1508), and other applicable regulations, the USCG and the Maritime Administration intend to prepare an Environmental Impact Statement (EIS) to assist in evaluating the license application submitted by Port Dolphin Energy, L.L.C. for the proposed Port Dolphin deepwater port. NEPA requires Federal agencies to consider environmental impacts that may result from a proposed action, to inform the public of potential impacts and alternatives, and to facilitate public involvement in the assessment process. The EIS will describe in detail the nature and extent of the environmental impacts of the Proposed Action and alternatives and discuss appropriate mitigation measures for any adverse impacts. The EIS will include, among other matters, discussions of the purpose and need for the Proposed Action, a description of alternatives, a description of the affected environment, and an evaluation of the environmental impacts of the Proposed Action and alternatives. The U.S. Army Corps of Engineers (USACE) will use the EIS for their findings on the applicant's Section 10 of the Rivers and Harbors Act and Section 404 of the Clean Water Act permits. The U.S. Environmental Protection Agency (USEPA) will use the EIS findings on the applicant's NPDES permit application under the Section 402 of the Clean Water Act. The USEPA and USACE evaluations will be coordinated with and incorporated into the EIS prepared by USCG and the Maritime Administration.

Proposed Action



Port Dolphin Energy LLC, proposes to own, construct, and operate a deepwater port, named Port Dolphin, in the Federal waters of the Outer Continental Shelf in the St. Petersburg (PB) blocks: PB545, PB589 and PB590, approximately 28 miles off the west coast of Florida to the southwest of Tampa Bay, in a water depth of approximately 100 feet. Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately three miles. The buoys would be designed to moor a specialized type of LNG vessel called a Shuttle and Regasification Vessel (SRV) of between 145,000 and 217,000 cubic meter capacity. SRV vessels are equipped to vaporize cryogenic LNG cargo to natural gas through an onboard closed loop vaporization system, and to odorize and meter gas for send-out by means of the unloading buoy to a 36-inch flowline to a Y intersection and then a 36-inch pipeline approximately 42 miles in length that would connect onshore in Port Manatee, Manatee County, Florida with the Gulfstream Natural Gas System, LLC and Tampa Electric Company (TECO) pipeline. The 36-inch gas transmission line will make landfall on Port Manatee property. When the vessels are not present, the buoys would be submerged on a special landing pad on the seabed, 60–70 feet below the sea surface.

Only shuttle and regasification vessels (SRVs) would call on Port Dolphin. Initially Port Dolphin would be capable of a natural gas throughput of 400 mmscfd and would eventually be capable of an average of 800 mmscfd with a peak capacity of 1200 mmscfd . Construction of Port Dolphin would be expected to take 22 months. The Port Dolphin deepwater port would be designed, constructed, and operated in accordance with applicable codes and standards and would have an expected operating life of approximately 20 years.

Alternatives

Consistent with NEPA, USCG and the Maritime Administration must also consider alternative means to construct and operate a deepwater port. USCG and the Maritime Administration review will extend to matters such as the specific location of the port, methods of port construction and platform layout, and technologies for storing and regasifying LNG. The applicant presented alternatives for consideration by USCG and the Maritime Administration, including:

- No action alternative whereby no facility is constructed.
- Non-gas alternatives including fossil fuel, renewables, nuclear, and other types of electric power generation.
- LNG system alternatives considering existing and proposed LNG import facilities.
- Pipeline system alternatives.
- Offshore technology alternatives considering available and contemplated technologies.
- Geographic alternatives evaluating sites along the west coast of Florida.
- The USCG has created public input tools to allow interested parties to submit comments, including suggested alternatives, for consideration by USCG and the Maritime Administration.

Port Dolphin Project Area

2. Statutory Basis

The Exchange believes that the proposed rule change is consistent with and furthers the objectives of Section 6(b)(5) of the Act,[9] in that it is designed to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the forgoing rule change does not: (1) Significantly affect the protection of investors or the public interest; (2) impose any significant burden on competition; and (3) become operative for 30 days after the date of this filing, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A) of the Act [10] and Rule 19b–4(f)(6) thereunder.[11]

A proposed rule change filed under 19b–4(f)(6) normally may not become operative prior to 30 days after the date of filing.[12] However, Rule 19b–4(f)(6)(iii) [13] permits the Commission to designate a shorter time if such action is consistent with the protection of investors and the public interest. The Exchange has requested that the Commission waive the 30-day operative delay. The Commission believes that waiving the 30-day operative delay is consistent with the protection of investors and the public interest because such waiver would permit position and exercise limits for options on IWM to continue at 500,000 option contracts for an approximately six-month pilot period. For this reason, the Commission designates the proposed rule change to be operative upon filing with the Commission.[14]

At any time within 60 days of the filing of such proposed rule change the Commission may summarily abrogate such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors or otherwise in furtherance of the purposes of the Act.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's Internet comment form (*http://www.sec.gov/rules/sro.shtml*); or
- Send an e-mail to *rule-comments@sec.gov*. Please include File Number SR–NYSEArca-2007–58 on the subject line.

Paper Comments

- Send paper comments in triplicate to Nancy M. Morris, Secretary, Securities and Exchange Commission, 100 F Street, NE., Washington, DC 20549–1090.

All submissions should refer to File Number SR–NYSEArca-2007–58. This file number should be included on the subject line if e-mail is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's Internet Web site (*http://www.sec.gov/rules/sro.shtml*). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Room, 100 F Street, NE., Washington, DC 20549, on official business days between the hours of 10 a.m. and 3 p.m. Copies of the filing also will be available for inspection and copying at the principal office of NYSE Arca. All comments received will be posted without change; the Commission does not edit personal identifying information from submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR–NYSEArca-2007–58 and should be submitted on or before August 2, 2007.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.[15]

Florence E. Harmon,

Deputy Secretary.

BILLING CODE 8010–01–P

[9] 15 U.S.C. 78f(b)(5).

[10] 15 U.S.C. 78s(b)(3)(A).

[11] 17 CFR 240.19b–4(f)(6).

[12] 17 CFR 240.19b–4(f)(6)(iii). In addition, Rule 19b-4(f)(6)(iii) requires that a self-regulatory organization submit to the Commission written notice of its intent to file the proposed rule change, along with a brief description and text of the proposed rule change, at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission. The Exchange has satisfied the five-day pre-filing notice requirement.

[13] *Id.*

[14] For the purposes only of waiving the 30-day operative delay, the Commission has considered the proposed rule's impact on efficiency, competition, and capital formation. *See* 15 U.S.C. 78c(f).

DEPARTMENT OF TRANSPORTATION

Maritime Administration

[USCG–2007–28532]

Port Dolphin Energy LLC, Port Dolphin Energy Liquefied Natural Gas Deepwater Port License Application

AGENCY: Maritime Administration, DOT.

ACTION: Notice of intent; notice of public meeting; request for comments.

SUMMARY: The Maritime Administration announces that the Coast Guard, in coordination with the Maritime Administration, will prepare an Environmental Impact Statement (EIS) as part of the environmental review of this license application. The application describes a project that would be located approximately 28 miles off the western coast of Florida, and approximately 42 miles from Port Manatee, Manatee County, Florida. Publication of this notice begins a scoping process that will help identify and determine the scope of environmental issues to be addressed in the EIS. This notice requests public participation in the scoping process and provides information on how to participate.

DATES: The public meeting in Palmetto, FL will be held on July 25, 2007. The public meeting will be held from 6 p.m. to 8 p.m. and will be preceded by an open house from 4:30 p.m. to 5:30 p.m. The public meeting may end later than the stated time, depending on the

number of persons wishing to speak. Material submitted in response to the request for comments must reach the Docket Management Facility by August 13, 2007.

ADDRESSES: Public open house and meeting: The Manatee Convention Center, Conference Center, One Haben Blvd., Palmetto, Florida 34221. (941) 722–3244.

Address docket submissions for USCG–2007–28532 to: Docket Management Facility, U.S. Department of Transportation, West Building, Ground Floor, Room W12–140, 1200 New Jersey Avenue, SE., Washington, DC 20590.

The Docket Management Facility accepts hand-delivered submissions, and makes docket contents available for public inspection and copying at this address, in room W12–140, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The Facility's telephone is 202–366–9329, its fax is 202–493–2251, and its Web site for electronic submissions or for electronic access to docket contents is *http://dms.dot.gov*.

FOR FURTHER INFORMATION CONTACT: Ray Martin, U.S. Coast Guard, telephone: 202–372–1449, e-mail: *raymond.w.martin@uscg.mil*, Lieutenant Commander Brian Moore, U.S. Coast Guard, telephone: 202–372–1442, e-mail: *brian.e.moore@uscg.mil*, or Chris Hanan, U.S. Maritime Administration, telephone: 202–366–1900, e-mail: *Christopher.Hanan@dot.gov*. If you have questions on viewing the docket, call Renee V. Wright, Program Manager, Docket Operations, telephone 202–493–0402.

SUPPLEMENTARY INFORMATION:

Public Meeting and Open House

We invite you to learn about the proposed deepwater port at an informational open house, and to comment at a public meeting on environmental issues related to the proposed deepwater port. Your comments will help us identify and refine the scope of the environmental issues to be addressed in the EIS.

In order to allow everyone a chance to speak at the public meeting, we may limit speaker time, or extend the meeting hours, or both. You must identify yourself, and any organization you represent, by name. Your remarks will be recorded or transcribed for inclusion in the public docket.

You may submit written material at the public meeting, either in place of or in addition to speaking. Written material must include your name and address, and will be included in the public docket.

Public docket materials will be made available to the public on the Docket Management Facility's Docket Management System (DMS). See "Request for Comments" for information about DMS and your rights under the Privacy Act.

Our public meeting location is wheelchair-accessible. If you plan to attend the open house or public meeting, and need special assistance such as sign language interpretation or other reasonable accommodation, please notify the Coast Guard (see **FOR FURTHER INFORMATION CONTACT**) at least 3 business days in advance. Include your contact information as well as information about your specific needs.

Request for Comments

We request public comments or other relevant information on environmental issues related to the proposed deepwater port. The public meeting is not the only opportunity you have to comment. In addition to or in place of attending a meeting, you can submit comments to the Docket Management Facility during the public comment period (see **DATES**). We will consider all comments and material received during the comment period.

Submissions should include:

- Docket number USCG–2007–28532.
- Your name and address.
- Your reasons for making each comment or for bringing information to our attention.

Submit comments or material using only one of the following methods:

- Electronic submission to DMS, *http://dms.dot.gov*.
- Fax, mail, or hand delivery to the Docket Management Facility (see **ADDRESSES**). Faxed or hand delivered submissions must be unbound, no larger than 8½ by 11 inches, and suitable for copying and electronic scanning. If you mail your submission and want to know when it reaches the Facility, include a stamped, self-addressed postcard or envelope.

Regardless of the method used for submitting comments or material, all submissions will be posted, without change, to the DMS website (*http://dms.dot.gov*), and will include any personal information you provide. Therefore, submitting this information makes it public. You may wish to read the Privacy Act notice that is available on the DMS website, or the Department of Transportation Privacy Act Statement that appeared in the Federal Register on April 11, 2000 (65 FR 19477).

You may view docket submissions at the Docket Management Facility (see **ADDRESSES**), or electronically on the DMS Web site.

Background

Information about deepwater ports, the statutes and regulations governing their licensing, and the receipt of the current application for the proposed Port Dolphin liquefied natural gas (LNG) deepwater port appeared in the Federal Register on June 25, 2007 (72 FR 34741). The "Summary of the Application" from that publication is reprinted below for your convenience.

Consideration of a deepwater port license application includes review of the proposed deepwater port's natural and human environmental impacts. The Coast Guard, in coordination with the Maritime Administration, is the lead agency for determining the scope of this review, and in this case has determined that review must include preparation of an EIS. This notice of intent is required by 40 CFR 1501.7, and briefly describes the proposed action and possible alternatives and the proposed scoping process. You can address any questions about the proposed action, the scoping process, or the EIS to the Coast Guard project manager identified in **FOR FURTHER INFORMATION CONTACT**.

Proposed Action and Alternatives

The proposed action requiring environmental review is the Federal licensing of the proposed deepwater port described in "Summary of the Application" below. The alternatives to licensing the proposed port are: (1) Licensing with conditions (including conditions designed to mitigate environmental impact), and (2) denying the application, which for purposes of environmental review is the "no-action" alternative.

Scoping Process

Public scoping is an early and open process for identifying and determining the scope of issues to be addressed in the EIS. Scoping begins with this notice, continues through the public comment period (see **DATES**), and ends when the Coast Guard has completed the following actions:

- Invites the participation of Federal, State, and local agencies, any affected Indian tribe, the applicant, and other interested persons;
- Determines the actions, alternatives, and impacts described in 40 CFR 1508.25;
- Identifies and eliminates, from detailed study, those issues that are not significant or that have been covered elsewhere;
- Allocates responsibility for preparing EIS components;

• Indicates any related environmental assessments or environmental impact statements that are not part of the EIS;

• Identifies other relevant environmental review and consultation requirements;

• Indicates the relationship between timing of the environmental review and other aspects of the application process; and

• At its discretion, exercises the options provided in 40 CFR 1501.7(b).

Once the scoping process is complete, the Coast Guard will prepare a draft EIS, and publish a **Federal Register** notice announcing its public availability. (If you want that notice to be sent to you, please contact the Coast Guard project manager identified in **FOR FURTHER INFORMATION CONTACT**). You will have an opportunity to review and comment on the draft EIS. The Coast Guard will consider those comments in the preparation of the final EIS. As with the draft EIS, the availability of the final EIS will be announced and an opportunity for review and comment will again be provided.

Summary of the Application

Port Dolphin Energy LLC, proposes to own, construct, and operate a deepwater port, named Port Dolphin, in the Federal waters of the Outer Continental Shelf in the St. Petersburg (PB) blocks: PB545, PB589 and PB590, approximately 28 miles off the west coast of Florida to the southwest of Tampa Bay, in a water depth of approximately 100 feet. Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately three miles. Each unloading buoy would be permanently secured to eight mooring lines, consisting of wire rope, chain, and buoyancy elements, each attached to anchor points on the seabed. Anchor points will most likely consist of driven piles.

The buoys would be designed to moor a specialized type of LNG vessel called a Shuttle and Regasification Vessel (SRV) of between 145,000 and 217,000 cubic meter capacity. SRV vessels are equipped to vaporize cryogenic LNG cargo to natural gas through an onboard closed loop vaporization system, and to odorize and meter gas for send-out by means of the unloading buoy to conventional subsea pipelines. The SRVs would moor to the unloading buoys which connect through the hull of the vessels to specially designed turrets that would enable the vessels to weathervane or rotate in response to prevailing wind, wave, and current directions. When the vessels are not present, the buoys would be submerged on a special landing pad on the seabed, 60–70 feet below the sea surface.

Each unloading buoy would connect through a 16-inch flexible riser and a 36-inch flowline to a Y intersection and then a 36-inch pipeline approximately 42 miles in length that would connect onshore in Port Manatee, Manatee County, Florida. The pipeline would connect with the Gulfstream Natural Gas System, LLC and Tampa Electric Company (TECO) System.

The 36-inch gas transmission line would make landfall on Port Manatee property. From there, the transmission pipeline would proceed in a generally easterly direction to the first interconnection point with the Gulfstream system at 3.6-miles. The Gulfstream Interconnection Station would occupy an approximately two-acre site. Up to approximately 80 percent of the natural gas or 800 million standard cubic feet per day (mmscfd) is expected to be delivered to the Gulfstream Pipeline.

The remaining portion of the natural gas, up to approximately 360 mmscfd, would be transported by 14-inch line to the TECO interconnection station; located 2.1-miles east of the Gulfstream interconnect. Only shuttle and regasification vessels (SRVs) will call on Port Dolphin. Offloading would require between 4–8 days and when empty the SRV would disconnect from the buoy and leave the port.

Initially it is expected that Port Dolphin would be capable of a natural gas throughput of 400 mmscfd and would eventually be capable of 800 mmscfd with a peak capacity of 1200 mmscfd by having at least one SRV regasifying and discharging at all times. The system would be designed so that two SRVs can be moored simultaneously for continuous unloading of natural gas.

Port Dolphin Energy LLC is seeking Federal Energy Regulatory Commission (FERC) approval for the onshore pipelines concurrent with this deepwater port application. As required by FERC regulations, FERC will also maintain a docket for the FERC portion of the project. The docket numbers are CP07–191–000 and CP07–192–000. The filing may also be viewed on the Web at *http://www.ferc.gov* using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document. For assistance, call (866) 208–3767 or TYY, (202) 502–8659.

In addition, pipelines and structures such as the moorings may require permits under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act which are administered by the U.S. Army Corps of Engineers (USACE).

Port Dolphin will also require permits from the Environmental Protection Agency (EPA) pursuant to the provisions of the Clean Air Act, as amended, and the Clean Water Act, as amended.

The new pipeline will be included in the National Environmental Policy Act (NEPA) review as part of the deepwater port application process. FERC, EPA, and the USACE among others, are cooperating agencies and will assist in the NEPA process as described in 40 CFR 1501.6; will be participating in the scoping meetings; and will incorporate the EIS into their permitting processes. Comments sent to the FERC docket, EPA or USACE will also be incorporated into the DOT docket and EIS to ensure consistency with the NEPA Process.

Construction of the deepwater port would be expected to take approximately 22 months with startup of commercial operations following construction, should a license be issued by the Maritime Administration. The deepwater port would be designed, constructed and operated in accordance with applicable codes and standards.

Privacy Act

The electronic form of all comments received into the DOT docket are available to any person and may be searched by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (Volume 65, Number 70; Pages 19477–78) or you may visit *http://dms.dot.gov.*

(Authority 49 CFR 1.66)

Dated: July 6, 2007.

By order of the Maritime Administrator.

Daron T. Threet,

Secretary, Maritime Administration.

General Notices

PUBLIC NOTICE

Informational Open House and Public Meeting for the Port Dolphin LNG Deepwater Port License Application Environmental Impact Statement (EIS)

Tampa Bay, FL - The U.S. Coast Guard (USCG) and the Maritime Administration announce their intent to prepare an Environmental Impact Statement (EIS) to assist in the evaluation of an application for a license for the proposed Port Dolphin liquefied natural gas deepwater port. The Port would be constructed and operated in the Federal waters of the Outer Continental Shelf on St. Petersburg blocks - PB545, PB589, and PB590, approximately 28 miles west of Tampa Bay, FL in a water depth of approximately 100 feet. Port Dolphin would be capable of mooring up to two LNG carriers by means of a submerged unloading buoy system. The agencies are now in the scoping period that precedes preparation of the EIS, and invite public comment relating to concerns on the proposal or to the scope of the EIS.

As part of the scoping process, the USCG and the Maritime Administration will hold an informational open house and public Meeting on 25 July 2007 at The Manatee Convention Center, Conference Center, One Haben Blvd., Palmetto, Florida 34221, (941) 722-3244. The Open House will run from 4:30pm to 6:00pm. A Public Meeting will be after the informational open house, from 6:00 p.m. to 8:00 p.m. The events are open to the public and all interested parties are encouraged to attend.

Written and oral comments will be accepted at the Open House and Public Meeting. Comments may also be submitted to the Department of Transportation's Docket Management Facility. Comments and related material must reach the Docket Management Facility on or before August 13, 2007. To make sure your comments and related material are not entered more than once in the docket, please submit them by only one of the following means:

(1) By mail or Delivery to the Docket Management Facility (USCG-2007-28532), Department of Transportation Docket Management Facility, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue, SE, Washington, DC 20590. The Facility's telephone is 202-366-9329.

(3) By fax to the Docket Management Facility at (202) 493-2251.

(4) Electronically through the Web Site for the Docket Management System at http://dms.dot.gov.

Please give due regard to the continuing difficulties and delays associated with delivery of mail through the U.S. Postal Service to federal facilities. Comments and material received from the public, as well as the Environmental Impact Statement, will become part of this docket and will be available for inspection or copying at Room Docket Management Facility between 9 a.m. and 5 p.m., Monday through Friday, except for Federal holidays. You may also view this docket, including this notice and comments, on the Internet at http://dms.dot.gov.

If you have questions about the project or the meeting, you may contact Mr. Raymond Martin, USCG at (202) 372-1449 or Raymond.W.Martin@uscg.mil. If you have questions or comments

PUBLIC NOTICE

Informational Open House and Public Meeting for the Port Dolphin LNG Deepwater Port License Application Environmental Impact Statement (EIS)

Tampa Bay, FL – The U.S. Coast Guard (USCG) and the Maritime Administration announce their intent to prepare an Environmental Impact Statement (EIS) to assist in the evaluation of an application for a license for the proposed Port Dolphin liquefied natural gas deepwater port. The Port would be constructed and operated in the Federal waters of the Outer Continental Shelf on St. Petersburg blocks, PB545, PB589, and PB590, approximately 28 miles west of Tampa Bay, FL in a water depth of approximately 100 feet. Port Dolphin would be capable of mooring up to two LNG carriers by means of a submerged unloading buoy system. The agencies are now in the scoping period that precedes preparation of the EIS, and invite public comment relating to concerns on the proposal or to the scope of the EIS.

As part of the scoping process, the USCG and the Maritime Administration will hold an informational open house and public Meeting on 25 July 2007 at The Manatee Convention Center, Conference Center, One Haben Blvd., Palmetto, Florida 34221, (941) 722-3244. The Open House will run from 4:30pm to 6:00p.m. A Public Meeting will be after the informational open house, from 6:00 p.m. to 8:00 p.m. The events are open to the public and all interested parties are encouraged to attend.

Written and oral comments will be accepted at the Open House and Public Meeting. Comments may also be submitted to the Department of Transportation's Docket Management Facility. Comments and related material must reach the Docket Management Facility on or before August 13, 2007. To make sure your comments and related material are not entered more than once in the docket, please submit them by only one of the following means:

(1) By mail or Delivery to the Docket Management Facility (USCG-2007-28532) Department of Transportation Docket Management Facility, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue, SE, Washington, DC 20590. The Facility's telephone is 202-366-9329.
(2) By fax to the Docket Management Facility at (202) 493-2251.
(3) Electronically through the Web Site for the Docket Management System at http://dms.dot.gov.

Please give due regard to the continuing difficulties and delays associated with delivery of mail through the U.S. Postal Service to federal facilities. Comments and material received from the public, as well as the Environmental Impact Statement, will become part of this docket and will be available for inspection or copying at Room Docket Management Facility between 9 a.m. and 5 p.m., Monday through Friday, except for federal holidays. You may also view this docket, including this notice and comments, on the Internet at http://dms.dot.gov.

If you have questions about the project or the meeting, you may contact Mr. Raymond Martin, USCG at (202) 372-1449 or Raymond.W.Martin@uscg.mil. If you have questions or comments about the NEPA process or EIS, you may contact Ms. Patience Whitten, USCG at (202) 372-1453 or mailto: Patience.K.Whitten@uscg.mil.

APPENDIX D

PUBLIC MEETING MATERIALS

Port Dolphin LNG Deepwater Port Environmental Impact Statement (USCG-2007-28532)

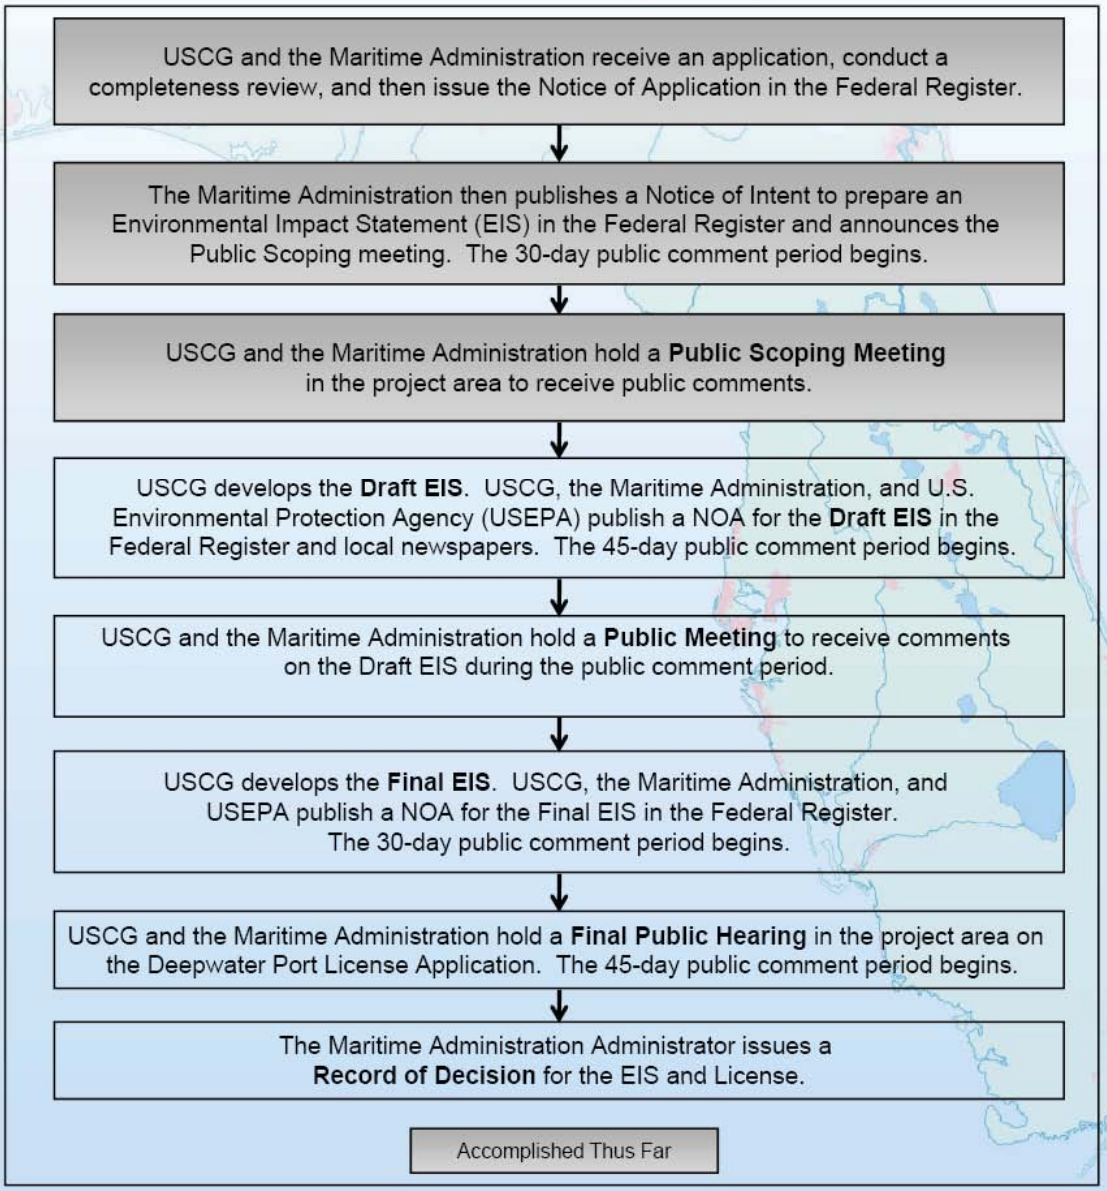
Proposed Action Fact Sheet

Introduction

In accordance with the Deepwater Port Act of 1974, as amended (the Act, 33 U.S. Code [U.S.C.] 1501 et seq.), the National Environmental Policy Act (NEPA) (Section 102(2)(c)), as implemented by the Council on Environmental Quality (CEQ) regulations (40 Code of Federal Regulations [CFR] Parts 1500-1508), and other applicable regulations, the USCG and the Maritime Administration intend to prepare an Environmental Impact Statement (EIS) to assist in evaluating the license application submitted by Port Dolphin Energy, L.L.C. for the proposed Port Dolphin deepwater port. NEPA requires Federal agencies to consider environmental impacts that may result from a proposed action, to inform the public of potential impacts and alternatives, and to facilitate public involvement in the assessment process. The EIS will describe in detail the nature and extent of the environmental impacts of the Proposed Action and alternatives and discuss appropriate mitigation measures for any adverse impacts. The EIS will include, among other matters, discussions of the purpose and need for the Proposed Action, a description of alternatives, a description of the affected environment, and an evaluation of the environmental impacts of the Proposed Action and alternatives. The U.S. Army Corps of Engineers (USACE) will use the EIS for their findings on the applicant's Section 10 of the Rivers and Harbors Act and Section 404 of the Clean Water Act permits. The U.S. Environmental Protection Agency (USEPA) will use the EIS findings on the applicant's NPDES permit application under the Section 402 of the Clean Water Act. The USEPA and USACE evaluations will be coordinated with and incorporated into the EIS prepared by USCG and the Maritime Administration.

Proposed Action

Port Dolphin Energy LLC, proposes to own, construct, and operate a deepwater port, named Port Dolphin, in the Federal waters of the Outer Continental Shelf in the St. Petersburg (PB) blocks: PB545, PB589 and PB590, approximately 28 miles off the west coast of Florida to the southwest of Tampa Bay, in a water depth of approximately 100 feet. Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately three miles. The buoys would be designed to moor a specialized type of LNG vessel called a Shuttle and Regasification Vessel (SRV) of between 145,000 and 217,000 cubic meter capacity. SRV vessels are equipped to vaporize cryogenic LNG cargo to natural gas through an onboard closed loop vaporization system, and to odorize and meter gas for send-out by means of the unloading buoy to a 36-inch flowline to a Y intersection and then a 36-inch pipeline approximately 42 miles in length that would connect onshore in Port Manatee, Manatee County, Florida with the Gulfstream Natural Gas System, LLC and Tampa Electric Company (TECO) pipeline. The 36-inch gas transmission line will make landfall on Port Manatee property. When the vessels are not present, the buoys would be submerged on a special landing pad on the seabed, 60–70 feet below the sea surface.



Only shuttle and regasification vessels (SRVs) would call on Port Dolphin. Initially Port Dolphin would be capable of a natural gas throughput of 400 mmscfd and would eventually be capable of an average of 800 mmscfd with a peak capacity of 1200 mmscfd . Construction of Port Dolphin would be expected to take 22 months. The Port Dolphin deepwater port would be designed, constructed, and operated in accordance with applicable codes and standards and would have an expected operating life of approximately 20 years.

Alternatives

Consistent with NEPA, USCG and the Maritime Administration must also consider alternative means to construct and operate a deepwater port. USCG and the Maritime Administration review will extend to matters such as the specific location of the port, methods of port construction and platform layout, and technologies for storing and regasifying LNG. The applicant presented alternatives for consideration by USCG and the Maritime Administration, including:

- No action alternative whereby no facility is constructed.
- Non-gas alternatives including fossil fuel, renewables, nuclear, and other types of electric power generation.
- LNG system alternatives considering existing and proposed LNG import facilities.
- Pipeline system alternatives.
- Offshore technology alternatives considering available and contemplated technologies.
- Geographic alternatives evaluating sites along the west coast of Florida.
- The USCG has created public input tools to allow interested parties to submit comments, including suggested alternatives, for consideration by USCG and the Maritime Administration.

Environmental Review Process For The National Environmental Policy Act (NEPA)

Environmental Impact Statement Review Topics

Typical Areas of Review

Air Quality Concerns

The Air Quality Review will evaluate the positive or negative impacts that emissions from construction and operation of the proposed deepwater port will have on air quality both locally and regionally.

Cultural/Historic Resource Concerns

This review generally includes a review of archaeological and cultural resources for onshore and offshore resources. Existing historical and cultural resources will be identified and preserved. An Unanticipated Discoveries Plan will be developed and followed during project construction.

Essential Fish Habitat Concerns

The EFH review will evaluate positive or negative impacts of construction and operation on fisheries and essential fish habitat, including threatened and endangered species and managed species important to commercial and recreational fishing.

Noise Concerns

A noise review will evaluate positive or negative impacts of construction and operation of the deepwater port on marine resources such as dolphins and manatees and on various land uses in the immediate area surrounding the onshore pipelines.

Socioeconomic Issues and Environmental Justice Concerns

Socioeconomic and Environmental Justices review will determine if construction and operation of the deepwater port will cause positive or negative impacts on local communities and services that they provide, such as schools, emergency services, and employment. It will also determine if these impacts will fall disproportionally on minority or low income populations.

Threatened and Endangered Species Concerns

A review of federally and state listed flora and fauna in the immediate areas of the deepwater port will be conducted to determine both positive or negative impacts to population and habitat.

Water Quality Concerns

A water quality review will evaluate positive or negative impacts of construction and operation on existing water quality parameters set forth by Federal, state, and local authorities.

Navigation and Transportation

A review of traffic patterns will evaluate positive or negative impacts of construction and operation of the deepwater port both on and offshore.

Land Use

A review of land use within the coastal zone and onshore will evaluate positive or negative impacts of construction and operation of the pipelines associated with the deepwater port. The review will determine if these impacts are consistent with Federal, state, and local planning authorities.

Liquefied Natural Gas (LNG) Fact Sheet

What is LNG?

LNG stands for liquefied natural gas. LNG is natural gas cooled to a temperature of approximately -260°F at atmospheric pressure at which point it condenses to a liquid. It is composed primarily of methane with small amounts of other liquefied petroleum gases. LNG is odorless, colorless, non-corrosive, and non-toxic. When LNG is regasified, the vapors are flammable only in concentrations of 5 to 15 percent natural gas when mixed with air. LNG is neither flammable nor explosive. Natural gas will not explode in an unconfined environment.

Natural gas can be imported to the U.S. from distant sources in the form of LNG. Because LNG occupies only a fraction of the volume of natural gas and takes up less space, it is more economical to transport across large distances and can be stored in larger quantities. Liquefying natural gas makes it feasible to transport natural gas by ship and store it in preparation for vaporization and delivery to markets.

Where does LNG Come From?

LNG supplies come primarily from locations where large gas discoveries have been made, such as Algeria, Indonesia, Trinidad, Nigeria, Malaysia, Qatar, Oman, and Australia. LNG is produced in Alaska as well. Typically, these locations are remote from areas of high natural gas demand.

How is LNG Transported?

LNG is transported in large, specially designed ships. These ships are double-hulled and have a cargo capacity of 138,000 cubic meters or more. These ships are fitted with a special cargo containment system inside the inner hull to maintain LNG at atmospheric pressure and -260°F. There are 167 ships currently in the LNG fleet and 60 or more are on order to meet anticipated future demand.

Is LNG Safe?

LNG has been handled safely for many years. The industry is not without incidents, but it has maintained an enviable safety record. Worldwide, there are approximately 17 LNG export (liquefaction) terminals, 40 import (regasification) terminals, and 167 LNG carriers, altogether handling approximately 120 million metric tons of LNG each year. There are currently about 200 storage facilities worldwide, some operating since the mid-60s. The U.S. has the largest number of LNG facilities in the world. There are 113 active LNG facilities across the U.S.

Deepwater Port Applications and the NEPA Process Fact Sheet

What is NEPA?

Congress passed the National Environmental Policy Act (NEPA) in 1969 to address concerns about environmental quality. NEPA establishes a national policy for attaining harmony between people and nature, for promoting efforts to eliminate damage to the environment, and for better understanding of ecological systems and natural resources. NEPA contains two major objectives:

1. ***To ensure that Federal agencies consider the potential environmental effects of proposed programs, projects, and actions before initiating them***
2. ***To inform the public and encourage and facilitate public involvement in Federal agency activities that affect the quality of the human environment***

Guidelines for Federal agencies to implement NEPA were established in regulations by the President's Council on Environmental Quality (CEQ) at 40 CFR 1500 -1508. The most detailed analysis prescribed by the CEQ regulations is the Environmental Impact Statement (EIS). An EIS is a detailed public document with the primary purpose of ensuring that requirements and goals of NEPA are incorporated into Federal programs and actions. An EIS is required to "provide a basis of consideration and inform decision-makers and the public of the reasonable alternatives."

Steps in the NEPA Process

NEPA requires Federal agencies to document potential environmental impacts of their proposed projects and policies. During the NEPA process, agencies consider issues ranging from air quality and biological impacts to cultural resources and socioeconomic impacts. The NEPA process for an EIS includes the following steps:

Conduct Public Scoping. In this phase of the project, the U.S. Coast Guard (USCG) and Maritime Administration ask the public to provide feedback on the proposed project, its potential environmental impacts, and analysis methods. Public scoping is critical for determining issues that will be discussed in the EIS and the way in which the study is conducted.

Prepare a Draft EIS. The Draft EIS is the first version of the formal document. A Notice of Availability (NOA) for the Draft EIS will be published in the *Federal Register*. The Draft EIS will be placed in public libraries throughout the affected area for public review. The Draft EIS will also be distributed to Federal, state, regional, and local agencies, private citizens, and local organizations. The USCG and the Maritime Administration will hold a public meeting to provide citizens an opportunity to make formal oral comments concerning the Draft EIS. Resource experts will be present to answer questions, and the public will have this additional opportunity to enter written and oral comments and concerns into the official record.

Prepare Final EIS. After the close of the comment period on the Draft EIS, USCG and the Maritime Administration will prepare a Final EIS to document the manner in which comments were considered. A NOA for the Final EIS will be published in the *Federal Register*.

Public Involvement

Methods for getting involved in the EIS process include submitting comments and attending public scoping meetings and public hearings. USCG and the Maritime Administration will notify the public of the times and places for these forums.

Agency Coordination

NEPA mandates that local, state, and Federal agencies within the affected areas be given the opportunity to comment on proposed actions. Other Federal agencies are asked to identify specific areas or issues that USCG and the Maritime Administration must address. The list of agencies contacted for agency coordination and their comments will be a part of the EIS.

Deepwater Port Act Requirements for Issuance of License to Own, Construct, and Operate a Deepwater Port

The Maritime Administration and U.S. Coast Guard (USCG) were jointly delegated responsibility by the Secretary of Transportation for processing deepwater port applications. The Secretary of Transportation has delegated to the Maritime Administrator the authority and responsibility to issue deepwater port licenses.

Maritime Administration, in consultation with the USCG, issues a Record of Decision (ROD) for each deepwater port license application. The ROD either approves, denies, or approves a license with conditions. The ROD is primarily based on the conditions for license issuance set forth in Section 1503 of the Deepwater Port Act of 1974, as amended (33 U.S.C. §§1501 et seq.) by the Maritime Transportation Security Act of 2002 (MTSA, Public Law 107-295).

Conditions for License Issuance Addressed in the Deepwater Port Act

1. The applicant must be financially responsible and able to meet the requirements of Section 1016 of the Oil Pollution Act of 1990 (33 U.S.C. §§2701 et seq.; 104 Stat 484). The applicant must be financially able to construct, own, and operate the deepwater port. The applicant also must provide a financial guarantee or bond sufficient to meet the cost for removal of components of the deepwater port upon termination or revocation of the license.
2. It must be determined that the applicant can and will comply with relevant laws, regulations, and license conditions. As part of this requirement the applicant must provide, in writing, its intended compliance with related laws, regulations, and conditions.
3. Construction and operation of the deepwater port must be in the national interest and consistent with national security and other national policy goals and objectives, including energy sufficiency and environmental quality.
4. The deepwater port should not unreasonably interfere with international navigation or other reasonable uses of the high seas as defined by treaty, convention, or customary international law.
5. In accordance with environmental review criteria, it must be determined that the applicant will construct and operate the deepwater port using best available technology to prevent or minimize adverse impacts on the marine environment.
6. The application must properly address all applicable provisions of the Clean Air Act, as amended, the Federal Water Pollution Control Act, as amended, and the Marine Protection, Research and Sanctuaries Act, as amended.
7. The Secretary of the Army, the Secretary of State, and the Secretary of Defense must convey their views on the adequacy of the application and its effect on programs within their respective jurisdictions.
8. The governor of the adjacent coastal State or States, pursuant to Section 1508 of the Deepwater Port Act, must approve the issuance of a deepwater port license. (Silence on this issue denotes approval.)
9. The adjacent coastal State to which the deepwater port is to be directly connected by pipeline must have an approved coastal zone management program pursuant to the Coastal Zone Management Act of 1972.

Deepwater Port Act and the Licensing Process Fact Sheet

What is the Deepwater Port Act?

The Deepwater Port Act (DWPA) of 1974, as amended, establishes a licensing system for ownership, construction, and operation of manmade structures beyond the U.S. territorial sea. The DWPA promotes the construction and operation of deepwater ports as a safe and effective means of importing oil and natural gas into the U.S. and transporting oil and natural gas from the Outer Continental Shelf, while minimizing tanker traffic and associated risks.

All deepwater ports must be licensed. The DWPA requires a license applicant to submit detailed plans for its facility to the Secretary of Transportation (the Secretary). The DWPA also requires the Secretary to designate an adjacent coastal state for consultation, and requires the consent of the governor of that state for license approval. The DWPA also mandates compliance with the National Environmental Policy Act (NEPA).

What is the Deepwater Port Licensing Process?

The Secretary has delegated the processing of deepwater port applications to the U.S. Coast Guard (USCG) and the Maritime Administration. The Secretary also delegated to Maritime Administration the authority to issue, transfer, amend, or reinstate a license for construction and operation of a deepwater port.

The DWPA license review process is driven by a series of legally mandated deadlines totaling a maximum of 356 calendar days from the date an application is approved. The DWPA mandates one NEPA process for all Federal agencies in the license application review process. Hence, there is a need to fully incorporate all necessary information and analysis to meet Federal (and state) environmental requirements in a single NEPA document. (The granting of the Federal or state permits or other authorities based on the NEPA analysis may occur at a later date. However, the NEPA process for the license application review must conclude that the proposal is substantially in compliance.)

USCG has a maximum of 21 calendar days from the date of application submittal to perform a completeness review. If determined complete, the USCG then has a maximum of 5 calendar days to publish a notice of application in the Federal Register.

The Federal Register notice triggers a maximum 240-day period in which to perform an application review, complete a NEPA process, and hold a final public hearing.

The DWPA requires at least one public hearing in each adjacent coastal state for each application. The final public hearing must occur no later than 240 days after publication of the Notice of Application in the Federal Register. The final public hearing then triggers a maximum 90-calendar day deadline for the Maritime Administrator to make a decision whether to grant, grant with conditions, or deny the application.

This 90-day period is divided into two 45-day periods. Federal agencies and the governor of the adjacent coastal state(s) have 45 days after the final public hearing to make their final comments on the application. The Maritime Administrator has a subsequent 45 days to issue a Record of Decision (ROD). There will be one ROD for both the EIS and the application.

All together, these various periods of time consume a total of 356 calendar days from the date a deepwater port license application is filed with the USCG.

Instructions for Submitting Written Comments

How Can I Submit Comments to the Federal Register?

To ensure that your comments are included as part of the environmental analysis, comments must be received in Washington, DC on or before August 28, 2007.

By Mail:

Docket Management Facility (USCG-2007-28532)
U.S. Department of Transportation
West Building, Ground Floor, Room W12-140
1200 New Jersey Avenue, SE
Washington, DC 20590

By Personal Delivery:

Room W12-140 on the Ground Floor of the West Building, 1200 New Jersey Ave, SE, Washington DC between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The telephone number is (202) 366-9329.

By FAX:

To the Docket Management Facility at (202) 493-2251.

Electronically:

Through the Web Site for the Docket Management System at http://dms.dot.gov.

The Docket Management Facility maintains the public docket for this notice. Comments will become part of this docket and will be available for inspection or copying in Room PL-401, located at 400 7th Street Southwest, Washington, DC 20590 between 9 a.m. and 5 p.m., Monday through Friday, except for Federal holidays. You may also view this docket, including this notice and comments, on the Internet at http://dms.dot.gov. Click on Simple Search and enter the docket number (28532).

If you choose to submit comments by mail or hand delivery, submit them in an unbound format, no larger than 8 ½ by 11 inches, and suitable for copying and electronic filing. If you submit comments by mail and would like to know if they reached the Facility, please enclose a stamped, self-addressed postcard or envelope. We will consider all comments and materials received during the comment period. (Note that delays in delivering packages to the Washington, DC-area is still being experienced due to security concerns, and that it may take longer than anticipated for mailed comments to reach the Department of Transportation.)

For Further Information:

If you have questions about the project, you may contact Mr. Ray Martin, U.S. Coast Guard, at (202) 372-1449, or Raymond.W.Martin@uscg.mil. If you have questions about the NEPA process or about the EIS, please contact Ms. Patience Whitten, U.S. Coast Guard, at (202) 372-1926, or Patience.K.Whitten@uscg.mil. For questions on viewing or submitting materials to the docket, contact Renee V. Wright, Program Manager, Docket Operations, at (202) 493-0402.

PORT DOLPHIN LNG DEEPWATER PORT

PUBLIC SCOPING MEETING

DATE TAKEN: Wednesday, July 25, 2007

TIME: 4:30 p.m.

PLACE: Manatee Convention Center
One Haben Boulevard
Palmetto, Florida

PRESENT:

DON BECKHAM - Engineering-Environmental Management
RAY MARTIN - U.S. Coast Guard
CHRIS HANAN - Maritime Administration
DAVE SWEARINGEN - Federal Energy Regulatory Commission
GARY LARSEN - Moderator

Patricia A. Pilarski, CSR
Executive Reporting Service
Bank of America Tower, Suite 400
One Progress Plaza, 200 Central Avenue
St. Petersburg, Florida 33701

Page 2

***

MR. MARTIN: We are going to get started. It's 6:00.

Good evening. My name is Ray Martin and I am the U.S. Coast Guard project manager for the Port Dolphin Project at U.S. Coast Guard Headquarters in Washington D.C. Also up here are Chris Hanan of the Maritime Administration; Dave Swearingen, the Federal Energy Regulatory Commission; Don Beckham of Engineering Environmental Management, environmental consultant for this project. Also in the audience is Mark Petersen of the U.S. Army Corp of Engineers. If you have any questions, he is available.

In a few minutes the other people up here will provide a shorter review of their responsibilities regarding the Port Dolphin Deepwater Port License application. But first I would like to give a brief background on this process.

November 2002 Congress passed a Maritime Transportation Security Act, which amended Deepwater Port Act by including the importation of natural gas. Prior to that it applied only to oil. Since the passage of the Act, the Coast Guard and the Maritime Administration have received 16 applications for natural gas deepwater ports.

Page 3

One of those applications was submitted on March 29, 2007, by Port Dolphin Energy, LLC. They proposed to own, construct and operate a natural gas deepwater port located, approximately, 28 miles off the western coast of Florida.

On June 25, 2007, the Coast Guard and the Maritime Administration published a notice in the Federal Register stating that the Port Dolphin application appeared to contain the required information to proceed. Since the project is closest to Florida it has been identified as an adjacent coastal state.

To issue a deepwater port license it must be found that the applicant is financially responsible, can and will comply with the applicable laws and regulations, and that the construction of the deepwater port is in the national interest.

As part of the overall licensing process the Maritime Transportation Security Act requires an environmental review. In this case an environmental impact statement or EIS must be prepared in accordance with the National Environmental Policy Act.

The fact that we are preparing an EIS was announced in the July 12, 2007, Federal Register.

Page 4

The EIS for Port Dolphin will describe the nature and extent of the environmental impacts of the proposed action, which is the construction and operation of Port Dolphin. EIS will also include, among other topics, the purpose and need of the proposed action, a description of the alternatives and a description of the affected environment.

The intent of this public scoping meeting is receive your input on these issues and any other issues you think should be considered.

I would like to emphasis, this meeting will not be your only opportunity to comment. Readily, comments on the type of scope, that is the type of issues that you would like analyzed and the EIS should be received by August 13, 2007. Once the draft EIS is completed, it will be announced in the Federal Register and made available for public review.

At least one public meeting will be held in Florida to receive public comments on the draft EIS. The meeting will probably be similar to this and will be announced in the Federal Register and local newspapers.

Separately from the EIS we will hold at least one public hearing in Florida to consider the Port

Page 5

Dolphin license application. The dates, locations and times will be announced in the Federal Register and local newspapers.

Now I would like to provide a brief overview of the Coast Guard's responsibility regarding the license application process. The Coast Guard and the Maritime Administration work together processing deepwater port applications. Although the administrator of the Maritime Administration will ultimately decide whether to approve, disapprove or approve with conditions a license for this proposed port, the Coast Guard will be the lead agency in developing the environmental analysis as one input for that decision.

In fulfilling our role as the lead agency for the development of the EIS, the Coast Guard must seek input from the public, as well as other state and federal agencies. The Coast Guard will also be responsible for the evaluation of proposed engineering design standards, the development of operations, wastewater management, Maritime safety and security requirements, in compliance with various laws and regulations for LNG carriers calling on the Port Dolphin Deepwater Port.

I want to make it clear that the Coast Guard

Page 6

is neither a proponent nor opponent of any deepwater port project. I also want to emphasis that only after the environmental review and license processes have been completed can there be any activity on the proposed project.

Now I am going to let Chris explain the responsibilities of his agency.

MR. HANAN: Good evening. As Ray said, my name is Chris Hanan and I am a member of the Maritime Administration Deepwater, Port Management Team.

On behalf of the Maritime Administrator I would like to thank all of you for attending this evening's scoping meeting for the Port Dolphin Energy Liquified Natural Gas Deepwater Port License application.

The Maritime Administration was delegated the authority and responsibility by the Secretary of Transportation to issue deepwater port licenses. With this long history of concern for safety and the environment we are pleased to work with the United States Coast Guard in processing deepwater port applications for the federal government.

As the deepwater port licensing authority, the Maritime Administration is keenly interested in the

Page 7

thorough environmental analysis of the Port Dolphin project and we are confident in the Coast Guard's leadership in this effort.

Sometime later this year or early next year at the end of the deepwater port application process the Maritime Administrator will have a decision to make, issue a deepwater port license, reject the deepwater port license, application or issue a deepwater port license subject to certain conditions. This decision to approve or disapprove the application will be reflected in the agency of the official record of decision document issued by the Maritime Administrator.

A favorable decision will be based upon the assurance that the applicant is financially responsible, the applicant is able to comply with applicable laws, regulations and license conditions. The deepwater port will operate in the national interest and consistent with national security, energy sufficiency and environmental quality of policy goals.

The deepwater port will not unreasonably interfere with international navigation. The deepwater port will be constructed and operate to prevent and minimize adverse impacts on the maritime

Page 8

environment.

The deepwater port will comply with national and environmental laws, an approved coastal and management program is in place; the secretaries of Army, state and defense were consulted and the effects of their programs considered. And, finally, the governor of the adjacent coastal states approves or has presumed to have approved the deepwater port.

We emphasize that these license requirements are stringent and completely enforceable. If a licensee violates the conditions of this license the Maritime Administration will suspend the license and/or operation of the facility until the conditions are sufficiently met.

We consider the environmental impact statement a major part of the application review process and we assure you that it will have a substantial bearing on the final licensing decision.

We appreciate your interest and encourage you to express your views and concerns to help shape the environmental analysis for the Port Dolphin Deepwater Port Project.

Finally we note, the recent amendment to the Deepwater Port Act of 1974, which allows the Maritime Administration to give priority processing

Page 9

to deepwater port applications that utilize U.S. flag vessels or U.S. officers and mariners of both foreign flag LNG vessels servicing our nation's ports.

Prior to issuing a license applicants will be required to provide information regarding the nationality of the flag state of vessels and the nationality of officers and crew that will service the deepwater ports. In keeping with this mandate the Maritime Administration has developed a U.S. crewing initiative in conjunction with the United States Merchant Marine Academy, State Maritime Academies, and labor based training facilities in an effort to expand and develop programs to train and employ U.S. citizens.

Ultimately it is the goal of the Maritime Administration to provide sufficient job opportunities for Americans while ensuring the safe and secure importation of LNG to our nation's shores.

Again, thank you for attending this evening's session and we look forward to receiving your comments and concerns.

MR. MARTIN: And now Dave Swearingen of the Federal Energy Regulatory Commission will describe

Page 10

his agency's responsibilities.
MR. SWEARINGEN: Thank you, Chris, Ray.
My name is Dave Swearingen. I am an environmental project manager with the Federal Regulatory Commission or FERC. And the FERC is going to be a cooperating agency for the production of the environmental impact statement because of the onshore pipeline. That particular piece of this overall project is under the FERC jurisdiction, the onshore pipeline.
The National Environmental Policy Act, or NEPA, requires that the FERC Commission take into consideration the environmental impacts associated with natural gas facilities under its jurisdiction. So the FERC will use this cooperation process to fulfill its NEPA obligations.
Now, the commission, the FERC Commission, is responsible for making a determination on whether to issue a certificate of public convenience and necessity to Port Dolphin. Now, the EIS prepared by the various agencies does not make that decision for the clerk. The EIS will be used to advise to the FERC Commission and to disclose to the public the environmental impact of constructing and operating the proposed project. The commission will consider

Page 11

the environmental information from the EIS, public comments, as well as a host of nonenvironmental issues such as engineering, markets, race, terrorists, finances and design and costs in making an informed decision on whether or not to approve the part of the project that is under the FERC jurisdiction.
Only after taking these environmental and nonenvironmental factors into consideration will the commission then make its final decision whether or not to approve Port Dolphin's proposed onshore pipeline.
Port Dolphin filed its FERC application for the onshore pipeline on April 25th of this year. Now, that application is part of the public record. So if you want more specific information about the onshore portion of this project you can get that from the FERC website. The FERC website is www.ferc, f-e-r-c, dot gov. And there is a link called eLibrary. And if you go to eLibrary and you type in the docket number. For the FERC portion, the docket number is CP07-191. You type that in and follow the prompts and you can pull up all of the information that is on the public record regarding the onshore portion of this project.

Page 12

So are there any questions regarding the FERC role in these proceedings?
Well, if not, I will turn things over to Don Beckham with E2M.
MR. BECKHAM: Thank you, Dave.
Good evening. My name is Don Beckham. I am with the Engineering Environmental Management, or E2M. We are the U.S. Coast Guard and the Maritime Administration's contractor for preparing the environmental impact statement for the proposed Port Dolphin LNG Deepwater Port. And I am the E2M's project manager for this project.
I wanted to provide an overview of the public participation process that is involved in preparing the EIS. E2M is a science-based environmental consulting firm experienced in EIS's and related studies. My team includes specialists in many resource areas covering all of the environmental sciences, including biologists, chemists, geologists and engineers.
We will be doing an independent evaluation of the environmental impacts of the proposed project and we will assist the Coast Guard in preparing the EIS to explain what the impacts would be.
Public involvement is a fundamental aspect of

Page 13

the NEPA process and the U.S. Coast Guard's environmental policies. We are now in an early stage of the EIS process at a step called scoping, in which we seek input from the public on the potential impacts and especially sources of information related to potential impacts. It is termed scoping because we are determining the scope of issues that should be included in the EIS.
The U.S. Coast Guard began the scoping process by publishing a notice of intent to prepare an environmental impact statement in the Federal Register, as Ray mentioned, on July 12th. A similar notice was published in the Tampa Tribune and the Bradenton Herald. The NOI was also mailed to, approximately, 150 state and federal agencies, individuals and groups that might have some interest in the project.
The notice of intent provided directions for making comments during the scoping process and announced the location and time of these public meetings.
Oral and written comments made today will be recorded and addressed in the draft EIS. In addition to providing comments tonight, you can also submit written comments to the docket over the

Page 14

Internet, by fax or by mail. For details on how you can submit those comments, they are in the NOI and they are also on this fax sheet that was in the open house portion on one of the boards and is available on the front table outside.

If you are making comments, please try to use only one of the methods that are available. You do not need to duplicate comments that you mail in by also sending them in over the Internet. If you send them in one time, they will be included in the docket.

As a minimum, an environmental analysis will be completed on the following topics in the EIS: geology, soils and sediments, water resources, wetlands, fisheries, wildlife, threatened and endangered species, socioeconomic impacts, transportation, cultural resources, marine biology, noise, recreation and esthetics and the liability and safety.

We will consider the environmental effects of construction, operation and decommissioning of the deepwater port. In addition, we will look at the cumulative impact of other foreseeable projects within the area of which we are aware. One of our responsibilities in preparing the EIS is to analyze

Page 15

a range of alternatives. We will consider alternative locations for the deepwater port and alternatives for the offshore and onshore pipeline routes.

We will look at alternative deepwater port concepts and alternative LNG technologies. We will also consider the no action alternative, or what would happen if the license is not granted and the project is not built, as mentioned earlier, the cumulative impacts of other projects in the same vicinity.

The next step in this process will be to prepare a draft EIS. To announce the availability of the EIS, the Maritime Administration will publish a notice of availability for the DEIS in the Federal Register and place ads in the local newspapers as we did with the announcement for this meeting.

When the DEIS is completed, copies will be sent to federal, state, regional and local agencies and local groups and individuals who have requested copies. Additional copies will be placed in local public libraries where the public may review them. The DEIS will also be available on the Department of Transportation docket system, via the Internet and you can request a copy from the Coast Guard.

Page 16

If you have not already done so -- and I know they were badgering you at the front table to do it -- please indicate on your registration card if you would like to receive a copy of the DEIS when it becomes available and we will ensure that you get a copy.

The U.S. Coast Guard and Maritime Administration will return to the Port Manatee area to hold a public meeting to provide citizens an opportunity to make formal oral comments concerning the draft EIS. Resource experts will be present to answer questions during the open house portion of the meeting and the public meeting will have this additional opportunity to enter comments and concerns into the official record.

After the close of the public comment period on the draft EIS we will assist the Coast Guard in preparing a final EIS, including an explanation of how comments were considered. On completion of the final EIS, though not part of the NEPA process, the U.S. Coast Guard and Maritime Administration will hold at least one public hearing in Florida to solicit comments on the final EIS and on the Port Dolphin license application.

Again, the dates, locations and times of the

Page 17

meeting will be announced in the Federal Register and local papers. When the EIS is finalized, the Maritime Administrator will use it as one of the inputs to its decision on whether to issue the license, not issue the license or issue it with specific conditions. There is another fax sheet that was on one of the boards and is available in the packets that include all of the fax sheets that were used that describe all of the additional requirements that go into the licensing decision.

Thank you very much for taking the time to come out this evening and we look forward to receiving your comments.

MR. MARTIN: Thanks, Don.

Gary Larsen will be the moderator for the remainder of this meeting and he will explain the process that will be used for taking comments.

MR. LARSEN: Good evening. My name is Gary Larsen. I am a local mediator and I will serve as your moderator tonight. My goal is just to help run the meeting and make sure everybody gets their chance to enter their comments on the record.

As you have now heard multiple times, decisions don't get made tonight. This is really the first opportunity for you to provide your public

Page 18

input into what will become the draft EIS that will then be subject to another meeting. It's not really a question-and-answer session and it's not meant to be necessarily an adversarial process.

One person we haven't mentioned is Patti, our court reporter. She is probably to me one of the most important people in the room because I want everybody to know that what you say will be transcribed and that transcription will then become part of the record that these entities consider when they make their decisions. So how loud someone speaks won't be as relevant as how clearly they speak, what they have to say.

The way we do this is, it's three minutes. I am going to do my best to hold people to three minutes. But I think right now we've got more time then we have speakers. So once we've done the three-minute drill, if those speakers, for instance, want to come back up because they feel there is something else they need to put in the record, we'll make that available to you. If anyone out there in the audience decides that, you know, I want to say something, I want to air something on the record, we'll make that opportunity available as well.

I am not aware of any public officials or

Page 19

agency officials being out in the audience because I would defer to them first. Correct me if I am wrong.

That having been said, one final note would be this: If you have something that you want physically to be part of the record, whether it's an article or a study or whatever, you can offer that to the court reporter as well and she will attach it to the record and it will become part of what you've had to say here this evening.

So pretty straightforward and we'll get started with it. I believe that Mr. White, Dan White is our first person that signed up. So if you are here sir, glad to hear from you.

MR. WHITE: Good evening. My name is Dan White and I work for Seminole Electric Cooperative, an elective cooperative up in Tampa, Florida, that it serves ten member distribution co-ops throughout the State of Florida. And I work -- I am a fuel supply coordinator for the company.

And I would just like to state that Seminole uses gas as a fuel and a gas fired natural gas facility that is interconnected with both the Gulf Stream and the Florida Gas Transmission Company, pipelines that are already here in the state.

Page 20

Seminole generally supports the development of additional infrastructure to facilitate the importation of liquified natural gas to meet the growing demand for natural gas in the Florida peninsula.

The addition of Port Dolphin natural gas supply into the Florida market area will provide Florida with much needed diversity and reliability of supply. This gas supply diversity and reliability should continue to support the ever growing electrical demand that we are seeing in the Florida reliability coordinating council here in the state. And that is what I have to say.

MR. LARSEN: And well within three minutes, Dan.

Rand Snell.

MR. SNELL: Hi. I am Rand Snell. I represent Reeder Farms and the Snell Family Limited Partnership of Southwest Florida. We manage and own 240 acres of property directly south of Port Manatee.

I am not here tonight to speak either for or against the proposed port and pipelines, offshore and onshore. I am here to raise a concern regarding the location of the pipeline as it transitions to

Page 21

the onshore portion.

We have an interest, obviously, as property owners in seeing that the pipelines onshore component is as much as possible colocated with the existing pipe lines to limit both the environmental impact and also the economic impact on landowners in the area. With respect to the offshore portion I encourage the company and regulators to look at the possibility of locating the pipeline where there is already disturbed area and there is a good pit of it near the port, as opposed to a more southerly location which could impact mangroves and other environmental impacts.

It's not clear to U.S. currently what the location extremity exactly will be. The maps are not scale sufficient to really determine that. So at this time we are reserving the option to protest potentially the location as it becomes better known. We definitely want to raise this with you now. Thank you.

MR. LARSEN: Thank you, Mr. Snell. I appreciate it.

I have a new name that has been handed to me. Chris Calvert.

MR. CALVERT: Thank you. I am Chris Calvert.

Page 22

Well, if you ask my wife she'll be the first to tell you, I am not the sharpest tool in the shed, but when I look at the room next door and look at the route, I am all in favor of LNG or any other supply of natural gas to Florida. I was here in 2004, 2005. The coal was wet and wouldn't burn. The barges couldn't get across the Atlantic. We have two supplies of natural gas.

What befuddles me is why we would put a third supply right on top of one of the others. It would seem to me that diversity would require U.S. to come in from a different direction so that we have an opportunity to at least have two out of three should some kind of disaster happen. If one of those pipelines -- one of the two pipelines that would be on top of each other had an incident, you might take them both out and then where are we. Just kind of wondering what we are thinking.

Thanks.

MR. LARSEN: Thank you, sir.

That is all of the speakers that I have that have written down that they would like to speak. But possibly someone out there in the audience having heard these stories would like to speak for themselves. And certainly that is what we are here

Page 23

for. So if anyone wants to speak, I will take the first one to raise their hand.

Well, I think the goal is to be available to all of U.S. at least to all of U.S. to be here until 8:00, should someone come in late to this public session.

MS. KENNEDY: I am Sharon Kennedy. I am with the Bradenton Herald and I have a question. I just want to know how much the environmental impact statement will cost.

MR. LARSEN: I can't answer that. I am just a moderator.

MR. MARTIN: I don't have an answer to that. I don't know what the total cost would be. As we told you earlier, the applicant pays the cost of the environmental impact statement.

MS. KENNEDY: You don't know how much it is?

MR. MARTIN: I would direct you to the applicant and they may have some estimates.

MR. LARSEN: Well, again, I don't want to make everybody have to sit around. Quite frankly, we are going to be here until 8:00. This is a public comment session. You know, so people have something to say, now is the time to say it and it's here to be recorded.

Page 24

MR. MARTIN: What we will do is, we'll adjourn and if someone else comes and wants to speak, we'll readjourn or whatever the term is. I forget. And then give them an opportunity to speak.

MR. LARSEN: If someone wants to speak, let U.S. know. We will reconvene this group and we'll more importantly reconvene the court reporter and make sure that those comments get on the record.

(Adjourn at 6:30 p.m. and reconvene at 7:00 p.m.)

MR. MARTIN: I am going to go ahead and reconvene and make sure nobody wants to speak. Is there anyone that would like to speak? If not, we are going to go ahead and adjourn and reconvene at 8:00. If there is any speakers then, we'll give them an opportunity. Thank you.

(Adjourn at 7:00 p.m. and reconvene at 8:00 p.m.)

MR. MARTIN: It's now 8:00 p.m. Do we have any speakers in the audience who would wish to make a comment?

We are now adjourned. This is the public meeting for Port Dolphin. Thank you.

(Meeting concluded at 8:00 p.m.)

Page 25

CERTIFICATE OF REPORTER

STATE OF FLORIDA)
COUNTY OF SARASOTA)

I, PATRICIA ANN PILARSKI, Registered Professional Reporter and Notary Public at Large in and for the State of Florida, certify that I was authorized to and did stenographically report the foregoing proceedings, and that the transcript is a true and complete record of my stenographic notes.

I further certify that I am not a relative, employee, attorney, or counsel of any of the parties, nor am I a relative or employee of any of the parties' attorney or counsel connected with the action, nor am I financially interested in this action.

Dated this 2nd day of August, 2007.

Dear Sirs,

This letter is in regard to my firm objection to the proposed construction of Port Dolphin Energy, LLC deep sea port off of Tampa Bay.

The proposed pipeline would pass near "Bean Point", the northern tip of Anna Maria Island, Florida and could gravely effect the ecosystem with potential damaging impacts upon the shore.

I would appreciate a final resolve to this situation by demanding a further environmental impact study with the results made public. This area has always been my families second home and we would hate to see it destroyed.

Thank you, Sharon Bolster

I would like to voice my opinion against your open loop system in the Gulf of Mexico. I would rather have no gas and a plentiful environment than to have your natural gas and no gulf of mexico. Dont be ignorant and say that your system will not harm the environment because it will. Find some other way to run your plant that doesnt destroy our environment and habitat.

Nathan Hunter
Baton Rouge, LA
CCA Member

the process. Among other things, intervenors have the right to receive copies of case-related Commission documents and filings by other intervenors. Likewise, each intervenor must send one electronic copy (using the Commission's eFiling system) or 14 paper copies of its filings to the Secretary of the Commission and must send a copy of its filings to all other parties on the Commission's service list for this proceeding.

If you want to become an intervenor you must file a motion to intervene according to Rule 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.214) (see Appendix 2).[3] Only intervenors have the right to seek rehearing of the Commission's decision.

Affected landowners and parties with environmental concerns may be granted intervenor status upon showing good cause by stating that they have a clear and direct interest in this proceeding which would not be adequately represented by any other parties. You do not need intervenor status to have your environmental comments considered.

Additional Information

Additional information about the project is available from the Commission's Office of External Affairs, at 1–866–208–FERC or on the FERC Internet Web site (*http://www.ferc.gov*) using the "eLibrary" link. Click on the eLibrary link, then on "General Search" and enter the docket number excluding the last three digits in the Docket Number field. Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at *FercOnlineSupport@ferc.gov* or toll free at 1–866–208–3676, or for TTY, contact (202) 502–8659. The eLibrary link also provides access to the texts of formal documents issued by the Commission, such as orders, notices, and rulemakings.

In addition, the Commission now offers a free service called eSubscription which allows you to keep track of all formal issuances and submittals in specific dockets. This can reduce the amount of time you spend researching proceedings by automatically providing you with notification of these filings, document summaries and direct links to the documents. Go to *http://www.ferc.gov/esubscribenow.htm.*

Finally, public meetings or site visits will be posted on the Commission's calendar located at *http://www.ferc.gov/EventCalendar/EventsList.aspx* along with other related information.

Kimberly D. Bose,

Secretary.

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket Nos. CP07–191–001]

Port Dolphin Energy LLC; Notice of Amendment

January 28, 2008.

Take notice that on January 18, 2008, Port Dolphin Energy LLC (Port Dolphin), 400 North Tampa Street, Suite 1050, Tampa, Florida 33602, filed in Docket No. CP07–191–001 to amend its application, pursuant to section 7(c) of the Natural Gas Act and Part 157, Subpart A of the Commission's regulations, filed April 25, 2007 in Docket No. CP07–191–000 in order to reroute its proposed pipeline. Specifically, Port Dolphin now proposes to: (1) To construct, install, own, operate, and maintain a single-use, 3.93-mile natural gas pipeline and related facilities necessary to provide transportation from the proposed Port Dolphin Project, a deepwater port offshore of Tampa Bay, Florida, to interconnections with Gulfstream Natural Gas System, L.L.C. (Gulfstream) and TECO Energy, Inc. (TECO), with applicable waivers. The application is on file with the Commission and open to public inspection. The filing may also be viewed on the Web at *http://www.ferc.gov* using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document. For assistance, call (866) 208–3767 or TYY, (202) 502–8659.

The Port Dolphin Pipeline will be a proprietary, single-use pipeline which will be dedicated solely to transporting re-gasified LNG from the Port Dolphin Project with a capacity up to 1,200 million standard cubic feet per day (MMscf/d). Port Dolphin states that it will operate the Port Dolphin port as a proprietary LNG receiving and re-gasification facility pursuant to the Deepwater Port Act of 1974. Accordingly, Port Dolphin filed an application to construct and operate the offshore portions of the Port Dolphin project with the Maritimes Administration and the U.S. Coast Guard (USCG) on March 29, 2007, as amended on December 7, 2007.

The USCG will serve as the lead agency responsible for developing and issuing an Environmental Impact Statement (EIS) for both the deepwater port and the associated onshore pipeline and related facilities referenced in this Notice. The FERC will act as a cooperating agency in developing the EIS. The filing of the final EIS in the Commission's public record for this proceeding will serve to notify federal and state agencies of the timing for the completion of all necessary reviews, and the subsequent need to complete all federal authorizations within 90 days of the date of issuance of the final EIS.

Any questions regarding this application should be directed to German Castro, Port Dolphin Energy LLC, 400 North Tampa Street, Suite 1050, Tampa, Florida 33602, phone (813) 514–1398.

There are two ways to become involved in the Commission's review of this project. First, any person wishing to obtain legal status by becoming a party to the proceedings for this project should, on or before the comment date stated below, file with the Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426, a motion to intervene in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 385.214 or 385.211) and the Regulations under the NGA (18 CFR 157.10). A person obtaining party status will be placed on the service list maintained by the Secretary of the Commission and will receive copies of all documents filed by the applicant and by all other parties. A party must submit 14 copies of filings made with the Commission and must mail a copy to the applicant and to every other party in the proceeding. Only parties to the proceeding can ask for court review of Commission orders in the proceeding.

However, a person does not have to intervene in order to have comments considered. The second way to participate is by filing with the Secretary of the Commission, as soon as possible, an original and two copies of comments in support of or in opposition to this project. The Commission will consider these comments in determining the appropriate action to be taken, but the filing of a comment alone will not serve to make the filer a party to the proceeding. The Commission's rules require that persons filing comments in opposition to the project provide copies of their protests only to the party or parties directly involved in the protest.

The Commission may issue a preliminary determination on non-environmental issues prior to the

completion of its review of the environmental aspects of the project. This preliminary determination typically considers such issues as the need for the project and its economic effect on existing customers of the applicant, on other pipelines in the area, and on landowners and communities. For example, the Commission considers the extent to which the applicant may need to exercise eminent domain to obtain rights-of-way for the proposed project and balances that against the non-environmental benefits to be provided by the project. Therefore, if a person has comments on community and landowner impacts from this proposal, it is important either to file comments or to intervene as early in the process as possible.

Persons who wish to comment only on the environmental review of this project should submit an original and two copies of their comments to the Secretary of the Commission. Environmental commenters will be placed on the Commission's environmental mailing list, will receive copies of the environmental documents, and will be notified of meetings associated with the Commission's environmental review process. Environmental commenters will not be required to serve copies of filed documents on all other parties. However, the non-party commenters will not receive copies of all documents filed by other parties or issued by the Commission (except for the mailing of environmental documents issued by the Commission) and will not have the right to seek court review of the Commission's final order.

The Commission strongly encourages electronic filings of comments, protests and interventions in lieu of paper using the "eFiling" link at *http://www.ferc.gov*. Persons unable to file electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, NE., Washington, DC 20426.

This filing is accessible on-line at *http://www.ferc.gov*, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, DC. There is an "eSubscription" link on the Web site that enables subscribers to receive e-mail notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please e-mail *FERCOnlineSupport@ferc.gov*, or call (866) 208–3676 (toll free). For TTY, call (202) 502–8659.

Comment Date: February 19, 2008.

[Docket No. ER07–1199–001]

Airtricity Munnsville Wind Farm, LLC; Notice of Filing

January 28, 2008.

Take notice that on January 17, 2008, Airtricity Munnsville Wind Farm, LLC, tendered for filing revised market-based rate tariff sheets in response to a request for reformatting.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211, 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant and all the parties in this proceeding.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at *http://www.ferc.gov*. Persons unable to file electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, NE., Washington, DC 20426.

This filing is accessible on-line at *http://www.ferc.gov*, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, DC. FILED

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE; Room 1A
Washington, D. C. 20426

Dear Ms. Bose:

Subject: Port Dolphin Energy LLC
Docket Number CP07-191-001
Notice of Limited Scoping for the Proposed Port Dolphin Project and Request for Comments on Environmental Issues

NOAA's National Marine Fisheries Service (NMFS), Southeast Region, Habitat Conservation Division, has received the Federal Energy Regulatory Commission's (FERC) February 4, 2008, scoping letter for the onshore pipeline and associated components of the subject project. FERC is assisting the United States Coast Guard in the preparation of an environmental impact statement that will discuss the anticipated environmental impacts of the onshore pipeline component of the Port Dolphin liquefied natural gas project in Manatee County, Florida. This action is to ensure FERC's compliance with the National Environmental Policy Act, and consultation requirements of the essential fish habitat (EFH) provisions of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act)

We have reviewed the information contained in the FERC notice and determined that NMFS does not have any EFH conservation recommendations to offer. Should the project be revised to include activities that may adversely impact estuarine habitats of Tampa Bay, review of the project should be re-coordinated through our office.

Thank you for your efforts to comply with the EFH consultation provisions of the Magnuson-Stevens Act. Comments, questions or correspondence should be directed to Mark Sramek at the letterhead address, by telephone at (727) 824-5311, or e-mail at Mark.Sramek@noaa.gov.

Sincerely,

W. Mark Thompson

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Port Dolphin Energy LLC	)	**Docket No. CP07-191-001**

COMMENTS OF
FLORIDA POWER & LIGHT COMPANY

Pursuant to Rule 212 of the Federal Energy Regulatory Commission's ("Commission" or "FERC") Rules of Practice and Procedure, 18 C.F.R. § 385.212 (2007), and the *Notice of Amendment* issued by the Commission on January 28, 2008, Florida Power & Light Company ("FPL") hereby submits these comments in the above-captioned proceeding. In support, FPL states the following:

I.
BACKGROUND

On January 18, 2008, Port Dolphin Energy LLC ("Port Dolphin") submitted an amendment to its April 25, 2007 application for a certificate of public convenience and necessity in order to reroute its proposed pipeline ("Amended Application"). Specifically, Port Dolphin's Amended Application proposes to construct, install, own, operate, and maintain a single-use 3.93-mile natural gas pipeline and related facilities necessary to provide transportation from the proposed Port Dolphin Project, a deepwater port offshore of Tampa Bay, Florida, to interconnections with Gulfstream Natural Gas System, L.L.C. ("Gulfstream") and TECO Energy, Inc. ("TECO"). FPL initially intervened in these proceedings on May 30, 2007, submitted comments on August 7, 2007, and submitted an answer on September 6, 2007.

The revised route of the pipeline from Port Manatee to the Interconnection Station was described in the Amended Application, as follows:

The revised route would include a N-8 segment between Port Manatee and a FP&L property and an E-W segment between the same FP& L property and a proposed new Interconnection Station that would be located next to Gulfstream's pressure reduction station along Buckeye Road. The pipeline would continue south approximately 280 feet west of and parallel to CBX Railroad.

The pipeline would use a horizontal drill ("HDD") to cross under the existing FP&L tank farm, continue south past the FP&L tank farm for approximately 1,300 feet, and then turn east, where it would cross CSX Railroad. It would continue east across an FP&L property (named "Substation 41" [the "Buckeye Substation"] parcel by FP&L) and cross US 41. The pipeline would continue east back onto an FP&L property, along the south and east sides of an existing borrow pit. Once the pipeline reached the northeast corner of the FP&L property, it would turn east onto Buckeye Industrial Property.

The pipeline would continue east approximately 3,350 feet until reaching Bud Rhoden Road and then continue east onto Tami Bols property for approximately 3,700 feet along the north side of an existing borrow pit until reaching O'Nell Road. After crossing O'Nell Road, the pipeline would enter Gene Citrus property and would turn immediately north across the Gene Citrus facility entrance road and continue north approximately 230 feet, where it would cross both the FP&L existing ROW and Buckeye Road. Once across Buckeye Road, the pipeline would enter the Port Dolphin property, where the pipeline would be terminated at the Gulfstream/TECO Interconnection Station.[1]

FPL submits the following comments on the Amended Application.

II.
COMMENTS

As indicated in the initial comments in this proceeding, FPL generally supports the Port Dolphin project and the additional supplies of natural gas it will bring to Florida. In the initial comments, however, FPL raised certain concerns with Port Dolphin's request for a forty (40) foot easement within FPL's 170 foot transmission easement along the south side of the Buckeye Road ROW. Since that time, FPL has met numerous times with representatives of Port Dolphin to discuss both Port Dolphin's use of the Buckeye Road ROW and their plans to run the pipeline

1 Port Dolphin Energy LLC, "Amended Application of Port Dolphin Energy LLC for a Certificate of Public Convenience and Necessity," FERC Docket No. CP07-191-001 (January 18, 2008), p. 18.

along the south side of South Dock Road. Port Dolphin has been willing to work through various siting issues relating to the Buckeye Road ROW and is currently conducting appraisals of FPL-owned properties where easements will be necessary. Port Dolphin has also agreed to add appropriate language to the proposed easement documents and the parties are working through the drafts.

FPL expects that this level of cooperation will continue as we resolve the remaining routing issues with respect to the pipeline running along the south side of South Dock Road. First, FPL is concerned that there is not sufficient clearance on the south side of the South Dock Road past Reeder Road to site Port Dolphin's new 36-inch pipeline in conjunction with FPL's existing 30-inch oil pipeline and TECO's existing gas pipeline. Second, in the area where Port Dolphin's proposed 36-inch pipeline turns to the south towards the FPL oil terminal, FPL has requested that Port Dolphin move the southbound pipeline about 20 feet to the east toward the CSX railroad. This would allow sufficient space for FPL's existing 30-inch oil pipeline. Finally, FPL has requested that in areas where the Port Dolphin pipeline will cross under FPL's pipeline, the distance between the Port Dolphin pipeline and FPL's 30-inch and 16-inch pipelines should be increased to provide sufficient clearance, and the crossing should be made at a 90-degree angle. FPL has confidence that these issues can be resolved and will continue to work with Port Dolphin to ensure that the proposed route meets with the public convenience and necessity.

III.
CONCLUSION

WHEREFORE, for the reasons set forth above, FPL requests that the Commission allow the parties sufficient time to work through the siting issues outlined above prior to granting Port Dolphin a certificate of public convenience and necessity.

Respectfully submitted,

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Port Dolphin Energy LLC	)	**Docket No. CP07-191-001**

ENVIRONMENTAL SCOPING COMMENTS OF
GULFSTREAM NATURAL GAS SYSTEM, L.L.C.

Gulfstream Natural Gas System, L.L.C. (Gulfstream), pursuant to the Commission's February 4, 2008 "Notice of Limited Scoping for the Proposed Port Dolphin Project and Request for Comments on Environmental Issues," hereby submits these environmental scoping comments regarding the January 18, 2008 application of Port Dolphin Energy LLC ("Port Dolphin") under Section 7(c) of the Natural Gas Act, 15 U.S.C. § 717f(c), and Part 157 of the Commission's regulations, 18 C.F.R. Part 157, for a certificate of public convenience and necessity authorizing Port Dolphin to construct, install, own, operate, and maintain a single-use, natural gas pipeline and related facilities.

I. BACKGROUND

Port Dolphin proposes to construct and operate a deepwater LNG port approximately 28 miles offshore of Tampa Bay, Florida. According to Port Dolphin, the deepwater port will be utilized by Shuttle and Regasification Vessels ("SRVs"), which are ocean going vessels capable of transporting LNG from abroad and of regasifying cargo LNG prior to offloading and subsequent transportation by pipeline.

The two unloading buoys are proposed to be about 3.1 miles (5 km) apart, and once offloaded the natural gas is to feed via subsea flowlines into a subsea pipeline extending for approximately 47.2 miles to the shore at Port Manatee, Tampa Bay, Florida. Once it makes

landfall, Port Dolphin's proposed pipeline is to continue for an additional 3.93 miles over land. Port Dolphin seeks to interconnect with Gulfstream at a point in Manatee County, Florida downstream of Gulfstream's Station 420.

II. COMMENTS

Gulfstream previously submitted comments in a motion filed in Docket No. CP07-191-000 on May 30, 2007. In that pleading, Gulfstream raised several concerns including, among others, safety and environmental problems. Those comments were in the nature of a Protest to the Port Dolphin original proposal, and Gulfstream renewed and incorporated those comments in its February 19, 2008 intervention and protest in Docket No. CP07-191-001.[1] Gulfstream is still reviewing Port Dolphin's amended application in this proceeding as well as the amended filing Port Dolphin submitted recently with the U.S. Coast Guard under the Deep Water Port Act in Docket No. USCG-2007-28532. Gulfstream only has portions of the amendment to the Deep Water Port Act Application. Gulfstream is reviewing that information as well; but it has not yet had an opportunity to see the entirety of the amendment to the Deep Water Port Application. At this time, it is not clear to Gulfstream whether the amended applications reduce or exacerbate Gulfstream's safety and environmental concerns. What is clear is that the onshore route proposed by Port Dolphin will have a direct and potentially adverse impact on Gulfstream. Gulfstream sent a letter to Port Dolphin requesting an opportunity to meet to discuss aspects of the project that are of concern to Gulfstream.[2] As a result, a meeting between Gulfstream and Port Dolphin now has been scheduled for April 1, 2008. Consequently, Gulfstream reserves its

To: Sarah Schenk, Assistant County Attorney

From: Joel D. Christian, Environmental Manager

Date: March 3, 2008

Subject: **Amended Application for Certificate of Public Convenience and Necessity for the Port Dolphin; CAO File No.**

The Natural Resources Division has reviewed the above referenced application and offers the following comments:

1. The applicant should verify whether the preferred corridor traverses any existing Conservation Easements.

2. What activities are proposed within the Interconnection Station as identified on Figure 3-4. There appears to be wetlands within the northern portion of the station that have not been identified.

3. Are the anticipated wetland impacts within Port Manatee property consistent with the approved Port Manatee General Development Plan?

4. Why was wetland impact avoidance and minimization not considered as Evaluation Criteria for the route alternatives through Port Manatee? The preferred corridor will impact mangroves within the south conveyance ditch.

5. Alternative Corridor 1 appears to be the most desirable in regard to wetland impact avoidance. Are there any methods that can be utilized, such as HDD, if this option were chosen that minimize the risk of disturbing contaminated sites? Please further describe what type of stormwater control issues are of concern with Alternative Corridor 1.

6. It doesn't appear that the wetland impacts in the following locations within the preferred corridor were identified:
   - Stations 10500 to 10600
   - Stations 11300 to 11800

Please contact me at ext. 6206 should have any questions regarding these comments.

IN REPLY REFER TO:

March 4, 2008

FWS Log No. 41910-08-TA-0194

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First St. NE; Room 1A
Washington, D.C. 20426

Applicant: Port Dolphin Energy LLC
Project Name: Port Dolphin
County: Manatee County
FWS Environmental Review # 08/0114, dated 2/5/08
FERC No. CP07-191-001

Dear Ms. Bose:

The U.S. Fish and Wildlife Service (Service) provides the following scoping comments in accordance with section 7 of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*) (ESA) and the National Environmental Policy Act (NEPA).

Port Dolphin Energy, LLC (Port Dolphin) amended its application with the Federal Energy Regulatory Commission (FERC) on January 18, 2008 for a proposed 3.93 mile onshore pipeline in Manatee County, Florida. A general location map for the pipeline was provided online with the FERC Notice of Limited Scoping. The pipeline extends from the high water mark in Manatee County to a new interconnection station where the pipeline would join with the interstate Gulfstream Natural Gas Pipeline and the intrastate TECO/Peoples Pipeline systems. The pipeline is associated with the Port Dolphin Liquefied Natural Gas Deepwater Port Project.

A number of federally-listed threatened and endangered species are known to occur in Manatee County and may occur in the project area. This includes the endangered wood stork, *Mycteria americana,* the threatened Florida scrub-jay, *Aphelocoma coeruluscens*, and the threatened Eastern indigo snake, *Dymarchon corais couperi.* The Service assumes that federally-listed species occur in ecological communities suitable for the species. If appropriate habitat exists for these species within the project impact area, we recommend that surveys be conducted to determine the presence or absence of listed species. Once completed, survey reports should be provided to the Service for review. Please note that we consider the core foraging area for the wood stork to be suitable wetlands within 15 miles of an active wood stork nesting colony. Nesting colony locations and core foraging areas are available on the Service's North Florida website, www.fws.gov/northflorida. Suitable foraging habitat is water that is relatively calm, uncluttered by dense thickets of aquatic vegetation, and having a water depth between two and

15 inches in depth. We suggest you consult our website for our survey methodologies for specific species. Please note that, in some cases, these methodologies may not be consistent with those of the Florida Fish and Wildlife Conservation Commission (FWC).
If you have any questions, please contact Ms. Linda Smith, of our St. Petersburg branch office, at (904)868-4044. Thank you for the opportunity to comment.

Sincerely,

David L. Hankla
Field Supervisor

Tampa Regulatory Office

PUBLIC NOTICE

Permit Application No. SAJ-2007-1064(IP-MEP)

TO WHOM IT MAY CONCERN: This district has received an application for a Department of the Army permit pursuant to Section 404 of the Clean Water Act (33 U.S.C. §1344) and Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. §403) as described below:

APPLICANT: Port Dolphin Energy, LLC
400 N. Tampa St., Suite 1050
Tampa, Florida 33602

WATERWAY & LOCATION: The 42 mile project alignment extends from Port Manatee, Manatee County, to a proposed deep water port consisting of two permanent unloading buoy systems, located approximately 28 miles off the west coast of Florida in the Gulf of Mexico.

LATITUDE & LONGITUDE:
North Buoy: Latitude 27.4200° North/Longitude -83.1973° West
South Buoy: Latitude 27.3745° North/Longitude -83.1897° West

PROJECT PURPOSE:

Basic: Construct a deepwater port facility and pipeline.

Overall: Construct a deepwater port facility and pipeline to deliver liquefied natural gas to serve the growing demand for natural gas for residential, industrial, and electric generation within west-central Florida.

PROPOSED WORK: Port Dolphin Energy LLC, proposes to own, construct, and operate a deepwater port, named Port Dolphin, in the Federal waters of the Outer Continental Shelf in lease blocks designated by the Minerals Management Service as St. Petersburg (PB) blocks: PB545, PB589 and PB590. These blocks are approximately 28 miles off the west coast of Florida to the southwest of Tampa Bay. Port Dolphin would consist of a permanently moored unloading buoy system with two submersible

buoys separated by a distance of approximately 3 miles. The buoys would be designed to moor a specialized type of liquefied natural gas vessel called a Shuttle and Regasification Vessel (SRV) of between 145,000 and 217,000 cubic meter capacity. Natural gas would be delivered to shore from Port Dolphin via a proposed new 36-inch-diameter-pipeline, approximately 42 miles in length that would connect onshore in Manatee County, Florida with the Gulfstream Natural Gas System, LLC and Tampa Electric Company (TECO) Bayside pipeline. Initially, Port Dolphin would be capable of a natural gas throughput of 400 million standard cubic feet per day (mscfd) and would eventually be capable of an average of 800 mscfd with a peak capacity of 1200 mscfd.

EXISTING CONDITIONS:
The Applicant performed a benthic survey along a 25,500 foot by 12,000 foot site at the proposed buoy system array footprint and a 3,000-foot corridor along the proposed pipeline corridor. Approximately 33 percent of the proposed route was hard /live bottom habitat. Survey results indicate that the majority of hard-bottom areas were located offshore (outside of Tampa Bay) in water depths of 40 to 50 feet and water depths from 70 to 90 feet. In depths of 40 to 50 feet, communities were dominated by macroalgae, accounting for 34 to 68 percent of benthic cover. In deeper waters (> 100 feet) macroalgal abundance was less pronounced and emergent substrate was uncommon to rare. Smaller sporadic patches of paddle grass were observed in deeper offshore areas of the Proposed Site and Pipeline Route.

Soft bottom/sand was the dominant habitat type inshore (within Tampa Bay) with small areas of sporadic hard bottom scattered throughout the bay. Hard-bottom communities included octocorals, sponges, hydroids, bryozoans, and various other invertebrates. Fields of one species of tunicate was observed in Tampa Bay, but not offshore. Artificial substrate in the proposed site and pipeline route were areas of dredge spoil (colonized primarily by sponges, tunicates, macroalgae, and some octocorals) and an artificial reef created as mitigation for hard/live bottom for impacts associated with installation of the Gulfstream Pipeline. Artificial substrate, such as mitigation reefs, bridge rubble, miscellaneous debris, and an unidentified "dome" structure (possibly oceanographic equipment), was also observed in the pipeline route. Bridge rubble was colonized by octocorals, sponges, macroalgae, and other various invertebrates in the pipeline route. Only the area around the horizontal directional drill (HDD) exit of the inshore portion of the proposed pipeline route was surveyed for seagrasses. No seagrasses were observed. Approximately 1 percent of the area

surveyed for the inshore portion of the proposed route (195 acres) was seagrass habitat identified off Port Manatee. This area overlaps soft substrate/sand habitat. The benthic survey confirmed that turtle grass, manatee, shoal grass, widgeon grass, and star grass were present along the inshore portion of the Pipeline route in depths less than 7 feet and concentrated in shallow waters around Manbirdtree Island, south of Port Manatee.

The on-shore portion of the project falls within a 100-foot wide right-of-way, of which 30-feet would be retained as permanent right-of way. A total of 63.6 acres of land would be affected by pipeline construction. Of this, about 13.8 acres would be permanently impacted for operation. The majority (about 56 percent) of the land crossed by the pipeline is either classified as urban/industrial or as agricultural/rangeland. The remaining land comprises upland forest, wetland, and surface water (e.g. ponds, canals, and ditches).

ENDANGERED SPECIES: The U.S. Army Corps of Engineers (Corps) has determined the proposed project may affect, but is not likely to adversely affect the following threatened and endangered species or their designated critical habitats:

Common Name	Scientific Name	Status
Kemp's ridley sea turtle	*Lepidochelys kempii*	endangered
leatherback sea turtle	*Dermochelys coriacea*	endangered
hawksbill sea turtle	*Eretmochelys imbricata*	endangered
green sea turtle	*Chelonia mydas*	threatened
loggerhead sea turtle	*Caretta caretta*	threatened
sperm whale	*Physeter macrocephalus*	endangered
humpback whale	*Megaptera novaeangliae*	endangered
fin whale	*Balaenoptera physalus*	endangered
sei whale	*Balaenoptera borealis*	endangered
blue whale	*Balaenoptera musculus*	endangered
West Indian manatee	*Trichechus manatus*	endangered
smalltooth sawfish	*Pristis pectinata*	endangered
wood stork	*Mycteria americana*	endangered

The Corps will request Fish and Wildlife's and National Marine Fisheries Service's concurrence with this determination pursuant to Section 7 of the Endangered Species Act.

ESSENTIAL FISH HABITAT (EFH): This notice initiates consultation with the National Marine Fisheries Service on EFH as required by the Magnuson-Stevens Fishery Conservation and Management Act 1996. The proposal may impact multiple marine and estuarine habitats utilized by various life stages of shrimp, red drum, sea trout, and the snapper/grouper complex. Our initial determination is that the proposed action would have

a substantial adverse impact on EFH or federally managed fisheries in the Gulf of Mexico. Our final determination relative to project impacts and the need for mitigation measures is subject to review by and coordination with the National Marine Fisheries Service.

NOTE: This public notice is being issued based on information furnished by the applicant. This information has not been verified. The jurisdictional line has not been verified by Corps personnel.

AUTHORIZATION FROM OTHER AGENCIES: Water Quality Certification is required from the Florida Department of Environmental Protection (FDEP).

The on-shore portion of the project is being reviewed under the National Environmental Policy Act (NEPA) by the Federal Energy Regulatory Commission (FERC), Docket No CP07-191-001.

The off-shore portion of the project is being reviewed under NEPA by the U.S. Coast Guard for a Deepwater Port License, DOT Docket No. USCG-2007-28532.

Comments regarding the application should be submitted in writing to the District Engineer at the above address within 21 days from the date of this notice.

If you have any questions concerning this application, you may contact Mark E. Peterson at the letterhead address, by electronic mail at Mark.E.Peterson@usace.army.mil, by fax at 813-769-7061, or by telephone at 813-769-7065.

The decision whether to issue or deny this permit application will be based on the information received from this public notice and the evaluation of the probable impact to the associated wetlands. This is based on an analysis of the applicant's avoidance and minimization efforts for the project, as well as the compensatory mitigation proposed.

Date: 7-April-2008
Page 3 of 3

EVALUATION: The decision whether to issue a permit will be based on an evaluation of the probable impact including cumulative impacts of the proposed activity on the public interest. That decision will reflect the national concern for both protection and utilization of important resources. The benefits, which reasonably may be expected to accrue from the proposal, must be balanced against its reasonably foreseeable detriments. All factors which may be relevant to the proposal will be considered including cumulative impacts thereof; among these are conservation, economics, esthetics, general environmental concerns, wetlands, historical properties, fish and wildlife values, flood hazards, floodplain values, land use, navigation, shoreline erosion and accretion, recreation, water supply and conservation, water quality, energy needs, safety, food and fiber production, mineral needs, considerations of property ownership, and in general, the needs and welfare of the people. Evaluation of the impact of the activity on the public interest will also include application of the guidelines promulgated by the Administrator, EPA, under authority of Section 404(b) of the Clean Water Act of the criteria established under authority of Section 102(a) of the Marine, Protection, Research, and Sanctuaries Act of 1972. A permit will be granted unless its issuance is found to be contrary to the public interest.

The US Army Corps of Engineers (Corps) is soliciting comments from the public; Federal, State, and local agencies and officials; Indian Tribes; and other interested parties in order to consider and evaluate the impacts of this proposed activity. Any comments received will be considered by the Corps of Engineers to determine whether to issue, modify, condition, or deny a permit for this proposal. To make or deny this decision, comments are used to assess impacts on endangered species, historic properties, water quality, general environmental effects, and the other public interest factors listed above. Comments are used in the preparation of an Environmental Assessment and/or an Environmental Impact Statement pursuant to the National Environmental Policy Act. Comments are also used to determine the need for a public hearing and to determine the overall public interest of the proposed activity.

COASTAL ZONE MANAGEMENT CONSISTENCY: In Florida, the State approval constitutes compliance with the approved Coastal Zone Management Plan. In Puerto Rico, a Coastal Zone Management Consistency Concurrence is required from the Puerto Rico Planning Board. In the Virgin Islands, the Department of Planning and Natural Resources permit constitutes compliance with approved Coastal Zone Management Plan.

REQUEST FOR PUBLIC HEARING: Any person may request a public hearing. The request must be submitted in writing to the District Engineer within the designated comment period of the notice and must state the specific reasons for requesting the public hearing.

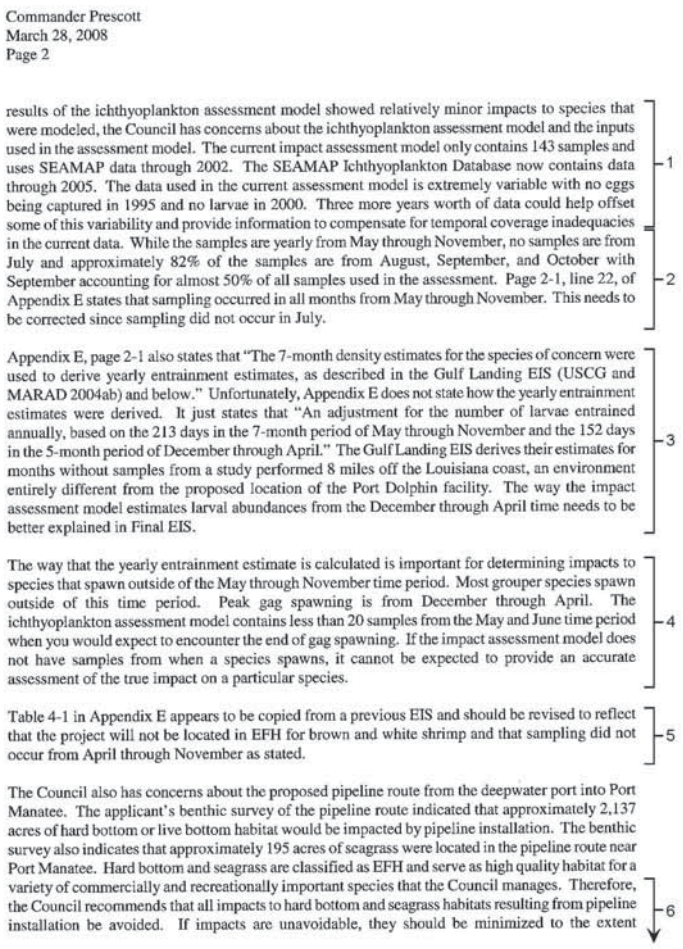
Commander Mark A. Prescott
Chief, Deepwater Ports Standards Division
U.S. Coast Guard
2100 Second Street, SW
Washington, DC 20593-0001



Dear Commander Prescott:

The Gulf of Mexico Fishery Management Council (Council) has reviewed the Draft Environmental Impact Statement (DEIS) for license application USCG–2006–28532 for the Port Dolphin Energy Liquefied Natural Gas Deepwater Port. Port Dolphin Energy, LLC proposes to construct a permanently moored unloading buoy system with two submersible buoys along with 42 miles of 36-inch diameter pipeline that would connect the deepwater port with the Gulfstream Natural Gas pipeline in Port Manatee, Florida. The deepwater port would be approximately 28 miles west of Tampa, Florida in 100 feet of water. The Council is concerned about potential impacts to essential fish habitat and associated fishery resources managed by the Council.

The Council is one of eight regional fishery management councils that were established by the Fishery Conservation and Management Act in 1976 (reauthorized as the Magnuson-Stevens Fishery Conservation and Management Reauthorization Act [M-SFCMRA] in 2007). The Council prepares fishery management plans for fishery resources in the Exclusive Economic Zone of the Gulf of Mexico. Section 305 of the M-SFCMRA gives the Council the authority to comment and make recommendations on activities that would adversely affect essential fish habitat (EFH).

The project area has been designated as EFH for various life stages of red drum, gray snapper, stone crab, spiny lobster, pink shrimp, coral, red grouper, gag, black grouper, yellowfin grouper, vermilion snapper, lane snapper, greater amberjack, lesser amberjack, Spanish mackerel, king mackerel, and cobia. Categories of EFH include hard bottom, marine and estuarine water column, benthic sediments, and submerged aquatic vegetation. Detailed information on these EFH designations can be located in the Council's 2005 Generic Amendment Number 3 for Addressing Essential Fish Habitat Requirements, Habitat Areas of Particular Concern, and Adverse Effects of Fishing in the Fishery Management Plans of the Gulf of Mexico. In addition to being designated as EFH for managed species, the project area also provides nursery and forage habitats that support additional ecologically, commercially, and recreationally important marine fishery species. Some of these organisms serve as prey for species managed by the Council.

Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately 3 miles. The buoys would be designed to moor a specialized type of liquefied natural gas (LNG) vessel called a Shuttle and Regasification Vessel (SRV). While at Port Dolphin, two SRVs would use approximately 23.66 million gallons of seawater per day for cooling SRV generators, LNG vaporization and vessel ballasting. While the

Commander Prescott
March 28, 2008
Page 2

results of the ichthyoplankton assessment model showed relatively minor impacts to species that were modeled, the Council has concerns about the ichthyoplankton assessment model and the inputs used in the assessment model. The current impact assessment model only contains 143 samples and uses SEAMAP data through 2002. The SEAMAP Ichthyoplankton Database now contains data through 2005. The data used in the current assessment model is extremely variable with no eggs being captured in 1995 and no larvae in 2000. Three more years worth of data could help offset some of this variability and provide information to compensate for temporal coverage inadequacies in the current data. While the samples are yearly from May through November, no samples are from July and approximately 82% of the samples are from August, September, and October with September accounting for almost 50% of all samples used in the assessment. Page 2-1, line 22, of Appendix E states that sampling occurred in all months from May through November. This needs to be corrected since sampling did not occur in July. 1 2

Appendix E, page 2-1 also states that "The 7-month density estimates for the species of concern were used to derive yearly entrainment estimates, as described in the Gulf Landing EIS (USCG and MARAD 2004ab) and below." Unfortunately, Appendix E does not state how the yearly entrainment estimates were derived. It just states that "An adjustment for the number of larvae entrained annually, based on the 213 days in the 7-month period of May through November and the 152 days in the 5-month period of December through April." The Gulf Landing EIS derives their estimates for months without samples from a study performed 8 miles off the Louisiana coast, an environment entirely different from the proposed location of the Port Dolphin facility. The way the impact assessment model estimates larval abundances from the December through April time needs to be better explained in Final EIS. 3

The way that the yearly entrainment estimate is calculated is important for determining impacts to species that spawn outside of the May through November time period. Most grouper species spawn outside of this time period. Peak gag spawning is from December through April. The ichthyoplankton assessment model contains less than 20 samples from the May and June time period when you would expect to encounter the end of gag spawning. If the impact assessment model does not have samples from when a species spawns, it cannot be expected to provide an accurate assessment of the true impact on a particular species. 4

Table 4-1 in Appendix E appears to be copied from a previous EIS and should be revised to reflect that the project will not be located in EFH for brown and white shrimp and that sampling did not occur from April through November as stated. 5

The Council also has concerns about the proposed pipeline route from the deepwater port into Port Manatee. The applicant's benthic survey of the pipeline route indicated that approximately 2,137 acres of hard bottom or live bottom habitat would be impacted by pipeline installation. The benthic survey also indicates that approximately 195 acres of seagrass were located in the pipeline route near Port Manatee. Hard bottom and seagrass are classified as EFH and serve as high quality habitat for a variety of commercially and recreationally important species that the Council manages. Therefore, the Council recommends that all impacts to hard bottom and seagrass habitats resulting from pipeline installation be avoided. If impacts are unavoidable, they should be minimized to the extent 6

1. However, if a license is issued USGC and the Maritime Administration would require the Applicant to develop a mitigation plan, which would include baseline monitoring prior to construction and monitoring after construction to validate the impact forecasts and initiate any necessary mitigation. In Section 4.11, a minimum of three years of monitoring to start immediately upon receiving a license, and to include at least one year prior to operation, is recommended.

2. Text revised per comment.

3. Text clarified per comment.

4. Text clarified and numbers explained per comment.

5. Text revised per comment.

6. Based on additional information provided by the Applicant's geotechnical surveys, estimated hard bottom impacts are shown in Table 4.2-13 and discussed in Section 4.2.1.6. According to the construction plans submitted by the Applicant, most hard bottom impacts will result from the pipeline being laid over the existing hardbottom features and covered with concrete mattresses. Section 4.11.1 discusses compensatory mitigation for hard bottom impacts.

Commander Prescott
March 28, 2008
Page 3

practicable and be fully mitigated. For unavoidable impacts, a compensatory mitigation plan for impacts to hard bottom marine habitats should include the following elements: 1) conceptual description of the overall mitigation plan; 2) quantification of anticipated hard/live bottom impact acreage versus proposed mitigation acreage and justification for the proposed mitigation acreage; 3) scientific criteria for determining mitigation success; 4) a project and mitigation implementation schedule; 5) targeted hard/live bottom climax communities expected in mitigation area(s), including their acreage and configurations; 6) materials and methods to be used to achieve the intended mitigation; 7) comprehensive 5-year monitoring and reporting schedules; and 8) contingency plans by which equivalent mitigation would be completed if the proposed mitigation fails. 6 7

The Council appreciates the opportunity to provide comments on the DEIS for the Port Dolphin Energy LNG Deepwater Port. If you have any questions regarding our comments, please do not hesitate to contact us.

Sincerely,

Thomas McIlwain by KD

Dr. Thomas McIlwain
Chairman

7. The applicant is consulting with USCG and the Maritime Administration to develop appropriate mitigation plans and additional geophysical surveys. Additionally, video mapping results from the Gulfstream Pipeline Project EIS (2001) are being compiled to augment the predicted benthic impacts, as appropriate. All available data will be used to specify mitigation type, extent, duration, and schedule.

Washington, DC 20593-0001

Re: Draft Environmental Impact Statement for the Port Dolphin LLC Deepwater Port License Application (Docket No. USCG-2007-28532)

Dear Mr. Prescott:

Thank you for providing the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS) the opportunity to comment on the draft Environmental Impact Statement (DEIS) for the Port Dolphin, LLC Deepwater Port liquefied natural gas facility, dated April 2008 (docket number USCG-2007-28532). According to the DEIS, Port Dolphin, LLC is proposing to construct and operate a liquefied natural gas regasification facility in the Gulf of Mexico approximately 28 miles off the west coast of Florida, southwest of Tampa Bay.

These comments address issues related to the Magnuson-Stevens Fishery Conservation and Management Act (MSA), Endangered Species Act (ESA), the Marine Mammal Protection Act (MMPA) and the National Environmental Policy Act (NEPA). The enclosed comments and recommendations are intended to further the consultation processes of the ESA, satisfy our commenting requirements under the MSA, and ensure a full analysis is conducted under NEPA.

If there are questions on MSA issues, please contact Rusty Swafford at (409) 766-3699. For questions related to the ESA or MMPA, please contact Kyle Baker at (727) 551-5789.

Sincerely,

Phil Steele for

Roy E. Crabtree, Ph.D.
Regional Administrator

Enclosure

ENCLOSURE – NOAA'S NATIONAL MARINE FISHERIES SERVICE
COMMENTS AND RECOMMENDATIONS
DRAFT ENVIRONMENTAL IMPACT STATEMENT
PORT DOLPHIN LLC, LIQUEFIED NATURAL GAS DEEPWATER PORT

Below, the National Marine Fisheries Service (NMFS) offers comments pursuant to its responsibilities under the National Environmental Policy Act, the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), the Endangered Species Act (ESA), and the Marine Mammal Protection Act (MMPA). NMFS is using the Draft Environmental Impact Statement (DEIS) to: 1) provide comments for the improvement of the Final Environmental Impact Statement (FEIS), 2) to provide the United States Coast Guard (USCG) with Essential Fish Habitat (EFH) conservation recommendations, and 3) to make recommendations on additional information needed to further the ESA consultation.

NATIONAL ENVIRONMENTAL POLICY ACT

Federal agencies that have jurisdiction by law or special expertise with respect to any environmental impact resulting from an agency action are required to comment on draft environmental impact statements. *SEE* 40 C.F.R. §1503.2. NOAA maintains expertise and jurisdiction by law over the nation's marine resources and offers the following comments and recommendations on the DEIS for the Port Dolphin LLC, Deepwater Port (Port Dolphin). This document contains comments and recommendations from the National Oceanic and Atmospheric Administration's (NOAA) NMFS regarding the DEIS, dated April 2008, on the Port Dolphin License Application. These comments and recommendations are provided to the USCG and the Maritime Administration (MARAD) pursuant to the interagency Memorandum of Understanding Related to the Licensing of Deepwater Ports.

DESCRIPTION OF THE PROPOSED ACTION

Port Dolphin, LLC, proposes to construct and operate a liquefied natural gas (LNG) deepwater port facility located in the Gulf of Mexico, approximately 28 miles southwest of Tampa Bay, off Manatee County, Florida. Port Dolphin would consist of two, permanent mooring unloading buoys connected to a 36-inch diameter, 41-mile long gas transport pipeline constructed from the offshore port to landward portions of existing natural gas pipelines in Manatee County. The proposed mooring buoys would be sited approximately three miles apart in water depth of approximately 100 feet. The two mooring buoys would have eight mooring lines connected to eight pile-driven anchor points in the seafloor. Up to two shuttle and regasification vessels (SRV) would moor at Port Dolphin to offload regasified LNG between four to eight-day evolutions. When not connected to an SRV, the mooring buoys would be submerged 60 to 70 feet below the sea surface. A marker buoy and retrieval line would be used to locate and recover the buoy as an SRV arrives at the deepwater port. The unloading buoy would be retrieved from its submerged position and hoisted in through a moon-pool in the forward part of the SRV where it would be positioned in a receiving cone within the hull trunk. After the buoy is locked in position, unloading of regasified LNG would begin. The SRVs would be equipped to transport, store, vaporize, and meter natural gas. A closed-loop, glycol-

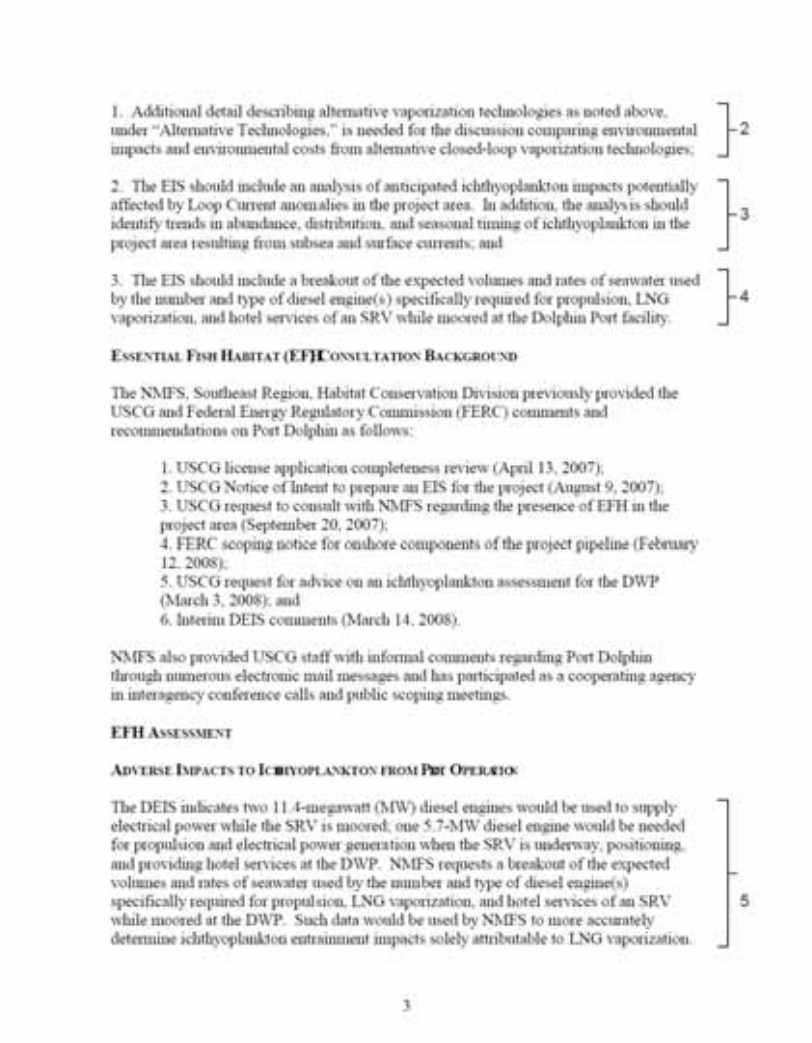
water heat transfer media would be used to vaporize the LNG. Natural gas flowlines from Port Dolphin would connect to a 36-inch diameter gas transmission line, which would interconnect with the existing Gulfstream Pipeline natural gas transmission line located approximately 46 miles east of the project site.

As proposed, Port Dolphin activities would require approximately 9.5 million gallons of seawater per day (MGD) for LNG regasification operations aboard each SRV. An additional 2.3 MGD of ballast seawater would also be required during SRV off-loading, requiring approximately 24 MGD for regasification activities aboard two SRVs. It is expected between 45 and 90 SRVs would utilize Port Dolphin for LNG vaporization annually, requiring some 540 million to 1.1 billion gallons of seawater annually. Deepwater port construction is expected to take 11 months to complete, with operations planned to commence in the second quarter of 2011.

MAGNUSON-STEVENS FISHERY CONSERVATION AND MANAGEMENT ACT (16 U. S. C. SS 1801 ET SEQ.)

Below are NMFS' recommendations regarding the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act). For each of the issues discussed below, NMFS is available to assist USCG, MARAD, or the project applicant in identifying relevant studies and information sources that may assist in completing subsequent environmental impact statements (EIS).

ALTERNATIVE TECHNOLOGIES



The DEIS describes LNG vaporization alternatives available for use aboard SRVs at Port Dolphin. In summary, the applicant proposes the use of a closed-loop vaporization system, utilizing an intermediate water-glycol fluid to regasify LNG prior to offloading. The proposed Calypso LNG (Calypso) project off the east coast of Florida has proposed the use of a similar, closed-loop vaporization system aboard special regasification ships (SRS) moored at one of two buoys. The Calypso SRS include a system capable of vaporizing the LNG in a closed-loop system and cooling the electricity-generating engines. The Calypso SRS also include an open-loop mode used when LNG is not being vaporized, and a closed-loop mode not requiring any seawater intake. To further minimize ichthyoplankton impacts, NMFS recommends the final EIS include discussions and evaluations of entirely closed-loop LNG vaporization alternatives, which use a small portion of LNG to effectively heat and regasify LNG for offloading. Further, additional discussion is warranted why the SRS vaporization technology used for Calypso would not be available for Port Dolphin. We believe utilization of an entirely closed-loop regasification system would reduce necessary seawater consumption to 2.3 MGD for vessel ballasting, and eliminate ichthyoplankton impacts resulting from the consumption of 9.5 MGD per SRV. 1

RECOMMENDATIONS FOR INFORMATION NEEDS IN THE FINAL EIS

Based on our review of the DEIS, NMFS provides the following additional recommendations for improving the final EIS:

2

1. The closed-loop engine cooling system proposed for the Calypso project is discussed in the Alternatives Analysis, Section 2.1.7.4.

1. Additional detail describing alternative vaporization technologies as noted above, under "Alternative Technologies," is needed for the discussion comparing environmental impacts and environmental costs from alternative closed-loop vaporization technologies; 2

2. The EIS should include an analysis of anticipated ichthyoplankton impacts potentially affected by Loop Current anomalies in the project area. In addition, the analysis should identify trends in abundance, distribution, and seasonal timing of ichthyoplankton in the project area resulting from subsea and surface currents; and 3

3. The EIS should include a breakout of the expected volumes and rates of seawater used by the number and type of diesel engine(s) specifically required for propulsion, LNG vaporization, and hotel services of an SRV while moored at the Dolphin Port facility. 4

ESSENTIAL FISH HABITAT (EFH) CONSULTATION BACKGROUND

The NMFS, Southeast Region, Habitat Conservation Division previously provided the USCG and Federal Energy Regulatory Commission (FERC) comments and recommendations on Port Dolphin as follows:

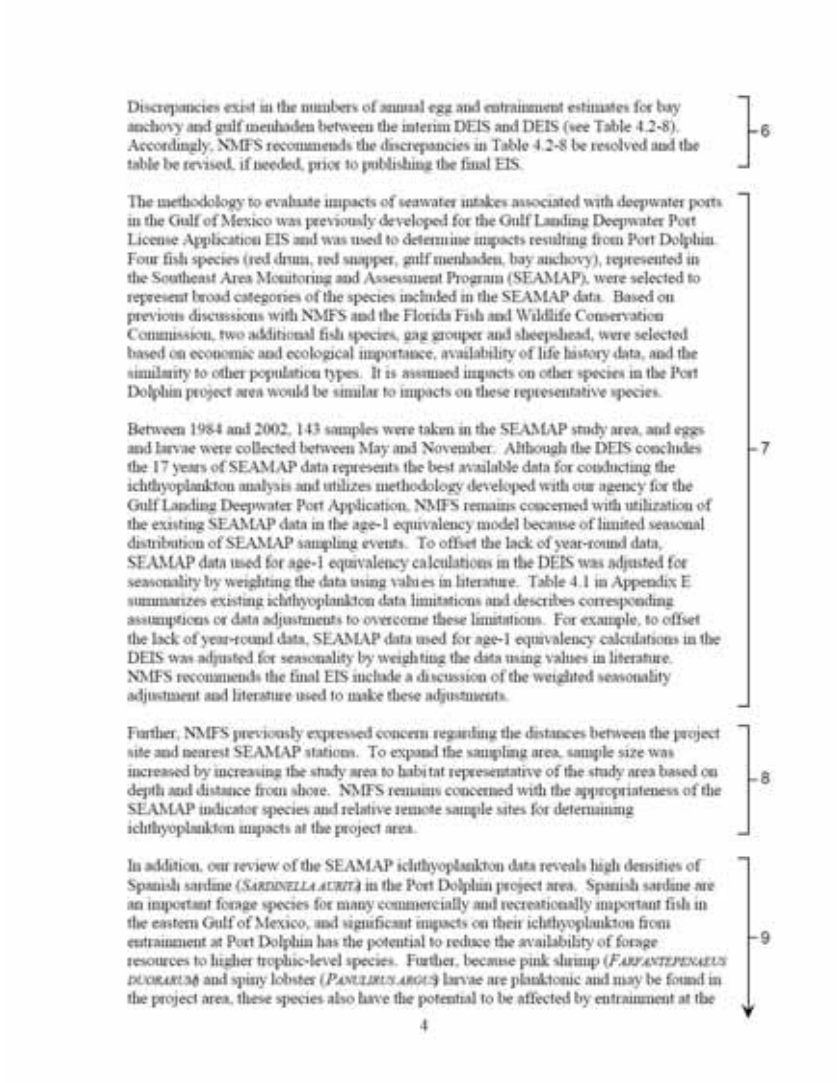
1. USCG license application completeness review (April 13, 2007);
2. USCG Notice of Intent to prepare an EIS for the project (August 9, 2007);
3. USCG request to consult with NMFS regarding the presence of EFH in the project area (September 20, 2007);
4. FERC scoping notice for onshore components of the project pipeline (February 12, 2008);
5. USCG request for advice on an ichthyoplankton assessment for the DWP (March 3, 2008); and
6. Interim DEIS comments (March 14, 2008).

NMFS also provided USCG staff with informal comments regarding Port Dolphin through numerous electronic mail messages and has participated as a cooperating agency in interagency conference calls and public scoping meetings.

EFH ASSESSMENT

ADVERSE IMPACTS TO ICHTHYOPLANKTON FROM PORT OPERATION

The DEIS indicates two 11.4-megawatt (MW) diesel engines would be used to supply electrical power while the SRV is moored; one 5.7-MW diesel engine would be needed for propulsion and electrical power generation when the SRV is underway, positioning, and providing hotel services at the DWP. NMFS requests a breakout of the expected volumes and rates of seawater used by the number and type of diesel engine(s) specifically required for propulsion, LNG vaporization, and hotel services of an SRV while moored at the DWP. Such data would be used by NMFS to more accurately determine ichthyoplankton entrainment impacts solely attributable to LNG vaporization. 5



3

2. Alternative LNG vaporization technologies are discussed in Section 2.1.7 of the Final EIS.

3. Currently, there are no available data that would allow the impact assessment to account for Loop Current, surface and bottom currents to be factored in to the ichthyoplankton assessment. The Final EIS qualitatively describes the affect of the Loop Current and other currents on larval transport in Section 4.2.1.11. The current analysis takes into account general trends in abundance, distribution, and seasonal timing of ichthyoplankton in area.

4. A discussion of water uses, and the potential maximum volume of intake and discharge can be found in Section 2.3.4, Vaporization and Process Facilities. The maximum potential intake and discharge is analyzed in the EIS. Actual water intake during operations would be based on ambient temperatures and engine loads, therefore, there are an unlimited range of intake volumes and rates below this maximum value.

5. A discussion of water uses, and the potential maximum volume of intake and discharge can be found in Section 2.3.4, Vaporization and Process Facilities. The maximum potential intake and discharge is analyzed in the EIS. Actual water intake during operations would be based on ambient temperatures and engine loads, therefore, there are an unlimited range of intake volumes and rates below this maximum value.

Discrepancies exist in the numbers of annual egg and entrainment estimates for bay anchovy and gulf menhaden between the interim DEIS and DEIS (see Table 4.2-8). Accordingly, NMFS recommends the discrepancies in Table 4.2-8 be resolved and the table be revised, if needed, prior to publishing the final EIS. 6

The methodology to evaluate impacts of seawater intakes associated with deepwater ports in the Gulf of Mexico was previously developed for the Gulf Landing Deepwater Port License Application EIS and was used to determine impacts resulting from Port Dolphin. Four fish species (red drum, red snapper, gulf menhaden, bay anchovy), represented in the Southeast Area Monitoring and Assessment Program (SEAMAP), were selected to represent broad categories of the species included in the SEAMAP data. Based on previous discussions with NMFS and the Florida Fish and Wildlife Conservation Commission, two additional fish species, gag grouper and sheepshead, were selected based on economic and ecological importance, availability of life history data, and the similarity to other population types. It is assumed impacts on other species in the Port Dolphin project area would be similar to impacts on these representative species.

Between 1984 and 2002, 143 samples were taken in the SEAMAP study area, and eggs and larvae were collected between May and November. Although the DEIS concludes the 17 years of SEAMAP data represents the best available data for conducting the ichthyoplankton analysis and utilizes methodology developed with our agency for the Gulf Landing Deepwater Port Application, NMFS remains concerned with utilization of the existing SEAMAP data in the age-1 equivalency model because of limited seasonal distribution of SEAMAP sampling events. To offset the lack of year-round data, SEAMAP data used for age-1 equivalency calculations in the DEIS was adjusted for seasonality by weighting the data using values in literature. Table 4.1 in Appendix E summarizes existing ichthyoplankton data limitations and describes corresponding assumptions or data adjustments to overcome these limitations. For example, to offset the lack of year-round data, SEAMAP data used for age-1 equivalency calculations in the DEIS was adjusted for seasonality by weighting the data using values in literature. NMFS recommends the final EIS include a discussion of the weighted seasonality adjustment and literature used to make these adjustments. 7

Further, NMFS previously expressed concern regarding the distances between the project site and nearest SEAMAP stations. To expand the sampling area, sample size was increased by increasing the study area to habitat representative of the study area based on depth and distance from shore. NMFS remains concerned with the appropriateness of the SEAMAP indicator species and relative remote sample sites for determining ichthyoplankton impacts at the project area. 8

In addition, our review of the SEAMAP ichthyoplankton data reveals high densities of Spanish sardine (*SARDINELLA AURITA*) in the Port Dolphin project area. Spanish sardine are an important forage species for many commercially and recreationally important fish in the eastern Gulf of Mexico, and significant impacts on their ichthyoplankton from entrainment at Port Dolphin has the potential to reduce the availability of forage resources to higher trophic-level species. Further, because pink shrimp (*FARFANTEPENAEUS DUORARUM*) and spiny lobster (*PANULIRUS ARGUS*) larvae are planktonic and may be found in the project area, these species also have the potential to be affected by entrainment at the 9

4

6. Table 4.2-8 was revised between the Interim Draft and the Draft EIS as discussion with NOAA NMFS led to changes in the analysis. The Final EIS includes Spanish Sardine (*Sardinella aurita*) with bay anchovy and gulf menhaden as described in response to Comment 9.

7. A discussion of the weighted seasonality adjustment and literature used to make these adjustments is presented in Section 4.1 of Appendix E.

8. SEAMAP data, although limited, remains the best available data for use in modeling potential impacts to ichthyoplankton. If a license is issued, USCG and the Maritime Administration would require the Applicant to develop a site specific monitoring plan consistent with other projects licensed in the GOM. These plans include pre- and post-construction monitoring to validate the ichthyoplankton impact forecasts and initiate any necessary mitigation.

9. Regarding Spanish sardines, we agree SEAMAP ichthyoplankton data reveals high densities of Spanish sardine (*Sardinella aurita*) in the Port Dolphin project area. Annual egg and larval entrainment estimates and lower and upper ranges of age-1 equivalents and equivalent yield for Spanish sardines has been included in the Final EIS. In the absence of life history data for Spanish sardines, Gulf menhaden and scaled sardines have been used as surrogate species (see Section 4.2.1.11).

   Regarding pink shrimp and spiny lobster, SEAMAP data does not include crustacean densities and no shrimp and larvae have been identified to develop annual egg and larval entrainment estimates for each of these species. The potential impacts on these species are described in the Final EIS qualitatively, as appropriate. However, a requirement for a Monitoring Program will be recommended for inclusion in the license, if issued, and the details of the program to be implemented prior to construction and during initial years of operation would be subject to review by NMFS. The details of such monitoring program remain to be designed in consultation with the FWC, NOAA/NMFS, and USEPA. This plan would help to determine impacts on pink shrimp and spiny lobster and to formulate mitigation if necessary.

project site. To determine anticipated losses on Spanish sardine, pink shrimp, and spiny lobster as a direct result of shipboard LNG vaporization, we recommend the final EIS include annual egg and larval entrainment estimates for each of these species, and lower and upper ranges of age-1 equivalents and equivalent yields for Spanish sardine, pink shrimp and spiny lobster. Annual equivalent yield estimates for pink shrimp and spiny lobster should be expressed as a percentage of total Florida west coast landings for these species. 9

The DEIS includes a discussion indicating eddies from the Loop Current in the Gulf of Mexico have the potential to transport deepwater fish larvae onto the Florida shelf. The applicant is conducting Loop Current modeling to assess what effect these phenomena may have on larval transport into the project area. The results of this modeling effort, when available, should be considered in the ichthyoplankton impact analysis for the final EIS. 10

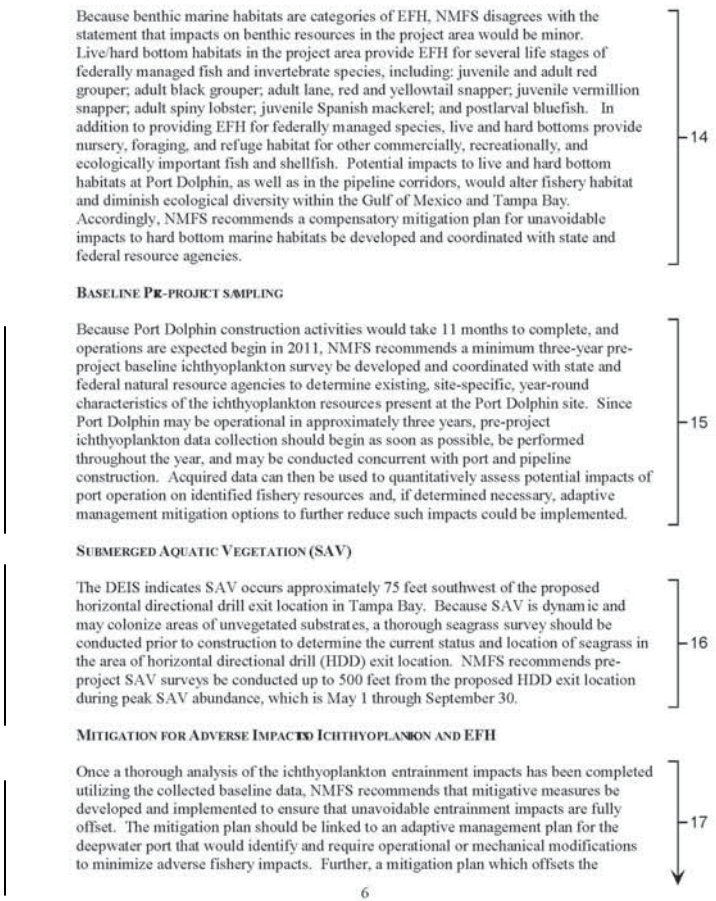
In order to determine potential impacts on fishery resources and to fully assess ichthyoplankton impacts from the Port Dolphin project, NMFS continues to recommend additional data sources for zooplankton, egg, and larvae abundance and distribution be used in conjunction with SEAMAP data to complete the necessary age-1 equivalency models. We further recommend these additional data sources from existing fishery studies in the Gulf of Mexico be utilized in the development of an empirical transport model to be included in the final EIS. 11

ADVERSE IMPACTS TO EFH FROM PORT CONSTRUCTION

In reviewing Figure 3.2-3 depicting hardbottom habitats at the proposed mooring buoy sites, it appears the figure erroneously depicts the original mooring array anchor configuration. NMFS received a copy of the applicants' letter dated December 14, 2007, regarding "Deepwater Port Application Addendum – Project Design Changes and Corresponding Impacts –December 2007." Attached to that letter was an optimized buoy anchoring arrangement and associated tables indicating reduced acreages of benthic habitats affected by anchor sweep during routine SRV mooring operations.

In reviewing the Executive Summary and Section 4 of the DEIS, NMFS notes varying acreage values listed for anticipated impacts on benthic resources in the mooring array and pipeline areas. Specifically, the Executive Summary indicates approximately 300 acres of impacts on benthic impacts would occur from port and pipeline installation from the project. Further, Table 4.2-1 indicates approximately 8,786 acres of soft and hardbottom habitats would be affected from port construction activities. NMFS recommends the applicant's proposed December 2007 revised mooring array be selected as the preferred alternative and that the associated impact tables in the final EIS also be revised to reflect the reduced benthic resource impacts. 12

The two mooring buoys would have eight mooring lines connected to eight pile-driven anchor points in the seafloor. Approximately 30 acres of recurring, long-term impacts to benthic habitats would be caused by cable sweeping during SRV mooring activities. To avoid impacts to these habitats from cable sweep, NMFS recommends the use of mid-line buoys to reduce sweep impacts. 13



5

10. In June of 2008, the Applicant proposed the use of an Empirical Transport Model (ETM) to strengthen the Ichthyoplankton Assessment methodology currently used in the EIS. FWC did not think the ETM would be meaningful without preconstruction modeling to verify data from that model. If a license is issued, the USCG and the Maritime Administration would require the Applicant to develop a site specific monitoring plan consistent with other projects licensed in the GOM. The details of such monitoring program will be designed in consultation with the FWCC, NOAA/NMFS, and USEPA.

11. A literature review of available data for additional data sources for zooplankton, egg, and larvae abundance and distribution resulted in no additional information for zooplankton. Spanish sardines, sheepshead and grouper family information were available. Houde et. al 1979 was used for Gulf menhaden. These species were assessed in the Final EIS. See response to comment 10 regarding ETM.

12. The Applicant has altered their Proposed Action to include the revised mooring scheme discussed in the December 2008 addendum, and has altered the proposed pipeline route to balance Federal, state, and local concerns for various natural resources including benthic resource areas. The Proposed Action and alternatives are discussed in Section 2.1 and the discussion is carried throughout the EIS.

13. Mitigation and minimization measures are located in Section 4.11. The Applicant has committed to using mid-line buoys and other methods as appropriate to keep anchor lines taut during both construction and operation.

Because benthic marine habitats are categories of EFH, NMFS disagrees with the statement that impacts on benthic resources in the project area would be minor. Live/hard bottom habitats in the project area provide EFH for several life stages of federally managed fish and invertebrate species, including: juvenile and adult red grouper; adult black grouper; adult lane, red and yellowtail snapper; juvenile vermillion snapper; adult spiny lobster; juvenile Spanish mackerel; and postlarval bluefish. In addition to providing EFH for federally managed species, live and hard bottoms provide nursery, foraging, and refuge habitat for other commercially, recreationally, and ecologically important fish and shellfish. Potential impacts to live and hard bottom habitats at Port Dolphin, as well as in the pipeline corridors, would alter fishery habitat and diminish ecological diversity within the Gulf of Mexico and Tampa Bay. Accordingly, NMFS recommends a compensatory mitigation plan for unavoidable impacts to hard bottom marine habitats be developed and coordinated with state and federal resource agencies. 14

BASELINE PRE-PROJECT SAMPLING

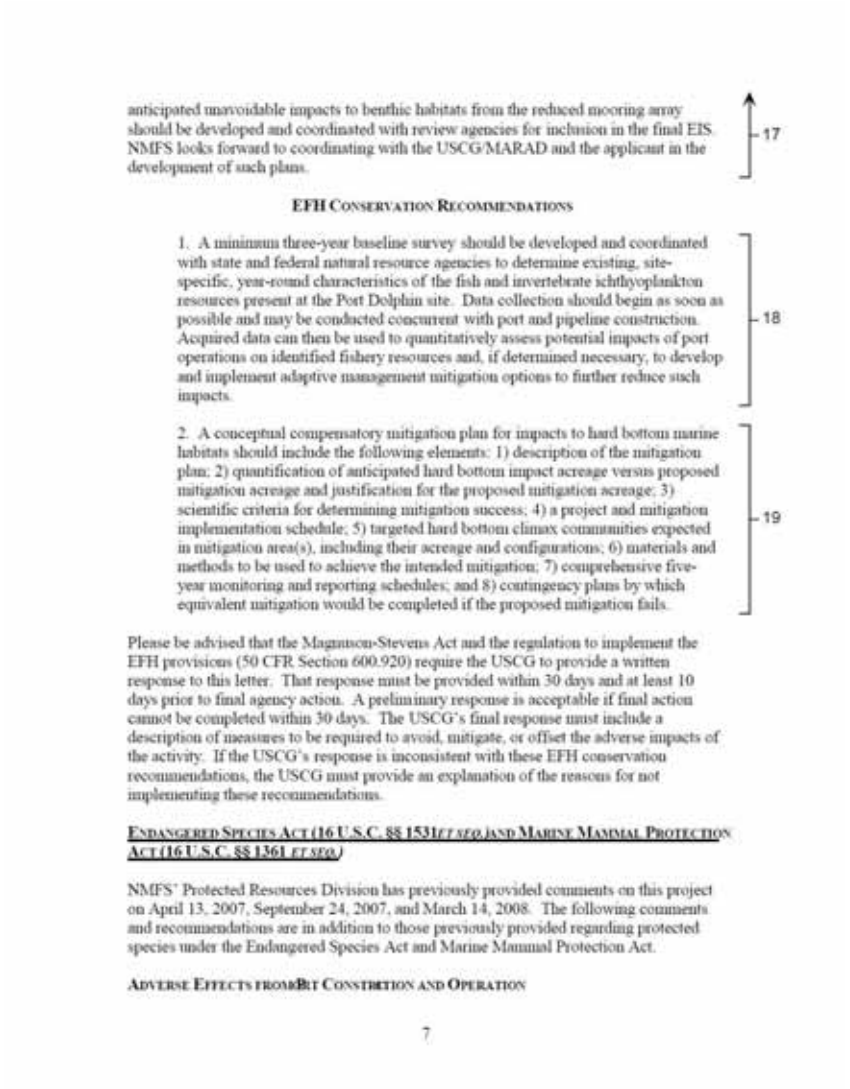
Because Port Dolphin construction activities would take 11 months to complete, and operations are expected begin in 2011, NMFS recommends a minimum three-year pre-project baseline ichthyoplankton survey be developed and coordinated with state and federal natural resource agencies to determine existing, site-specific, year-round characteristics of the ichthyoplankton resources present at the Port Dolphin site. Since Port Dolphin may be operational in approximately three years, pre-project ichthyoplankton data collection should begin as soon as possible, be performed throughout the year, and may be conducted concurrent with port and pipeline construction. Acquired data can then be used to quantitatively assess potential impacts of port operation on identified fishery resources and, if determined necessary, adaptive management mitigation options to further reduce such impacts could be implemented. 15

SUBMERGED AQUATIC VEGETATION (SAV)

The DEIS indicates SAV occurs approximately 75 feet southwest of the proposed horizontal directional drill exit location in Tampa Bay. Because SAV is dynamic and may colonize areas of unvegetated substrates, a thorough seagrass survey should be conducted prior to construction to determine the current status and location of seagrass in the area of horizontal directional drill (HDD) exit location. NMFS recommends pre-project SAV surveys be conducted up to 500 feet from the proposed HDD exit location during peak SAV abundance, which is May 1 through September 30. 16

MITIGATION FOR ADVERSE IMPACTS TO ICHTHYOPLANKTON AND EFH

Once a thorough analysis of the ichthyoplankton entrainment impacts has been completed utilizing the collected baseline data, NMFS recommends that mitigative measures be developed and implemented to ensure that unavoidable entrainment impacts are fully offset. The mitigation plan should be linked to an adaptive management plan for the deepwater port that would identify and require operational or mechanical modifications to minimize adverse fishery impacts. Further, a mitigation plan which offsets the 17



6

14. Geophysical and geotechnical data have been received and reviewed since the publication of the Draft EIS and incorporated in the Final EIS in Section 3.4. Impacts on benthic resources and EFH in Sections 4.2.1.6 and 4.2.1.12 respectively, have been revised from "minor" to "short-term and long-term, minor to moderate, direct and indirect." BMPs have been added to Section 4.11 regarding reduction of potential impacts and compensatory mitigation. Information has been gathered from the Gulfstream pipeline construction reports as applicable and added to those minimization discussions.

15. If a license is issued, Port Dolphin Energy LLC will be required to develop a Prevention, Monitoring, and Mitigation Plan to assess, minimize, and mitigate impacts on marine fisheries species (including ichthyoplankton) associated with port operations. The plan would be developed in consultation with NMFS and other cooperating agencies, as appropriate, and subject to approval by the Maritime Administrator. The requirements for this plan are contained in Appendix H of the Port Dolphin Deepwater Port License Application EIS.

16. Specific SAV surveys have been conducted to identify current areas where seagrass can be found. That information has been added to relevant discussions in the Final EIS in Section 3.2.5. In addition, the Applicant would conduct surveys just prior to construction to identify SAV that may have not been present during the original SAV surveys. A Mitigation Plan to compensate for unavoidable impacts on seagrasses and live- and hard- bottom habitats would be developed during the permitting process.

17. If a license is issued, USCG and the Maritime Administration would require the Applicant to develop a site specific monitoring plan consistent with other projects licensed in the GOM. These plans include pre and post construction monitoring to validate the ichthyoplankton impact forecasts and initiate any necessary mitigation.

anticipated unavoidable impacts to benthic habitats from the reduced mooring array should be developed and coordinated with review agencies for inclusion in the final EIS. NMFS looks forward to coordinating with the USCG/MARAD and the applicant in the development of such plans. 17

EFH Conservation Recommendations

1. A minimum three-year baseline survey should be developed and coordinated with state and federal natural resource agencies to determine existing, site-specific, year-round characteristics of the fish and invertebrate ichthyoplankton resources present at the Port Dolphin site. Data collection should begin as soon as possible and may be conducted concurrent with port and pipeline construction. Acquired data can then be used to quantitatively assess potential impacts of port operations on identified fishery resources and, if determined necessary, to develop and implement adaptive management mitigation options to further reduce such impacts. 18

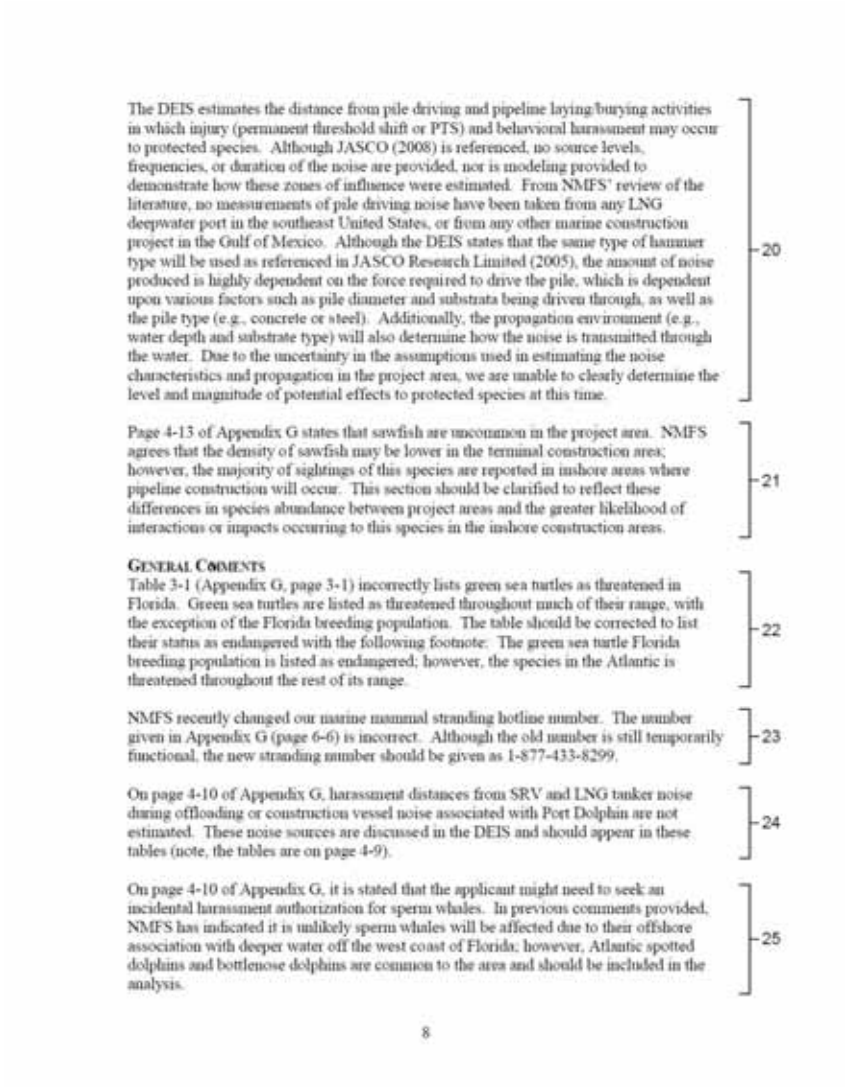
2. A conceptual compensatory mitigation plan for impacts to hard bottom marine habitats should include the following elements: 1) description of the mitigation plan; 2) quantification of anticipated hard bottom impact acreage versus proposed mitigation acreage and justification for the proposed mitigation acreage; 3) scientific criteria for determining mitigation success; 4) a project and mitigation implementation schedule; 5) targeted hard bottom climax communities expected in mitigation area(s), including their acreage and configurations; 6) materials and methods to be used to achieve the intended mitigation; 7) comprehensive five-year monitoring and reporting schedules; and 8) contingency plans by which equivalent mitigation would be completed if the proposed mitigation fails. 19

Please be advised that the Magnuson-Stevens Act and the regulation to implement the EFH provisions (50 CFR Section 600.920) require the USCG to provide a written response to this letter. That response must be provided within 30 days and at least 10 days prior to final agency action. A preliminary response is acceptable if final action cannot be completed within 30 days. The USCG's final response must include a description of measures to be required to avoid, mitigate, or offset the adverse impacts of the activity. If the USCG's response is inconsistent with these EFH conservation recommendations, the USCG must provide an explanation of the reasons for not implementing these recommendations.

Endangered Species Act (16 U.S.C. §§ 1531 *et seq.*) and Marine Mammal Protection Act (16 U.S.C. §§ 1361 *et seq.*)

NMFS' Protected Resources Division has previously provided comments on this project on April 13, 2007, September 24, 2007, and March 14, 2008. The following comments and recommendations are in addition to those previously provided regarding protected species under the Endangered Species Act and Marine Mammal Protection Act.

Adverse Effects from Pile Construction and Operation



7

18. If a license is issued, Port Dolphin Energy LLC will be required to conduct site-specific, year-round surveying to collect data on existing fish and invertebrate ichthyoplankton populations. If a license is issued, data collection would begin as soon as a license is issued, and continue for a minimum of three years, one of which must be completed prior to the start of operations. Surveying shall be developed and coordinated with state and Federal natural resource agencies.

    Requiring Port Dolphin Energy LLC to acquire a minimum of three years of baseline survey data prior to operations is inconsistent with the intent of the Memorandum of Understanding (MOU) on Deepwater Port Licensing of May 20, 2004 signed by the participating agencies. The MOU is based on National Energy Policy and Presidential Executive Order (EO) 13212 issued on May 18, 2001. EO 13212 requires that executive departments and agencies take appropriate actions, to the extent consistent with applicable law, to expedite projects that will increase the production, transmission, or conservation of energy. Federal agencies are directed to expedite their reviews of authorizations for energy-related projects and to take other action necessary to accelerate the completion of such projects, while maintaining safety, public health and environmental protections.

    The potential impacts to fish and invertebrate ichthyoplankton populations are presented in Appendix G of the Port Dolphin Deepwater Port License Application EIS.

19. If a license is issued, Port Dolphin Energy LLC will be required to develop a Prevention, Monitoring, and Mitigation Plan to assess, minimize, and mitigate impacts on marine fisheries species (including ichthyoplankton) associated with port operations. The plan would be developed in consultation with NMFS and other cooperating agencies, as appropriate, and subject to approval by the Maritime Administrator. The requirements for this plan are contained in Appendix H of the Port Dolphin Deepwater Port License Application EIS.

The DEIS estimates the distance from pile driving and pipeline laying/burying activities in which injury (permanent threshold shift or PTS) and behavioral harassment may occur to protected species. Although JASCO (2008) is referenced, no source levels, frequencies, or duration of the noise are provided, nor is modeling provided to demonstrate how these zones of influence were estimated. From NMFS' review of the literature, no measurements of pile driving noise have been taken from any LNG deepwater port in the southeast United States, or from any other marine construction project in the Gulf of Mexico. Although the DEIS states that the same type of hammer type will be used as referenced in JASCO Research Limited (2005), the amount of noise produced is highly dependent on the force required to drive the pile, which is dependent upon various factors such as pile diameter and substrata being driven through, as well as the pile type (e.g., concrete or steel). Additionally, the propagation environment (e.g., water depth and substrate type) will also determine how the noise is transmitted through the water. Due to the uncertainty in the assumptions used in estimating the noise characteristics and propagation in the project area, we are unable to clearly determine the level and magnitude of potential effects to protected species at this time. 20

Page 4-13 of Appendix G states that sawfish are uncommon in the project area. NMFS agrees that the density of sawfish may be lower in the terminal construction area; however, the majority of sightings of this species are reported in inshore areas where pipeline construction will occur. This section should be clarified to reflect these differences in species abundance between project areas and the greater likelihood of interactions or impacts occurring to this species in the inshore construction areas. 21

GENERAL COMMENTS

Table 3-1 (Appendix G, page 3-1) incorrectly lists green sea turtles as threatened in Florida. Green sea turtles are listed as threatened throughout much of their range, with the exception of the Florida breeding population. The table should be corrected to list their status as endangered with the following footnote: The green sea turtle Florida breeding population is listed as endangered; however, the species in the Atlantic is threatened throughout the rest of its range. 22

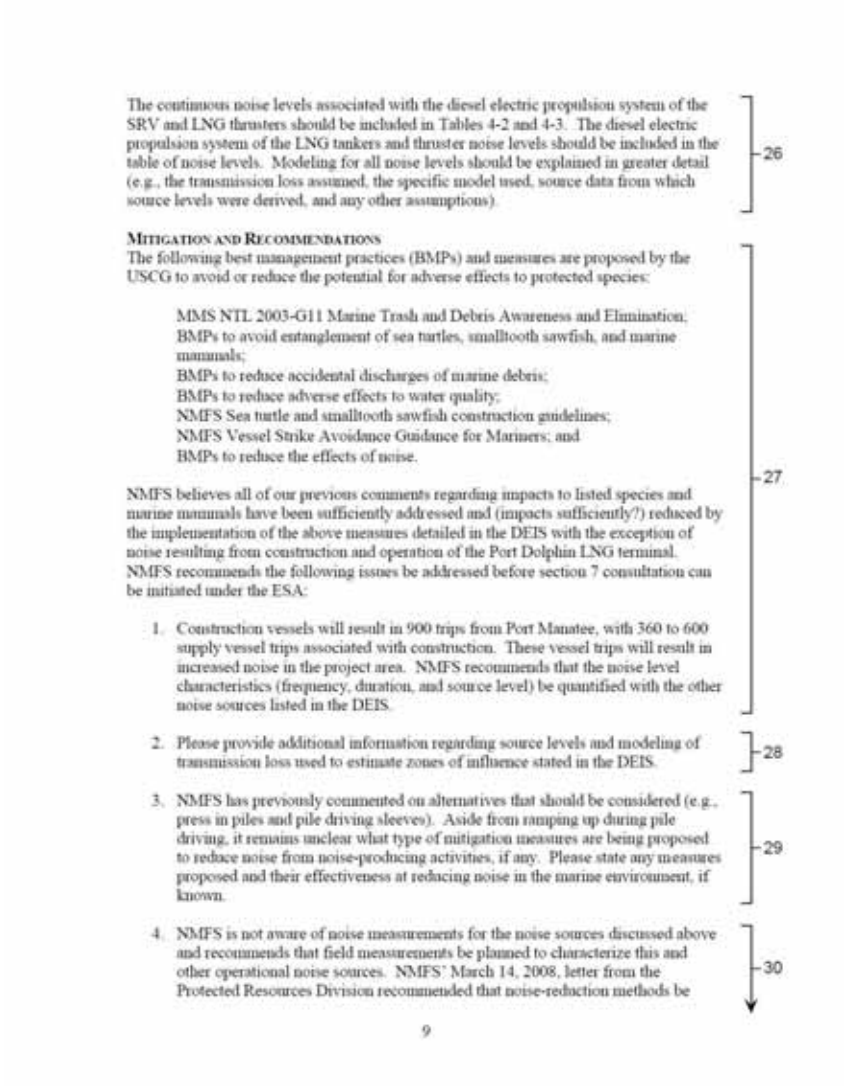
NMFS recently changed our marine mammal stranding hotline number. The number given in Appendix G (page 6-6) is incorrect. Although the old number is still temporarily functional, the new stranding number should be given as 1-877-433-8299. 23

On page 4-10 of Appendix G, harassment distances from SRV and LNG tanker noise during offloading or construction vessel noise associated with Port Dolphin are not estimated. These noise sources are discussed in the DEIS and should appear in these tables (note, the tables are on page 4-9). 24

On page 4-10 of Appendix G, it is stated that the applicant might need to seek an incidental harassment authorization for sperm whales. In previous comments provided, NMFS has indicated it is unlikely sperm whales will be affected due to their offshore association with deeper water off the west coast of Florida; however, Atlantic spotted dolphins and bottlenose dolphins are common to the area and should be included in the analysis. 25

8

20. Due to the uncertainty of noise measurement assumptions based on the limited data available in the Jasco Report (2005), and the lack of empirical testing of this sort, the Applicant has committed to using sound-muffling devices and other BMPs to reduce acoustic disturbance. Also, the Applicant has reviewed the specific requirements for the preparation of IHA and LOA applications, and has initiated pre-application consultations with the NOAA/NMFS – Protected Resources Office in Silver Spring, MD regarding the Port Dolphin Project and applicable IHA or LOA requirements and mitigations. In addition, if a license is issued, the USCG and the Maritime Administration would require the Applicant to develop a site specific monitoring plan consistent with other projects licensed in the GOM. These plans would include the appropriate noise monitoring and initiate any necessary mitigation.



21. The discussion in section 3.2.3.4 was expanded to clarify the potential locations of smalltooth sawfish in relationship to the port site and pipeline. The potential impact of pipeline construction on smalltooth sawfish was analyzed in Section 4.2.1.5.1 of the Final EIS.

22. The text referred to in Appendix G was revised per comment.

23. Text revised per comment.

24. Additional acoustic noise modeling discussions have been added to the appropriate tables in Section 4.1.1 of Appendix G and Sections 4.2.1.2.1 and 4.8.1 of the EIS, including potential harassment distances from noise sources.

25. Analysis has been revised in Section 4.2.1.7 of the EIS to include Atlantic spotted dolphins and bottlenose dolphins. Text regarding sperm whale has been revised per comment.

The continuous noise levels associated with the diesel electric propulsion system of the SRV and LNG thrusters should be included in Tables 4-2 and 4-3. The diesel electric propulsion system of the LNG tankers and thruster noise levels should be included in the table of noise levels. Modeling for all noise levels should be explained in greater detail (e.g., the transmission loss assumed, the specific model used, source data from which source levels were derived, and any other assumptions). 26

MITIGATION AND RECOMMENDATIONS

The following best management practices (BMPs) and measures are proposed by the USCG to avoid or reduce the potential for adverse effects to protected species:

MMS NTL 2003-G11 Marine Trash and Debris Awareness and Elimination;
BMPs to avoid entanglement of sea turtles, smalltooth sawfish, and marine mammals;
BMPs to reduce accidental discharges of marine debris;
BMPs to reduce adverse effects to water quality;
NMFS Sea turtle and smalltooth sawfish construction guidelines;
NMFS Vessel Strike Avoidance Guidance for Mariners; and
BMPs to reduce the effects of noise. 27

NMFS believes all of our previous comments regarding impacts to listed species and marine mammals have been sufficiently addressed and (impacts sufficiently?) reduced by the implementation of the above measures detailed in the DEIS with the exception of noise resulting from construction and operation of the Port Dolphin LNG terminal. NMFS recommends the following issues be addressed before section 7 consultation can be initiated under the ESA:

1. Construction vessels will result in 900 trips from Port Manatee, with 360 to 600 supply vessel trips associated with construction. These vessel trips will result in increased noise in the project area. NMFS recommends that the noise level characteristics (frequency, duration, and source level) be quantified with the other noise sources listed in the DEIS. 27
2. Please provide additional information regarding source levels and modeling of transmission loss used to estimate zones of influence stated in the DEIS. 28
3. NMFS has previously commented on alternatives that should be considered (e.g., press in piles and pile driving sleeves). Aside from ramping up during pile driving, it remains unclear what type of mitigation measures are being proposed to reduce noise from noise-producing activities, if any. Please state any measures proposed and their effectiveness at reducing noise in the marine environment, if known. 29
4. NMFS is not aware of noise measurements for the noise sources discussed above and recommends that field measurements be planned to characterize this and other operational noise sources. NMFS' March 14, 2008, letter from the Protected Resources Division recommended that noise-reduction methods be 30

9

26. Operational noise tables and additional details about the noise modeling have been added to Section 4.8 and Appendix E (Biological Assessment) per the comment.

27. The noise impacts of construction vessel noise were added to Section 4.8.1.

28. Additional information regarding noise model assumptions and source levels were added to Section 4.8.1. Table 4.8-1 provides the source levels for noises associated with construction.

29. BMPs and mitigation measures are provided in Section 4.11 of the EIS. Suction piles have been considered as an alternative anchoring method in Section 2.1.1.4 and the associated impacts are discussed throughout Section 4. Port Dolphin has reviewed the specific requirements for the preparation of an IHA and LOA applications, and has initiated pre-application consultations with the NOAA/NMFS – Protected Resources Office in Silver Springs, MD regarding the Port Dolphin Project and applicable IHA or LOA requirements and mitigations. In addition, if a license is issued, the USCG and the Maritime Administration would require the Applicant to develop a site specific monitoring plan consistent with other projects licensed in the GOM. These plans would include appropriate construction noise monitoring and initiate any necessary mitigation.

30. If a license is issued, the USCG and the Maritime Administration would require the Applicant to develop a site specific monitoring plan consistent with other projects licensed in the GOM. These plans would include appropriate construction noise monitoring and initiate any necessary mitigation.

utilized, that noise levels be measured in the field to verify noise measurements from construction and operation activities and the effectiveness of any noise-reduction methods or technologies be utilized during construction. To date, there are no measurements of pile driving noise from offshore LNG terminals and all modeling has been based on other studies from areas and projects that may not be comparable to the methods being proposed for Port Dolphin. In addition to pile driving, other potential noises of concern include those from pipeline laying, vessel construction operations, and SRV and thruster noise during LNG tanker offloading during terminal operation. David Mann at the University of South Florida (USF), college of Marine Science is installing autonomous recorders in waters off west Florida, including the project area. NMFS recommends Port Dolphin utilize this existing study to monitor noise levels as part of ESA consultation with NMFS to address uncertainties in the noise estimates used in the DEIS, and to monitor the effectiveness of any noise-reduction methodologies proposed. NMFS is available to assist in the design of a monitoring protocol to measure construction noise and further information regarding the current study underway at USF.

30

Based on the information provided in the DEIS, an incidental take authorization under MMPA section 101 (a)(5) is necessary for Atlantic spotted dolphins and bottlenose dolphins. Atlantic spotted dolphins and bottlenose dolphins are common to the project area. A publication is available on these dolphin species in the proposed project area,[1] and studies are ongoing by these authors at Mote Marine Laboratory on these species. Please contact Kenneth Hollingshead of our Protected Resources Division at (301) 713-2289 for additional information regarding an incidental take authorization. Additional information is also available at http://www.nmfs.noaa.gov/pr/permits/incidental.htm.

31

The USCG requested informal section 7 consultation under the ESA on August 24, 2007. Although most of our previous comments regarding impacts to listed species and marine mammals have been sufficiently addressed, our comment regarding noise impacts, modeling, and field measurements have not been sufficiently addressed for us to initiate section 7 consultation under the ESA. Once these remaining comments are sufficiently addressed, NMFS believes we will be able to initiate section 7 consultation with the USCG on Port Dolphin.

10

31. BMPs and mitigation measures are provided in Section 4.11 of the EIS. Suction piles have been considered as an alternative anchoring method in Section 2.1.1.4 and the associated impacts are discussed throughout Section 4. Port Dolphin has reviewed the specific requirements for the preparation of an IHA and LOA applications, and has initiated pre-application consultations with the NOAA/NMFS – Protected Resources Office in Silver Springs, MD regarding the Port Dolphin Project and applicable IHA or LOA requirements and mitigations. In addition, if a license is issued, the USCG and the Maritime Administration would require the Applicant to develop a site specific monitoring plan consistent with other projects licensed in the GOM. These plans would include appropriate construction noise monitoring and initiate any necessary mitigation.

32. Additional information on noise impacts on threatened and endangered marine species has been included in Sections 4.2.1.2 through 4.2.1.5. Responses to specific comments are included with each comment.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 4
ATLANTA FEDERAL CENTER
61 FORSYTH STREET
ATLANTA, GEORGIA 30303-8960

June 2, 2008

Mr. Mark Prescott, Chief
Deepwater Ports Standards Division (CG-3PSO-5)
United States Coast Guard Headquarters
2100 Second Street, S.W.
Washington, D.C. 20593

Subject: Port Dolphin Liquefied Natural Gas Deepwater Port Draft Environmental Impact Statement; Docket Number: USCG-2007-28532; CEQ: 20070463; ERP: CGD-E03017-FL

Dear Mr. Prescott:

Pursuant to Section 309 of the Clean Air Act (CAA) and Section 102(2)(C) of the National Environmental Policy Act (NEPA), the U.S. Environmental Protection Agency (EPA) Region 4 has reviewed the U. S. Coast Guard's (USCG) Draft Environmental Impact Statement (draft EIS) for the proposed Port Dolphin Liquefied Natural Gas (LNG) Deepwater Port. Under Section 309 of the CAA, EPA is responsible for reviewing and commenting on major federal actions significantly affecting the quality of the human environment. In addition, EPA is a cooperating agency under NEPA for this project because Port Dolphin LLC has applied to EPA for National Pollutant Discharge Elimination System (NPDES) and Clean Air Act (CAA) approvals to construct and operate this facility. EPA's review of the draft EIS also includes comments pursuant to EPA's regulatory roles.

Port Dolphin Energy LLC proposes to construct, own and operate an LNG receiving and regasification facility in the Gulf of Mexico approximately 28 miles offshore from Manatee County, Florida. The proposed port would consist of two submerged-buoy mooring points to dock two vessels concurrently while allowing them to be unloaded sequentially. Vaporization of the LNG would occur on specially designed shuttle and regasification vessels (SRVs) by means of a closed-loop Shell and Tube Vaporization (STV) system. Flexible gas pipeline risers from each mooring would connect the ships to manifolds on the seabed. The gas would flow into pipelines along the seabed extending approximately 2 miles from each mooring to a common junction and then into a 46-mile pipeline to a connection on the shore, 4 miles east of Port Manatee. The proposed peak regasification capacity would be 1.2 billion standard cubic feet of gas per day.

Alternative technologies were considered in the Draft EIS in addition to the proposed closed loop Shell and Tube Vaporization technology. While most of the technologies would utilize seawater to heat the gas, Ambient Air Vaporization (AAV) entirely avoids seawater withdrawals and air emissions. AAV was discussed, but not

1

Internet Address (URL) • http://www.epa.gov
Recycled/Recyclable • Printed with Vegetable Oil Based Inks on Recycled Paper (Minimum 30% Postconsumer)

1. Ambient Air Vaporization (AAV) has been evaluated for use with the FSRU port technology. It is now discussed as a vaporization technology in Section 2.1.7.3. Impacts are discussed in Section 4.

carried forward for detailed evaluation. While we agree with the selection of the Shell and Tube Vaporization technology, we recommend that the AAV alternative be analyzed further in the final EIS due to its anticipated environmental and operational benefits. 1

EPA also requests further analysis of an additional pipeline alternative landfall route within Sarasota County to allow for a possible connection to an existing pipeline. Pipeline alternatives were considered, but only the options of routing a pipeline into Tampa Bay and into the commercial harbor of Port Manatee were considered in detail. The preferred route terminates at Port Manatee and is expected to result in adverse impacts to estuarine resources, as well as potential conflicts with navigation and another pipeline. The draft EIS has insufficient information about potential impacts of this alternative landfall route to determine whether the 2,137 acres of hardbottom habitat, 13 acres of emergent wetlands, and additional seagrass habitat impacts of the preferred pipeline route could be substantially reduced. 2

In summary, EPA has environmental concerns regarding this project, as proposed, and rates this draft EIS as "EC-2" (*i.e.*, environmental concerns with additional information requested in the final EIS). Our primary concerns relate to the scope of the analysis of alternatives, minimization of impacts to hard bottom marine habitat, accuracy of the analysis of seawater intake and discharge impacts to ichthyoplankton, and need to clarify the potential air quality impacts from port construction and operation. EPA supports the selection of the proposed STV port design which confines the operational components onboard specially designed ships. The proposed closed-loop STV design would result in substantial minimization of marine resource impacts and thereby reduce the overall environmental impacts of the proposed port. I have enclosed EPA's detailed comments as well as the explanation of EPA's ratings with this letter.

Thank you for the opportunity to review and comment on this draft EIS. We look forward to working with you, the USCG staff and the Port Dolphin Energy LLC to adequately address these remaining concerns. We encourage open communication between our technical staffs to achieve this goal. If you wish to discuss EPA's comments, please contact me at 404/562-9611 (mueller.heinz@epa.gov) or Ted Bisterfeld of my staff at 404/562-9621 (bisterfeld.ted@epa.gov)

Sincerely,

Heinz J. Mueller, Chief
NEPA Program Office
Office of Policy and Management

Enclosures: Detailed Comments on the draft EIS
EPA Rating System Description

NMFS, St. Petersburg

2

2. As noted in the Draft EIS, there are no alternative onshore locations for pipeline landfall and HDD construction other than Port Manatee due to dense development and inappropriate land uses. Therefore, an interconnection with the Florida Gas Transmission pipeline in Sarasota County is not feasible and was not carried forward. As noted, the near shore areas have multiple sensitive species and habitat areas which are denser than those on lower Tampa Bay. The discussion in Section 2.1.1.3 has been expanded to clarify and Appendix F has been added to provide additional detail on the screening process.

ENCLOSURE: Detailed EPA Comments on Port Dolphin Draft EIS

PERMITS AND APPROVALS

Page 1-14, Table 1.1-6 1. EPA's Ocean Discharge Criteria Evaluation pertains to the Section 403(c) of the Clean Water Act. 3

DETAILED DESCRIPTION OF THE PROJECT AND ALTERNATIVES

1. Page 2-17, Section 2.1.1.3. EPA recommends that the mapped "Sand Resources" shown on Figure 2.1-10 be clarified to indicate they are wholly within State of Florida jurisdictional waters and, therefore, not under MMS federal jurisdiction. 4

2. Page 2-15 thru 18, Section 2.1.1.3. The alternative site evaluation criteria of Phases 1, 2, and 3 may be met for a pipeline landfall near the Town of Osprey in Sarasota County. A major Florida Gas Transmission pipeline terminates very near the coast and US Highway 41, as shown on Figure 2.1-8. Please provide the exact location of this terminus and clarify how a connection to this pipeline compares to the preferred alternative. A connection here may avoid and/or minimize impacts to important marine resources and the designated sand resource area, as well as reduce the engineering complexity required to bring the pipeline into Tampa Bay to Port Manatee. The Phase 2 Alternatives Analysis discussion does not indicate whether this potential connection point and other offshore port sites were considered in the analysis. A landfall for the pipeline in this vicinity potentially avoids substantial estuarine resources in lower Tampa Bay and conflict with other pipelines and vessel traffic in the Port Manatee vicinity. In addition, the required pipeline distance to Port Manatee may be less. If this pipeline landfall point is considered in the Phase 3 Pipeline Route Analysis, it potentially meets all 5 selection criteria on Page 2-17. Finally, horizontal directional drilling (HDD) technology for pipeline emplacement could be utilized and may greatly minimize impacts to beach and estuarine habitats. Development of a mitigation plan during the permit review stage is mentioned on Page 4-139. EPA recommends that it be prepared sooner and presented in the final EIS, as recommended by NEPA. 5

3. Page 2-24, Section 2.1.1.5. EPA and USCG staff have discussed the relevance of Ambient Air Vaporization technology for several LNG deepwater port projects, e.g., Bienville Deepwater Port and Calypso Deepwater Port. EPA has recommended that such technology be considered in detail in EISs, including the viability of the technology and its environmental merits. Therefore, we strongly recommend the USCG reconsider its decision to not consider AAV further in any detail. EPA urges that USCG fully document in the final EIS its evaluation of the viability of this technology, even if such evaluation is independent of a project-specific application. It is particularly relevant for proposed LNG projects in peninsular Florida to consider AAV with the other major technologies in a side-by-side documentation of the impacts. AAV appears particularly suitable to peninsular Florida because of the meteorological conditions. 6

1

3. Text revised per comment.

4. The discussion of sand resources in Section 2.1.1.3 has been expanded and the figure revised to show the Federal/State water boundary.

5. As noted in the Draft EIS, there are no alternative onshore locations for pipeline landfall and HDD construction other than Port Manatee due to dense development and inappropriate land uses. Therefore, an interconnection with the Florida Gas Transmission pipeline in Sarasota County is not feasible and was not carried forward. As noted, the near shore areas have multiple sensitive species and habitat areas which are denser than those on lower Tampa Bay. The discussion in section 2.1.1.3 has been expanded to clarify.

   The exact location of the Florida Gas Transmission terminal is not available from FERC and cannot be provided in a public document since it is considered critical energy infrastructure.

   Although the Final EIS identifies recommended monitoring and mitigation, the plan development cannot be completed until permit reviews (including EPA's) have progressed and final engineering design is completed.

6. Ambient Air Vaporization (AAV) has been evaluated for use with the FSRU port technology. It is now discussed as a vaporization technology in Section 2.1.1.6. Impacts are discussed in Section 4.

4. Page 4-5, Section 4.1.1.1. The text indicates a total offshore pipeline length of 42 miles; however, text on page 2-34 indicates there is an additional 4 miles of pipeline (one 36 inch diameter 2- mile long flowline from each PLEM) not accounted for in this total nor in Table ES-6. EPA recommends the text be corrected to clarify that the total length is 50 miles for the project. — 7

MARINE RESOURCES

1. Page 2-19, Section 2.1.1.3. EPA believes this section does not provide sufficient information about potential adverse impacts to the benthos to enable comparison of the three port sites independent of the pipelines. Table 4.2-1 only provides data for the proposed port site and pipeline. Having these data on benthic habitat would assume greater importance if an additional pipeline route to shore was identified to enable comparisons of pipeline route alternatives alone. It is also unclear whether Table 4.2-1 includes the benthic impact of constructing the 4 miles of flowline connectors. EPA recommends that the additional data be included in the final EIS. — 8

2. Page 2-25, Section 2.1.1.6. Entrainment of small marine life can be reduced by the use of exclusion systems for seawater intakes. The DEIS does not identify the proposed slot size for the seawater intake, but the slot size is at least as important as the intake velocity at the screen. EPA recommends the final EIS assess the available performance of small slot size openings. Also, some text appears to be missing on the subject of biocides from this section. — 9

3. Page 4-22, Section 4.2.1.2. We appreciate the USCG's emphasis towards minimization of impacts to marine protected areas, mostly in the Terra Ceia Aquatic Preserve. While rooted seagrass exists in that area, the direct loss and estimated indirect impacts from sediment and turbidity deposition are unclear. Also, the draft EIS does not indicate whether seagrass impacts are included in the direct effects to 6, 650 acres of soft bottom area for the total project. EPA recommends the final EIS clarify the potential magnitude of impacts to seagrass. — 10

4. Page 4-44, thru 4-57 Section 4.2.1.7. The draft EIS estimates total hard bottom habitat impacts from construction to be 2,137 acres and to have long term duration. Because colonization of new hard structure is uncertain, it may be more appropriate to consider this loss as permanent. Further, this section mentions the HDD technique relative only to minimizing impacts to rooted seagrass. EPA recommends the final EIS more fully define the capabilities of HDD and that the USCG further consider the potential for this technology to mitigate benthic losses. In addition, we recommend that the USCG reconcile the tabulated impacts data in Table 4-5 of the Volume II Appendix G, "Biological Assessment" with the data presented in Table 4-5 on pg. 4-14 of Volume I. — 11

5. Page 4-58 thru 4-63, Section 4.2.1.12. While the introductory paragraph of Section 4 states that each alternative is analyzed in this section, no analysis appears to be included for alternative vaporization technologies. For example, the analysis of the potential ichthyoplankton impacts addresses cooling water discharges only of the closed-loop — 12

2

7. Text clarified per comment. Pipeline lengths have been updated to reflect revisions made by the Applicant to the proposed pipeline route.

8. The information in Table 4.2-1 has been updated to reflect revisions made by the Applicant to the proposed pipeline route. The impacts from the flowlines have been separately listed for clarity. Impacts for the Southern Pipeline Route Alternative are discussed in Section 4.3.2.1.

9. Text was revised for clarification in Section 2.1.1.7, Alternatives for Marine Life Exclusion Systems. Smaller slot sizes were not considered because they would require larger intake structures or increased intake velocities, as explained in Section 2.1.1.7. Please note that the impact analysis for ichthyoplankton assumes 100 percent mortality and does not take credit for any potential minimization of impacts that would result from the use of screens.

   The missing text (Section head and 1 line of text) has been restored.

10. Text revised to clarify in Section 4.2.1.6 that based on Applicant provided survey results, seagrass beds will not be impacted. The EIS recommends that a license condition require additional seagrass surveys prior to construction. See Section 4.2.1.6.1 for information regarding survey.

11. Text revised to clarify. Because hard bottom areas are dispersed along the proposed pipeline route, it would not be practical to use HDD to avoid impacts to hard bottom areas (See Section 4.2.1.6). Construction methods proposed by the applicant have been evaluated based on geotechnical data and impacts to hard bottom areas have been minimized. The values in Section 4.2.1.6 and the BA have been revised and made consistent.

12. The closed loop vaporization system and the AAV have been carried forward for analysis. The greater impacts to marine resources from open-loop vaporization systems were acknowledged in the screening discussions in Section 2.1.7.4.

alternative. The draft EIS does not document the expected greater adverse impacts to icthyoplankton from the added withdrawals and discharge of seawater for open-loop gas vaporization. EPA recommends that the final EIS include such analyses, which would be similar to previously reviewed, similarly situated LNG projects. 12

In our efforts to be consistent in our review of NEPA documentation for LNG projects, we continue to strongly recommend that ichthyoplankton/fisheries assessments not focus on a few indicator species and that such assessments include consideration of the impacts occurring within the discharge plume. We believe that a focus on indicator species can significantly underestimate the true impacts. EPA recommends the USCG include comprehensive ichthyoplankton/fisheries assessments in EISs. 13

6. Page 4-78, Section 4.2.3.2. The Southern Port Site Alternative is mentioned in this section and a survey of 30 acres apparently was done, separate from a survey of pipeline construction impacts. However, the draft EIS presents no data on the composition of the benthic communities at the proposed and southern site alternative. The survey data within Section 3.2.4 are exclusive to the preferred alternative. Because it is important to determine whether the proposed port site and pipeline route would have greater or fewer impacts on hard bottom benthos than the alternatives, EPA recommends that such data be included in the final EIS, if it is available. 14

7. Page 4-139, Section 4.11. The draft EIS identifies numerous mitigation measures. A proposed mitigation plan is mentioned for unavoidable adverse impacts to hard bottom marine resources, but the draft EIS notes that it will be developed during the permitting process. EPA recommends that the final EIS include the proposed mitigation plan, thus allowing initial public and agency review to expedite approval of a plan. EPA appreciates MARAD agreeing to require monitoring and mitigation of ichthyoplankton impacts and to develop a plan with interagency input. 15

AIR QUALITY MODELING AND TRANSPORTATION

1. Executive Summary. Some statements in the draft EIS do not reflect the analyses and information provided in the draft EIS. EPA recommends the following changes based on the content of the draft EIS.

ES-8, Line 39: Since the project will have both short-term and long-term minor impacts, EPA recommends adding "and long-term" to the first sentence. 16

ES-8, Line 41: EPA recommends adding the following sentence: "Estimated adverse onshore construction impacts appear to be major in the short-term." 17

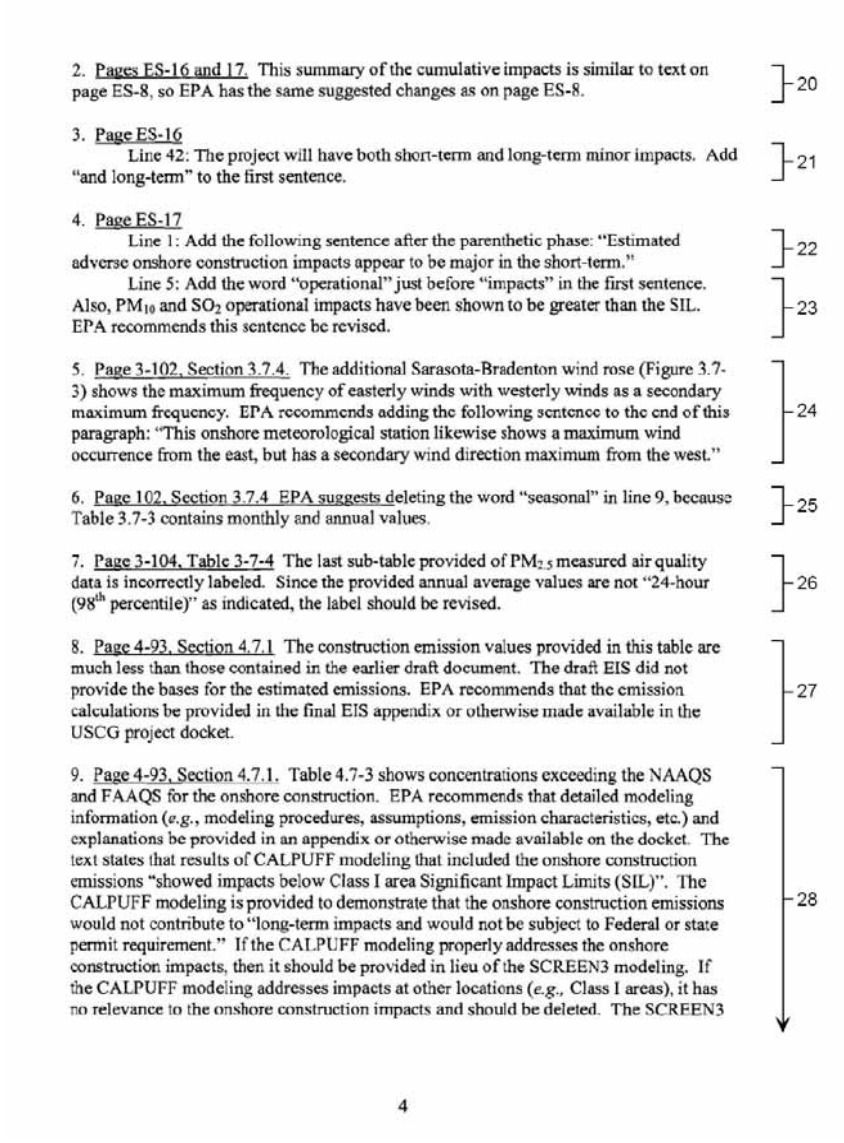
ES-8, Line 45: Given that the project impacts are not negligible, EPA recommends clarifying the description of impacts on Class I areas so that the revised sentence reads, "No significant impacts on Class I areas are expected." 18

ES-9, Line 1: Add the word "operational" to the first sentence. Also, PM_{10} and SO_2 operational impacts have been shown to be greater than the SIL. EPA recommends this sentence be revised. 19

3

13. The scope and methodology for ichthyoplankton analysis in this EIS follows protocol developed by USCG and NOAA, and is consistent with analyses performed for other similar projects. As discussed in Section 4.2.1.11 and Appendix G, the analysis has been expanded per consultation with NMFS. Assumptions and limitations of the analysis are discussed in Section 4.2.1.11 and Appendix G.

14. Section 4.3.2.1 has been expanded to include information on the Southern Site and Route Alternative that was surveyed by the applicant after the Draft EIS was published.



15. Although the Final EIS identifies recommended monitoring and mitigation, a meaningful plan cannot be developed until permit reviews (including EPA's) have progressed and final engineering design is being completed. This approach is consistent with other similar projects.

16. Text revised per comment.

17. Text revised per comment.

18. Text revised per comment.

19. Text revised per comment

2. Pages ES-16 and 17. This summary of the cumulative impacts is similar to text on page ES-8, so EPA has the same suggested changes as on page ES-8. 20

3. Page ES-16
Line 42: The project will have both short-term and long-term minor impacts. Add "and long-term" to the first sentence. 21

4. Page ES-17
Line 1: Add the following sentence after the parenthetic phase: "Estimated adverse onshore construction impacts appear to be major in the short-term." 22
Line 5: Add the word "operational" just before "impacts" in the first sentence. Also, PM_{10} and SO_2 operational impacts have been shown to be greater than the SIL. EPA recommends this sentence be revised. 23

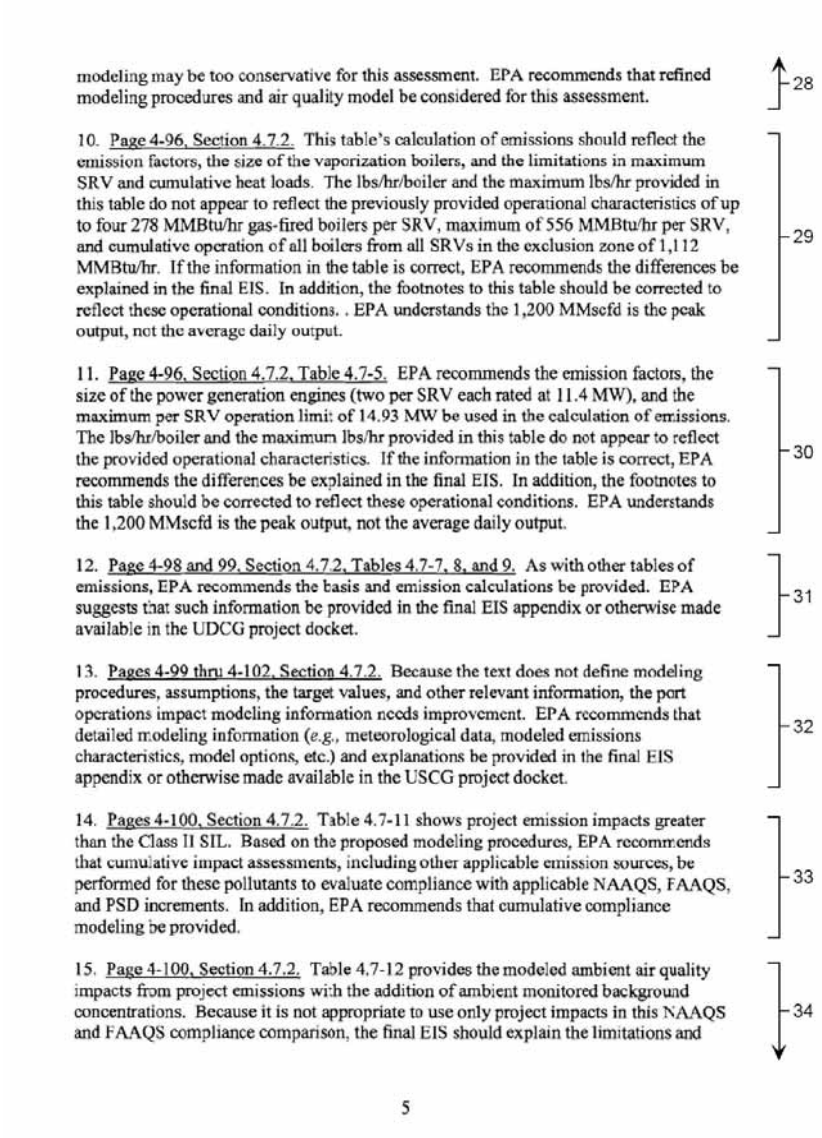
5. Page 3-102, Section 3.7.4. The additional Sarasota-Bradenton wind rose (Figure 3.7-3) shows the maximum frequency of easterly winds with westerly winds as a secondary maximum frequency. EPA recommends adding the following sentence to the end of this paragraph: "This onshore meteorological station likewise shows a maximum wind occurrence from the east, but has a secondary wind direction maximum from the west." 24

6. Page 102, Section 3.7.4 EPA suggests deleting the word "seasonal" in line 9, because Table 3.7-3 contains monthly and annual values. 25

7. Page 3-104, Table 3-7-4 The last sub-table provided of $PM_{2.5}$ measured air quality data is incorrectly labeled. Since the provided annual average values are not "24-hour (98^{th} percentile)" as indicated, the label should be revised. 26

8. Page 4-93, Section 4.7.1 The construction emission values provided in this table are much less than those contained in the earlier draft document. The draft EIS did not provide the bases for the estimated emissions. EPA recommends that the emission calculations be provided in the final EIS appendix or otherwise made available in the USCG project docket. 27

9. Page 4-93, Section 4.7.1. Table 4.7-3 shows concentrations exceeding the NAAQS and FAAQS for the onshore construction. EPA recommends that detailed modeling information (*e.g.*, modeling procedures, assumptions, emission characteristics, etc.) and explanations be provided in an appendix or otherwise made available on the docket. The text states that results of CALPUFF modeling that included the onshore construction emissions "showed impacts below Class I area Significant Impact Limits (SIL)". The CALPUFF modeling is provided to demonstrate that the onshore construction emissions would not contribute to "long-term impacts and would not be subject to Federal or state permit requirement." If the CALPUFF modeling properly addresses the onshore construction impacts, then it should be provided in lieu of the SCREEN3 modeling. If the CALPUFF modeling addresses impacts at other locations (*e.g.*, Class I areas), it has no relevance to the onshore construction impacts and should be deleted. The SCREEN3 28



4

20 - 25. Text revised per comment.

26. Label revised per comment.

27. Comment noted. Applicant provided documents including the air emission calculations are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.

28. Sentence referring to Class I impacts was deleted. Construction activity for onshore facilities (e.g. pipeline) will occur along the designated corridor. The SCREEN3 analysis demonstrates that potential air quality impacts in the immediate vicinity of ongoing construction activity are expected to exceed ambient standards (Section 4.7.1.1). A "refined analysis" entails modeling an emission scenario for hourly meteorology spanning an extended time period (typically five years). During construction, the emission scenario would be constantly changing. A refined analysis based on average emissions over the construction period would understate peak short-term impacts; if based on peak short-term emissions at each location, the analysis would basically reproduce the SCREEN3 results. Without a stationary location or a clearly defined (fixed) "ambient boundary" for construction activities, a meaningful "refined" modeling analysis was judged to be infeasible. The modeling reports are too lengthy to include in the EIS but are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.

modeling may be too conservative for this assessment. EPA recommends that refined modeling procedures and air quality model be considered for this assessment. 28

10. Page 4-96, Section 4.7.2. This table's calculation of emissions should reflect the emission factors, the size of the vaporization boilers, and the limitations in maximum SRV and cumulative heat loads. The lbs/hr/boiler and the maximum lbs/hr provided in this table do not appear to reflect the previously provided operational characteristics of up to four 278 MMBtu/hr gas-fired boilers per SRV, maximum of 556 MMBtu/hr per SRV, and cumulative operation of all boilers from all SRVs in the exclusion zone of 1,112 MMBtu/hr. If the information in the table is correct, EPA recommends the differences be explained in the final EIS. In addition, the footnotes to this table should be corrected to reflect these operational conditions. . EPA understands the 1,200 MMscfd is the peak output, not the average daily output. 29

11. Page 4-96, Section 4.7.2, Table 4.7-5. EPA recommends the emission factors, the size of the power generation engines (two per SRV each rated at 11.4 MW), and the maximum per SRV operation limit of 14.93 MW be used in the calculation of emissions. The lbs/hr/boiler and the maximum lbs/hr provided in this table do not appear to reflect the provided operational characteristics. If the information in the table is correct, EPA recommends the differences be explained in the final EIS. In addition, the footnotes to this table should be corrected to reflect these operational conditions. EPA understands the 1,200 MMscfd is the peak output, not the average daily output. 30

12. Page 4-98 and 99, Section 4.7.2, Tables 4.7-7, 8, and 9. As with other tables of emissions, EPA recommends the basis and emission calculations be provided. EPA suggests that such information be provided in the final EIS appendix or otherwise made available in the UDCG project docket. 31

13. Pages 4-99 thru 4-102, Section 4.7.2. Because the text does not define modeling procedures, assumptions, the target values, and other relevant information, the port operations impact modeling information needs improvement. EPA recommends that detailed modeling information (e.g., meteorological data, modeled emissions characteristics, model options, etc.) and explanations be provided in the final EIS appendix or otherwise made available in the USCG project docket. 32

14. Pages 4-100, Section 4.7.2. Table 4.7-11 shows project emission impacts greater than the Class II SIL. Based on the proposed modeling procedures, EPA recommends that cumulative impact assessments, including other applicable emission sources, be performed for these pollutants to evaluate compliance with applicable NAAQS, FAAQS, and PSD increments. In addition, EPA recommends that cumulative compliance modeling be provided. 33

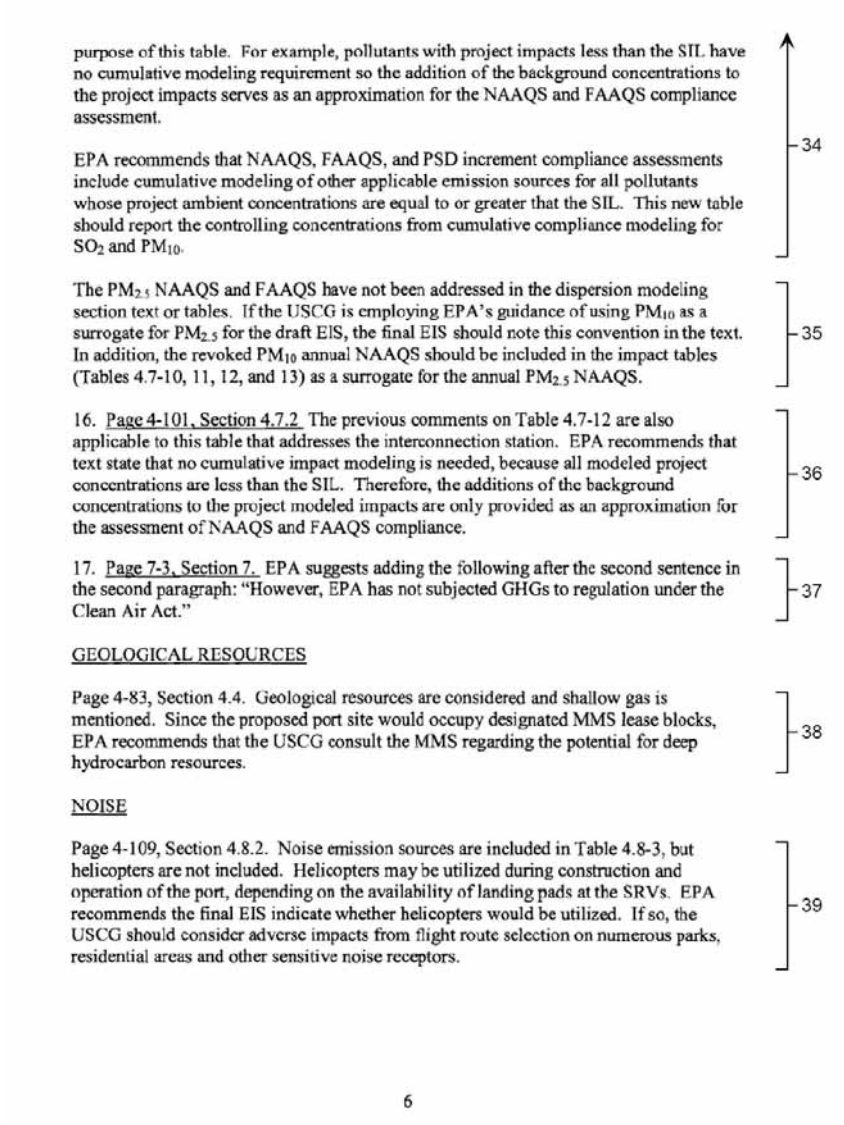
15. Page 4-100, Section 4.7.2. Table 4.7-12 provides the modeled ambient air quality impacts from project emissions with the addition of ambient monitored background concentrations. Because it is not appropriate to use only project impacts in this NAAQS and FAAQS compliance comparison, the final EIS should explain the limitations and 34

5

29. Text revised per comment. Tables renumbered to 4.7-3 and 4.7-4 from 4.7-4 and 4.7-5). Footnote a in Table 4.7-3 has been modified to four 278 MMBTU first bullet.

    The EIS includes an evaluation of potential impacts from the project as proposed.

30. The table referred to has been revised. Issues raised in the comment have been resolved.



31. Comment noted. Applicant documents are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.

32. Comment noted. Applicant documents are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.

33. Potential impacts are below the Class II SIL (as demonstrated by SCREEN3 modeling). Text in Section 4.7.1.2 revised to clarify.

34. Refined, cumulative modeling would ordinarily be required by Florida DEP as a condition for permitting the onshore interconnection station (assuming that the station is a large enough emission source to warrant modeling). That is a more appropriate venue for such modeling, since Florida is the responsible permitting authority for that facility, and the facility design will be more refined at that stage of project development.

    Table 4.7-12 demonstrates that the impacts of the proposed facility, plus a conservative estimate of ambient background, are in compliance with applicable standards and increments, with a comfortable margin for impacts from other emission sources. These results demonstrate that, absent impacts from any existing nearby emissions sources, the impacts of the project alone, plus background, do not exceed any ambient air quality standards.

purpose of this table. For example, pollutants with project impacts less than the SIL have no cumulative modeling requirement so the addition of the background concentrations to the project impacts serves as an approximation for the NAAQS and FAAQS compliance assessment.

EPA recommends that NAAQS, FAAQS, and PSD increment compliance assessments include cumulative modeling of other applicable emission sources for all pollutants whose project ambient concentrations are equal to or greater that the SIL. This new table should report the controlling concentrations from cumulative compliance modeling for SO_2 and PM_{10}.

34

The $PM_{2.5}$ NAAQS and FAAQS have not been addressed in the dispersion modeling section text or tables. If the USCG is employing EPA's guidance of using PM_{10} as a surrogate for $PM_{2.5}$ for the draft EIS, the final EIS should note this convention in the text. In addition, the revoked PM_{10} annual NAAQS should be included in the impact tables (Tables 4.7-10, 11, 12, and 13) as a surrogate for the annual $PM_{2.5}$ NAAQS.

35

16. Page 4-101, Section 4.7.2 The previous comments on Table 4.7-12 are also applicable to this table that addresses the interconnection station. EPA recommends that text state that no cumulative impact modeling is needed, because all modeled project concentrations are less than the SIL. Therefore, the additions of the background concentrations to the project modeled impacts are only provided as an approximation for the assessment of NAAQS and FAAQS compliance.

36

17. Page 7-3, Section 7. EPA suggests adding the following after the second sentence in the second paragraph: "However, EPA has not subjected GHGs to regulation under the Clean Air Act."

37

GEOLOGICAL RESOURCES

Page 4-83, Section 4.4. Geological resources are considered and shallow gas is mentioned. Since the proposed port site would occupy designated MMS lease blocks, EPA recommends that the USCG consult the MMS regarding the potential for deep hydrocarbon resources.

38

NOISE

Page 4-109, Section 4.8.2. Noise emission sources are included in Table 4.8-3, but helicopters are not included. Helicopters may be utilized during construction and operation of the port, depending on the availability of landing pads at the SRVs. EPA recommends the final EIS indicate whether helicopters would be utilized. If so, the USCG should consider adverse impacts from flight route selection on numerous parks, residential areas and other sensitive noise receptors.

39

6

35. If USCG employs USEPA guidance to use PM_{10} as a surrogate for $PM_{2.5}$, the (revoked) annual PM_{10} standard will be included in impact tables (and $PM_{2.5}$ entries will be removed, since they will be redundant). Tables updated for $PM_{2.5}$ standards. Currently EPA standard requires evaluation of $PM_{2.5}$.

36. Table revised to show comparison of SILs instead of NAAQS and FAAQS.

37. Sentence added.

38. MMS is a cooperating agency on this project and has been consulted regarding alternate offshore uses.

39. No helicopters will be used during construction or operation.

ENCLOSURE

U.S. ENVIRONMENTAL PROTECTION AGENCY
ENVIRONMENTAL IMPACT STATEMENT (EIS) RATING SYSTEM CRITERIA
EPA has developed a set of criteria for rating Draft EISs. The rating system provides a basis upon which EPA makes recommendations to the lead agency for improving the draft.

RATING THE ENVIRONMENTAL IMPACT OF THE ACTION

LO (Lack of Objections): The review has not identified any potential environmental impacts requiring substantive changes to the preferred alternative. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposed action.

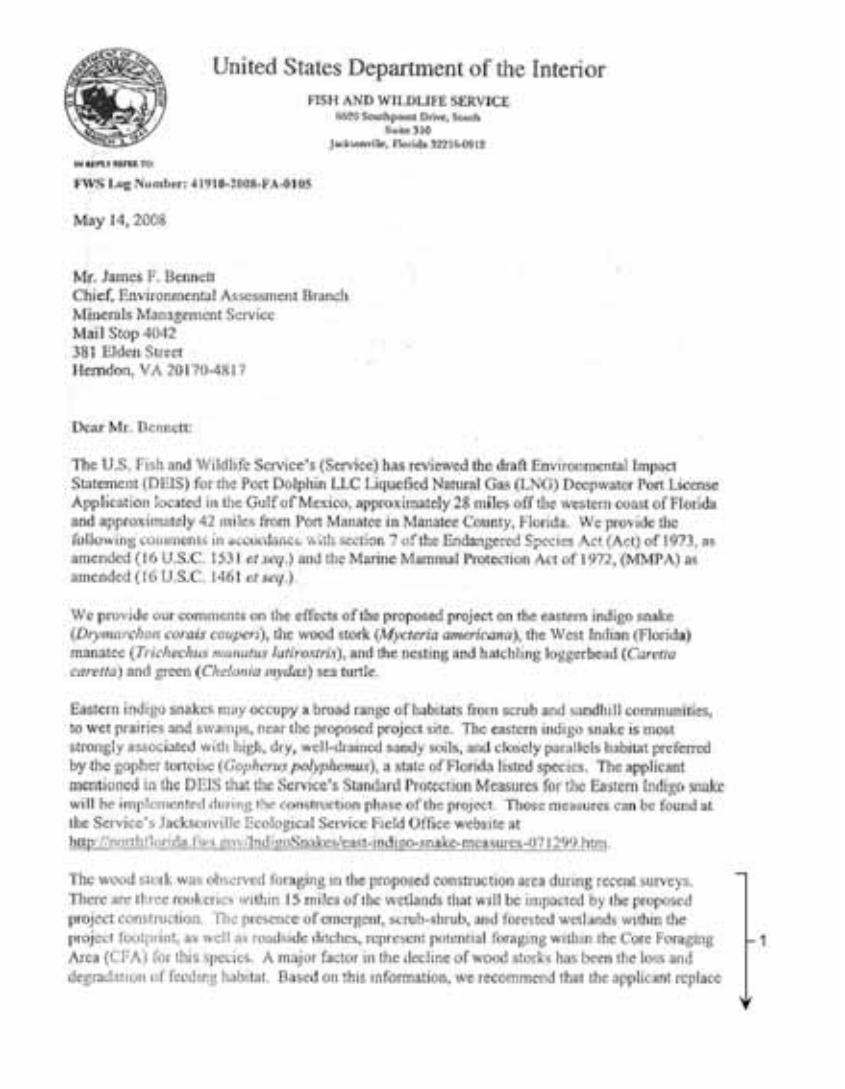
EC (Environmental Concerns): The review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact.

EO (Environmental Objections): The review has identified significant environmental impacts that should be avoided in order to adequately protect the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). The basis for environmental objections can include situations:

1. Where an action might violate or be inconsistent with achievement or maintenance of a national environmental standard;
2. Where the Federal agency violates its own substantive environmental requirements that relate to EPA's areas of jurisdiction
or expertise;
3. Where there is a violation of an EPA policy declaration;
4. Where there are no applicable standards or where applicable standards will not be violated but there is potential for significant environmental degradation that could be corrected by project modification or other feasible alternatives; or
5. Where proceeding with the proposed action would set a precedent for future actions that collectively could result in significant environmental impacts.

EU (Environmentally Unsatisfactory): The review has identified adverse environmental impacts that are of sufficient magnitude that EPA believes the proposed action must not proceed as proposed. The basis for an environmentally unsatisfactory determination consists of identification of environmentally objectionable impacts as defined above and one or more of the following conditions:

1. The potential violation of or inconsistency with a national environmental standard is substantive and/or will occur on along-term basis;
2. There are no applicable standards but the severity, duration, or geographical scope of the impacts associated with the proposed action warrant special attention; or
3. The potential environmental impacts resulting from the proposed action are of national importance because of the threat to national environmental resources or to environmental policies.



RATING THE ADEQUACY OF THE ENVIRONMENTAL IMPACT STATEMENT (EIS)

1 (Adequate): The Draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

2 (Insufficient Information). The Draft EIS does not contain sufficient information to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the Draft EIS, which could reduce the environmental impacts of the proposal. The identified additional information, data, analyses, or discussion should be included in the Final EIS.

3 (Inadequate): The Draft EIS does not adequately assess the potentially significant environmental impacts of the proposal, or the reviewer has identified new, reasonably available, alternatives, that are outside of the spectrum of alternatives analyzed in the Draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. The identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. This rating indicates EPA's belief that the Draft EIS does not meet the purposes of NEPA and/or the Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised Draft EIS.

1

United States Department of the Interior

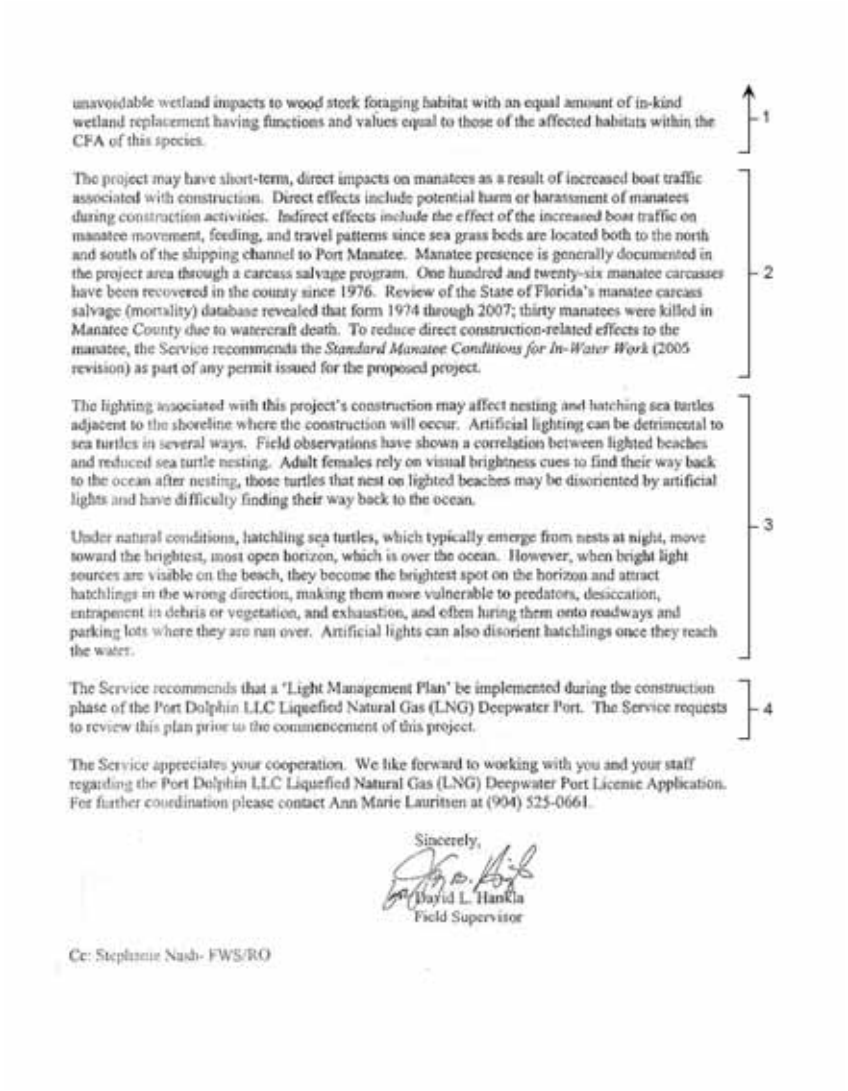
FISH AND WILDLIFE SERVICE
6620 Southpoint Drive, South
Suite 310
Jacksonville, Florida 32216-0912

IN REPLY REFER TO:
FWS Log Number: 41910-2008-FA-0105

May 14, 2008

Mr. James F. Bennett
Chief, Environmental Assessment Branch
Minerals Management Service
Mail Stop 4042
381 Elden Street
Herndon, VA 20170-4817

Dear Mr. Bennett:



The U.S. Fish and Wildlife Service's (Service) has reviewed the draft Environmental Impact Statement (DEIS) for the Port Dolphin LLC Liquefied Natural Gas (LNG) Deepwater Port License Application located in the Gulf of Mexico, approximately 28 miles off the western coast of Florida and approximately 42 miles from Port Manatee in Manatee County, Florida. We provide the following comments in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*) and the Marine Mammal Protection Act of 1972, (MMPA) as amended (16 U.S.C. 1461 *et seq.*).

We provide our comments on the effects of the proposed project on the eastern indigo snake (*Drymarchon corais couperi*), the wood stork (*Mycteria americana*), the West Indian (Florida) manatee (*Trichechus manatus latirostris*), and the nesting and hatchling loggerhead (*Caretta caretta*) and green (*Chelonia mydas*) sea turtle.

Eastern indigo snakes may occupy a broad range of habitats from scrub and sandhill communities, to wet prairies and swamps, near the proposed project site. The eastern indigo snake is most strongly associated with high, dry, well-drained sandy soils, and closely parallels habitat preferred by the gopher tortoise (*Gopherus polyphemus*), a state of Florida listed species. The applicant mentioned in the DEIS that the Service's Standard Protection Measures for the Eastern Indigo snake will be implemented during the construction phase of the project. Those measures can be found at the Service's Jacksonville Ecological Service Field Office website at http://northflorida.fws.gov/IndigoSnakes/east-indigo-snake-measures-071299.htm.

The wood stork was observed foraging in the proposed construction area during recent surveys. There are three rookeries within 15 miles of the wetlands that will be impacted by the proposed project construction. The presence of emergent, scrub-shrub, and forested wetlands within the project footprint, as well as roadside ditches, represent potential foraging within the Core Foraging Area (CFA) for this species. A major factor in the decline of wood storks has been the loss and degradation of feeding habitat. Based on this information, we recommend that the applicant replace

1. The proposed action would not cross known wood stork feeding habitat or known rookeries. Please see the impact discussion in Section 4.2.1.4, and Section 4.11 for mitigation and monitoring discussions for the terrestrial portion of the project.

unavoidable wetland impacts to wood stork foraging habitat with an equal amount of in-kind wetland replacement having functions and values equal to those of the affected habitats within the CFA of this species. 1

The project may have short-term, direct impacts on manatees as a result of increased boat traffic associated with construction. Direct effects include potential harm or harassment of manatees during construction activities. Indirect effects include the effect of the increased boat traffic on manatee movement, feeding, and travel patterns since sea grass beds are located both to the north and south of the shipping channel to Port Manatee. Manatee presence is generally documented in the project area through a carcass salvage program. One hundred and twenty-six manatee carcasses have been recovered in the county since 1976. Review of the State of Florida's manatee carcass salvage (mortality) database revealed that form 1974 through 2007; thirty manatees were killed in Manatee County due to watercraft death. To reduce direct construction-related effects to the manatee, the Service recommends the *Standard Manatee Conditions for In-Water Work* (2005 revision) as part of any permit issued for the proposed project. 2

The lighting associated with this project's construction may affect nesting and hatching sea turtles adjacent to the shoreline where the construction will occur. Artificial lighting can be detrimental to sea turtles in several ways. Field observations have shown a correlation between lighted beaches and reduced sea turtle nesting. Adult females rely on visual brightness cues to find their way back to the ocean after nesting, those turtles that nest on lighted beaches may be disoriented by artificial lights and have difficulty finding their way back to the ocean.

Under natural conditions, hatchling sea turtles, which typically emerge from nests at night, move toward the brightest, most open horizon, which is over the ocean. However, when bright light sources are visible on the beach, they become the brightest spot on the horizon and attract hatchlings in the wrong direction, making them more vulnerable to predators, desiccation, entrapment in debris or vegetation, and exhaustion, and often luring them onto roadways and parking lots where they are run over. Artificial lights can also disorient hatchlings once they reach the water. 3

The Service recommends that a 'Light Management Plan' be implemented during the construction phase of the Port Dolphin LLC Liquefied Natural Gas (LNG) Deepwater Port. The Service requests to review this plan prior to the commencement of this project. 4

The Service appreciates your cooperation. We like forward to working with you and your staff regarding the Port Dolphin LLC Liquefied Natural Gas (LNG) Deepwater Port License Application. For further coordination please contact Ann Marie Lauritsen at (904) 525-0661.

Sincerely,

David L. Hankla
Field Supervisor

Cc: Stephanie Nash- FWS/RO

2. This recommendation has been added to Section 4.11 of the EIS.

3. Potential impacts on turtle hatchlings from construction lighting are addressed in Section 4.2.1.3 of the EIS.

4. This recommendation is included in Section 4.11 of the EIS.

Subject: Port Dolphin DEIS Review Comments - MMS

Ray,

Attached to this message are the comments from the MMS reviewers regarding the Port Dolphin DEIS delivered to coincide with the June 2nd deadline. The comments contained within represent MMS' experienced, expert opinion on environmental concerns in the proposed project areas.

Also please note the various citations of MMS Notice to Lessees (NTL) documents. The MMS understands that LNG DWP applicants are not lessees and fall under the regulatory authority of the Maritime Administration; however, MMS published NTLs represent a useful source of information for potential DWP applicants to ensure that their planned activities are carried out using MMS recognized best practices for operating in the offshore environment. 1

For example, NTL No. 2005-G07 provides guidance on MMS regulations regarding archaeological discoveries, and deepwater survey requirements. I believe applicants who conduct their required surveys according to the guidance issued in this document should generally find themselves on the right side of the National Historic Preservation Act (NHPA) and with the appropriate information to apply for a pipeline ROW grant for DWP associated pipelines included in their EIS documentation.

Jarvis B. Abbott
Petroleum Engineer

1. Thank you for your comment. The Maritime Administration and USCG value MMS expertise and appreciate MMS cooperation on this project.

Matrix for Suggested Changes to Port Dolphin Draft EIS

Received from Minerals Management Service on May 23, 2008

	Section	Page	Line	Reviewer (initials)	Comment
1.	General Comment			GEdR	This Draft EIS review concentrated on the offshore aspects of the proposed Port Dolphin deepwater port project.
2.	General Comment			TG	Migratory birds were discussed and the possible impacts. Migratory bats should also be discussed with potential, if any, impacts.
3.	General Comment			GSB	All of my comments on the Interim DEIS still stand. The ones that could have had responses or changes in the Interim DEIS were not addressed in the new Draft EIS. I will restate parts of those that need repeating. Overall, this project is proposing to cause substantial impacts to hard bottom (live bottom) communities in Federal waters offshore of St. Petersburg Florida. In Table 4.2-1, long-term impacts on a total of 2,137 acres of various types of hard bottom communities are anticipated. This is a far greater impact than the entirety of the eastern portion of the Gulfstream pipeline, but this project currently has no attached mitigations I am aware of. The MMS Live Bottom (low relief) stipulation (in NTL 2004-G05) applies in the eastern Gulf for all areas shallower than 100 m and also applies to right-of-way pipeline installation, specifically states, "all bottom disturbances from right-of way pipeline construction activities are limited in the same manner as bottom disturbances occurring from lease operations." And further states, If it is determined that live-bottom areas might be adversely impacted by the proposed activity, then the RD will require the lessee to undertake any measure deemed economically, environmentally, and technically feasible to protect live bottom areas. The Gulfstream pipeline was required to use midline buoys on anchor cables used for the plowing operation that was said to reduce impacted areas due to cable sweep 93% from 3,764 acres down to 254 acres. It is suggested that this mitigation be required for this pipeline installation as

1. Comment noted.

2. Comment noted.

3. The applicant is consulting with USCG and the Maritime Administration to develop appropriate mitigation plans and additional geophysical surveys. Additionally, video mapping results from the Gulfstream Pipeline Project EIS (2001) are being compiled to augment the predicted benthic impacts, as appropriate. All available data, will be used to specify mitigation type, extent, duration, and schedule. The referenced NTL has been included in the discussion of BMPs and mitigation measures in Section 4.11. The Applicant has committed to use of midline buoys and other measures to reduce impacts to hardbottom areas as described in Section 4.2.1.6 and 4.11. Construction details, including the use of plows or other pipeline construction processes, were submitted by the Applicant in December 2008. The documents are available via the Federal Docket Management System (www.regulations.gov), Docket No. USCG-2007-28532.

	Section	Page	Line	Reviewer (initials)	Comment
					well. The State of Florida also required extensive artificial reef mitigation as well as monitoring of the effectiveness of various configurations of artificial reefs to mitigate for the destruction of live bottom by plowing and anchoring. While MMS was not necessarily supportive of this mitigation, we did want to see results from monitoring of anchor scar and plow trench recovery of impacted hard bottom areas. Results from that requirement for the Gulfstream pipeline have yet to be received and MMS still lacks basic information on recovery rates of low relief live bottom impacts. This is also suggested as a mitigation for the Port Dolphin pipeline installation. There is still no commitment as to what kind of trenching method will be used. This could make a huge difference in how much impact to live bottoms there will be. The section describing physical impacts to benthic communities is extremely brief. Maps are on a very large scale and there is no way to determine the accuracy of impact estimates. There is no obvious documentation of the impacts from anchor cable sweep separated from direct anchor impacts. Again, the use of a plow experienced extensive problems in the Gulfstream project and long portions of the pipeline that required burial remained either partially or fully exposed above the seabed due to the ineffectiveness of the plow in hard carbonate substrates (the same as will be experienced offshore St Petersburg).
4.	Executive Summary	ES-7	21 & 22	GEdR	The Draft EIS states, "Benthic communities would be expected to recover quickly by recolonization from surrounding communities of similar organisms." This is only partially true. Benthic communities will be adversely affected by the sweep of the mooring systems for the two buoys and the flexible riser. Recolonization is not likely to occur in these areas because of the constant disturbance of the sea bottom.

4. Discussion of benthic impacts was revised to match the impact discussion in Section 4.2.1.6. The text was deleted regarding recovery. Statement clarified to meet intent of comment.

	Section	Page	Line	Reviewer (initials)	Comment
5.	Executive Summary	Executive Summary ES-9	1 Mitigation	LH	Add some discussion of mitigation for wetland crossings and how the mitigation will be monitored, evaluated and maintained. Also, add this info to mitigation section of the report.
6.	Executive Summary	ES-10	37 through 40	GEdR	Please include monitoring requirements along with the mitigation requirements that the applicant must perform to comply with the license.
7.	Cumulative	ES-11	7	LH	Add discussion of any cumulative affect of vessel traffic erosion on wetland resources. Make appropriate changes in section 6 to support this discussion.
8.	Executive Summary	ES-11	11 through 13	GEdR	The MMS wants to have the opportunity to participate in the environmental monitoring program developed in consultation with NMFS. The program would include preconstruction/baseline monitoring and operational monitoring aimed at identifying potential effects and developing procedures to minimize adverse impacts. Likewise, the MMS wants to receive and review the data collected from the program's studies and to review the subsequent reports.
9.	Executive Summary	ES-11	19 through 33	GEdR	Please include "ramping up" of machinery as a mitigative measure for noise abatement. This may give time for biota to leave or avoid the area that is adversely affected by noise from construction, operation, and decommissioning activities.
10.	Executive Summary	ES-9 & ES-17	ES-9: 42 & 43 ES-17: 14 & 15	GEdR	There is an inconsistency in the Draft EIS. At page ES-9, the document states, "An Independent Risk Assessment for the Project estimated the maximum thermal radiation distance to be 1,935 m (1.2 mi)." While at page ES-17, the Draft EIS states, "An Independent Risk Assessment for the Project estimated the maximum thermal radiation distance to be 7,330 m (4.6 mi)." This inconsistency needs to be resolved and the text appropriately modified.

5. Mitigation, monitoring, and BMPs are discussed in Section 4.11. The Applicant would be required to follow FERC Certificate requirements including wetland crossing techniques.

6. Specific monitoring requirements would be developed after a license is issued. The License issued by the Maritime Administration would include an Operations Manual and Facility Security Plan from the Applicant. The Operations Manual and Facility security plan will have to be approved by the Coast Guard and will include mitigation measures for all the hazards discussed and identified by the stakeholders. The local USCG Sector will inspect and monitor.

7. Increased erosion to onshore wetlands from vessel traffic from the Port Dolphin Project would be negligible to minor. Current and proposed LNG projects in the GOM are located off the coast of Louisiana and Alabama and not expected to impact the onshore wetlands in the Port Dolphin Project. Section 6.3.4 provides a discussion of these impacts.

8. Comment Noted.

9. Text added per comment. Ramping up of machinery is considered a Best Management Practice and part of project design.

10. Text modified in the Executive Summary per comment to reflect a bounding case pool fire distance of 4,500 m with a heat flux > 5kW/m^2.

	Section	Page	Line	Reviewer (initials)	Comment
11.	1.2	1-4	22 23 24 25	BLJ	Change "The adjacent coastal state to which the deepwater port is to be directly connected by pipeline has developed, or is making at the time the application is submitted, reasonable progress, toward developing an approved coastal zone management program pursuant to the Coastal Zone Management Act (CZMA) of 1972 (16 U.S.C. 1451 et seq.)." To "The adjacent coastal state, the State of Florida, to which the deepwater port is to be directly connected by pipeline has an approved coastal zone management program pursuant to the Coastal Zone Management Act (CZMA) of 1972 (16 U.S.C. 1451 et seq.)."
12.	1.2.1 Increasing Demand for Natural Gas	1-6	17 & 18	GEdR	The Draft EIS states, "Lower 48 states offshore natural gas production is projected to decrease." From the Gulf of Mexico perspective, it is true that shallow water gas production has declined recently. However, several large deepwater gas projects such as the Independence Hub have begun production. These projects will offset some of the decline in the Gulf's shallow water natural gas production. The MMS is also providing incentives to develop shallow water, deep gas prospects that will assist in increasing gas production from the Region.
13.	1.4	1-10	30	ALJ	This EIS assesses potential environmental impacts associated with the installation, operation, and decommissioning of the Port. Shouldn't the EIS mention that it assess the potential impacts associated with a ROW pipeline associated with the Port?
14.	1.5	1-12	11-12	ALJ	FERC 02/11/08 NOI was for the onshore portion of the pipeline ROW and related facilities, however Table 1.6-1 (page 1-13) indicates FERC is responsible for construction, installation, own, operate, and maintain a pipeline. Is this just for the onshore portion? What about MMS's duty to permit the offshore portion of the pipeline? It does not indicate that MMS will issue a ROW permit for the offshore portion of the pipeline.

11. Text is quoted from the Deepwater Port Act and cannot be changed.

12. The discussion of domestic gas supply has been updated to include the most recent projections by EIA. See Section 1.2.

13. "Port" changed to "project".

14. The Maritime Administration and USCG have requested input from cooperating agencies, including MMS, and have incorporated information received as appropriate. However, for a deepwater port, a pipeline ROW issued by MMS is not required.

	Section	Page	Line	Reviewer (initials)	Comment
15.	2	2-1	2-13	ALJ	Once again, the EIS fails to mention that impacts associated with the installation and maintenance of a 36-inch transmission pipeline is part of the proposed action.
16.	Criterion 4, Avoidance of Ocean Dredged Material Disposal Sites.	2-17	12	GEdR	The Draft EIS states, "Siting a project in an identified dredged material disposal site would be difficult, and likely would not be approved by MMS." Please change the reference from the MMS in this sentence to the Corps of Engineers (COE) in coordination with the US EPA. Permits for the ocean dumping of dredged materials are issued by the COE subject to the US EPA approval (Marine Protection, Research and Sanctuaries Act, Section 103).
17.	2.1.1.3	2-17	29, 33, 38	ALJ	Instead of saying "MMS lease blocks", the EIS should refer to the Blocks as, "MMS OCS blocks" or "OCS blocks" or "St. Petersburg Blocks 190, 233, etc".
18.	2	2-20		GSB	Comment for this table was not addressed. It would seem that avoidance of live bottom areas would be a "Selection Criteria," particularly when there is a "proposed" anchor handling plan that is intended for "judicious anchor placement" described on page 4-13. This appears to be a proposal and no details or commitments are indicated.
19.	2.1.2.1 Energy Source Alter-natives	2-27 through 2-29	Whole Section	GEdR	There is no discussion on the use of ocean currents as an energy source alterative. Add a section to the Final EIS that discusses this alterative. Note in the "new section" that the MMS has the responsibility for Alternate Energy Uses on the OCS (Energy Policy Act of 2005 – Public Law 1098-58).
20.	Various Sections	Various Pages	Various Lines	GEdR	There are inconsistencies in the Draft EIS regarding the MMS blocks that will be affected by the proposed port's location. Correct the location description throughout the document. Here are examples. In the Abstract, the Draft EIS states, "Abstract: Port Dolphin Energy LLC, proposes to own, construct, and operate a deepwater port, named Port Dolphin, in the Federal waters of the Outer Continental Shelf in lease blocks designated by the Minerals Management Service as St.

15. The second paragraph to the introductory project descriptions includes the pipeline description. Please see Section 2.1.1.3 for a detailed description of the proposed port locations and pipeline route alternatives, and Section 4 for impacts for the pipeline and alternatives.

16. Text changed per comment.

17. Text changed to "MMS PB blocks" per comment.

18. Comment noted. See Section 4.2.1.6 for a discussion of impacts on hardbottom areas for each alternative.

19. The discussion in Section 2.1.2.1, *Energy Source Alternatives,* is limited to alternatives that are currently commercially available. According to a technology White Paper on Wave Energy Potential in the US OCS, May 2006 (available at http:ocsenergy.anl.gov), the technologies that capture energy from waves are still being developed, and are not ready for commercial application. Therefore, no change to text has been made.

20. Global change to document: "…MMS St. Petersburg (PB) blocks: PB545, PB546, PB547, PB548, PB504, PB505, PB506, PB507, PB463, and PB589 (See **Figure 2.2-4)**."

	Section	Page	Line	Reviewer (initials)	Comment
					Petersburg (PB) blocks: PB545, PB589, and PB590." From the maps/diagrams on various pages, it appears that the port will affect PB 545, PB 589, and PB 590. In the Description of the Proposed Action (page ES-4), the Draft EIS states, "The Port would be located in areas designated by the U.S. Department of the Interior (DOI) Minerals Management Service (MMS) as Lease Blocks St. Petersburg (PB) 546 and PB589." In the Overview (page 2-30), the Draft EIS states, "The Applicant proposes to construct, own, and operate a deepwater port, named Port Dolphin, in the Federal waters of the OCS in St. Petersburg blocks PB545 and PB589, …" In the Lease Blocks and Overall Site Plan (page 2-34), the Draft EIS states, "The Port unloading buoys would be in MMS lease blocks PB545, PB546, and PB589." Table 2.3-1, Proposed Action Lease Block Information Description OCS Area OCS Lease Blocks, shows the following locations: North Unloading Buoy St. Petersburg 589 South Unloading Buoy St. Petersburg 545 and 546
21.	2.3.2	2-34	36, 39, 42	ALJ	When identifying OCS blocks, especially for this project, it would be useful to a complete identifier i.e., St. Petersburg (PB) Area (NG 17-01) Blocks 545, 546, etc instead of "MMS lease blocks PB545, PB546, and PB589." This should be indicated the first time the PB Block(s) is mentioned.

21. Comment noted; See **Figure 2.2-4.**

	Section	Page	Line	Reviewer (initials)	Comment
22.	2.3.8 Pipelines	2-46	3	JES	Construction corridor of 3000 ft. may not be wide enough to account for typical anchor spread of lay vessels. If the survey extends only 1500 ft. to each side of the pipeline, all bottom disturbances must be kept within that area. "As placed" survey plats should be required to show the actual occurrence of bottom disturbances.
23.	Figure 2.3-8	2-46		JES	Text in this figure is far too small. All text should be a minimum of 10 pt equivalent.
24.	Figure 2.3-9	2-47		JES	Text in this figure is far too small. All text should be a minimum of 10 pt equivalent.
25.	2.3.8 Pipeline Crossing	2-47	4	JES	This sentence needs clarification, "The easternmost crossing would be 898 m (2,947 feet), and the westernmost crossing would be 407 m (1,335 feet)." What are these measurements? Distance from some point of origin? Location markers?
26.	Offshore Pre-construction Activities	2-53	30 through 40	GEdR	• The MMS would like to be involved in the following activities: • Review of the applicant's construction plan • Review of the geotechnical and hazard surveys • Evaluation of FMV and clearance of the project footprint (including project pipelines); issuance of the MMS Segment Number, clearance letter, or other evidence that the project does not conflict with planned or existing OCSLA regulated facilities or activities. • Review of detailed construction procedures • Review of the pre-lay survey of pipeline routes and review of the anchor placement plans
27.	2.3-11	2.53	34	ALJ	There is no mentioning of MMS issuing a ROW permit for the offshore portion of the pipeline.

22. The Applicant has developed an anchor plan, and has surveyed proposed anchor placement locations. Potential impacts are discussed in Section 4.2.1.6.

23. Figures have been modified to improve readability. Full-sized figures are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532

24. Figures have been modified to improve readability. Full-sized figures are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532

25. The text has been clarified to more fully describe the HDD offshore crossing locations.

26. Comment noted.

27. The Maritime Administration and USCG have requested input from cooperating agencies, including MMS, and have incorporated information received as appropriate. However, for a deepwater port, a pipeline ROW issued by MMS is not required.

	Section	Page	Line	Reviewer (initials)	Comment
28.	Offshore Construction Sequence	2-54	Whole Section	GEdR	The USCG and MARAD must require the applicant to conduct post-pipeline lay surveys – commonly called "as-built" surveys. This allows the regulating agencies to know the exact locations of the pipelines at the time of their construction and installation. This is also essential to ensure adherence to the mandated mitigative measures during the pipelines' installations. This must be a condition for the license. See the MMS' NTL No. 98-09, Proposed and As-Built Pipeline Location Data (effective date: August 10, 1998).
29.	Gulf of Mexico: Water	3-6	18	GEdR	Please change the term "dead zones" to "anoxic zones." This is in keeping with the scientific terms of low oxygen concentrations in the seawater. Then explain the term anoxic in the document.
30.	3.2.3.1	3-14	43	TG	Are there any recent surveys of the Florida manatee populations? The one indicated was based on 1995 aerial survey.
31.	Threatened & End. Fish Species	3-23	After line 33 add Gulf Sturgeon section	LH	Primarily historic sightings but check for current near shore occurrence or habitat. Just note that this is part of historic range but no designated critical habitat. See note on #8 below
32.	3.2.4 Benthic Resources	3-26	34	JES	"Benthos" can refer to both the substrate and the organisms that live on it. "Benthic communities" would only refer to the organisms. Description of benthic habitat in the rest of the paragraph is excellent.
33.	3.2.4 Benthic Resources	3-27	8 – 13	JES	Is "Inner Shelf Live Bottom Assemblage I" different from "Inner and Middle Shelf Live Bottom I"? Should this be "II" or did you leave out the description of the third assemblage? Looks like there are two assemblages described using four different names in this short paragraph. Clarify.
34.	3.2.4 Benthic Resources	3-27	8 – 13	JES	The characterization of these assemblages is important to the site description. Two sentences about each assemblage seems inadequate. Consider expanding this description.

28. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

29. No change to text.

30. Text revised to include Synoptic Survey data through 2008.

31. Text revised per comment.

32. Text revised per comment.

33. Text revised per comment.

34. Discussion has been expanded per the comment.

	Section	Page	Line	Reviewer (initials)	Comment
35.	3.2.4 Benthic Resources	3-28	24	JES	The info given does not show "less than 6 percent" of non-algal cover. If you use the smallest percent of cover (20%) described for habitat Type A and multiply it by the smallest percent of non-algal cover (100% - 68% = 32%), the result is 6.4%. In other words, this is the minimum non-algal benthic cover found, not representative.
36.	3.2.5	Many		TG/CR	Information on Marine Mammals, particularly endangered marine mammals, is very outdated. Viada 2000 is the sole reference for this section and that is 8 years old. Several of the species rarely seen have been sighted in the Gulf since Viada's records so accounts of sightings are incorrect. Since NMFS does an annual abundance estimate, those data can be easily obtained.
37.	3.3 Cultural Resources 3.3.1 Definitions of a Resource	3-65	3 & 4	GEdR	The correct citing for the MMS' NTL regarding the list of blocks requiring archaeological surveys is Revision to the List of OCS Lease Blocks, Requiring Archaeological Resource Surveys, NTL No. 2006-G07 (not NTL No. 2007-G01 as stated in the Draft EIS). The MMS' latest NTL regarding the Shallow Hazards Program is NTL No. 2008-G05. Please change the text in all locations where this reference occurs in the Draft EIS.
38.	3.3.1	3-65	4	JBI	Shallow hazard NTL still incorrectly listed as 98-20. Should read 2007-G01
39.	3.3.2	3-67	18	JBI	Should read Alternate Route Sonar Contact 10, not 1. See survey report p. 18 and Sidescan Sonar Contact Table, which is described as shipwreck-like debris.
40.	3.4.1.	3-70	2-4	ALJ	One distinguishing component of soil isn't included in this definition of Soil: i.e., organics or organic material.
41.	3.4.3.1 Southern Site and Route Geology	3-80	Whole Section	GEdR	If the Southern Site and Route is selected for installation, additional shallow hazard surveys and analyses must be required of the applicant. This alternate pipeline routing is not adequately assessed or evaluated in the Draft EIS.

35. Text revised to clarify.

36. The marine mammal discussion has been updated and the discussion expanded, see Section 3.2.4 .1 and 3.2.6.

37. Text changed per comment.

38. Text changed per comment.

39. Text changed per comment.

40. Text revised to add organic material to physical soil characteristics, see Section 3.4.1.

41. If the Southern Site and Route were used then additional surveys and studies would be required as necessary to evaluate existing conditions and potential impacts associated with implementation of the project along that alignment.

	Section	Page	Line	Reviewer (initials)	Comment
42.	Sediments	3-81	11 through 13	GEdR	The Draft EIS suggest that there may be strong currents along the proposed southern pipeline route evidenced by sand waves or ridges. The USCG must ensure that if this alternative is selected, the pipelines will be monitored for scour. The concern is that the scour could lead to spanning of the pipeline. Remedial actions would be required of the licensee.
43.	Geologic Hazards	3-81	30 through 32	GEdR	The MMS is concerned that areas to the south of the proposed pipeline route (and the alternative southern route) on the 14-inch pipeline segment could be candidate sites for future mining of sandy sediments. The location of the pipeline in these areas could interfere with potential mining operations.
44.	3.4.3.1.	3-81	30-32	ALJ	I'm not sure why reference is made to the 14-inch PL segment. What 14-inch PL segment?
45.	3.5 Marine Areas and Land Use: 3.5.1 Definition of the Resource	3-87	This Section	GEdR	The MMS provides guidance to all OCS Right-of-Way applicants in its NTL No. 2007-G20, Coastal Zone Management Program Requirements for OCS Right-of-way Pipeline Applications (effective date: May 25, 2007). The applicant should be required to adhere to this NTL.
46.	3.5 Marine Areas and Land Use: 3.5.1 Definition of the Resource	3-87	This Section	GEdR	The MMS has the responsibility for Alternate Energy Uses on the OCS (Energy Policy Act of 2005 – Public Law 1098-58). This mandated responsibility should be addressed in this section as well.
47.	3.5.1.	3-87	25	ALJ	This could be correct but the wording is different. Also, should include ROW permits as well as lease blocks.
48.	3.5.2 Marine Areas	3-88	9	GEdR	The MMS is also responsibility for Alternate Energy Uses on the OCS (Energy Policy Act of 2005 – Public Law 1098-58).

42. Comment noted. If the Southern Site and Route were used then additional surveys and studies would be required as necessary to evaluate existing conditions and potential impacts associated with implementation of the project along that alignment.

43. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are discussed in Sections 3.4 and 4.4.

44. Text revised to remove the 14-inch pipeline segment.

45. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

46. Text changed per comment.

47. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

48. Text changed per comment.

	Section	Page	Line	Reviewer (initials)	Comment
49.	3.5.2.1 Lease Blocks	3-88	This Section	GEdR	It is worthy to note that there is a moratorium on certain activities in a portion of the Eastern Planning Area of the Gulf of Mexico. The Gulf of Mexico Energy Security Act (GOMESA) established a moratorium (until June 30, 2022) on leasing, pre-leasing, and other activities in defined areas within the eastern Gulf.
50.	3.5.2.1.	3-88	16-18	ALJ	An oil and gas lease sale does not begin with the reading of sealed bids; That's one of the last steps. Each oil and gas Lease sale goes through the NEPA process first. The referenced blocks are within 100 miles of Florida's (west) coastline and are not subject to being leased at this time. Additionally, the St. Petersburg blocks that the proposed pipeline would traverse should be included in the listing of blocks potentially affected by the proposed action and not just the blocks potentially impacted by the LNG Port.
51.	3.5.3 Coastal Zone Manage-ment Areas	3-89	This Section	GEdR	The MMS provides guidance to all OCS Right-of-Way applicants in its NTL No. 2007-G20, Coastal Zone Management Program Requirements for OCS Right-of-way Pipeline Applications (effective date: May 25, 2007). The applicant should be required to adhere to this NTL.
52.	3.5.3	3-89	18 18	BLJ	Change "Florida CZM" to "FDEP" Change "determination" to "concurrence, objection, or request for an extension"
53.	4.1 Water Resources	4-4	1	GEdR	Please add the following words, "gauging and" (it appears in italics in the following sentence) to the narrative in the EIS, "…the discharges of water from gauging and hydrostatic testing of the pipelines; …."
54.	4.1 Water Resources	4-4	4	GEdR	The Draft EIS states, "The offshore portion of the Project would not degrade marine water quality …." This is not true. During construction, the marine water quality will be adversely affected from the temporary re-suspension of sediments and the resulting increases in turbidity in the water column. Please change the text.
55.	4.1.1 Con-struction Impacts	4-4	14	GEdR	Please add the following word and punctuation, ", gauging," (it appears in italics in the following sentence) to the narrative in the EIS, "Installation, gauging, and hydrostatic testing of the pipeline…."

49. Text changed to meet intent of comment.

50. Text revised to "It is possible that MMS could lease the blocks traversed by the project should a license be granted and the lease blocks receive a bid (see **Figure 2.2-4**)."

51. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

52. Text revised per comment.

53. Text changed per comment.

54. Text changed to state that the degradation of marine water quality during offshore construction affected from the temporary resuspension of sediments and the resulting increase in turbidity column would be minimal.

55. Text changed per comment.

	Section	Page	Line	Reviewer (initials)	Comment
56.	Proposed Pipeline Route Location	4-5	36 & 37	GEdR	The Draft EIS states, "Sediment suspension modeling for mooring line sweep, which would occur routinely during operations, was not been completed by the Applicant." This discussion seems to be out of place. The text is discussing the pipeline impacts. However, since this seafloor disturbance will occur throughout the life of the project, the US Coast Guard should require appropriate modeling of the mooring line sweeps.
57.	4.1.3 Decommis-sioning 2 4.1.3.1 Offshore Impacts	4-12	Whole Section	GEdR	The US Coast Guard should require all equipment imbedded in the seafloor to be severed at least 5 meters below the mud line and removed. The MMS has specific requirements to abandon pipelines. The applicant must be required to comply with them. For example, the ends of the abandoned pipeline must be recovered to preclude interference with futures uses on the OCS. The Draft EIS did not include this requirement in the text. The text should be revised in the EIS to include this requirement.
58.	4.2.1.1 General Impacts Dis-cussion Con-struction Impacts Seafloor Dis-turbance	4-13	39 & 40	GEdR	The Draft EIS states, "…by judicious anchor placement during the first pass offers the greatest potential for further reduction of live bottom impact area." The US Coast Guard should require the applicant to adhere to an anchor placement plan that minimizes the adverse effects to the live bottom areas.
59.	Vessel Traffic	4-16	Whole Section	GEdR	It is appropriate to require the applicant to adhere to the MMS' NTL No. 2007-G04, Vessel Strike Avoidance and Injured/Dead Protected Species Reporting. The text in the EIS should be revised to reflect this requirement.

56. The out of place paragraph has been incorporated into Section 4.1.2.1, SRV Mooring. The sediment suspension modeling for the mooring line sweep has been obtained and incorporated.

57. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

58. The applicant is currently involved in consultation with USCG and the Maritime Administration to develop appropriate mitigation plans and additional geophysical surveys. Additionally, video mapping results from the Gulfstream Pipeline Project EIS (2001) are being compiled to augment the predicted benthic impacts, as appropriate. All available data will be used to specify mitigation type, extent, duration, and schedule. The referenced NTL has been included in the discussion of BMPs and mitigation measures in Section 4.11. The Applicant has committed to use of midline buoys and other measures to reduce impacts to hardbottom areas as described in Section 4.2.1.6 and 4.11. Construction details, including the use of plows or other pipeline construction processes, were submitted by the Applicant in December 2008. The documents are available via the Federal Docket Management System (www.regulations.gov), Docket No. USCG-2007-28532.

59. Text revised per comment. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

	Section	Page	Line	Reviewer (initials)	Comment
60.	Noise	4-17	Whole Section	GEdR	Noise will also emanate from helicopters that may be used during the construction and operational life of the project. There should be a discussion of this noise source in the EIS.
61.	Oper-ations Impacts: Seafloor dis-turbance	4-18	42 through 44	GEdR	There is an inconsistency in the Draft EIS. In this section, the Draft EIS states, "Modeling results indicate that continuous anchor sweep would resuspend and deposit the sediments in the immediate vicinity of the chains and that cumulative accumulation of deposited sediment would not occur." However, back on page 4-5, the Draft EIS states, "Sediment suspension modeling for mooring line sweep, which would occur routinely during operations, was not been completed by the Applicant." Has modeling been done or not on the anchor sweep area? The text needs to be appropriately modified.
62.	Marine Debris	4-21	29	GEdR	The MMS has issued NTL No. 2007-G03, Marine Trash and Debris Awareness and Elimination that supersedes NTL 2003-G11. Please revise the text as appropriate.
63.	Decommis-sioning	4-22	11 & 12	GEdR	The MMS has very specific requirement to abandon pipelines in place during decommissioning operations. For example, pipelines must be flushed and filled. A right-of-way grantee cannot just seal and abandon the pipeline in place, as stated in the Draft EIS. See the applicable MMS Operating Regulations at 30 CFR 250.1006.
64.	4.2.1.3			TG	Only marine mammals not sea turtles should be discussed in this section. Similarly, Section 4.2.1.4 should only discuss sea turtles not marine mammals.
65.	Hydro-static Pipeline Integrity Testing	4-24 & 4-25	Whole Section	GEdR	The water use here does not take into consideration the "gauging and cleaning run" prior to the hydrostatic pipeline integrity testing. Revise the section accordingly.
66.	Vessel Traffic	4-25 throug h 4-27	Whole Section	GEdR	It is appropriate to require the applicant to adhere to the MMS' NTL No. 2007-G04, Vessel Strike Avoidance and Injured/Dead Protected Species Reporting. The text in this section of the EIS should be revised to reflect this requirement.

60. No helicopters will be used during construction or operation.

61. Anchor sweep modeling has been completed, and information has been added to the Final EIS, see Section 4.2.1.6.1.

62. Text revised per comment.

63. Text added to specify that specific requirements for decommissioning will conform to requirements in place at that time.

64. Text revised per comment.

65. Text revised per comment.

66. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

	Section	Page	Line	Reviewer (initials)	Comment
67.	Threatened and Endangered Fish Species	p.4-43 section 20	Within section 20	LH	Need to mention that the Tampa Bay/ Port Charlotte area while not designated as critical habitat, was part of the historic range for Gulf sturgeon. Based on USFWS (Paruka, Perscom 2008)information an occasional fish has been captured in the area as recent as 3 years ago. Reference: Paruka , Frank. pers. comm may 2008. US FWS Gulf Sturgeon Recovery Team . Panama City Field Office
68.	4.7.2	4-49	21	CH	'Predicted impacts at Class II receptors are above the SILs for SO2 and PM10.' So how do you resolve or deal with this situation? Use mitigations?
69.	4.2.1.10 Operations Impacts	4-54	37	JES	1° C above ambient?
70.	4.2.1.11 Operations Impacts	4-56	34	JES	1° C above ambient?
71.	4.2.1.12 Appendix F			GSB	While the analysis of SEAMAP plankton data was good, there is little analysis of EFH impacts from installation anywhere in Chapter 4 and it is completely ignored in the EFH Assessment in Appendix F (other than a box in a matrix table). The brief EFH Assessment needs to be referenced in Chapter 4 as well as Chapter 3. The subject of EFH assessment and consultation should be specifically addressed somewhere in the text of the EIS and the four required specific requirements of an EFH Assessment identified; (1) description of the proposed action; (2) description of the action agency's approach to protection of EFH and proposed mitigation, if applicable; (3) description of EFH and managed and associated species in the vicinity of the proposed action; and (4) analysis of the effects of the proposed and cumulative actions on EFH, the managed species, and associated species. The mitigation discussion in Appendix F, page 1-7 make no mention of installation impacts and the long-term impact to 2,137 acres hard bottom

67. Text revised per comment.

68. Impacts above SILs warranted further investigation to ensure compliance with ambient standards. Results of that further investigation are shown in Table 4.7-12 and indicate compliance with applicable standards and increments by a comfortable margin. No mitigation is warranted.

69. Correct. The discharged water would cool from 10°C above ambient water temperature to 1°C above ambient water temperature. Text revised to clarify.

70. Correct. The discharged water would cool from 10°C above ambient water temperature to 1°C above ambient water temperature. Text revised to clarify.

71. Text revised per comment.

	Section	Page	Line	Reviewer (initials)	Comment
72.	Operations Impacts: Seafloor disturbance	4-79	28 through 30	GEdR	The Draft EIS states, "Because the Southern Port Site and the offshore portions of the Alternative Route were not surveyed, the acreage of each habitat type disturbed under this alternative is unknown." Should this alternative be chosen for the port, additional surveys and analyses would be required to evaluate the potential impacts from this choice. A supplemental EIS may be required.
73.	4.3 Cultural Resources 4.3.1 Construction Impacts 4.3.1.1 Offshore	4-80	Whole Section	GEdR	It is essential that the applicant have an anchoring plan and that those individuals that oversee the project be aware of the areas to be avoided by bottom disturbing activities. An "undiscovered resource plan" must also be in place before initiating operations.
74.	4.3 Cultural Resources 4.3.1 Construction Impacts 4.3.1.1 Offshore	4-80 & 4-81	Whole Section	GEdR	The applicant should be required to adhere to the MMS' NTL No. 2005-G07, Archaeological Resource Surveys and Reports (effective date: 1 July 2005).
75.	4.4 Geological Resources	4-83	Whole Section	GEdR	The applicant should be required to adhere to the MMS' NTL No. 2008-G05, Shallow Hazards Program (effective date: 1 May 2008).
76.	5 4.4.1.1 Port Instal-lation			GEdR	Please modify the section to require the applicant to adhere to the provisions found in NTL 2007-G014, Pipeline Risers Subject to the Platform Verification Program. This is an integral part of the overall safety of the facility.

72. If the Southern Site and Route were used then additional surveys and studies would be required as necessary to evaluate existing conditions and potential impacts associated with implementation of the project along that alignment.

73. The Applicant has submitted an anchoring plan with buffer zone, and the Unanticipated Discovery Plan is included in Appendix I.

74. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

75. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

76. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

	Section	Page	Line	Reviewer (initials)	Comment
77.	4.4.1.2 Offshore Pipeline Instal-lation	4-84	Whole Section	GEdR	The applicant should be required to submit an "as built" survey for the pipelines associated with the project. This allows the permitting agencies to know the precise location of the pipelines and if mitigations were adhered to during construction and installation.
78.	4.4.2 Oper-ations Impacts	4-85	Whole Section	GEdR	The US Coast Guard should require the applicant to consider the use of midline buoys for the final design on the port's mooring system. The buoys use would reduce the amount of anchor chain sweep thus minimizing the environmental impacts to the seafloor and biota in the area.
79.	4.4.3 Decommis-sioning	4-86	26 & 27	GEdR	The Draft EIS states, "The underground decommissioning would consist of the removal of any hydrocarbons in the pipe through flushing, filling the pipe with treated freshwater, and capping the ends of the pipe." The applicant must be required to also bury/cover the ends of the pipeline when abandoning the pipelines "in place" to help preclude future interference with other uses of the OCS lands.
80.	4.4.3 Decommis-sioning	4-86	Whole Section	GEdR	The applicant must be required to adhere to the MMS' latest NTL for Structure Removal Operations - NTL No. 2004-G06. In addition, site clearance verification procedures would be required after decommission operations had been done.
81.	4.5.1 Con-struction Impacts	4-87	31	GEdR	Please avoid the term "construction ROW" in the text. A better term may be "construction corridor." The Draft EIS states that the "…construction ROW for the offshore portion for the pipeline is 3,000 feet wide…." In actuality, this is the area affected by the construction and installation operations. A pipeline right-of-way is limited to 200 ft in width – 100 ft either side of the centerline of the pipeline route. As written, the text can be confusing to the readers.
82.	4.7	4-92	18	CH	Air quality impacts associated with the Project are expected to be minor – Very good.
83.	4.7	4-92	6	CH	Construction-related activities/emissions for the pipeline/station facilities do not require Federal regulations. Remark: MMS does regulate construction –related emission activities.
84.	4.7.2	4-99	2	CH	Dispersion Modeling - Provide the version for CALPUFF dispersion model.

77. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. An as built survey is recommended in Section 4.11.6.

78. This mitigation is included in Section 4.11.

79. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. Given that decommissioning would occur 25 years from now, it seems reasonable to expect that technologies for decommissioning and removal, as well as the understanding of impacts on the marine ecosystem, might be different from current conditions. This issue will be addressed at the time of decommission (estimated at 2034), at which time the owner would be required to adhere to all applicable and appropriate requirements. The owner would consult with the appropriate Federal agencies at the time and submit a decommissioning plan to the Secretary for approval.

80. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

81. Text changed throughout the document.

82. Comment noted.

83. Wording modified to clarify the discussion. The intent was to discuss permit requirements and to distinguish between temporary, mobile emission sources and permanent, stationary sources.

84. Versions for CALPUFF and CALMET added.

	Section	Page	Line	Reviewer (initials)	Comment
85.	4.7.2	4-99	2	CH	Mesoscale datasets – Provide the source of the datasets such as where to download these datasets or provide the website for these datasets (MM4 and MM5)
86.	Mitigation and monitoring	4-106	Mitigation and monitoring	LH	Discuss mitigation planning, monitoring , maintenance for wetland crossings for pipelines. Also may want to add table comparing the NWI classifications affected by the proposed and alternative pipeline corridors.
87.	4.11 Mitigation and Minimiza-tion Measures and Mon-itoring	4-132	Whole Section	GEdR	It is essential that the US Coast Guard and MARAD include all mitigation, minimizing measures, and monitoring requirements in the Record of Decision and in the license, should it be granted. The US Coast Guard should make periodic checks on the licensee and its contractors to ensure that the mitigation, minimizing measures and monitoring requirements are being conducted in manner prescribed by the license.
88.	4.11	4-132		ALJ	Quite a few mitigations have been proposed. However, there are some parts of the proposed action that would occur in federal waters that MMS
89.	4.11.2 The Maritime Admin-istration/ USCG-Recom-mended Mitigation Measures	4-142	Whole Section	GEdR	It is essential that the US Coast Guard and MARAD require the licensee to perform an "as built" survey of the pipelines. This requirement should be included in the mitigation section.
90.	4.11.4 NOAA/ NMFS Recommend ations	4-146	Whole Section	GEdR	It is essential that the US Coast Guard and MARAD require the licensee to perform an "as built" survey of the pipelines. This requirement should be included in the mitigation section.

85. These data sets are proprietary and are not available publicly. The datasets can be obtained from the Applicant.

86. Mitigation, monitoring, and BMPs are discussed in Section 4.11. The Applicant would be required to follow FERC Certificate requirements including wetland crossing techniques.

87. Comment noted.

88. Comment submitted was incomplete.

89. An as built survey of project pipelines is recommended in Section 4.11.6.

90. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

	Section	Page	Line	Reviewer (initials)	Comment
91.	5.3.4.1 Deepwater Port	5-6	9 through 11	GEdR	The Draft EIS states, "Construction on the Northeast Gateway Deepwater Port in Massachusetts Bay was initiated in spring 2007 and is anticipated to be operational in the near future." It is my understanding that the NE Gateway DW Port is about to receive its initial cargo delivery. Please revise the text for the Final EIS to recognize the fact that there are now two DW ports that are operational (including the Gulf Gateway DW Port).
92.	4 5.5.1 Marine Safety Standards	5-13	Whole Section	GEdR	The MMS respectfully requests the opportunity to review the proposed port's operations manual before the US Coast Guard makes its final determination on the adequacy of the document.
93.	5.5.2 Naviga-tional Safety Measures	5-15	Add a Section	GEdR	It is appropriate to include another section that discusses the No Anchoring Activity Zone. Though it is likely to be encompassed by the ATBA, a discussion should be provided for the readers. The no anchoring mandate would protect the subsea infrastructure of the proposed deepwater port.
94.	5.6.1 Offshore Pipeline Safety Standards	5-17	Whole Section	GEdR	The applicant should be required to adhere to the MMS' NTL No. 2007-G14, Pipeline Risers Subject to the Platform Verification Program, (effective date: May 7, 2007).
95.	5.6.1 Offshore Pipeline Safety Standards	5-17	22 & 23	GEdR	The MMS would like to have the opportunity to "witness" the hydrostatic testing of the pipelines associated with the proposed port.
96.	5.6.1 Offshore Pipeline Safety Standards	5-17 & 5-18	Whole Section	GEdR	The US Coast Guard and the MMS should reserve the right to conduct announced as well as unannounced inspections on the port's pipelines to ensure the licensee is properly adhering to all of the appropriate safety, maintenance, and operational standards.

91. Text revised per comment.

92. Comment noted.

93. This is discussed in Section 2.3.10, under *Surface Requirements*. No change to text.

94. The Maritime Administration and USCG would require the Applicant to follow the Best Management Practices for operating in the offshore environment. See section 4.11.6 for discussion of MMS recommended mitigation and monitoring measures.

95. Comment noted.

96. Inspection details will be outlined in the Operations Manual if the Project is granted a license.

	Section	Page	Line	Reviewer (initials)	Comment
97.	6.2.1 LNG Projects	6-3	Table 6.2-1	GEdR	This table will need to be undated for the Final EIS.
98.	6.2.4 Oil and Gas Leasing/ Mineral Leasing	6-5	Whole Section	GEdR	Gulf of Mexico Sale 224 was held on 19 March 2008 in New Orleans, LA. The MMS received 58 bids from 6 companies on 36 tracts resulting in $ 64,713,213 in high bids. Also, note that the MMS prepared and disseminated to the public the Gulf of Mexico OCS Oil and Gas Lease Sale 224: Eastern Planning Area, Final Supplemental Environmental Impact Statement (EIS) (MMS, October 2007). Please revise the text for the Final EIS to reflect these changes.
99.	Table 6.3-1. Cumula-tive Impacts on Resources	6-11	Navigation and Transporta tion	GEdR	In the Known Future Actions column of the table, MPEH should also be added to this segment. Both MPEH and BOET should be recognized as known future actions and for their effects on navigation and transportation.
100.	Threat-ened and Endanger-ed Species	6-13	15 & 16	GEdR	By definition in the Endangered Species Act, as amended, harassment as well as "… injury or death…" constitute a "take."
101.	Marine Mammals	6-14	24	GEdR	Please insert the word "operators" in to the following sentence. It should read, "…solid debris from vessels by lessees and operators (emphasis added) by the MMS …."
102.	Sea Turtles	6-15	1 & 2	GEdR	By definition in the Endangered Species Act, as amended, harassment as well as "… injury or death…" constitute a "take."
103.	Sea Turtles	6-15	11	GEdR	Please insert the word "operators" in to the following sentence. It should read, "…solid debris from vessels by lessees and operators (emphasis added) by the MMS …."

97. Table updated as of January 2009.

98. Text revised per comment.

99. MPEH and BOET are considered in the cumulative impacts section, and are included in Table 6.2-1. However, because of their relation to the Port Dolphin as outlined in Figure 6.1-1, no cumulative impacts to transportation and navigation are anticipated.

100. Text revised per comment.

101. Text revised per comment.

102. Text revised per comment.

103. Text revised per comment.

	Section	Page	Line	Reviewer (initials)	Comment
104.	Non-threatened and Non-endanger-ed Marine Mammal.	6-16	25 & 26	GEdR	Harassment as well as "… injury or death …" constitutes a "take" under the MMPA.
105.	Non-threatened and Non-endanger-ed Coastal and Marine Birds	6-16	Whole Section	GEdR	This is an inadequate discussion on the potential cumulative effects on nonthreatened and nonendangered coastal and marine birds. The current discussion in the Draft EIS is one sentence long.
106.	6.4.3 Cultural Resources Offshore Com-ponents	6-25	24 through 26	GEdR	The Draft EIS states, "Avoid by a distance of 250 feet the margins of buried relict fluvial channels in the Port's buoy mooring area in Blocks PB545 and PB589 …." It appears that the mooring system may also impinge into PB 590. This mitigation measure should include the additional block.
107.	6.4.4 Geo-logical Resources	6-26	8 & 9	GEdR	This whole section is one sentence. More discussion is warranted on the potential effects of this topic.
108.	6.4.7 Air Quality	6-26	28 & 29	GEdR	The Draft EIS states, "Construction of the interconnection station would also cause major, short-term, localized impacts on air quality." Since the construction would cause major but short-term, localized effects, more discussion is warranted on the mitigation measures to reduce the potential adverse impacts.

104. Comment noted.

105. The discussion of cumulative impacts on marine and coastal birds has been expanded.

106. Text changed per comment.

107. This discussion of cumulative impacts on geological resources has been expanded.

108. Such impacts are unavoidable, given that in the construction phase there is no "buffer zone" separating emission sources and ambient air. Mitigation measures are discussed in Section 4.11.

	Section	Page	Line	Reviewer (initials)	Comment
109.	6.5 Irrevers-ible and Irretriev-able Commit-ment of Resources	6-27	30 & 31	GEdR	The Draft EIS states, "…building materials for new structures, platforms, and other equipment." The word "platforms" needs to be deleted in this sentence. I could understand lumping the buoys and pipelines under the "new structures" title, but no "platforms" are proposed with this port. This can be confusing to the public because people in the Gulf states think of offshore oil and gas structure as platforms.

109. Text revised per comment.

Re: Review of Draft Environmental Impact Statement for the Port Dolphin LNG Deepwater Port License Application (U.S. Coast Guard Docket No. USCG-2007-28532)

Dear Mr. Prescott,

The U.S. Department of Interior has reviewed the U.S. Coast Guard's (USCG) and Maritime Administration's (MARAD) April 2008 Draft Environmental Impact Statement (DEIS) on the Port Dolphin LLC Deepwater Port License Application. Comments were received from the Minerals Management Service and they are presented in the attached comment matrix form.

We thank you for the opportunity to comment. For any questions about the comments you may contact Mr. Dirk Herkhof of the Minerals Management Service at 703-787-1735. I can be reached at 404-331-4524.

Sincerely,

Gregory Hogue
Regional Environmental Officer

Comments in this comment response matrix have been responded to as part of the document provided by Mr. Jarvis Abbott, also with DOI MMS. Please see that document for comments and responses.

Comment Matrix for Review of Port Dolphin Draft EIS

	Section	Page	Line	Reviewer (initials)	Comment
1.	General Comment			GEdR	This Draft EIS review concentrated on the offshore aspects of the proposed Port Dolphin deepwater port project.
2.	Executive Summary	ES-7	21-22	GEdR	The Draft EIS states, "Benthic communities would be expected to recover quickly by recolonization from surrounding communities of similar organisms." This is only partially true. Benthic communities will be adversely affected by the sweep of the mooring systems for the two buoys and the flexible riser. Recolonization is not likely to occur in these areas because of the constant disturbance of the sea bottom.
3.	Executive Summary	ES-10	37-40	GEdR	Please include monitoring requirements along with the mitigation requirements that the applicant must perform to comply with the license.
4.	Executive Summary	ES-11	11-13	GEdR	The MMS wants to have the opportunity to participate in the environmental monitoring program developed in consultation with NMFS. The program would include preconstruction/baseline monitoring and operational monitoring aimed at identifying potential effects and developing procedures to minimize adverse impacts. Likewise, the MMS wants to receive and review the data collected from the program's studies and to review the subsequent reports.
5.	Executive Summary	ES-11	29-33	GEdR	Please include "ramping up" of machinery as a mitigative measure for noise abatement. This may give time for biota to leave or avoid the area adversely affected by noise from construction, operation, and decommissioning activities.

2

	Section	Page	Line	Reviewer (initials)	Comment
6.	Executive Summary	ES-9 and ES-17	ES-9: 42-43 ES-17: 14-15	GEdR	There is an inconsistency in the Draft EIS. At page ES-9, the document states, "An Independent Risk Assessment for the Project estimated the maximum thermal radiation distance to be 1,935 m (1.2 mi)", while at page ES-17, the Draft EIS states, "An Independent Risk Assessment for the Project estimated the maximum thermal radiation distance to be 7,330 m (4.6 mi)." This inconsistency needs to be resolved and the text appropriately modified.
7.	1.2.1 Increasing Demand for Natural Gas	1-6	17-18	GEdR	The Draft EIS states, "Lower 48 states offshore natural gas production is projected to decrease." From the Gulf of Mexico perspective, it is true that shallow water gas production has declined recently. However, several large deepwater gas projects such as the Independence Hub have begun production. These projects will offset some of the decline in the Gulf's shallow water natural gas production. The MMS is also providing incentives to develop shallow water, deep gas prospects that will assist in increasing gas production from the Region.
8.	Criterion 4, Avoidance of Ocean Dredged Material Disposal Sites.	2-17	11-12	GEdR	The Draft EIS states, "Siting a project in an identified dredged material disposal site would be difficult, and likely would not be approved by MMS." Please change the reference from the MMS in this sentence to the Corps of Engineers (COE) in coordination with the US EPA. Permits for the ocean dumping of dredged materials are issued by the COE subject to the US EPA approval (Marine Protection, Research and Sanctuaries Act, Section 103).
9.	2.1.2.1 Energy Source Alter-natives	2-27 through 2-29	Whole Section	GEdR	There is no discussion on the use of ocean currents as an energy source alterative. We suggest that you add a section to the Final EIS that discusses this alterative. Note in the "new section" that the MMS has the responsibility for Alternate Energy Uses on the OCS (Energy Policy Act of 2005 – Public Law 1098-58).

3

	Section	Page	Line	Reviewer (initials)	Comment
10.	Various Sections	Various Pages	Various Lines	GEdR	There are inconsistencies in the Draft EIS regarding the MMS blocks that would be affected by the proposed port's location. Please correct the location description throughout the document. Here are examples. In the Abstract, the Draft EIS states, "**Abstract:** Port Dolphin Energy LLC, proposes to own, construct, and operate a deepwater port, named Port Dolphin, in the Federal waters of the Outer Continental Shelf in lease blocks designated by the Minerals Management Service as St. Petersburg (PB) blocks: PB545, PB589, and PB590." From the maps/diagrams on various pages, it appears that the port will affect PB 545, PB 589, and PB 590. In the Description of the Proposed Action (page ES-4), the Draft EIS states, "The Port would be located in areas designated by the U.S. Department of the Interior (DOI) Minerals Management Service (MMS) as Lease Blocks St. Petersburg (PB) 546 and PB589." In the Overview (page 2-30), the Draft EIS states, "The Applicant proposes to construct, own, and operate a deepwater port, named Port Dolphin, in the Federal waters of the OCS in St. Petersburg blocks PB545 and PB589, …" In the Lease Blocks and Overall Site Plan (page 2-34), the Draft EIS states, "The Port unloading buoys would be in MMS lease blocks PB545, PB546, and PB589." Table 2.3-1, Proposed Action Lease Block Information Description OCS Area OCS Lease Blocks, shows the following locations: North Unloading Buoy St. Petersburg 589 South Unloading Buoy St. Petersburg 545 and 546

4

	Section	Page	Line	Reviewer (initials)	Comment
11.	Offshore Precon-struction Activities	2-53	30-40	GEdR	• The MMS would like to be involved in the following activities: • Review of the applicant's construction plan • Review of the geotechnical and hazard surveys • Evaluation of FMV and clearance of the project footprint (including project pipelines); issuance of the MMS Segment Number, clearance letter, or other evidence that the project does not conflict with planned or existing OCSLA regulated facilities or activities. • Review of detailed construction procedures • Review of the pre-lay survey of pipeline routes and review of the anchor placement plans
12.	Offshore Con-struction Sequence	2-54	Whole Section	GEdR	The USCG and MARAD must require the applicant to conduct post-pipeline lay surveys – commonly called "as-built" surveys. This allows the regulating agencies to know the exact locations of the pipelines at the time of their construction and installation. This is also essential to ensure adherence to the mandated mitigative measures during the pipelines' installations. This must be a condition for the license. See the MMS' NTL No. 98-09, *Proposed and As-Built Pipeline Location Data* (effective date: August 10, 1998).
13.	Gulf of Mexico: Water	3-6	18	GEdR	Please change the term "dead zones" to "anoxic zones." This is in keeping with the scientific terms of low oxygen concentrations in the seawater. You should then explain the term anoxic in the document.
14.	3.3 Cultural Resources 3.3.1 Def-initions of a Resource	3-65	3-4	GEdR	The correct citing for the MMS' NTL regarding the list of blocks requiring archaeological surveys is *Revision to the List of OCS Lease Blocks, Requiring Archaeological Resource Surveys,* NTL No. 2006-G07 (not NTL No. 2007-G01 as stated in the Draft EIS). The MMS' latest NTL regarding the *Shallow Hazards Program* is NTL No. 2008-G05. Please change the text in all locations where this reference occurs in the Draft EIS.

5

	Section	Page	Line	Reviewer (initials)	Comment
15.	3.4.3.1 Southern Site and Route Geology	3-80	Whole Section	GEdR	If the Southern Site and Route is selected for installation, additional shallow hazard surveys and analyses must be required of the applicant. This alternate pipeline routing is not adequately assessed or evaluated in the Draft EIS.
16.	Sediments	3-81	11-13	GEdR	The Draft EIS suggest that there may be strong currents along the proposed southern pipeline route evidenced by sand waves or ridges. The USCG must ensure that if this alternative is selected, the pipelines will be monitored for scour. The concern is that the scour could lead to spanning of the pipeline. Remedial actions would be required of the licensee.
17.	Geologic Hazards	3-81	30-32	GEdR	The MMS is concerned that areas to the south of the proposed pipeline route (and the alternative southern route) on the 14-inch pipeline segment could be candidate sites for future mining of sandy sediments. The location of the pipeline in these areas could interfere with potential mining operations.
18.	3.5 Marine Areas and Land Use: 3.5.1 Definition of the Resource	3-87	This Section	GEdR	The MMS provides guidance to all OCS Right-of-Way applicants in its NTL No. 2007-G20, *Coastal Zone Management Program Requirements for OCS Right-of-way Pipeline Applications* (effective date: May 25, 2007). The applicant should be required to adhere to this NTL.

6

	Section	Page	Line	Reviewer (initials)	Comment
19.	3.5 Marine Areas and Land Use: 3.5.1 Definition of the Resource	3-87	This Section	GEdR	The MMS has the responsibility for Alternate Energy Uses on the OCS (Energy Policy Act of 2005 – Public Law 1098-58). This mandated responsibility should be addressed in this section as well.
20.	3.5.2 Marine Areas	3-88	9	GEdR	The MMS is also responsibility for Alternate Energy Uses on the OCS (Energy Policy Act of 2005 – Public Law 1098-58).
21.	3.5.2.1 Lease Blocks	3-88	This Section	GEdR	It is worthy to note that there is a moratorium on certain activities in a portion of the Eastern Planning Area of the Gulf of Mexico. The Gulf of Mexico Energy Security Act (GOMESA) established a moratorium (until June 30, 2022) on leasing, pre-leasing, and other activities in defined areas within the eastern Gulf.
22.	3.5.3 Coastal Zone Manage-ment Areas	3-89	This Section	GEdR	The MMS provides guidance to all OCS Right-of-Way applicants in its NTL No. 2007-G20, *Coastal Zone Management Program Requirements for OCS Right-of-way Pipeline Applications* (effective date: May 25, 2007). The applicant should be required to adhere to this NTL.
23.	4.1 Water Resources	4-4	1	GEdR	Please add the following words, "gauging and" (it appears in italics in the following sentence) to the narrative in the EIS, "…the discharges of water from *gauging and* hydrostatic testing of the pipelines; …."
24.	4.1 Water Resources	4-4	4	GEdR	The Draft EIS states, "The offshore portion of the Project would not degrade marine water quality …." This is not true. During construction, the marine water quality would be adversely affected from the temporary re-suspension of sediments and the resulting increases in turbidity in the water column. Please change the text.

7

	Section	Page	Line	Reviewer (initials)	Comment
25.	4.1.1 Con-struction Impacts	4-4	14	GEdR	Please add the following word and punctuation, ", gauging," (it appears in italics in the following sentence) to the narrative in the EIS, "Installation, *gauging*, and hydrostatic testing of the pipeline…."
26.	Proposed Pipeline Route Location	4-5	36-37	GEdR	The Draft EIS states, "Sediment suspension modeling for mooring line sweep, which would occur routinely during operations, was not been completed by the Applicant." This discussion seems to be out of place. The text is discussing the pipeline impacts. However, since this seafloor disturbance will occur throughout the life of the project, the US Coast Guard should require appropriate modeling of the mooring line sweeps.
27.	4.1.3 Decommis-sioning 2 4.1.3.1 Offshore Impacts	4-12	Whole Section	GEdR	The US Coast Guard should require all equipment imbedded in the seafloor to be severed at least 5 meters below the mud line and removed. The MMS has specific requirements to abandon pipelines. The applicant must be required to comply with them. For example, the ends of the abandoned pipeline must be recovered to preclude interference with futures uses on the OCS. The Draft EIS did not include this requirement in the text. We suggest that you revise the text in the EIS to include this requirement.

8

	Section	Page	Line	Reviewer (initials)	Comment
28.	4.2.1.1 General Impacts Dis-cussion Con-struction Impacts Seafloor Dis-turbance	4-13	39-40	GEdR	The Draft EIS states, "…by judicious anchor placement during the first pass offers the greatest potential for further reduction of live bottom impact area." The US Coast Guard should require the applicant to adhere to an anchor placement plan that minimizes the adverse effects to the live bottom areas.
29.	Vessel Traffic	4-16	Whole Section	GEdR	It is appropriate to require the applicant to adhere to the MMS' NTL No. 2007-G04, *Vessel Strike Avoidance and Injured/Dead Protected Species Reporting*. The text in the EIS should be revised to reflect this requirement.
30.	Noise	4-17	Whole Section	GEdR	Noise will also emanate from helicopters that may be used during the construction and operational life of the project. There should be a discussion of this noise source in the EIS.
31.	Oper-ations Impacts: Seafloor dis-turbance	4-18	42-44	GEdR	There is an inconsistency in the Draft EIS. In this section, the Draft EIS states, "Modeling results indicate that continuous anchor sweep would resuspend and deposit the sediments in the immediate vicinity of the chains and that cumulative accumulation of deposited sediment would not occur." However, on page 4-5 the Draft EIS states, "Sediment suspension modeling for mooring line sweep, which would occur routinely during operations, was not been completed by the Applicant." Note also that in line 37 the word "was" should be "has". Please clarify whether you have completed modeling of the anchor sweep area.

9

	Section	Page	Line	Reviewer (initials)	Comment
32.	Marine Debris	4-21	29	GEdR	The MMS has issued NTL No. 2007-G03, *Marine Trash and Debris Awareness and Elimination* that supersedes NTL 2003-G11. Please revise the text as appropriate.
33.	Decommis-sioning	4-22	11-12	GEdR	The MMS has very specific requirement to abandon pipelines in place during decommissioning operations. For example, pipelines must be flushed and filled. A right-of-way grantee cannot just seal and abandon the pipeline in place, as stated in the Draft EIS. See the applicable MMS Operating Regulations at 30 CFR 250.1006.
34.	Hydro-static Pipeline Integrity Testing	4-24 and 4-25	Whole Section	GEdR	The water use here does not take into consideration the "gauging and cleaning run" prior to the hydrostatic pipeline integrity testing. Revise the section accordingly.
35.	Vessel Traffic	4-25 through 4-27	Whole Section	GEdR	It is appropriate to require the applicant to adhere to the MMS' NTL No. 2007-G04, *Vessel Strike Avoidance and Injured/Dead Protected Species Reporting*. The text in this section of the EIS should be revised to reflect this requirement.
36.	Oper-ations Impacts: Seafloor dis-turbance	4-79	28-30	GEdR	The Draft EIS states, "Because the Southern Port Site and the offshore portions of the Alternative Route were not surveyed, the acreage of each habitat type disturbed under this alternative is unknown." Should this alternative be chosen for the port, additional surveys and analyses would be required to evaluate the potential impacts from this choice. This may necessitate the preparation of a supplemental EIS.

10

	Section	Page	Line	Reviewer (initials)	Comment
37.	4.3 Cultural Resources 4.3.1 Construction Impacts 4.3.1.1 Offshore	4-80	Whole Section	GEdR	It is essential that the applicant have an anchoring plan and that those individuals that oversee the project be aware of the areas to be avoided by bottom disturbing activities. An "undiscovered resource plan" must also be in place before initiating operations.
38.	4.3 Cultural Resources 4.3.1 Construction Impacts 4.3.1.1 Offshore	4-80 and 4-81	Whole Section	GEdR	The applicant should be required to adhere to the MMS' NTL No. 2005-G07, *Archaeological Resource Surveys and Reports* (effective date: 1 July 2005).
39.	4.4 Geological Resources	4-83	Whole Section	GEdR	The applicant should be required to adhere to the MMS' NTL No. 2008-G05, *Shallow Hazards Program* (effective date: 1 May 2008).
40.	5 4.4.1.1 Port Installation			GEdR	Please modify the section to require the applicant to adhere to the provisions found in NTL 2007-G014, *Pipeline Risers Subject to the Platform Verification Program*. This is an integral part of the overall safety of the facility.

11

	Section	Page	Line	Reviewer (initials)	Comment
41.	4.4.1.2 Offshore Pipeline Instal-lation	4-84	Whole Section	GEdR	The applicant should be required to submit an "as built" survey for the pipelines associated with the project. This allows the permitting agencies to know the precise location of the pipelines and if mitigations were adhered to during construction and installation.
42.	4.4.2 Oper-ations Impacts	4-85	Whole Section	GEdR	The US Coast Guard should require the applicant to consider the use of midline buoys for the final design of the port's mooring system. The buoys use would reduce the amount of anchor chain sweep thus minimizing the environmental impacts to the seafloor and biota in the area.
43.	4.4.3 Decommis-sioning	4-86	26-27	GEdR	The Draft EIS states, "The underground decommissioning would consist of the removal of any hydrocarbons in the pipe through flushing, filling the pipe with treated freshwater, and capping the ends of the pipe." The applicant must be required to also bury/cover the ends of the pipeline when abandoning the pipelines "in place" to help preclude future interference with other uses of the OCS lands.
44.	4.4.3 Decommis-sioning	4-86	Whole Section	GEdR	The applicant must be required to adhere to the MMS' latest NTL for *Structure Removal Operations* - NTL No. 2004-G06. In addition, site clearance verification procedures would be required after decommission operations had been done.
45.	4.5.1 Con-struction Impacts	4-87	31	GEdR	Please avoid the term "construction ROW" in the text. A better term may be "construction corridor." The Draft EIS states that the "…construction ROW for the offshore portion for the pipeline is 3,000 feet wide…." In actuality, this is the area affected by the construction and installation operations. A pipeline right-of-way is limited to 200 ft in width – 100 ft either side of the centerline of the pipeline route. As written, the text can be confusing to the readers.

12

	Section	Page	Line	Reviewer (initials)	Comment
46.	4.11 Mitigation and Minimiza-tion Measures and Mon-itoring	4-132	Whole Section	GEdR	It is essential that the US Coast Guard and MARAD include all mitigation, minimizing measures, and monitoring requirements in the Record of Decision and in the license. The US Coast Guard should make periodic checks on the licensee and its contractors to ensure that the mitigation, minimizing measures and monitoring requirements are conducted in a manner prescribed by the license.
47.	4.11.2 The Maritime Admin-istration/ USCG-Recom-mended Mitigation Measures	4-142	Whole Section	GEdR	It is essential that the US Coast Guard and MARAD require the licensee to perform an "as built" survey of the pipelines. This requirement should be included in the mitigation section.
48.	4.11.4 NOAA/ NMFS Recomme ndations	4-146	Whole Section	GEdR	It is essential that the US Coast Guard and MARAD require the licensee to perform an "as built" survey of the pipelines. This requirement should be included in the mitigation section.
49.	5.3.4.1 Deepwater Port	5-6	9-11	GEdR	The Draft EIS states, "Construction on the Northeast Gateway Deepwater Port in Massachusetts Bay was initiated in spring 2007 and is anticipated to be operational in the near future." It is my understanding that the NE Gateway DW Port is about to receive its initial cargo delivery. Please revise the text for the Final EIS to recognize the fact that there are now two DW ports that are operational (including the Gulf Gateway DW Port).

13

	Section	Page	Line	Reviewer (initials)	Comment
50.	4 5.5.1 Marine Safety Standards	5-13	Whole Section	GEdR	The MMS requests the opportunity to review the proposed port's operations manual before the US Coast Guard makes its final determination on the adequacy of the document.
51.	5.5.2 Naviga-tional Safety Measures	5-15	Add a Section	GEdR	It is appropriate to include another section that discusses the No Anchoring Activity Zone. Though it is likely to be encompassed by the ATBA, a discussion should be provided for the readers. The no anchoring mandate would protect the subsea infrastructure of the proposed deepwater port.
52.	5.6.1 Offshore Pipeline Safety Standards	5-17	Whole Section	GEdR	The applicant should be required to adhere to the MMS' NTL No. 2007-G14, *Pipeline Risers Subject to the Platform Verification Program,* (effective date: May 7, 2007).
53.	5.6.1 Offshore Pipeline Safety Standards	5-17	22-23	GEdR	The MMS would like to have the opportunity to "witness" the hydrostatic testing of the pipelines associated with the proposed port.
54.	5.6.1 Offshore Pipeline Safety Standards	5-17 and 5-18	Whole Section	GEdR	The US Coast Guard and the MMS should reserve the right to conduct announced as well as unannounced inspections on the port's pipelines to ensure the licensee is properly adhering to all of the appropriate safety, maintenance, and operational standards.
55.	6.2.1 LNG Projects	6-3	Table 6.2-1	GEdR	This table will need to be undated for the Final EIS.

	Section	Page	Line	Reviewer (initials)	Comment
56.	6.2.4 Oil and Gas Leasing/ Mineral Leasing	6-5	Whole Section	GEdR	Gulf of Mexico Sale 224 was held on 19 March 2008 in New Orleans, LA. The MMS received 58 bids from 6 companies on 36 tracts resulting in $ 64,713,213 in high bids. Also, note that the MMS prepared and disseminated to the public the *Gulf of Mexico OCS Oil and Gas Lease Sale 224: Eastern Planning Area, Final Supplemental Environmental Impact Statement (EIS)* (MMS, October 2007). Please revise the text for the Final EIS to reflect these changes.
57.	Table 6.3-1. Cumula-tive Impacts on Resources	6-11	Navigation and Transporta tion	GEdR	In the Known Future Actions column of the table, MPEH should also be added to this segment. Both MPEH and BOET should be recognized as known future actions and for their effects on navigation and transportation.

May 30, 2008

Commander Mark A. Prescott
Chief, Deepwater Ports Standards Division
U.S. Coast Guard
2100 Second Street, SW
Washington, DC 20593-0001

Dear Commander Prescott:

Thank you for the opportunity to comment on the Draft Environmental Impact Statement for Port Dolphin, docket number USCG-2006-28532.

The Gulf of Mexico, Tampa Bay and the Manatee County coastal areas are environmentally invaluable and economically vital areas of our community. I am concerned that Port Dolphin may not adequately take into account the community, environmental and security concerns. I have attached a number of documents that you may find useful and strongly encourage careful consideration of these concerns in the preparation of the final environmental impact statement, including a full range of alternatives. -1

From my cursory review, the dangers of Liquefied Natural Gas include a sobering list of potential environmental impacts. The regasification process of Liquid Natural Gas can impact water temperatures in the vicinity of the terminal, causing adverse impacts for sensitive fish and sea turtle populations. -2

Security must also be a key concern in any energy infrastructure project, particularly an underwater natural gas terminal. A natural gas spill on water would result in a widening pool of liquefied gas spreading across the water. If ignited, the danger and environmental impacts would be catastrophic. Of particular concern is the volatile nature of natural gas, which would evaporate and cause flammable vapor clouds. -3

Please feel free to contact my office at 202-225-3376 for further discussion.

Sincerely,

Kathy Castor

KATHY CASTOR
United States Representative
Florida
District 11

1. Potential impacts to the community are discussed in Section 4.9, socioeconomic impacts. The material provided was considered in evaluations of impacts.

2. Potential impacts from the regasification process are discussed throughout Section 4 of the Final EIS. Impacts from discharge of water used to cool electrical generating equipment onboard the SRVs is discussed in Sections 4.1 and 4.2 of the Final EIS. The regasification process proposed by the Applicant would not have a water discharge.

3. Section 5 and Independent Risk Assessment (IRA) (Appendix J) of the FEIS describes the major hazards due to LNG spill on water and provides the limits of the hazard zones due to pool fire and vapor dispersion. Phase I IRA consisted of developing accidental and intentional scenarios resulting from an LNG spill and determining impacts to public safety due to identified worst credible scenarios. A Risk Assessment which is the second phase developed the most applicable and effective mitigation measures for all accidental and intentional scenarios identified by the stake holders in Phase I.

Liquefied Natural Gas (LNG) Import Terminals: Siting, Safety, and Regulation

Summary

Liquefied natural gas (LNG) is a hazardous fuel frequently shipped in large tankers to U.S. ports from overseas. While LNG has historically made up a small part of U.S. natural gas supplies, rising gas prices, current price volatility, and the possibility of domestic shortages are sharply increasing LNG demand. To meet this demand, energy companies have proposed building dozens of new LNG import terminals throughout the coastal United States. Many of these terminals would be built onshore near populated areas.

The Federal Energy Regulatory Commission (FERC) grants federal approval for the siting of new onshore LNG facilities under the Natural Gas Act of 1938 and the Energy Policy Act of 2005 (P.L. 109-58). This approval process incorporates minimum safety standards for LNG established by the Department of Transportation. Although LNG has had a record of relative safety for the last 45 years, and no LNG tanker or land-based facility has been attacked by terrorists, proposals for new LNG terminal facilities have generated considerable public concern. Some community groups and governments officials fear that LNG terminals may expose nearby residents to unacceptable hazards, and that these hazards may not be appropriately considered in the federal siting approval process. Ongoing public concern about LNG terminal safety has focused congressional attention on the exclusivity of FERC's LNG siting authority, proposals for a regional LNG siting process, the lack of "remote" siting requirements in FERC regulations, state permitting requirements under the Clean Water Act and the Coastal Zone Management Act, terrorism attractiveness of LNG, and other issues.

Faced with the widely perceived need for greater LNG imports, and persistent public concerns about LNG safety, Congress is debating changes to safety and environmental provisions in federal LNG siting regulation. S. 323 would require LNG terminal developers to identify employees and agents engaged in activities to persuade communities of the benefits of the approval. S. 1174 would require state concurrence of federal siting approval decisions for onshore LNG terminals. H.R. 2042 includes provisions both for state LNG siting concurrence and for developer agent identification. H.R. 1564 would prohibit the construction of LNG terminals employing "a floating storage regasification unit" in estuaries of national significance. S. 1579 seeks to promote improved coordination among Federal, regional, state, and local agencies conducting LNG siting reviews under the Coastal Zone Management Act.

Both industry and government analysts project continued growth in the demand for natural gas — and a decreasing ability for domestic gas producers to meet that demand. Greater LNG imports represent one way to address this growth in demand, along with increased North American gas production, conservation, fuel-switching, and the development of renewable energy sources. If policy makers encourage LNG imports, then the need to foster the other energy options may be diminished — and vice versa. Thus decisions about LNG infrastructure could have consequences for a broader array of natural gas supply policies.

Liquefied Natural Gas (LNG) Import Terminals: Siting, Safety, and Regulation

Introduction

Liquefied natural gas (LNG) historically has played a minor role in U.S. energy markets, but concerns about rising natural gas prices, current price volatility, and the possibility of domestic shortages are sharply increasing demand for LNG imports. To meet this demand, dozens of new onshore and offshore LNG import terminals have been proposed in coastal regions throughout the United States. But LNG, like other fossils, is a hazardous[1] liquid transported and stored in enormous quantities, often near populated areas. Concerns exist about the safety of new LNG import terminals and the federal government's role in addressing LNG safety in the terminal siting process. In addition, various energy policy proposals could impact the need for new LNG terminals by encouraging the development of alternative U.S. energy supplies and promoting conservation.

This report provides an overview of recent industry proposals for new LNG import terminals. The report summarizes LNG hazards and the industry's safety record. It discusses federal laws and regulations related to LNG terminal siting with a focus on the authorities of key federal agencies and safety provisions in the permitting of onshore facilities. The report reviews controversial safety issues in recent LNG siting proceedings, such as safety zones, marine hazards, hazard modeling, and remote siting. The report outlines policy issues related to LNG terminal safety, including the Federal Energy Regulatory Commission's (FERC's) LNG siting authority, regional LNG siting, "remote" siting requirements in federal regulations, state permitting requirements, terrorism, and other issues.

Issues Facing Congress

Proposed LNG terminals will directly affect the safety of communities in a number of states and congressional districts, and will influence energy costs nationwide. Faced with the widely perceived national need for greater LNG imports, and persistent public concerns about LNG hazards, some in Congress are proposing changes to safety provisions in federal LNG siting regulation. S. 323, introduced by Senator Barbara Boxer on January 17, 2007, would require LNG terminal developers to identify employees and agents engaged in activities to persuade communities of the benefits of the approval. S. 1174 introduced by Senators Benjamin Cardin and Barbara Mikulski on April 19, 2007, would require state concurrence of federal siting

[1] 49 C.F.R. § 172.101. *List of Hazardous Materials.* Office of Hazardous Materials Safety, U.S. Department of Transportation.

approval decisions for onshore LNG terminals.[2] H.R. 2042, introduced by Representative Dutch Ruppersberger and three cosponsors on April 25, 2007, includes provisions both for state LNG siting concurrence as in S. 1174 and for developer agent identification as in S. 323 (for onshore LNG terminals only). H.R. 1564, introduced on March 19, 2007 by Representative Timothy Bishop and seven cosponsors, prohibits the construction of LNG terminals employing "a floating storage regasification unit" in estuaries of national significance. S. 1579, introduced by Senator Olympia Snowe and two cosponors on June 7, 2007, would require FERC and the Department of Commerce to report to Congress regarding improved coordination among government agencies reviewing coastal energy activities under the Coastal Zone Management Act. If Congress concludes that new LNG terminals as currently regulated will pose an unacceptable risk to public safety, Congress may consider additional LNG safety-related legislation, or may exercise its oversight authority in other ways to influence LNG terminal siting approval. Alternatively, Congress may consider other changes in U.S. energy policy legislation to reduce the nation's demand for natural gas.

Scope and Limitations

This report focuses broadly on industry and federal activities related to safety in LNG import terminal siting. For a more specific discussion of LNG security, see CRS Report RL32073, *Liquefied Natural Gas (LNG) Infrastructure Security: Background and Issues for Congress*, by Paul W. Parfomak. This report also deals primarily with those parts of LNG terminals which transfer, store, and process LNG prior to injection to natural gas pipelines for transmission off site. For more discussion of general natural gas or pipeline hazards, see CRS Report RL33347, *Pipeline Safety and Security: Federal Programs*, by Paul W. Parfomak. Also, this report discusses mostly onshore facilities and near-shore shipping, since they pose the greatest public hazards. Offshore LNG terminal siting regulations are summarized in the **Appendix**.

Background

What Is LNG and Where Does It Come From?

When natural gas is cooled to temperatures below minus 260° F it condenses into liquefied natural gas, or LNG. As a liquid, natural gas occupies only 1/600th the volume of its gaseous state, so it is stored more effectively in a limited space and is more readily transported. A single tanker ship, for example, can carry huge quantities of LNG — enough to supply a single day's energy needs of over 10 million homes. When LNG is warmed it "regasifies" and can be used for the same purposes as conventional natural gas such as heating, cooking, and power generation.

[2] The Senate rejected an amendment proposed by Sen. Cardin to H.R. 6, the Renewable Fuels, Consumer Protection and Energy Efficiency Act of 2007, that would have required state approval of federal LNG terminal citing decisions.

In 2007, LNG imports to the United States originated in Trinidad and Tobago (57.3%), Egypt (15.3%), Nigeria (12.7%), Algeria (9.9%), Qatar (2.4%), and Equatorial Guinea (2.4%).[3] In recent years, some LNG shipments have also come from Malaysia, Oman, Australia, and other countries.[4] Brunei, Indonesia, Libya, and the United Arab Emirates also export LNG, and may be significant U.S. suppliers in the future. In addition to importing LNG to the lower 48 states, the United States exports Alaskan LNG to Japan.

Expectations for U.S. LNG Import Growth

The United States has used LNG commercially since the 1940s. Initially, LNG facilities stored domestically produced natural gas to supplement pipeline supplies during times of high gas demand. In the 1970s, LNG imports began to supplement domestic production. Primarily because of low domestic gas prices, LNG imports stayed relatively small — accounting for only 1% of total U.S. gas consumption in 2002.[5] In countries with limited domestic gas supplies, however, LNG imports grew dramatically over the same period. Japan, for example, imported 97% of its natural gas supply as LNG in 2002, more than 11 times as much LNG as the United States.[6] South Korea, France, Spain, and Taiwan also became heavy LNG importers.

Natural gas demand has accelerated in the United States over the last several years due to environmental concerns about other energy sources, widespread building of natural gas-fired electricity generation, and low natural gas prices through the 1980s and 1990s. Domestic gas supplies have not kept up with this demand, however, so prices have often become high and volatile. At the same time, international prices for LNG have fallen substantially because of increased supplies and lower production and transportation costs, making LNG more competitive with domestic natural gas.

In 2003 testimony before Congress, the Federal Reserve Chairman called for a sharp increase in LNG imports to help avert a potential barrier to the U.S. economic recovery. According to the Chairman's testimony: "... high gas prices projected in the American distant futures market have made us a potential very large importer.... Access to world natural gas supplies will require a major expansion of LNG terminal import capacity."[7] FERC leadership has also spoken about the strategic importance of increased LNG imports. FERC Commissioner Suedeen Kelly told industry representatives in 2006 that "the U.S. cannot meet projected demand in the coming

years without LNG unless we shed more industrial load," and that it was unlikely that industrial needs would wane. She predicted that "while LNG has made a marginal contribution to gas supply over the last 30 years, it is poised to make a major contribution in the future."[8]

Proposed LNG Import Terminals in the United States

LNG tankers unload their cargo at dedicated marine terminals which store and regasify the LNG for distribution to domestic markets. Onshore terminals consist of docks, LNG handling equipment, storage tanks, and interconnections to regional gas transmission pipelines and electric power plants. Offshore terminals regasify and pump the LNG directly into offshore natural gas pipelines or may store LNG in undersea salt caverns for later injection into offshore pipelines.

There are five active onshore LNG import terminals in the United States: Everett, Massachusetts; Lake Charles, Louisiana; Cove Point, Maryland; Elba Island, Georgia; and Peñuelas, Puerto Rico. One active offshore import terminal is located in the Gulf of Mexico. A second offshore terminal near Boston, Massachusetts, is scheduled to begin operations in early 2008.[9] (There is also one export terminal in Kenai, Alaska.) In addition to these active terminals, developers have proposed more than 70 new LNG import terminals to serve the U.S. market. A number of these proposals have been withdrawn because of siting problems, financing problems, or other reasons. Many others are well-advanced, however, with recent or pending federal permit approvals. **Figure 1** shows summary information for active LNG terminal proposals located in North America.

Potential Safety Hazards from LNG Terminals

The safety hazards associated with LNG terminals have been debated for decades. A 1944 accident at one of the nation's first LNG facilities killed 128 people and initiated public fears about LNG hazards which persist today.[10] Technology improvements and standards since the 1940s have made LNG facilities much safer, but serious hazards remain since LNG is inherently volatile and is usually shipped and stored in large quantities. A January 2004 accident at Algeria's Skikda LNG terminal, which killed or injured over 100 workers, added to the ongoing controversy over LNG facility safety.[11]

Physical Hazards of LNG

Natural gas is combustible, so an uncontrolled release of LNG poses a hazard of fire or, in confined spaces, explosion. LNG also poses hazards because it is so cold. The likelihood and severity of catastrophic LNG events have been the subject of controversy. While questions remain about the credible impacts of specific LNG hazards, there appears to be consensus as to what the most serious hazards are.

Pool Fires. If LNG spills near an ignition source, evaporating gas will burn above the LNG pool.[12] The resulting "pool fire" would spread as the LNG pool expanded away from its source and continued evaporating. A pool fire is intense, burning far more hotly and rapidly than oil or gasoline fires.[13] It cannot be extinguished — all the LNG must be consumed before it goes out. Because an LNG pool fire is so hot, its thermal radiation may injure people and damage property a considerable distance from the fire itself. Many experts agree that a large pool fire, especially on water, is the most serious LNG hazard.[14]

Flammable Vapor Clouds. If LNG spills but does not immediately ignite, the evaporating natural gas will form a vapor cloud that may drift some distance from the spill site. If the cloud subsequently encounters an ignition source, those portions of the cloud with a combustible gas-air concentration will burn. Because only a fraction of such a cloud would have a combustible gas-air concentration, the cloud would not likely ignite all at once, but the fire could still cause considerable

[12] Methane, the main component of LNG, burns in gas-to-air ratios between 5% and 15%.

[13] Havens, J. "Ready to Blow?" *Bulletin of the Atomic Scientists.* July/August 2003. p. 17.

[14] Havens. 2003. p. 17.

damage.[15] An LNG vapor cloud fire would gradually burn its way back to the LNG spill where the vapors originated and would continue to burn as a pool fire.[16]

Other Safety Hazards. LNG spilled on water could (theoretically) regasify almost instantly in a "flameless explosion," although an Idaho National Engineering Laboratory report concluded that "transitions caused by mixing of LNG and water are not violent."[17] LNG vapor clouds are not toxic, but they could cause asphyxiation by displacing breathable air.[18] Such clouds may begin near the ground (or water) when they are still very cold, but rise in air as they warm, diminishing the threat to people. Extremely cold LNG could injure people or damage equipment through direct contact.[19] Such contact would likely be limited, however, as a major spill would likely result in a more serious fire. The environmental damage associated with an LNG spill would be confined to fire and freezing impacts near the spill since LNG dissipates completely and leaves no residue.[20]

Terrorism Hazards. LNG tankers and land-based facilities could be vulnerable to terrorism. Tankers might be physically attacked in a variety of ways to destroy their cargo — or commandeered for use as weapons against coastal targets. LNG terminal facilities might also be physically attacked with explosives or through other means. Some LNG facilities may also be indirectly disrupted by "cyber-attacks" or attacks on regional electricity grids and communications networks which could in turn affect dependent LNG control and safety systems.[21] The potential attractiveness of LNG infrastructure to terrorists is discussed later in this report.

Safety Record of LNG

The LNG tanker industry claims a record of relative safety over the last 45 years; since international LNG shipping began in 1959, tankers reportedly have carried over 45,000 LNG cargoes without a serious accident at sea or in port.[22] LNG tankers have experienced groundings and collisions during this period, but none has

[22] Foss, M.M. "Introduction to LNG." University of Texas at Austin, Center for Energy Economics. January, 2007. p. 28.

resulted in a major spill.[23] The LNG marine safety record is partly due to the double-hulled design of LNG tankers. This design makes them more robust and less prone to accidental spills than single-hulled oil and fuel tankers like the *Exxon Valdez*, which caused a major Alaskan oil spill after grounding in 1989.[24] LNG tankers also carry radar, global positioning systems, automatic distress systems and beacons to signal if they are in trouble. Cargo safety systems include instruments that can shut operations if they deviate from normal as well as gas and fire detection systems.[25]

The safety record of onshore LNG terminals is more mixed. There are more than 40 LNG terminals (and more than 150 other LNG storage facilities) worldwide. Since 1944, there have been approximately 13 serious accidents at these facilities directly related to LNG. Two of these accidents caused single fatalities of facility workers — one in Algeria in 1977, and another at Cove Point, Maryland, in 1979. On January 19, 2004, a fire at the LNG processing facility in Skikda, Algeria killed an estimated 27 workers and injured 74 others. The Skikda fire destroyed a processing plant and damaged a marine berth, although it did not damage a second processing plant or three large LNG storage tanks also located at the terminal.[26] Nor did the Skikda accident injure the rest of the 12,000 workers at the complex. Nonetheless, it was considered the worst petrochemical plant fire in Algeria in over 40 years.[27] According to press reports, the accident resulted from poor maintenance rather than a facility design flaw.[28] Another three accidents at worldwide LNG plants since 1944 have also caused fatalities, but these were construction or maintenance accidents in which LNG was not present.

LNG Hazard Models

Since the terror attacks of September 11, 2001, technical studies have been commissioned to evaluate the safety hazards of LNG terminals and associated shipping. The most widely cited of these studies are listed in **Table 1.** These studies have caused controversy because some reach differing conclusions about the potential public hazard of LNG terminal accidents or terror attacks. Consequently, community groups fear that LNG hazards may be misrepresented by government agencies, or that certain LNG hazards may simply not be understood well enough to support a terminal siting approval.

CRS-10

Most hazard analyses for LNG terminals and shipping depend on computer models to approximate the effects of hypothetical accidents. Federal siting standards specifically require computer modeling of thermal radiation and flammable vapor cloud exclusion zones (49 C.F.R. §§ 193.2057, 2059).[37] Such models are necessary because there have been no major LNG incidents of the type envisioned in LNG safety research and because historical LNG experiments have been limited in scale and scope. But LNG hazards models simulate complex physical phenomena and are inherently uncertain, relying on calculations and input assumptions about which fair-minded analysts may legitimately disagree. Even small differences in an LNG hazard model have led to significantly different conclusions. Referring to the recent LNG safety zone studies, for example, FERC notes that "distances have been estimated to range from 1,400 feet to more than 4,000 feet for [hazardous] thermal radiation."[38]

The LNG hazard studies in **Table 1** have been sponsored by a range of stakeholders and have been performed by individuals with various kinds of expertise. It is beyond the scope of this report to make detailed comparisons of the methodologies and findings of these studies and FERC analysis. Furthermore, each of the available studies (or its application) appears to have significant limitations, or has been questioned by critics. For example, the ABSG Consulting study released by FERC in May 2004, which reviewed existing LNG hazard models, concluded that

- No release models are available that take into account the true structure of an LNG carrier....
- No pool spread models are available that account for wave action or currents.
- Relatively few experimental data are available for validation of models involving LNG spills on water, and there are no data available for spills as large as the spills considered in this study.[39]

The Sandia National Laboratories study similarly reported that "there are limitations in existing data and current modeling capabilities for analyzing LNG spills over water."[40] Nonetheless, the Sandia report concluded that "existing [analytic] tools ... can be used to identify and mitigate hazards to protect both public safety and property."[41]

Uncertainty related to LNG hazard modeling continues. A December 2006 study using yet another LNG computer model of a large LNG fire states that "current generation models that are being used to calculate the radiant heat ... from the fire are

found to be overly conservative."[42] In February 2007, the Government Accountability Office (GAO) issued a report comparing six recent unclassified studies (including studies in **Table 1**) of the consequences of LNG spills. The GAO report concluded that[43]

> Because there have been no large-scale LNG spills or spill experiments, past studies have developed modeling assumptions based on small-scale spill data. While there is general agreement on the types of effects from an LNG spill, the results of these models have created what appears to be conflicting assessments of the specific consequences of an LNG spill, creating uncertainty for regulators and the public.

Following the GAO report, Members of Congress have expressed renewed concern about the uncertainty associated with LNG hazard analysis.[44]

Hazards vs. Risks. In reviewing the various LNG hazard studies, it is important to be clear about the distinction between *hazards* and *risks*. Although theoretical models may try to quantify the effects of "worst-case" hazards, evaluating the risks associated with those hazards requires an estimate of the probability that they will occur. Some argue that a significant *hazard* that is nonetheless highly unlikely does not represent an unacceptable *risk* to the public. In this view, worst-case hazard studies alone do not provide a sufficient basis for evaluating public safety. Unfortunately, few LNG safety studies comprehensively and convincingly address the probability of catastrophic accidents or attacks actually occurring.[45] In part, this shortcoming arises from a lack of historical LNG incidents and detailed terrorist threat information on which to base such probabilities. Faced with this analytic uncertainty, decision makers are forced to draw the best information they can get and rely upon their own best judgment to reach conclusions about LNG safety.

LNG Terminal Safety in Perspective

Other Hazardous Materials. LNG terminals and tankers have a high profile because of recent media coverage, although there are few of them relative to all the hazardous chemical plants and ships currently operating near U.S. cities. According

[44] See, for example Senator Barbara A. Mikulski, testimony before the House Transportation and Infrastructure Committee, Coast Guard and Maritime Transportation Subcommittee field hearing on the Safety and Security of Liquefied Natural Gas and the Impact on Port Operations. Baltimore, MD. April 23, 2007.

[45] One attempt at such a study is: Clarke, R.A., et al. *LNG Facilities in Urban Areas*. Good Harbor Consulting, LLC. Prepared for the Rhode Island Office of Attorney General. GHC-RI-0505A. May 2005.

to the U.S. Environmental Protection Agency (EPA), for example, more than 500 toxic chemical facilities operate in "urban" areas at which worst-case accidents could affect 100,000 or more people.[46] These include chlorine plants in city water systems and ammonia tanks in agricultural fertilizer production. There are also oil refineries and other liquefied petroleum gas (e.g., propane, butane) terminals operating in U.S. ports that pose safety hazards similar to those of LNG. Based on the most recent data available from the U.S. Office of Hazardous Materials Safety, there are over 100,000 annual U.S. shipments of hazardous marine cargo such as ammonia, crude oil, liquefied petroleum gases, and other volatile chemicals.[47] Many of these cargoes pose a similar hazard to LNG and pass through the same harbors serving existing or proposed LNG terminals. For further information on hazardous chemical marine cargoes, see CRS Report RL33048, *Marine Security of Hazardous Chemical Cargo*, by Paul Parfomak and John Frittelli.

Civil and Criminal Liability. One reason LNG tanker and terminal operators seek to ensure public safety is to avoid civil and criminal liability from an LNG accident; there are no special provisions in U.S. law protecting the LNG industry from such liability. The 1989 *Exxon Valdez* oil spill, for example, cost Exxon over $1 billion in criminal and civil settlements for violations of federal and state laws. In January 2003, the Justice Department announced over $100 million in civil and criminal penalties against Olympic Pipeline and Shell Pipeline resolving claims from a fatal pipeline fire in Bellingham, Washington in 1999.[48] In March 2003, emphasizing the environmental aspects of homeland security, Attorney General Ashcroft reportedly announced a crackdown on companies failing to protect against possible terrorist attacks on storage tanks, transportation networks, industrial plants, and pipelines.[49] Notwithstanding these announcements, some observers are skeptical that government scrutiny will ensure LNG infrastructure safety.

Even if no federal or state regulations are violated, LNG companies could still face civil liability for personal injury or wrongful death in the event of an accident. In the Bellingham case, the pipeline owner and associated defendants reportedly agreed to pay a $75 million settlement to the families of two children killed in the accident.[50] In 2002, El Paso Corporation settled wrongful death and personal injury

[46] Based on facilities submitting Risk Management Plans required under Section 112 of the Clean Air Act (42 U.S.C. § 7412) and classified in the December 1, 2003, update of the EPA National Database using EPA's software RMP*Review (v2.1). EPA states that an entire population is highly unlikely to be affected by any single chemical release, even in the worst case. In an actual release, effects on a population would depend on wind direction and many other factors. In addition, these worst-case scenarios do not account for emergency response measures facility operators or others might take to mitigate harm.

lawsuits stemming from a natural gas pipeline explosion near Carlsbad, New Mexico, which killed 12 campers.[51] Although the terms of those settlements were not disclosed, two additional lawsuits sought a total of $171 million in damages. The impact of these lawsuits on the company's business is unclear, however; El Paso's June 2003 quarterly financial report noted that "our costs and legal exposure ... will be fully covered by insurance."[52]

Regulation of Onshore LNG Siting

The Department of Transportation (DOT) and FERC are the federal agencies primarily responsible for the regulation of onshore LNG facilities. Although federal statutes do not explicitly designate the relative jurisdiction of DOT and FERC, the agencies have clarified their roles through interagency agreement. These roles and their relation to other authorities are summarized below.

Department of Transportation

The DOT sets safety standards for onshore LNG facilities. The DOT's authority originally stemmed from the Natural Gas Pipeline Safety Act of 1968 (P.L. 90-481) and the Hazardous Liquids Pipeline Safety Act of 1979 (P.L. 96-129). These acts were subsequently combined and recodified as the Pipeline Safety Act of 1994 (P.L. 102-508). The acts were further amended by the Pipeline Safety Improvement Act of 2002 (P.L. 107-355) and the Pipeline Safety Improvement Act of 2006 (P.L. 109-468). Under the resulting statutory scheme, DOT is charged with issuing minimum safety standards for the siting, design, construction, and operation of LNG facilities. It does not approve or deny specific siting proposals, because that authority is vested with FERC, as discussed below.

The Pipeline Safety Act, as amended, includes the following provisions concerning LNG facility siting (49 U.S.C. § 60103):

> The Secretary of Transportation shall prescribe minimum safety standards for deciding on the location of a new liquefied natural gas pipeline facility. In prescribing a standard, the Secretary shall consider the —
>
> (1) kind and use of the facility;
> (2) existing and projected population and demographic characteristics of the location;
> (3) existing and proposed land use near the location;
> (4) natural physical aspects of the location;

> (5) medical, law enforcement, and fire prevention capabilities near the location that can cope with a risk caused by the facility; and
> (6) need to encourage remote siting.

General safety-related regulations may also impact siting decisions and affect the operation of existing facilities. The Secretary is authorized to order corrective action if operating an LNG facility could be hazardous to life, property, or the environment (49 U.S.C. §§ 60112, 60117). DOT's implementing regulations for the Pipeline Safety Act, as amended, are in 49 C.F.R.§§ 190-199. Safety standards, including those on siting, for LNG facilities are in 49 C.F.R. § 193 and are overseen by the Department's Office of Pipeline Safety within the Pipeline and Hazardous Materials Safety Administration (PHMSA).

The siting provisions in 49 C.F.R. § 193 incorporate by reference standard 59A from the National Fire Protection Association (NFPA).[53] NFPA 59A requires thermal exclusion zones and flammable vapor-gas dispersion zones around LNG terminals (§§ 193.2057, 193.2059). The DOT regulations also adopt many of NFPA's design and construction guidelines including requirements for LNG facilities to withstand fire, wind, hydraulic forces, and erosion from LNG spills (§§ 193.2067, 193.2155, 193.2301). Other provisions address operations (§§ 193.2501-2521), maintenance (§§ 193.2601-2639), employee qualification (§§ 193.2701-2719), and security (§§ 193.2901-2917).

Federal Energy Regulatory Commission (FERC)

Under the Natural Gas Act of 1938 (NGA), FERC grants federal approval for the siting of new onshore LNG facilities.[54] Section 7 of the NGA authorizes FERC to issue certificates of "public convenience and necessity" for "the construction or extension of any facilities ... for the transportation in interstate commerce of natural gas" (15 U.S.C. § 717f). Section 7 does not expressly cover LNG facilities, however, so recent agency policy has FERC exercising LNG siting regulation under its Section 3 authority.[55,56] Section 3 of the NGA authorizes FERC to approve the import and export of natural gas (15 U.S.C. § 717b). Specifically, FERC asserts approval

[53] National Fire Protection Association (NFPA). *Standard for the Production, Storage, and Handling of Liquefied Natural Gas*, 1996 Edition. NFPA 59A. Quincy, MA. 1996.

[54] Natural Gas Act (NGA) of June 21, 1938, ch. 556, 52 Stat. 812 (codified as amended at 15 U.S.C. §§ 717 et seq.); the Department of Energy Organization Act of 1977 (P.L. 95-91) transferred to the NGA authority to approve siting, construction and operation of onshore LNG facilities to the Secretary of Energy (§ 301b). The Secretary, in turn, delegated this authority to FERC.

[55] California Energy Commission (CEC). *Liquefied Natural Gas in California: History, Risks and Siting*. No.700-03-005. Sacramento, CA. p. 16; 94 FERC 61,188 § 61,663.

[56] In 1997, FERC reaffirmed its Section 3 authority despite changes to the Natural Gas Act in the Energy Policy Act of 1992 (P.L. 102-486). For details *see* 97 FERC ¶ 61,231 (2001). Also note that FERC's regulatory power regarding LNG importation under section 3 has been held to allow FERC to impose requirements equivalent to any in section 7, so long as FERC finds them necessary or appropriate to the public interest. Distrigas Corp. v. FPC, 495 F.2d 1057, 1066 (D.C. Cir. 1974).

authority over the place of entry and exit, siting, construction, and operation of new LNG terminals as well as modifications or extensions of existing LNG terminals.[57]

The Energy Policy Act of 2005 (P.L. 109-58) amends Section 3 of the NGA to give FERC explicit and "exclusive" authority to approve onshore LNG terminal siting applications (Sec. 311c). The 2005 act requires FERC to promulgate regulations for pre-filing of LNG import terminal siting applications and directs FERC to consult with designated state agencies regarding safety in considering such applications. It permits states to conduct safety inspections of LNG terminals in conformance with federal regulations, although it retains enforcement authority at the federal level. The 2005 act also requires LNG terminal operators to develop emergency response plans, including cost-sharing plans to reimburse state and local governments for safety and security expenditures (Sec. 311(d)). The 2005 act designates FERC as the "lead agency for the purposes of coordinating all applicable Federal authorizations" and for complying with federal environmental requirements, discussed below (Sec. 313a). It also establishes FERC's authority to set schedules for federal authorizations and establishes provisions for judicial review of FERC's siting decisions in the U.S. Court of Appeals, among other administrative provisions (Sec. 313(b)).

FERC implements its authority over onshore LNG terminals through the agency's regulations at 18 C.F.R. § 153. These regulations detail the application process and requirements under Section 3 of the NGA. The process begins with a pre-filing, which must be submitted to FERC at least six months prior to the filing of a formal application. The pre-filing procedures and review processes are set forth at 18 C.F.R. § 157.21. Once the pre-filing stage is completed, a formal application may be filed. FERC's formal application requirements include detailed site engineering and design information, evidence that a facility will safely receive or deliver LNG, and delineation of a facility's proposed location (18 C.F.R. § 153.8). Additional data are required if an LNG facility will be in an area with geological risk (18 C.F.R. § 153.8). The regulations also require LNG facility builders to notify landowners who would be affected by the proposed facility (18 C.F.R. § 157.6d). Facilities to be constructed at the Canadian or Mexican borders for import or export of natural gas also require a Presidential Permit.[58] According to FERC officials, applications under their Section 3-based regulations are also sufficient for Presidential Permit purposes (18 C.F.R. §§ 153.15-153.17).[59]

Under the National Environmental Policy Act of 1969 (P.L. 91-190), FERC must prepare an environmental impact statement in its review of an LNG terminal siting application (18 C.F.R. § 380.6). Applicants must prepare certain environmental reports to aid FERC in its preparation of the environmental impact statement (18 C.F.R. § 380.3(c)(2)(i)). These reports require analysis of, among

---

[57] *See* 18 C.F.R. § 153; *see also* Foley, R., Federal Energy Regulatory Commission (FERC), Office of Energy Projects. "Liquefied Natural Gas Imports." Slide presentation. January 2003. p. 10.

[58] Executive Order No. 10,485 requires that FERC obtain a favorable recommendation from the Secretaries of State and Defense prior to issuing a Presidential Permit.

[59] FERC Office of Energy Projects, Personal communication, December 10, 2003.

other things, the socioeconomic impact of the LNG facility, geophysical characteristics of the site, safeguards against seismic risk, facility effects on air and noise quality, public safety issues in the event of accidents or malfunctions, and facility compliance with reliability standards and relevant safety standards (18 C.F.R. § 380.12). Once these environmental reports are received, the EPA may become involved in the approval process. The EPA often assists in the review of the environmental reports and the issuance of the environmental impact statements.[60]

In an effort to speed the review process for LNG projects and other natural gas infrastructure projects, FERC recently approved rules to expand eligibility for "blanket certificates." Blanket certificates are granted by FERC to companies that have previously been granted certificates for construction for public convenience and necessity under Section 7 of the NGA. A company that possesses a blanket certificate may improve or upgrade existing facilities or construct certain new facilities without further case-by-case authorization from FERC. Regulations governing acceptable actions under blanket certificate authority can be found at 18 C.F.R. §§ 157.201-157.218.

FERC also has created a Liquefied Natural Gas Compliance Branch to monitor the safety of operational LNG facilities on an ongoing basis.[61] This branch is responsible for the continued safety inspections and oversight of operating LNG facilities, and it reviews final facility design and engineering compliance with FERC orders. The staff comprises LNG engineers, civil and mechanical engineers, and other experts. The branch coordinates FERC's LNG Engineering Branch, the U.S. Coast Guard (USCG), and DOT to address safety and security at LNG facilities.[62]

FERC-DOT Jurisdictional Issues. Jurisdiction between the two federal agencies with LNG oversight responsibilities historically has been a point of contention.[63] In practice, FERC requires compliance with DOT's siting and safety regulations as a starting point, but can regulate more strictly if it chooses. This working arrangement is not explicitly established under the relevant federal law. Neither do the statutes and regulations clearly define the roles of the agencies vis-a-vis one another. The revised Pipeline Safety Act, for example, states:

> In a proceeding under section 3 or 7 of the Natural Gas Act (15 U.S.C. § 717b or 717f), each applicant ... shall certify that it will design, install, inspect, test, construct, operate, replace, and maintain a gas pipeline facility under ... section

[60] In July of 2006 EPA issued a "Liquefied Natural Gas Regulatory Roadmap" in an effort to assist LNG project applicants (both onshore and offshore) in dealing with environmental regulatory requirements. [http://www.epa.gov/opci/lng/lngroadmap.pdf]

[61] Press Release, Federal Energy Regulatory Commission, "Commission Establishes LNG Compliance Branch," May 2, 2006.

[62] *Id.*

[63] S.Rept. No. 96-182. 1979. p. 4.

> 60108 of this title. The certification is binding on the Secretary of Energy and the Commission... (49 U.S.C. § 60104(d)(2)).[64]

Despite this provision, which might appear to give DOT full control of gas safety regulation (including LNG siting authority), the authors of the House committee report for the revised Pipeline Safety Act indicated their intention to preserve FERC jurisdiction over LNG.[65] Accordingly, FERC has held that the Pipeline Safety Act does not remove its jurisdiction under the NGA to regulate LNG safety.[66] In 1985, FERC and DOT executed a Memorandum of Understanding expressly acknowledging "DOT's exclusive authority to promulgate Federal safety standards for LNG facilities" but recognizing FERC's ability to issue more stringent safety requirements for LNG facilities when warranted. This agreement appears to have resolved any jurisdictional conflict between the agencies at that time.[67] In February 2004, FERC streamlined the LNG siting approval process through an agreement with the USCG and DOT to coordinate review of LNG terminal safety and security. The agreement "stipulates that the agencies identify issues early and quickly resolve them."[68]

U.S. Coast Guard

The USCG has authority to review, approve, and verify plans for marine traffic around proposed onshore LNG marine terminals as part of the overall siting approval process led by FERC. The USCG is responsible for issuing a Letter of Recommendation regarding the suitability of waterways for LNG vessels serving proposed terminals. The agency is also responsible for ensuring that full consideration is given in siting application reviews to the safety and security of the port, the LNG terminal, and the vessels transporting LNG. The USCG acts as a cooperating agency in the evaluation of LNG terminal siting applications. The Coast Guard provides guidance to applicants seeking permits for onshore LNG terminals in "Guidance on Assessing the Suitability of a Waterway for Liquefied Natural Gas Marine Traffic" (NVIC 05-05) issued on June 14, 2005.[69]

National Fire Protection Association (NFPA)

As noted above, LNG terminal safety regulations incorporate standards set by the NFPA. The NFPA is an international nonprofit organization which advocates fire prevention and serves as an authority on public safety practices. According to NFPA, its 300 safety codes and standards "influence every building, process, service, design,

[64] 49 U.S.C. § 61018 specifies DOT's requirements for pipeline facility inspection and maintenance.

and installation in the United States."[70] The NFPA LNG Standards Committee includes volunteer experts with diverse representation from industry and government, including FERC, DOT, USCG, and state agencies. The NFPA standards for LNG safety were initially adopted in 1967, with 10 subsequent revisions, most recently in 2006.[71] According to the Society of International Gas Tanker and Terminal Operators (SIGTTO), although the NFPA standards originated in the United States, they were the first internationally recognized LNG standards and are widely used throughout the world today.[72]

State Regulatory Roles

While the federal government is primarily responsible for LNG terminal safety and siting regulation, state and local laws, such as environmental, health and safety codes, can affect LNG facilities as well. Under the Pipeline Safety Act, a state also may regulate *intra*state pipeline facilities if the state submits a certification under section 60105(a) or makes an agreement with the DOT under section 60106. Under these provisions, a state "may adopt additional or more stringent safety standards" for LNG facilities so long as they are compatible with DOT regulations (49 U.S.C. 60104(c)). Of course, if a particular LNG facility would otherwise not fall under FERC and DOT jurisdiction, states may regulate without going through the certification or agreement process. Regulation of *inter*state facilities remains the primary responsibility of federal agencies. The Office of Pipeline Safety may, however, delegate authority to *intra*state pipeline safety offices, allowing state offices to act as "agents" administering *inter*state pipeline safety programs (excluding enforcement) for those sections of *inter*state facilities within their boundaries.[73] As of 2008, all 50 states, the District of Columbia, and Puerto Rico were participants in the natural gas pipeline safety program.[74]

State regulation of LNG facility safety and siting runs the gamut from piecemeal to comprehensive. For example, Arizona sets out specific requirements for LNG storage facilities, including "peak shaving" plants used by regional gas utilities, consistent with DOT regulations for construction maintenance and safety standards (Ariz. Admin. Code R14-5-202, R14-5-203, 126-01-001). Colorado and Georgia have comprehensive administrative systems for enforcing the federal standards (see 4 Co. Admin. Code 723-11; Ga. Admin. Code 515-9-3-03).

Apart from state regulation aimed specifically at LNG facilities, generally applicable state and local laws, such as zoning laws and permit requirements for

water, electricity, construction, and waste disposal, also may impact the planning and development of LNG facilities. This is discussed in more detail later in this report.

Federal-State Jurisdictional Conflicts. Federal and state government agencies have had jurisdictional disagreements specifically related to the siting of new LNG terminals. In February 2004, for example, the California Public Utilities Commission (CPUC) disputed FERC's jurisdiction over the siting of a proposed LNG terminal at Long Beach because, in the CPUC's opinion, the terminal would not be involved in interstate sales or transportation and therefore would not come under the Natural Gas Act.[75] In March 2004, FERC rejected the CPUC's arguments and asserted exclusive regulatory authority for all LNG import terminal siting and construction.[76] In April 2004, the CPUC voted to assert jurisdiction over the Long Beach terminal and filed a request for FERC to reconsider its March ruling.[77] In June 2004, FERC reasserted its March ruling, prompting a federal court appeal by California regulators. The Energy Policy Act of 2005 effectively codified FERC's jurisdictional rulings, however, leading the CPUC to drop its lawsuit challenging FERC's LNG siting authority in September 2005. Notwithstanding the CPUC case, other state challenges to FERC jurisdiction remain a possibility.

Key Policy Issues

Proposals for new LNG terminal facilities have generated considerable public concern in many of the communities where the terminals could be built. Some community groups and government officials fear that LNG terminals may expose nearby residents to unacceptable hazards, and that these hazards may not be appropriately considered in the federal siting approval process. Ongoing public concern about LNG terminal safety has focused congressional attention on the exclusivity of FERC's LNG siting authority, proposals for a regional LNG siting process, the lack of "remote" siting requirements in FERC regulations, state permitting requirements under the Clean Water Act (CWA) and the Coastal Zone Management Act (CZMA), terrorism attractiveness of LNG, and other issues.

"Exclusive" Federal Siting Authority

As stated earlier in this report, the Energy Policy Act of 2005 (P.L. 109-58) gives FERC the "exclusive" authority to approve onshore LNG terminal siting applications (Sec. 311(c)). Supporters of this provision argue that it is necessary to prevent federal-state jurisdictional disputes over LNG siting authority, and that it reduces the possibility that state agencies might prevent or unduly delay the development of LNG infrastructure considered essential to the nation's energy supply. They further argue that states retain considerable influence over LNG siting

approval through their federally delegated permitting authorities under the Coastal Zone Management Act of 1972 (16 U.S.C. 1451 et seq.), the Clean Air Act (42 U.S.C. 7401 et seq.), and the Federal Water Pollution Control Act (33 U.S.C. 251 et seq.). They maintain that states have a role in siting reviews under provisions in P.L. 109-58 requiring FERC to consult with governor-designated state agencies regarding state and local safety considerations prior to issuing LNG terminal permit (Sec. 311(d)).

A number of lawmakers at the federal and state levels have suggested that Congress should consider amending or repealing FERC's exclusive authority under P.L. 109-58. Critics of this authority argue that it vests too much power in the federal government at the expense of state agencies, which may have a better understanding of local siting issues and may bear most of the risks or burdens associated with a new LNG facility. They do not believe that FERC adequately seeks state input in its LNG siting reviews, nor adequately addresses state concerns in its siting decisions.[78] Critics question why governors lack the authority to veto onshore LNG terminal proposals as they can offshore terminal proposals under the Deepwater Port Act (33 U.S.C. § 1503(c)(8)). Some in Congress have proposed granting governors similar veto authority over onshore LNG terminal proposals, or other legislation to increase state authority in terminal siting reviews. Accordingly, S. 1174 and H.R. 2042 both would require state concurrence of federal siting approval decisions for onshore LNG terminals.

Regional Siting Approach

In areas such as the Northeast, where a number of onshore LNG terminal proposals have been particularly controversial, some policy makers have sought to establish a regional approach for identifying suitable sites for such terminals. They argue that FERC's consideration of LNG terminals on a proposal-by-proposal basis does not adequately take into account the regional needs for LNG, public safety concerns, and environmental impacts.[79] They also argue that the proposal-by-proposal approach does not adequately account for the relative merits of multiple LNG terminals proposed in the same region. They assert a regional LNG siting process would be more efficient than FERC's current process because it would focus attention on sites and projects with the highest chances of success rather than having numerous communities and state and local agencies react to individual plans, many of which are unlikely to be approved.[80]

FERC officials reportedly have stated that while they are not opposed to regional siting in principle, the commission cannot adopt such a regional approach because it has no land-use authority or responsibility and must let the energy market

determine which terminals ultimately are constructed.[81] In the past, FERC officials also have reportedly expressed skepticism about the effectiveness of regional siting processes, for example, in finding storage locations for low-level radioactive waste.[82] As oversight of federal LNG siting activities continues, Congress may be asked to consider whether legislation that incorporates regional siting in the LNG siting process could alleviate state concerns about FERC's current process while supporting the nation's needs for new LNG infrastructure.

"Remote" Siting of LNG Terminals

The LNG safety provisions in the federal pipeline safety law require the Secretary of Transportation to "consider the ... need to encourage remote siting" of new LNG facilities (49 U.S.C. § 60103). Federal regulations contain no clear "remote" siting requirements, relying instead on safety exclusion zones to satisfy the remoteness requirements under the Pipeline Safety Act. This regulatory alternative was criticized by the General Accounting Office (GAO) in 1979 testimony to Congress supporting remote siting in the Pipeline Safety Act:

> We believe remote siting is the primary factor in safety. Because of the inevitable uncertainties inherent in large-scale use of new technologies and the vulnerability of the facilities to natural phenomena and sabotage, the public can be best protected by placing these facilities away from densely populated areas.[83]

In 2003, Representative Edward Markey, an original sponsor of the Pipeline Safety Act, reportedly expressed concern that DOT regulations did not go far enough in complying with the congressional intent of the remote siting provisions.[84]

Industry and government officials maintain that exclusion zones do provide adequate public safety based on the current state of knowledge about LNG. They argue that LNG terminals are no longer a new technology and face far fewer operational uncertainties than in 1979. In particular, some experts believe that hazard models in the 1970s were too conservative. They believe that more recent models have led to a better understanding of the physical properties of LNG and, consequently, a better basis for design decisions affecting public safety.[85] They point

out that LNG terminals like those in Everett, Massachusetts (1971); Barcelona, Spain (1969); Fezzano, Italy (1969); and Pyongtaek, Korea (1986) have been operating for decades near populated areas without a serious accident affecting the public. Of the 28 existing LNG terminals in Japan, a seismically active country, most are near major cities such as Tokyo and Osaka.[86] While the Algerian terminal accident was serious, experts point out that it did not lead to the catastrophic failure of the main LNG storage tanks and did not cause injuries to the general public. Nonetheless, some policy makers reportedly have called for amendments to federal energy law prohibiting new LNG terminals in urban and densely populated areas.[87]

Clean Water and Coastal Zone Management Acts

Section 311(c) of the Energy Policy Act of 2005 explicitly preserves states' authorities in LNG siting decisions under the Federal Water Pollution Control Act, the Coastal Zone Management Act of 1972, and other federal laws. Under the Federal Water Pollution Control Act, often referred to as the Clean Water Act (CWA), states have the authority to develop and enforce their own water quality standards.[88] Any federal permit applicant that may discharge pollutants into navigable waters must provide the permitting agency with a certification from the state in which the discharge originates or will originate that the discharge is in compliance with the applicable provisions of the CWA, including the state's water quality standards.[89] Thus, states could use their certification authority under the Clean Water Act to influence the siting of an LNG project by attaching conditions to the required water quality certificate or by denying certification. This certification authority has become an important tool used by states to protect the integrity of their waters. It is worth noting that the Energy Policy Act of 2005 created one potential avenue of relief for potential developers by providing for expedited review in a federal court of any order or action, or alleged inaction, by a federal or state agency acting under the authority of federal law.[90] Previously, parties seeking to challenge a state's decision regarding a water quality certificate had to do so in state court.[91]

States have delegated authority under the Coastal Zone Management Act (CZMA), 16 U.S.C. § 1451 et seq., which also could influence permitting of LNG terminals. Under the CZMA, applicants for federal permits to conduct activity

[91] For further discussion of the water quality certification process and its impact on LNG siting, see Dweck, J., Wochner, D., and Brooks, M. "Liquefied Natural Gas (LNG) Litigation after the Energy Policy Act of 2005: State Powers in LNG Terminal Siting." *Energy Law Journal*, Vol. 27, No. 45 (2006). p. 482-85.

affecting the coastal zone of a state must be certified by that state that the proposed activity complies with the state's federally approved coastal program and will be conducted in a manner consistent with that program.[92] A state wishing to forestall the licensing of an LNG terminal in its coastal waters could deny the certification required by the CZMA.[93] However, unlike the state-issued water quality certificates required for federal permitting by the Clean Water Act, the CZMA provides an alternative to applicants who are unable to obtain state certification. Under the CZMA, applicants may appeal the state's decision to the Department of Commerce, which may find that the activity is consistent with the objectives of the CZMA, or is otherwise necessary in the interest of national security, and thus override the state's denial of certification.[94] One analyst has suggested that there is a specific set of circumstances in which a state could create a regulatory stalemate pursuant to its CZMA authority by rejecting an application as incomplete (rather than rejecting it as improper or by failing to act). Under these circumstances the statute does not grant the Secretary of Commerce authority to review the decision. Indeed, battles between state regulatory agencies and applicants for LNG terminals have played out in this manner on at least two occasions.[95]

The discussion above suggests that authorities under the CWA and CZMA, at a minimum, give states the opportunity to have their concerns addressed when applicants seek federal approval for new LNG terminals. One legal commentator has stated that

> ultimately, while the EPAct of 2005 might have streamlined the federal [LNG siting] review process in some respects and changed the rules under which the review takes place, it has not dramatically changed the balance of power between the federal government and states.[96]

Indeed, a recent decision by the U.S. District Court for the District of Maryland seems to confirm this commentator's position. In AES Sparrows Point LNG, LLC v. Smith, Slip. Op., 2007 WL 1826889 (D. Md 2007), the court held that a recent amendment to the Baltimore County Zoning Regulations prohibiting the siting of an LNG facility in a particular "critical area" of the Chesapeake Bay was not preempted by the Natural Gas Act as amended by the Energy Policy Act of 2005. The plaintiffs claimed that the statutes explicitly gave LNG siting authority to the federal government, and thus the states could not interfere with FERC authority to rule on the plaintiff's LNG facility permit application.[97]

[92] 16 U.S.C. § 1456(c)(3)(A).

[93] The state must actively state its objection to the applicant's certification; a state's failure to act is presumed to be concurrence with project certification. *Id.*

[95] For further discussion see Ewing, K.A. and E. Petersen. "Significant Environmental Challenges to the Development of LNG Terminals in the United States." *Texas Journal of Oil, Gas and Energy Law*. November 2006. pp. 21-23; Dweck et al., p. 487-90.

[96] Dweck et al. 2006, p. 475.

[97] The same court had previously overturned a Baltimore County zoning ordinance that (continued...)

The provisions of the Natural Gas Act as amended by the Energy Policy Act of 2005 that grant FERC LNG siting authority specifically provide that "nothing in [the Natural Gas Act] affects the rights of States under ... the Coastal Zone Management Act" and other environmental statutes.[98] The court held that the new zoning regulation had been enacted as part of the state's Coastal Zone Management Plan, that had been approved by the Secretary of Commerce as required by the CZMA. The court held that not every detail of the CZMP must be approved by the Secretary of Commerce, and the Secretary's approval of the Maryland plan that expressly provided for delegation of authority to local jurisdictions to implement local protection plans was sufficient to make the elements of those local protection plans enforceable under the CZMA.[99] The court's decision may enhance the states' ability to influence LNG siting even after the enactment of Section 311 of the Energy Policy Act of 2005.

As oversight of the federal LNG siting process continues, Congress may consider how federal authorities under the Energy Policy Act of 2005, the CWA, the CZMA, and other federal statutes fit together to achieve their various objectives. For example, S. 1579 would amend the CZMA to require FERC and the Department of Commerce to submit a report to Congress regarding development of a memorandum of understanding for a "coordinated process for review of coastal energy activities that provides for ... improved coordination among Federal, regional, state, and local agencies concerned with conducting review under the Coastal Zone Management Act."[100]

Terror Attractiveness

Potential terrorist attacks on LNG terminals or tankers in the United States have been a key concern of policy makers because such attacks could cause catastrophic fires in ports and nearby populated areas. A 2007 report by the Government Accountability Office states that, "the ship-based supply chain for energy commodities," specifically including LNG, "remains threatened and vulnerable, and appropriate security throughout the chain is essential to ensure safe and efficient delivery."[101] Accordingly, the Coast Guard's FY2006 budget requested funding for "additional boat crews and screening personnel at key LNG hubs."[102] To date, no

LNG tanker or land-based LNG facility in the world has been attacked by terrorists. However, similar natural gas and oil assets have been terror targets internationally. The Department of Homeland Security (DHS) included LNG tankers among a list of potential terrorist targets in a security alert late in 2003.[103] The DHS also reported that "in early 2001 there was some suspicion of possible associations between stowaways on Algerian flagged LNG tankers arriving in Boston and persons connected with the so-called 'Millennium Plot'" to bomb targets in the United States. Although these suspicions could not be proved, DHS stated that "the risks associated with LNG shipments are real, and they can never be entirely eliminated."[104] The 2004 report by Sandia National Laboratories concluded that potential terrorist attacks on LNG tankers could be considered "credible and possible."[105] Former Bush Administration counterterrorism advisor Richard Clarke has asserted that terrorists have both the desire and capability to attack LNG shipping with the intention of harming the general population.[106]

Although they acknowledge the security information put forth by federal agencies, some experts believe that concern about threats to LNG infrastructure is overstated.[107] In 2003, the head of one university research consortium reportedly remarked, "from all the information we have ... we don't see LNG as likely or credible terrorist targets."[108] Industry representatives argue that deliberately causing an LNG catastrophe to injure people might be possible in theory, but would be extremely difficult to accomplish. Likewise, the Federal Energy Regulatory Commission (FERC) and other experts believe that LNG facilities are relatively secure compared with other hazardous chemical infrastructures that receive less public attention. In a December 2004 report, the FERC stated that

> for a new LNG terminal proposal ... the perceived threat of a terrorist attack may be considered as highly probable to the local population. However, at the national level, potential terrorist targets are plentiful.... Many of these pose a similar or greater hazard to that of LNG.[109]

The FERC also remarked, however, that "unlike accidental causes, historical experience provides little guidance in estimating the probability of a terrorist attack on an LNG vessel or onshore storage facility."[110] Former Director of Central Intelligence James Woolsey has stated his belief that a terrorist attack on an LNG tanker in U.S. waters would be unlikely because its potential impacts would not be great enough compared with other potential targets.[111] LNG terminal operators that have conducted proprietary assessments of potential terrorist attacks against LNG tankers have expressed similar views.[112] In its September 2006 evaluation of a proposed LNG terminal in Long Island Sound, the USCG states that "there are currently no specific, credible threats against" the proposed LNG facility or tankers serving the facility.[113] The evaluation also notes, however, that the threat environment is dynamic and that some threats may be unknown.[114]

Because the probability of a terrorist attack on LNG infrastructure cannot be known, policy makers and community leaders must, to some extent, rely on their own judgment to decide whether LNG security is adequately addressed in FERC siting application reviews. As oversight of the federal role in LNG terminal siting continues, Congress may explore policies to reduce this uncertainty by improving the gathering and sharing of terrorism intelligence related to LNG.

Other Issues

Conducting More Safety Research. Analysts have suggested for several years that Congress could call for additional LNG safety research to help reduce uncertainties about specific LNG terminal or shipping hazards.[115] Among the LNG terminal hazard reports issued by federal agencies, LNG developers, and community groups, there appears to be widespread agreement that additional "objective" LNG safety research would be beneficial. The ABSG report states, for example, that "additional research will need to be performed to develop more refined models, and additional large-scale spill tests would be useful for providing better data for

[110] FERC. FERC/EIS-0176D. December 2004. p. 4-162. Notwithstanding this assertion, in its subsequent draft review of the Long Beach LNG terminal proposal, the FERC states that "the historical probability of a successful terrorist event would be less than seven chances in a million per year...." validation of models."[116] The Sandia study similarly concludes that "obtaining experimental data for large LNG spills over water would provide needed validation and help reduce modeling uncertainty."[117] Physical testing (as opposed to computer simulations) of impacts and explosions on LNG tanker hulls by the USCG could also fill important gaps in engineering knowledge about the potential effects of terrorist attacks.

DOE is funding a study by Sandia National Laboratories to conduct LNG fire experiments to refine and validate existing LNG hazard models. In its 2007 report, the GAO stated that DOE's proposed research plan at that time would "address only 3 of the top 10 issues — and not the second-highest ranked issue — that our panel of experts identified as potentially affecting public safety."[118] In response to the GAO's concerns and those of congressional staff, the DOE and Sandia have since modified their test program to better align with the priorities put forward by the GAO.[119] The DOE's study could, nonetheless, still be subject to the same types of technical limitations and criticisms facing existing analysis, so while it may reduce key uncertainties, it may not eliminate them altogether. As Congressional oversight of DOE or other federal LNG research continues, Congress may seek to determine whether federal resources are appropriately devoted to reduce the LNG uncertainties of greatest importance to public safety.

Developer Employee Disclosure. Some policy makers are concerned that LNG terminal developers may engage in non-public community lobbying or other similar activities promoting individual LNG terminals. Concern arises that these activities may limit public information and awareness about the proposed terminals and, therefore, may impede the federal LNG siting review process. Accordingly, S. 323 would require an applicant for siting approval for an onshore or offshore LNG terminal to identify each of its employees and agents "that are engaged, directly or indirectly, in activities to persuade communities of the benefits" of approval of the siting application. Supporters of such a policy view it as a means of ensuring public transparency in LNG terminal siting. Disclosure requirements of this type may trigger some First Amendment concerns, however. The Supreme Court has recognized that such government disclosure requirements may have a deterrent effect on the exercise of First Amendment rights.[120] In balancing First Amendment interests, for example, against the government's interest preserving the integrity of the legislative process, the Court has generally upheld the constitutionality of disclosure requirements related to "direct" lobbying of members of Congress.[121] It is unclear how the Court would rule on a disclosure law such as S. 323 related to

[121] *United States v. Harriss*, 347 U.S. 612 (1954).

"indirect" lobbying efforts targeting constituents or otherwise taking place at the local level.[122]

Reducing LNG Demand. Some policy makers argue that Congress should try to reduce the need for new LNG terminals by acting to curb growth in domestic LNG demand, or growth in natural gas demand overall. For example, Congress could change public and industrial incentives for conservation, switching to other fuels, or developing renewable energy supplies. But other fuels like coal and nuclear power pose their own hazards to communities and the environment, so their expansion may not be preferable to additional LNG infrastructure. Conservation and renewable energy sources are less hazardous, although they face significant technological and cost barriers to public adoption on the scale that would be required. Federal investments in renewables research or conservation subsidies might have to be large, and might not have enough impact to alleviate the need for LNG expansion altogether. Various provisions in recent proposed energy legislation would encourage the development of conservation and other alternatives to natural gas, but critics believe they would not likely go far enough to significantly affect near-term natural gas consumption.

Another potential way to curb U.S. LNG demand would be to encourage greater North American production of natural gas. Provisions in the Energy Policy Act of 2005 seek to promote this objective, as do proposals to encourage construction of an Alaska gas pipeline. An Alaska gas pipeline would take years to build, however, and would not on its own be able to meet the anticipated long-term growth in U.S. gas demand. Increased production from natural gas wells in the lower 48 states could help alleviate a possible near-term natural gas supply shortage, but may not offer a sustainable long-term supply solution since domestic gas reserves may not be able to keep pace with rising gas demand.

Conclusion

Proposals for new U.S. LNG import terminals are numerous, but LNG imports pose safety challenges. LNG is inherently hazardous and its infrastructure is potentially attractive to terrorists. The 2004 LNG terminal fire in Algeria demonstrates that, despite technological improvements since the 1940s, LNG facilities can still experience serious accidents. Many lawmakers and the general public are concerned about these hazards.

The U.S. LNG industry is subject to more extensive siting and safety regulation than many other similarly hazardous facilities. Federal, state, and local governments have also put in place security measures intended to safeguard LNG against newly perceived terrorist threats. Some community groups and other stakeholders fear that federal siting requirements for LNG facilities are still not stringent enough, but the responsible federal agencies disagree.

[122] For further discussion on this topic, see CRS Report RL33794, *Grassroots Lobbying: Constitutionality of Disclosure Requirements*, by Jack Maskell.

The safety issues associated with LNG terminal siting are both important and familiar. Every major energy source poses some hazard to public safety. Similar public concerns have been raised around siting of other types of energy facilities such as nuclear power plants, oil import terminals, pipelines, and electric transmission lines. In evaluating new LNG terminal proposals, therefore, policy makers face a full range of facilities and safety hazards associated with U.S. energy supplies, not only LNG needs and hazards on their own.

Although LNG terminal regulations are extensive, and the global industry has decades of experience operating LNG facilities, many stakeholders question LNG terminal safety. Some of these questions might be resolved through additional research on key LNG topics. LNG siting decisions are already underway, however, so any research efforts intended to affect the siting process would probably have to be completed quickly. Revising LNG safety requirements after completion of a facility could be disruptive of energy supplies. Some cite the Shoreham nuclear power plant in the 1980s, which was closed after construction due to new public safety requirements, as an example of the need to resolve safety concerns before capital is invested.

Both industry and government analysts project continued near-term growth in the demand for natural gas — and a decreasing ability for domestic gas producers to meet that demand.[123] Greater LNG imports represent one way to address this growth in demand, along with increased North American gas production, conservation, fuel-switching, and the development of renewable energy sources. One way or another the fundamental gas supply and demand balance must be maintained. If policy makers encourage LNG imports, then the need to foster the other energy options may be diminished — and vice versa. Thus decisions about LNG infrastructure could have consequences for a broader array of natural gas supply policies.

Appendix: Offshore LNG Terminal Regulation

Under the Deepwater Port Act of 1974 (P.L. 93-627) the Secretary of Transportation is directed to "authorize and regulate the location, ownership, construction, and operation of deepwater ports" (33 U.S.C. §§ 1501(a), 1503). The Secretary has delegated this authority to the Maritime Administration (MARAD) within the Department of Transportation, and to the Coast Guard (USCG), within the Department of Homeland Security.[124] Originally, P.L. 93-627 applied only to offshore oil ports and terminals and not LNG facilities. However, the Maritime Transportation Security Act of 2002 (P.L. 107-295) amended P.L. 93-627 to include natural gas facilities, including LNG terminals, developed offshore. As amended, "deepwater ports" are:

> any fixed or floating manmade structure other than a vessel ... located beyond State seaward boundaries ... intended for use as a port or terminal for the transportation, storage, or further handling of oil *or natural gas* for transportation to any State... (33 U.S.C. § 1502(9a))[125]

The Deepwater Port Act sets out a detailed process for offshore facility siting applications. The act also authorizes regulations addressing potential threats to the environment or human welfare posed by development of offshore LNG facilities (33 U.S.C. §§ 1504, 1508; 33 C.F.R. § 148). The act also requires regulations for the designation of safety zones around deepwater ports (33 U.S.C. § 1509(d)). Among the amendments to the act is a provision exempting LNG terminals from the limitation on the number of "deepwater ports" that can be located in a designated "application area," a provision applicable to oil terminals (33 U.S.C. §§ 1504(d)(4), (i)(4)). Additionally, a preexisting provision of the act allows the governor of a state adjacent to a proposed offshore LNG facility to have that facility license conform to state environmental protection, land and water use, or coastal zone management programs (33 U.S.C. § 1508(b)).

The USCG's regulations regarding LNG facilities are codified throughout 33 C.F.R., with major provisions in part 127. These regulations detail the requirements for siting applications, which include information about the proposed location, design, construction, and operation (33 C.F.R. § 148.109). NEPA analysis is often instrumental in siting and safety-related decisions at specific proposed facilities and is facilitated by the Minerals Management Service, the agency responsible for offshore minerals extraction and the Outer Continental Shelf leasing program.[126] Unlike requirements for onshore facilities, the Coast Guard does not appear to require generally applicable exclusion zones for offshore facilities, but relies instead

[124] For a recent LNG siting application, MARAD performed financial analysis and USCG evaluated environmental impacts; the agencies cooperated on all other aspects of the review. ("First Offshore Terminal in U.S. is About to Secure Federal License." *Foster Natural Gas Report*. Bethesda, MD. November 20, 2003. p. 21.

Committees of Congress

Liquefied Natural Gas (LNG) Infrastructure Security:
Issues for Congress

Summary

Liquefied natural gas (LNG) is a hazardous fuel shipped in large tankers from overseas to U.S. ports. Because LNG infrastructure is highly visible and easily identified, it can be vulnerable to terrorist attack. Since September 11, 2001, the U.S. LNG industry and federal agencies have put new measures in place to respond to the possibility of terrorism. Nonetheless, public concerns about LNG risks continue to raise questions about LNG security. Faced with a perceived national need for greater LNG imports, and persistent public concerns about LNG risks, some in Congress are examining the adequacy of security provisions in federal LNG regulation.

LNG infrastructure consists primarily of tankers, import terminals, and inland storage plants. There are seven active U.S. terminals and proposals for many others. Although potentially catastrophic events could arise from a serious accident or attack on such facilities, LNG has a record of relative safety for the last 40 years, and no LNG tanker or land-based facility has been attacked by terrorists. The likelihood and possible impacts from LNG attacks continue to be debated among experts.

Several federal agencies oversee LNG infrastructure security. The Coast Guard has lead responsibility for LNG shipping and marine terminal security under the Maritime Transportation Security Act of 2002 (P.L. 107-295) and the Security and Accountability for Every Port Act of 2006 (P.L. 109-347). The Office of Pipeline Safety (OPS) and the Transportation Security Administration (TSA) both have security authority for LNG storage plants within gas utilities, as well as some security authority for LNG marine terminals. The Federal Energy Regulatory Commission (FERC) approves the siting, with some security oversight, of on-shore LNG marine terminals and certain utility LNG plants. The Coast Guard, OPS and FERC cooperate in the siting approval of new LNG facilities, inspection and operational review of existing facilities, informal communication, and dispute resolution.

Federal initiatives to secure LNG are still evolving, but a variety of industry and agency representatives suggest they are reducing the vulnerability of LNG to terrorism. S. 1594 would strengthen federal protection of vessels and infrastructure handling LNG and other especially hazardous cargoes through new international standards, new training requirements, vessel security cost-sharing, incident response and recovery plans, and other provisions. H.R. 2830 would require the Coast Guard to certify that new LNG terminals will be adequately secured before they can be approved. As Congress continues its oversight of LNG, it may consider whether future LNG security requirements will be appropriately funded, whether these requirements will be balanced against evolving risks, and whether the LNG industry is carrying its fair share of the security burden. Congress may also act to improve its understanding of LNG security risks. Costly "blanket" investments in LNG security might be avoided if more refined terror threat information were available to focus security spending on a narrower set of infrastructure vulnerabilities. Finally, Congress may initiate action to better understand the security and trade implications of efforts to promote U.S.-flagged LNG tankers and U.S. crews.

Liquefied Natural Gas (LNG) Infrastructure Security: Issues for Congress

Introduction

Liquefied natural gas (LNG) facilities are receiving a great deal of public attention due to their increasingly important role in the nation's energy infrastructure and their potential vulnerability to terrorist attack. LNG has long been important to U.S. natural gas markets, although energy economics and public perceptions about LNG risks have limited the industry's growth. Concerns about rising natural gas prices and the possibility of domestic gas shortages have been driving up demand for LNG imports. But LNG is a hazardous[1] liquid transported and stored in large quantities. Consequently, LNG infrastructure may directly impact the security of communities where this infrastructure is located. Faced with the widely perceived national need for greater LNG imports, and persistent public concerns about LNG risks, some in Congress are examining the adequacy of security provisions in federal LNG regulation.[2]

S. 1594, which was introduced by Senator Frank Lautenberg and three cosponsors and referred to the Senate Committee on Commerce, Science, and Transportation on June 12, 2007, would strengthen federal protection of vessels and infrastructure handling LNG and other especially hazardous cargoes. H.R. 2830, which was introduced by Representative James Oberstar and two cosponsors on June 22, 2007, and reported by the House Transportation and Infrastructure Committee on September 20, 2007, would require the Coast Guard to certify that new LNG terminals will be adequately secured before they can be approved, among other provisions. H.R. 2830 as sequentially reported by the House Homeland Security Committee on October 1, 2007, would further require a homeland security impact review of proposed LNG terminals and a comparative risk assessment of vessel-based and facility-based LNG regasification processes.

This report provides an overview of industry and federal activities related to LNG security. The report describes U.S. LNG infrastructure, the industry's safety record and security risks, and the industry's security initiatives since September 11, 2001. It summarizes recent changes in federal LNG and maritime security law and related changes in the security roles of federal agencies. The report discusses several policy concerns related to federal LNG security efforts: 1) public costs of marine

security, 2) uncertainty regarding LNG terrorism risks, and 3) security implications of building offshore LNG facilities.

Scope and Limitations

This report focuses on industry and federal activities in LNG infrastructure security. The report includes some discussion of state and local agency activities as they relate to federal efforts, but does not address the full range of state and local issues of potential interest to policy makers. The report also focuses on shipping, marine terminals and land-based storage facilities within gas utilities; it does not address LNG trucking, special purpose LNG facilities, or LNG-fueled vehicles. The report discusses activities in LNG safety only as they relate to security. For further discussion of LNG terminal safety, including LNG safety-related legislative proposals, see CRS Report RL32205, *Liquefied Natural Gas (LNG) Terminals: Siting, Safety and Regulation*, by Paul Parfomak and Adam Vann.

Background

What is LNG?

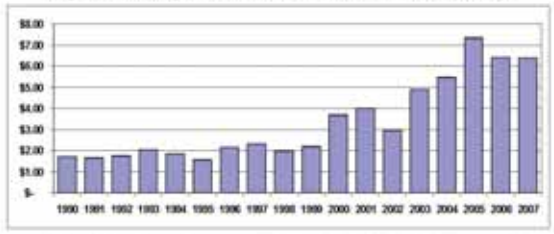
When natural gas is cooled to temperatures below minus 260°F it condenses into *liquefied* natural gas, or "LNG."[3] As a liquid, natural gas occupies only 1/600th the volume of its gaseous state, so it is stored more effectively in a limited space and is more readily transported by ship or truck. A single tanker ship, for example, can carry huge quantities of LNG — enough to supply the daily energy needs of over 10 million homes. When LNG is warmed it "regasifies" and can be used for the same purposes as conventional natural gas such as heating, cooking and power generation.

In 2007, LNG imports to the United States originated in Trinidad and Tobago (57.3%), Egypt (15.3%), Nigeria (12.7%), Algeria (9.9%), Qatar (2.4%), and Equatorial Guinea (2.4%).[4] In recent years, some LNG shipments have also come from Malaysia, Oman, Australia, and other countries.[5] Brunei, Indonesia, Libya, and the United Arab Emirates also export LNG, and may be significant U.S. suppliers in the future. In addition to importing LNG to the lower 48 states, the United States exports Alaskan LNG to Japan.

Expectations for U.S. LNG Growth

The United States has used LNG commercially since the1940s. Initially, LNG facilities stored domestically produced natural gas to supplement pipeline supplies

[3] Natural gas typically consists of at least 80% methane, although LNG is usually over 90% methane. It may also contain other hydrocarbon gases (e.g., propane) and nitrogen.



[4] U.S. Dept. of Energy, Office of Fossil Energy. "Natural Gas Import/Export Reports." Internal database. January 7, 2008. Excludes December 2007 imports.

[5] Energy Information Administration (EIA). *Natural Gas Year-In-Review 2006*. Washington, DC, March 2007. p. 5.

during times of high gas demand. In the 1970s LNG imports began to supplement domestic production. Due primarily to low domestic gas prices, LNG imports stayed relatively small — accounting for only 1% of total U.S. gas consumption in 2002.[6] In countries with limited domestic gas supplies, however, LNG imports grew dramatically over the same period. Japan, for example, imported 97% of its natural gas supply as LNG in 2002, over 11 times as much LNG as the United States.[7] South Korea, France, Spain, and Taiwan also became heavy LNG importers.

Natural gas demand has accelerated in the United States over the last several years due to environmental concerns about other energy sources, growth in natural gas-fired electricity generation, and historically low gas prices. Supply has not been able to keep up with demand, however, so gas prices have recently become high and volatile. As **Figure 1** shows, average annual gas prices at the wellhead have risen from between $1.50 and $2.50/Mcf ("thousand cubic feet") through most of the 1990s to above $6.00/Mcf since 2005. At the same time, international prices for LNG have fallen because of increased supplies and lower production and transportation costs, making LNG more competitive with domestic natural gas. While cost estimation is speculative, some industry analysts believe that LNG can be economically delivered to U.S. pipelines for between $2.25 to $4.15/Mcf, depending upon the source.[8]

In 2003 testimony before the House Energy and Commerce Committee, the Federal Reserve Chairman, Alan Greenspan, called for a sharp increase in LNG imports to help avert a potential barrier to U.S. economic growth. According to Mr. Greenspan's testimony

[8] Donnelly, M. "LNG as Price Taker." *Public Utilities Fortnightly*. November 1, 2006.

> ... notable cost reductions for both liquefaction and transportation of LNG ... and high gas prices projected in the American distant futures market have made us a potential very large importer.... Access to world natural gas supplies will require a major expansion of LNG terminal import capacity.[9]

If current natural gas trends continue, the Energy Information Administration (EIA) projects U.S. LNG imports to account for approximately 13% of total U.S. gas supply in 2030.[10]

Overview of U.S. LNG Infrastructure

The physical infrastructure of LNG consists of interconnected transportation and storage facilities, each with distinct physical characteristics affecting operational risks and security needs. This overview focuses on the three major elements of this infrastructure: tanker ships, marine terminals, and storage facilities.

LNG Tanker Ships

LNG is transported to the United States in very large, specially designed tanker ships. LNG tankers are double hulled, containing several massive refrigerated tanks, each sealed and insulated to maintain safe LNG temperature and prevent leakage during transit. There are currently 200 tankers in service around the world, with a combined cargo capacity of over 24 million cubic meters of LNG, equivalent to over eight times the average daily U.S. natural gas consumption. More than 200 additional tankers are expected to enter service by 2013.[11] There are no U.S.-flagged LNG tankers.

LNG Marine Terminals

LNG tankers unload their cargo at dedicated marine terminals which store and regasify the LNG for distribution to domestic markets. Onshore terminals typically consist of docks, LNG handling equipment, storage tanks, and interconnections to regional gas transmission pipelines. As discussed later in the report, the siting of onshore LNG import terminals is regulated by the Federal Energy Regulatory Commission (FERC). There are six active onshore LNG terminals in the United States:

- **Everett, Massachusetts.** The Everett terminal is located across the Mystic River from Boston; tankers must pass through Boston harbor to reach it. The terminal serves gas utilities and electric power

producers in New England. The terminal receives approximately 65 LNG shipments annually.[12]

- **Lake Charles, Louisiana.** The Lake Charles terminal is located approximately nine miles southwest of the city of Lake Charles near the Gulf of Mexico. The terminal completed a major expansion in 2006, allowing it to receive up to 175 shipments per year.[13]

- **Cove Point, Maryland**. Cove Point is located on the Chesapeake Bay 60 miles southeast of Washington, DC. Under federally approved expansion plans, the terminal could be capable of receiving up to 200 shipments per year in 2008.[14]

- **Elba Island, Georgia.** The Elba Island terminal is located on an island five miles down the Savannah River from Savannah, Georgia and ten miles from the Atlantic coast. The terminal completed a major expansion in 2006, allowing it to receive approximately 118 shipments per year.[15]

- **Peñuelas, Puerto Rico.** The Peñuelas terminal, located on the southern coast of Puerto Rico. The terminal is dedicated to fueling an electric generation plant which supplies 20% of Puerto Rico's power.[16] The terminal receives 10 to 15 LNG shipments annually.[17]

- **Kenai, Alaska.** Built in 1969, this is the oldest LNG marine terminal in the United States and the only one built for export (to Japan). The Kenai terminal is located in Nikiski near the Cook Inlet gas fields. Since 1969 the terminal has exported an average of approximately 34 LNG shipments each year.[18]

Offshore LNG terminals connect to land only by underwater pipelines. These offshore terminal designs seek to avoid community opposition, permitting, and operating obstacles which have hindered the construction of new on-shore LNG terminal facilities. Because offshore terminals would be located far from land, they

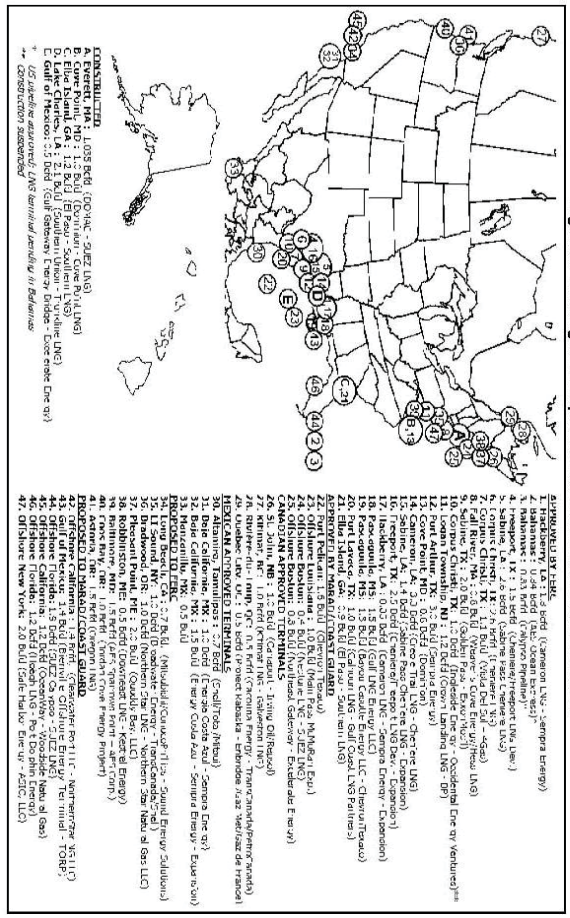
also would present fewer security risks than on-shore LNG terminals. Offshore terminals may present environmental concerns, however, if they use seawater for regasification. Such a process cools the waters in a terminal's vicinity with potential impacts on the local ecosystem due to the lower water temperatures.[19] As discussed later in the report, offshore LNG terminals are regulated jointly by the Maritime Administration (MARAD) and the U.S. Coast Guard. There is currently one operating offshore LNG terminal in U.S. waters:

- **Gulf of Mexico, Louisiana.** The Gulf Gateways (Energy Bridge) terminal was completed in 2004 and received its first LNG shipment in March, 2005. The terminal consists of an offshore gas pipeline buoy system and is served by specialized tankers which regasify their LNG cargoes on board. The terminal expects up to be able to serve up to 60 LNG shipments per year.[20]

A second offshore terminal near Boston, Massachusetts, is scheduled to begin operations in early 2008.[21]



In addition to these active terminals, developers have proposed over 70 new LNG import terminals to serve the U.S. market. A number of these proposals have been withdrawn due to siting problems, financing problems, or other reasons. Many others are well-advanced, however, with recent or pending federal permit approvals. **Figure 2** shows summary information for active LNG terminal proposals located in North America.

LNG Peak Shaving Plants

Many gas distribution utilities rely on "peak shaving" LNG plants to supplement pipeline gas supplies during periods of peak demand during winter cold snaps. The LNG is stored in large refrigerated tanks integrated with the local gas pipeline network. The largest facilities usually liquefy natural gas drawn directly from the interstate pipeline grid, although many smaller facilities without such liquefaction capabilities receive LNG by truck. LNG tanks are generally surrounded by containment impoundments which limit the spread of an LNG spill and the potential size of a resulting vapor cloud. LNG peak shaving plants are often located near the populations they serve, although many are in remote areas away from people. According to the Pipeline and Hazardous Materials Safety Administration (PHMSA) there are 103 active LNG storage facilities in the United States distributed across 31 states.[22] These facilities are mostly in the Northeast where pipeline capacity and underground gas storage have historically been constrained.

LNG Risks and Vulnerabilities

The safety hazards associated with LNG terminals have been debated for decades. A 1944 accident at one of the nation's first LNG facilities killed 128 people and initiated public fears about LNG hazards which persist today.[23] Technology improvements and standards since the 1940s have made LNG facilities much safer, but serious hazards remain since LNG is inherently volatile and is usually shipped and stored in large quantities. A January 2004 accident at Algeria's Skikda LNG terminal which killed or injured over 100 workers added to the ongoing controversy over LNG facility safety.[24] LNG infrastructure is also potentially vulnerable to terrorist attack.

Physical Hazards of LNG

Natural gas is combustible, so an uncontrolled release of LNG poses a serious hazard of explosion or fire. LNG also poses hazards because it is extremely cold. Experts have identified several potentially catastrophic events that could arise from an LNG release. The likelihood and severity of these events have been the subject of considerable research and analysis. While open questions remain about the impacts of specific hazards in an actual accident, there appears to be consensus as to what the greatest LNG hazards are.

[24] Junnola, J., et al. "Fatal Explosion Rocks Algeria's Skikda LNG Complex." *Oil Daily.* January 21, 2004. p. 6.

- **Pool fires.** If LNG spills near an ignition source, the evaporating gas in a combustible gas-air concentration will burn above the LNG pool.[25] The resulting "pool fire" would spread as the LNG pool expanded away from its source and continued evaporating. Such pool fires are intense, burning far more hotly and rapidly than oil or gasoline fires.[26] They cannot be extinguished — all the LNG must be consumed before they go out. Because LNG pool fires are so hot, their thermal radiation may injure people and damage property a considerable distance from the fire itself. Many experts agree that a pool fire, especially on water, is the most serious LNG hazard.[27]

- **Flammable vapor clouds.** If LNG spills but does not immediately ignite, the evaporating natural gas will form a vapor cloud that may drift some distance from the spill site. If the cloud subsequently encounters an ignition source, those portions of the cloud with a combustible gas-air concentration will burn. Because only a fraction of such a cloud would have a combustible gas-air concentration, the cloud would not likely explode all at once, but the fire could still cause considerable damage. An LNG vapor cloud fire would gradually burn its way back to the LNG spill where the vapors originated and would continue to burn as a pool fire.[28] If an LNG tank failed due to a collision or terror attack, experts believe the failure event itself would likely ignite the LNG pool before a large vapor cloud could form.[29] Consequently, they conclude that large vapor cloud fires are less likely than instantaneous pool fires.

- **Flameless explosion.** If LNG spills on water, it could theoretically heat up and regasify almost instantly in a "flameless explosion" (also called a "rapid phase transition"). While the effects of tanker-scale spills have not been studied extensively, Shell Corporation experiments with smaller LNG spills in 1980 did not cause flameless explosions. Even if there were a flameless explosion of LNG, experts believe the hazard zones around such an event "would not be as large as either vapor cloud or pool fire hazard zones."[30]

In addition to these catastrophic hazards, an LNG spill poses hazards on a smaller scale. An LNG vapor cloud is not toxic, but could cause asphyxiation by displacing breathable air. Such clouds rise in air as they warm, however, diminishing the threat to people on the ground. Alternatively, extremely cold LNG could injure

[25] Methane, the main component of LNG, burns in gas-to-air ratios between 5% and 15%.

[30] Havens. 2003. p. 17.

people or damage equipment through direct contact. The extent of such contact would likely be limited, however, as a major spill would likely result in a more serious fire. The environmental damage associated with an LNG spill would be confined to fire and freezing impacts near the spill since LNG dissipates completely and leaves no residue (as crude oil does).[31]

Safety Record of LNG

The LNG tanker industry claims a record of relative safety over the last 45 years; since international LNG shipping began in 1959, tankers reportedly have carried over 47,000 LNG cargoes without a serious accident at sea or in port.[32] LNG tankers have experienced groundings and collisions during this period, but none has resulted in a major spill.[33] The LNG marine safety record is partly due to the double-hulled design of LNG tankers. This design makes them more robust and less prone to accidental spills than single-hulled oil and fuel tankers like the *Exxon Valdez*, which caused a major Alaskan oil spill after grounding in 1989.[34] LNG tankers also carry radar, global positioning systems, automatic distress systems and beacons to signal if they are in trouble. Cargo safety systems include instruments that can shut operations if they deviate from normal as well as gas and fire detection systems.

The safety record of onshore LNG terminals is more mixed. There are more than 40 LNG terminals (and more than 150 other LNG storage facilities) worldwide. Since 1944, there have been approximately 13 serious accidents at these facilities directly related to LNG. Two of these accidents caused single fatalities of facility workers — one in Algeria in 1977, and another at Cove Point, Maryland, in 1979. On January 19, 2004, a fire at the LNG processing facility in Skikda, Algeria killed an estimated 27 workers and injured 74 others. The Skikda fire completely destroyed a processing plant and damaged a marine berth, although it did not damage a second processing plant or three large LNG storage tanks also located at the terminal.[35] The Skikda accident did not injure the rest of the 12,000 workers at the complex, but it was considered the worst petrochemical plant fire in Algeria in over 40 years.[36] According to press reports, the accident resulted from poor maintenance rather than a facility design flaw.[37] Another three accidents at worldwide LNG plants since 1944

have also caused fatalities, but these were construction or maintenance accidents in which LNG was not present.[38]

LNG Security Risks

LNG tankers and land-based facilities may be vulnerable to terrorism. Tankers could be physically attacked to destroy their cargo — or commandeered for use as weapons against coastal targets. Land-based LNG facilities could also be physically attacked with explosives or through other means. Alternatively, computer control systems could be "cyber-attacked," or both physical and cyber attack could happen at the same time. Some LNG facilities could also be indirectly disrupted by other types of terror strikes, such as attacks on regional electricity grids or communications networks, which could in turn affect dependent LNG control and safety systems. Since LNG is fuel for power plants, heating, military bases, and other uses, disruption of LNG shipping or storage poses additional "downstream" risks, especially in more LNG-dependent regions like New England.

LNG Tanker Vulnerability. LNG tankers cause the most concern among security analysts because they are potentially more accessible than fixed terminal facilities, because they may transit nearer to populated areas, and because LNG spills from tankers could be more difficult to control. According to a 2004 report by Sandia National Laboratories, an intentional LNG spill and resulting fire could cause "major" injuries to people and "significant" damage to structures within approximately 500 meters (0.3 mile) of the spill site, more moderate injuries and structural damage up to 1,600 meters (1.0 mile) from the spill site, and lower impacts out to 2,500 meters (1.5 miles).[39] These results are used by federal agencies in reviewing LNG terminal siting applications.

Other LNG hazard studies have reached somewhat different conclusions about LNG tanker vulnerability. A report by the Government Accountability Office (GAO) released in 2007 reviewed six unclassified studies of LNG tanker hazards, including the Sandia study. The GAO report concluded that[40]

> Because there have been no large-scale LNG spills or spill experiments, past studies have developed modeling assumptions based on small-scale spill data. While there is general agreement on the types of effects from an LNG spill, the results of these models have created what appears to be conflicting assessments of the specific consequences of an LNG spill, creating uncertainty for regulators and the public.

[38] CH-IV International. pp. 6-12.

[40] Government Accountability Office (GAO). *Maritime Security: Public Safety Consequences of a Terrorist Attack on a Tanker Carrying Liquefied Natural Gas Need Clarification*. GAO-07-316. February 2007. p. 22.

Following the GAO report, Members of Congress have expressed continuing concern about the uncertainty associated with LNG tanker vulnerability and hazard analysis.[41] In 2008, Congress appropriated $8 million to fund large-scale LNG fire experiments by the Department of Energy addressing some of the hazard modeling uncertainties identified in the GAO report.[42] It remains to be seen to what degree this research will increase policy makers' confidence in LNG tanker vulnerability analyses.

The *Gaz Fountain* Attack

Although there have been no terrorist attacks on LNG tankers, there is at least one documented case of a gas tanker of similar construction being attacked in wartime. During the Iran-Iraq War in the 1990s, the double-hulled LPG tanker *Gaz Fountain* was fired upon by an Iranian aircraft using three air-to-ground, armor-piercing Maverick missiles. Two of the missiles exploded on or above the ship's deck, causing relatively minor damage. The third missile penetrated the deck and exploded above a butane storage tank, opening a 6 square-meter (65 square-foot) hole in the roof of the tank. The escaping gas ignited, establishing a large fire on deck above the missile entry hole. The fire aboard the *Gaz Fountain* was successfully extinguished by a salvage ship, her remaining cargo was successfully unloaded to another tanker, and she was eventually repaired.[43]

The *Gaz Fountain* attack and salvage provides some evidence as to the robustness of double-hulled gas tankers like those that carry LNG. But the relatively benign outcome in the *Gaz Fountain* attack does not necessarily demonstrate that attacks on LNG tankers would have similarly limited impacts. The *Gaz Fountain* was fortunate that its storage tank was breached only at the top. If missiles had been targeted at the hull of the ship rather than its deck, one might have penetrated the side of a storage tank, causing a major spill on water and an inextinguishable pool fire. Furthermore, if the gas involved had been LNG rather than butane, the *Gaz Fountain* might have been subject to cryogenic damage since LNG is transported at a much lower temperature than butane (-260°F vs. +25°F). According to the Sandia report, such a combination could lead to cascading failure of adjacent storage tanks and, presumably, an even larger fire.[44]

[41] See, for example Senator Barbara A. Mikulski, testimony before the House Transportation and Infrastructure Committee, Coast Guard and Maritime Transportation Subcommittee field hearing on the Safety and Security of Liquefied Natural Gas and the Impact on Port Operations. Baltimore, MD. April 23, 2007.

Federal LNG Security Initiatives

Operators of LNG infrastructure had security programs in place prior to September 11, 2001, but these programs mostly focused on personnel safety and preventing vandalism. The terror attacks of September 11 focused attention on the vulnerability of LNG infrastructure to different threats, such as systematic attacks on LNG facilities by foreign terrorists. Consequently, both government and industry have taken new initiatives to secure LNG infrastructure in response to new threats.

Several federal agencies oversee the security of LNG infrastructure. The Coast Guard has lead responsibility for LNG shipping and marine terminal security. The Department of Transportation's Office of Pipeline Safety and the Department of Homeland Security's Transportation Security Administration have security authority for peak-shaving plants within gas utilities, as well as some security authority for LNG marine terminals. FERC has siting approval responsibility, with some security oversight, for land-based LNG marine terminals and certain peak-shaving plants. In addition to federal agencies, state and local authorities, like police and fire departments, also help to secure LNG.

Security Activities of Federal Maritime Agencies

The two federal agencies with the most significant roles in maritime security as it relates to LNG are the U.S. Coast Guard and the Maritime Administration.

U.S. Coast Guard. The Coast Guard is the lead federal agency for U.S. maritime security, including port security. Among other duties, the Coast Guard tracks, boards, and inspects commercial ships approaching U.S. waters. A senior Coast Guard officer in each port oversees the security and safety of vessels, waterways, and many shore facilities in his geographic area. The Coast Guard derives its security responsibilities under the Ports and Waterways Safety Act of 1972 (P.L. 92-340) and the Maritime Transportation Security Act of 2002 (P.L. 107-295). Maritime security regulations mandated by P.L.107-295 are discussed below. Under P.L.107-295 the Coast Guard and the Maritime Administration share siting approval authority for offshore LNG terminals.

Shortly after September 11, 2001, the Coast Guard began to systematically prioritize protection of ships and facilities, including those handling LNG, based on vulnerability assessments and the potential consequences of security incidents. The Coast Guard evaluated the overall susceptibility of marine targets, their use to transport terrorists or terror materials, and their use as potential weapons. In particular, the Coast Guard evaluated the vulnerability of tankers to "a boat loaded with explosives" or "being commandeered and intentionally damaged."[45] While the assessments focused on Coast Guard jurisdictional vessels and facilities, some scenarios involved other vital port infrastructure like bridges, channels, and tunnels.[46]

[45] 68*FR*126. July 1, 2003. p. 39244.

[46] Ibid., p. 39246.

The Coast Guard used these assessments in augmenting security of key maritime assets and in developing the agency's new maritime security standards.

The Coast Guard began increasing LNG tanker and port security immediately after September 11, 2001. For example, the Coast Guard suspended LNG shipments to Everett for several weeks after the terror attacks to conduct a security review and revise security plans.[47] The Coast Guard also worked with state, environmental and police marine units to establish 24-hour patrols in Boston harbor.[48] In July 2002, the Coast Guard imposed a 1,000-yard security zone around the Kenai LNG terminal — and subsequently imposed similar zones around other U.S. LNG terminals.[49] The Coast Guard also reassessed security at the Cove Point terminal before allowing LNG shipments to resume there for the first time since 1980.[50] As new LNG terminals have been proposed and approved by federal agencies, the Coast Guard has continued its involvement in LNG security.

The most heavily secured LNG shipments are those bound for the Everett terminal because they pass through Boston harbor. Depending upon the level of alert, the Coast Guard and local law enforcement agencies may put in place numerous security provisions for these shipments, including:

- Inspection of security and tanker loading at the port of origin.
- On-board escort to Boston by Coast Guard "sea marshals."
- 96-hour advanced notice of arrival of an LNG tanker.
- Advance notification of local police, fire, and emergency agencies, as well as the Federal Aviation Administration and the U.S. Navy.
- Boarding LNG tankers for inspection prior to Boston harbor entry.
- Harbor escort by armed patrol boats, cutters, or auxiliary vessels.
- Enforcement of a security zone closed to other vessels two miles ahead and one mile to each side of the LNG tanker.
- Suspension of overflights by commercial aircraft at Logan airport.
- Inspection of adjacent piers for bombs by police divers.
- Posting of sharpshooters on nearby rooftops.
- Additional security measures which cannot be disclosed publicly.[51]

According to the Coast Guard, such security provisions have been in place for the other U.S. LNG terminals as well, depending upon local assessments of security risk and the unique characteristics of each marine area.[52]

On October 22, 2003, the Coast Guard issued final rules to implement the new security requirements mandated by P.L. 107-295. The rules are codified in Title 33 of the Code of Federal Regulations, Chapter 1, Subchapter H. Among other provisions, the rules establish Coast Guard port officers as maritime security coordinators and set requirements for maritime area security plans and committees. The rules require certain owners or operators of marine assets to designate security officers, perform security assessments, develop and implement security plans, and comply with maritime security alert levels. The vessel rules apply to all LNG tankers entering U.S. ports. Facility rules apply to all land-based U.S. LNG terminals or proposed offshore LNG terminals. Finally, the rules require certain vessels, including LNG tankers, to carry an automatic identification system.

The Coast Guard also has authority to review, approve, and verify security plans for marine traffic around proposed LNG marine terminals as part of the overall siting approval process led by FERC. The Coast Guard is responsible for issuing a Letter of Recommendation regarding the suitability of waterways for LNG vessels serving proposed terminals. The Coast Guard acts as a cooperating agency in the evaluation of LNG terminal siting applications.[53]

The Coast Guard also led the International Maritime Organization (IMO) in developing maritime security standards outside U.S. jurisdiction.[54] These standards, the International Ship and Port Facility Security Code (ISPS Code) contain detailed mandatory security requirements for governments, port authorities and shipping companies, as well as recommended guidelines for meeting those requirements. The ISPS Code is intended to provide a standardized, consistent framework for governments to evaluate risk and to "offset changes in threat with changes in vulnerability."[55]

On October 13, 2006, President Bush signed the Security and Accountability for Every Port Act of 2006 (P.L. 109-347). While not addressing LNG security specifically, the act includes general maritime security provisions which could apply to LNG vessels and facilities. These provisions include, among others, requirements

relating to maritime facility security plans (Sec. 102); unannounced inspections of maritime facilities (Sec. 103); long-range vessel tracking (Sec. 107); operational centers for port security (Sec. 108); port security grants (Sec. 112); and training and exercise programs (Sec. 112-113). The Coast Guard is the federal agency primarily responsible for implementing these provisions.

Maritime Administration. The Maritime Administration (MARAD) within the Department of Transportation has as its stated mission "to strengthen the U.S. maritime transportation system - including infrastructure, industry and labor - to meet the economic and security needs of the Nation."[56] As noted above, under P.L.107-295, MARAD shares siting approval authority for offshore LNG terminals with the Coast Guard. Among other activities, the agency also administers its Maritime Security Program "to maintain an active, privately owned, U.S.-flag, and U.S.-crewed liner fleet in international trade."[57] Consistent with this mission, Congress passed the Coast Guard and Maritime Transportation Act of 2006 (P. L. 109 — 241) directing MARAD to implement a program to promote the transportation of LNG to domestic terminals in U.S. flag vessels (Sec. 304(a)). The act also directs the agency to give top priority to the processing of offshore LNG siting applications that will be supplied by U.S. flag vessels (Sec. 304(b). The act also requires the agency to consider the nation of registry for, and the nationality or citizenship of, officers and crew serving on board LNG tankers when reviewing an LNG terminal siting application (Sec. 304(c)).

Federal Pipeline and Chemical Security Agencies

Office of Pipeline Safety. The Office of Pipeline Safety (OPS) within the Pipeline and Hazardous Materials Safety Administration (PHMSA) of the Department of Transportation has statutory authority to regulate the safety and security of LNG peak-shaving plants. The agency derives this authority under the Natural Gas Pipeline Safety Act of 1968 (P.L. 90-481). The OPS security regulations for LNG peak-shaving facilities are found in 49 C.F.R. 193, *Liquefied Natural Gas Facilities: Federal Safety Standards* (Subpart J-Security). These regulations govern security procedures, protective enclosures, communications, monitoring, lighting, power sources, and warning signs. Federal LNG *safety* regulations (33 C.F.R. 127) and National Fire Protection Association standards for LNG also include provisions addressing security, such as requirements for monitoring facilities and preparing emergency response plans.[58]

On December, 28, 2006, the OPS published in the *Federal Register* a security advisory for LNG facility operators after an August, 2006 security breach at an LNG

[58] National Fire Protection Association (NFPA). *Standard for the Production, Storage, and Handling of Liquefied Natural Gas (LNG)*. NFPA 59A. Quincy, MA. 2006.

peak-shaving plant in Lynn, MA.[59] Although not a terrorist incident, the security breach involved the penetration of intruders through several security barriers and alert systems, permitting them to access the main LNG storage tank at the facility. The OPS advisory recommends that LNG facility operators ensure alarms and monitoring devices are functioning; ensure security personnel are properly trained; determine whether security personnel can respond to security breaches in a timely manner; update security procedures to incorporate the most relevant threat information; confirm that personnel properly coordinate their security activities; and independently audit facility security or conduct.[60]

Transportation Security Administration. The Transportation Security Administration (TSA) is the lead federal authority for the security of the interstate gas pipeline network under the Natural Gas Pipeline Safety Act of 1968 (P.L. 90-481). This security authority was transferred to TSA from the Transportation Department's Office of Pipeline Safety (OPS) under the Aviation and Transportation Security Act of 2001(P.L. 107-71). The TSA has asserted its security authority over land-based LNG facilities that are considered an integral part of the interstate pipeline network.[61] The TSA exercises its pipeline and LNG security oversight through the Pipeline Security Division (PSD) within the agency's Office of Transportation Sector Network Management.[62] The mission of TSA's Pipeline Security Division currently includes developing security standards; implementing measures to mitigate security risk; building and maintaining stakeholder relations, coordination, education and outreach; and monitoring compliance with security standards, requirements, and regulations.

Since 2003, TSA has put in place a number of initiatives related to pipeline security. These initiatives include the coordination, development, implementation, and monitoring of pipeline security plans; on-site reviews of pipeline operator security; United States and Canadian security assessment and planning for critical cross-border pipelines; regional supply studies for key natural gas markets; and pipelines security training, among other initiatives.[63] As of February 2008, TSA had completed 73 CSR reviews.[64] According to TSA, virtually all of the companies reviewed have developed security plans, identified critical assets, and conducted background checks on new employees. Most have also implemented employee security training programs and raised local community and law enforcement

awareness of pipeline security as part of their emergency response obligations.[65] In 2005, TSA issued an overview of recommended security practices for pipeline operators "for informational purposes only ... not intended to replace security measures already implemented by individual companies."[66] The agency released revised guidance on security best practices at the end of 2006 and plans to release a second revision in 2008.[67]

Federal Energy Regulatory Commission (FERC). The FERC is responsible for permitting new land-based LNG facilities, and for ensuring the safe operation of these facilities through subsequent inspections.[68] The initial permitting process requires approval of safety and security provisions in facility design, such as hazard detectors, security cameras, and vapor cloud exclusion zones. Every two years, FERC staff inspect LNG facilities to monitor the condition of the physical plant and inspect changes from the originally approved facility design or operations.[69] The FERC derives its LNG siting authority under the Natural Gas Act of 1938 (15 U.S.C. 717). The agency has jurisdiction over all on-shore LNG marine terminals and 12 peak-shaving plants involved in interstate gas trade.[70]

In response to public concern about LNG plant security since September 11, 2001, FERC has emphasized the importance of security at LNG facilities. According to the commission, FERC staff played key roles at inter-agency technical conferences regarding security at the Everett and Cove Point LNG terminals. According FERC staff, the commission has added a security chapter to its LNG site inspection manuals which consolidates previous requirements and adds new ones.[71] As part of its biennial inspection program, FERC also inspected 11 jurisdictional LNG sites in 2005 "placing increased emphasis on plant security measures and improvements."[72] FERC's FY2006 annual report states that "the Commission continues to give the highest priority to deciding any requests made for the recovery of extraordinary

expenditures to safeguard the reliability and security of the Nation's energy transportation systems and energy supply infrastructure."[73]

Department of Homeland Security. The Department of Homeland Security (DHS) Appropriations Act of 2007 (P.L. 109-295) grants DHS the authority to regulate chemical facilities that "present high levels of security risk" (Sec. 550). In November, 2007, DHS finalized its chemical facility security regulations under the act, requiring that facilities with certain hazardous chemicals, including LNG, at or above screening threshold quantities submit information to DHS through an on-line screening tool. Based on these evaluations, DHS will identify high risk facilities required to conduct a security vulnerability assessments and prepare site security plans to address identified vulnerabilities and meet risk-based performance standards.[74] These regulations may apply to inland LNG peak-shaving plants, although they exempt LNG facilities in ports which are subject to security regulations under the Maritime Transportation Security Act of 2002 (P.L. 107-295), as amended.

Federal Interagency Cooperation in LNG Security

The Coast Guard, TSA, and FERC all have potentially overlapping security jurisdiction over certain facilities at onshore LNG terminals. For example, FERC's biennial LNG site visits explicitly include security inspections, and TSA oversees onsite pipeline security — but the Coast Guard asserts lead security authority over the entire terminal in its maritime security regulations. Under current authority, both the Coast Guard and TSA could both require their own facility security assessments for pipelines and LNG storage at LNG marine terminals.

To avoid jurisdictional confusion, the Coast Guard, OPS and FERC have entered into an interagency agreement to ensure that they

> work in a coordinated manner to address issues regarding safety and security at waterfront LNG facilities, including the terminal facilities and tanker operations, to avoid duplication of effort, and to maximize the exchange of relevant information related to the safety and security aspects of LNG facilities and the related marine concerns.[75]

The agreement requires the agencies to cooperate in the siting approval of new LNG facilities, inspection and operational review of existing facilities, informal

February 11, 2004. p. 1.

communication, and dispute resolution.[76] According to FERC, in FY2006, the commission the "performed detailed reviews of [LNG] safety and security issues, in coordination with the U.S. Coast Guard and the U.S. Department of Transportation."[77]

The FERC's security review for new LNG terminal applications is conducted in consultation with the US Coast Guard. Security assessments of individual terminal proposals are conducted by Coast Guard field units through security workshops involving federal, state and local law enforcement officials as well as port stakeholders. FERC engineers provide technical assistance on marine spill issues. FERC and the Coast Guard require LNG terminal applicants to also submit a navigational suitability review under 33 C.F.R. 127, and begin a security assessment of their proposal in accordance with 33 C.F.R. 105. According to FERC, where site-specific security concerns have been raised, the agencies have conducted non-public technical workshops with "all relevant stakeholders and federal, state and local expert agencies" to resolve those security concerns.[78]

Industry Initiatives for Land-Based LNG Security

After the September 11 attacks, gas infrastructure operators, many with LNG facilities, immediately increased security against the newly perceived terrorist threat. The operators strengthened emergency plans; increased liaison with law enforcement; increased monitoring of visitors and vehicles on utility property; increased employee security awareness; and deployed more security guards.[79] In cooperation with the OPS, the Interstate Natural Gas Association of America (INGAA) formed a task force to develop and oversee industry-wide security standards "for critical onshore and offshore pipelines and related facilities, as well as liquefied natural gas (LNG) facilities."[80] The task force also included representatives from the Department of Energy (DOE), the American Gas Association (AGA), and non-member pipeline operators. With the endorsement of the OPS, the INGAA task force issued security guidelines for natural gas infrastructure, including LNG facilities, in September

2002.[81] The task force also worked with federal agencies, including the Department of Homeland Security, on a common government threat notification system.[82]

Key Policy Issues in LNG Security

Government and industry have taken significant steps to secure the nation's LNG infrastructure. But continued progress in implementing and sustaining LNG infrastructure protection activities may face several challenges. As discussed in detail in the following sections, members of Congress and federal officials are concerned about the growing public costs of LNG security, the uncertainty of terrorist threats against LNG, and security differences between foreign and U.S. LNG vessels and crews.

Public Costs of LNG Marine Security

Some policymakers are concerned about the public cost and sustainability of securing LNG shipments. Overall cost data for LNG security are unavailable, but estimates have been made for Everett shipments. In 2003, the Coast Guard Program Office estimated that it cost the Coast Guard approximately $40,000 to $50,000 to "shepherd" an LNG tanker through a delivery to the Everett terminal, depending on the duration of the delivery, the nature of the security escort, and other factors.[83] A 2007 update from the Coast Guard Boston Sector estimates an average direct cost to the Coast Guard of an LNG delivery to Everett of approximately $62,000.[84] State and local authorities also incur costs for overtime police, fire and security personnel overseeing LNG tanker deliveries. The state of Massachusetts and the cities of Boston and Chelsea estimated they spent a combined $37,500 to safeguard the first LNG shipment to Everett after September 11, 2001.[85] Based on these figures, the public cost of security for an LNG tanker shipment to Everett is on the order of $100,000, excluding costs incurred by the terminal owner.

Marine security costs at other active LNG terminals could be lower than for Everett to the extent they are farther from dense populations and face fewer vulnerabilities. But these terminals expect more shipments. Altogether, the six active onshore U.S. LNG terminals, including Everett, expect to have enough capacity for over 600 shipments per year in 2009. Further increasing LNG imports to meet 13% of total U.S. gas supply by 2030 as projected by the EIA could require

[81] Interstate Natural Gas Association of America (INGAA) et al., *Security Guidelines Natural Gas Industry Transmission and Distribution*. Washington, DC. September 6, 2002.

[82] Haener. February 13, 2002. p. 4.

[83] U.S. Coast Guard, Program Office. Personal communication. August 12, 2003. This estimate is based on boat, staff and administrative costs for an assumed 20-hour mission.

[84] Cdr. Mark Meservey, House Liaison, U.S. Coast Guard. "Sector Boston LNG Security Approximate Costs." Unpublished memorandum. May 4, 2007.

[85] McElhenny, J. "State Says LNG Tanker Security Cost $20,500." Associated Press. November 2, 2001. p. 1.

some 2,300 LNG shipments to LNG terminals serving the United States. Assuming an average security cost only half that for Everett, or $50,000 per shipment, annual costs to the public for marine LNG security could exceed $30 million by 2009 and $115 million by 2030.[86]

The potential increase in security costs from growing U.S. LNG imports, and the potential diversion of Coast Guard and safety agency resources from other activities have been a persistent concern to policy makers.[87] According to Coast Guard officials, the service's LNG security expenditures are not all incremental, since they are part of the Coast Guard's general mission to protect the nation's waters and coasts. Nonetheless, Coast Guard staff have acknowledged that resources dedicated to securing maritime LNG might be otherwise deployed for boating safety, search and rescue, drug interdiction, or other security missions. LNG security is funded from the Coast Guard's general maritime security budget, so it is not a line item in the FY2009 Department of Homeland Security budget request. However, the Coast Guard's FY2006 budget did include an additional $11 million in funding over FY2005 levels for "Increased Port Presence and LNG Transport Security," specifically including "additional boat crews and screening personnel at key LNG hubs."[88]

In a December 2007 report, the GAO recommended that the Coast Guard develop a national resource allocation plan to address growing LNG security requirements.[89] In subsequent testimony before Congress, Coast Guard Commandant Admiral Thad Allen expressed concern about the costs to the Coast Guard of securing dangerous cargoes such as LNG and called for a "national dialogue" on the issue.[90] During questioning, Admiral Allen acknowledged that the Coast Guard did not currently possess sufficient resources to secure future LNG deliveries to a proposed LNG terminal in Long Island Sound which has subsequently been authorized by FERC.[91]

[86] Note that security costs associated with any LNG terminals in Canada, Mexico and the Bahamas (built primarily to serve U.S. markets) would not be a direct U.S. responsibility, although such costs might still be priced into LNG supplied from those terminals.

[90] Admiral Thad Allen, Commandant, U.S. Coast Guard. Testimony before the House Committee on Appropriations, Subcommittee on Homeland Security hearing, "Coast Guard Budget: Impact on Maritime Safety, Security, and Environmental Protection." March 5, 2008.

[91] Admiral Thad Allen, March 5, 2008; Federal Energy Regulatory Commission. "Order Granting Authority Under Section 3 of the Natural Gas Act and Issuing Certificates." Docket No. CP06-54-0000. March 20, 2008.

State and local agencies are also seeking more funding to offset the costs of LNG security. Otherwise, they believe that LNG security needs may force them to divert limited local resources from other important public services. Addressing these concerns, the Energy Policy Act of 2005 requires private and public sector cost-sharing for LNG tanker security (Section 311d). In compliance with the act and prior FERC policy, FERC officials require new LNG terminal operators to pay the costs of any additional security or safety needed for their facilities.[92] The FERC has also recommended that LNG terminal operators provide private security staff to supplement Coast Guard and local government security forces.[93]

The public costs of LNG security may decline as federally mandated security systems and plans are implemented. New security technology, more specific threat intelligence, and changing threat assessments may all help to lower LNG security costs in the future. Nonetheless, the potential increase in security costs from growing U.S. LNG shipments may warrant a review of these costs and associated recovery mechanisms. S. 1594 would allow the DHS to establish a security cost-sharing plan to assist the USCG in securing LNG tankers and other vessels carrying especially hazardous cargo (Sec. 6). H.R. 2830 would prohibit LNG facility security plans based upon the provision of security by a state or local government unless that government has an LNG security arrangement with the facility operator (Sec. 328 (b)). H.R. 2830 would also require that, before facility security plans for new LNG terminals are approved, the Coast Guard certify that the agency has adequate resources in the sector where the terminal would be located to secure that terminal (Sec. 328(d)). Because the accounting of these security costs is unclear, however, and cost recovery may be partly tied to uncertain sources of federal funding, such as DHS security grants or future agency appropriations, stakeholders may continue to voice concern over costs for LNG security and incident response.

Uncertainty About LNG Threats

The likelihood of a terrorist attack on U.S. LNG infrastructure has been the subject of debate since September 11, 2001. To date, no LNG tanker or land-based LNG facility in the world has been attacked by terrorists. However, similar natural gas and oil facilities have been favored terror targets internationally. For example, since 2001, gas and oil pipelines have been attacked in at least half a dozen countries.[94] In October 2002, the French oil tanker *Limburg* was attacked off the Yemeni coast by a bomb-laden fishing boat.[95] In June 2003, U.S. intelligence

agencies warned about possible Al Qaeda attacks on energy facilities in Texas.[96] The Homeland Security Council included terrorist attacks on "cargo ships" carrying "flammable liquids" among the fifteen hazards scenarios it developed in 2004 as the basis for U.S. homeland security "national preparedness standards."[97]

In addition to warnings of a terrorist threat to energy facilities in general, federal agencies have identified LNG infrastructure in particular as a potential terrorist target. The Department of Homeland Security (DHS) specifically included LNG assets among a list of potential terrorist targets in a security alert late in 2003.[98] The DHS also reported that "in early 2001 there was some suspicion of possible associations between stowaways on Algerian flagged LNG tankers arriving in Boston and persons connected with the so-called 'Millennium Plot'" to bomb targets in the United States. While these suspicions could not be proved, DHS stated that "the risks associated with LNG shipments are real, and they can never be entirely eliminated."[99] The 2004 report by Sandia National Laboratories concluded that potential terrorist attacks on LNG tankers, could be considered "credible and possible."[100] The Sandia report identified LNG tankers as vulnerable to ramming, pre-placed explosives, insider takeover, hijacking, or external terrorist actions (such as a *Limburg*-type, missile or airplane attack).[101] Others further assert that terrorists have demonstrated both the desire and capability to attack such shipping with the intention of harming the general population.[102]

Although they acknowledge the security information put forth by federal agencies, many experts believe that concern about threats to LNG tankers is overstated.[103] In 2003, the head of one university research consortium remarked, for example, "from all the information we have ... we don't see LNG as likely or credible terrorist targets."[104] Industry representatives argue that deliberately causing an LNG catastrophe to injure people might be possible in theory, but would be extremely difficult to accomplish. Likewise, the Federal Energy Regulatory Commission

(FERC) and other experts believe that LNG facilities are relatively secure compared to other hazardous chemical infrastructures which receives less public attention. In a 2004 report, the FERC stated that

> for a new LNG terminal proposal ... the perceived threat of a terrorist attack may be considered as highly probable to the local population. However, at the national level, potential terrorist targets are plentiful.... Many of these pose a similar or greater hazard to that of LNG.[105]

The FERC also has remarked, however, that "unlike accidental causes, historical experience provides little guidance in estimating the probability of a terrorist attack on an LNG vessel or onshore storage facility."[106]

Former Director of Central Intelligence, James Woolsey, has stated his belief that a terrorist attack on an LNG tanker in U.S. waters would be unlikely because its potential impacts would not be great enough compared to other potential targets.[107] LNG terminal operators which have conducted proprietary assessments of potential terrorist attacks against LNG tankers, have expressed similar views.[108] In a September 2006 evaluation of a proposed LNG terminal in Long Island Sound, the Coast Guard stated that there were "currently no specific, credible threats against" the proposed LNG facility or tankers serving the facility.[109] The evaluation also noted, however, that the threat environment is dynamic and that some threats may be unknown.[110] Because the probability of a terrorist attack on LNG cannot be known with certainty, policy makers and community leaders must, to some extent, rely on their own judgment to decide whether LNG security measures for a specific facility will adequately protect the public. S. 1594 would increase federal protection of vessels and infrastructure handling LNG through new international standards (Sec. 2); safety and security assistance for foreign ports (Sec. 4-5), incident response and recovery plans (Sec. 7); and other provisions. Committee version of H.R. 2830 would prohibit the federal authorization of new LNG terminal facilities without the approval of DHS based upon a "comprehensive homeland security impact review" (Sec. 708).

Foreign vs. U.S. LNG Tankers and Crews

There are currently no U.S.-flagged LNG tankers and few, if any, U.S. citizens among LNG tanker crews. Some policy makers are concerned that, compared to U.S. vessels and crews, foreign-flagged LNG tankers may not face the same security requirements or may not face the same level of security oversight and verification.[111] This rationale underlies the provisions in P.L. 109-241 that promote LNG shipping to the United States on U.S.-flagged vessels with U.S. crews. Prompted by these provisions, at least four LNG developers have committed to using U.S. crews in their LNG terminal siting proposals.[112] Some stakeholders have called for similar measures to promote U.S. flags and crews for tankers serving onshore LNG terminals regulated by FERC.

Notwithstanding the LNG tanker provisions in P.L. 109-241, Coast Guard officials have stated that existing security provisions for foreign-flagged LNG tankers and foreign place them on an equal security footing with potential U.S. counterparts.[113]

> Our domestic maritime security regime is closely aligned with the International Ship and Port Facility Security (ISPS) Code.... Under the ISPS Code, vessels in international service, including LNG vessels, must have an International Ship Security Certificate (ISSC). To be issued an ISSC by its flag state, the vessel must develop and implement a threat-scalable security plan that, among other things, establishes access control measures, security measures for cargo handling and delivery of ships stores, surveillance and monitoring, security communications, security incident procedures, and training and drill requirements. The plan must also identify a Ship Security Officer who is responsible for ensuring compliance with the ship's security plan. The Coast Guard rigorously enforces this international requirement by evaluating security compliance as part of our ongoing port state control program.

Others have questioned preferential treatment of U.S. LNG tankers and crews on the grounds that it may impinge on free trade principles by discriminating against foreign LNG tanker operators fully adhering to international standards.[114] Given the potential maritime treaty and trade implications, federal efforts to promote U.S. flags and

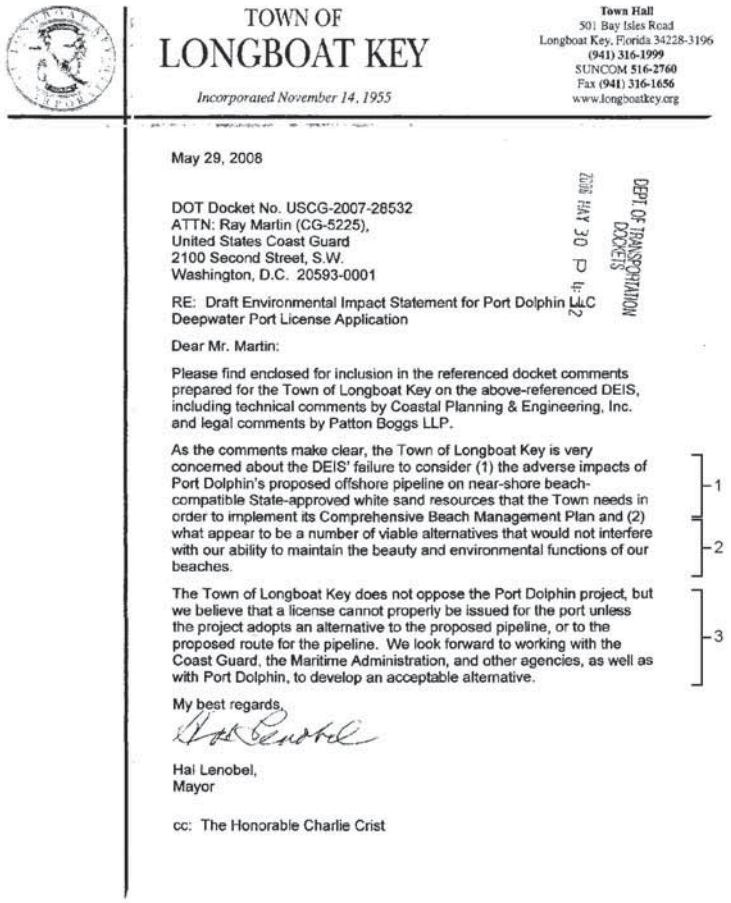
crews on LNG tankers may require careful consideration of potential benefits and costs.

Conclusions

The U.S. LNG industry is growing quickly. While rising LNG imports may offer economic benefits, they also pose risks. LNG infrastructure is inherently hazardous and it is potentially attractive to terrorists. Both lawmakers and the general public are concerned about these risks, although the LNG industry has a long history of relatively safe operations and has taken steps to secure its assets against terrorist attack. No LNG tanker or land-based facility has been attacked by terrorists, and federal, state and local governments have put in place security measures intended to safeguard LNG against newly perceived terrorist threats. These measures are evolving, but a variety of industry and agency representatives suggest that these federal initiatives are reducing the vulnerability of U.S. LNG to terrorism.



The ongoing debate about LNG infrastructure security in the United States has often been contentious. Local officials and community groups have challenged numerous LNG infrastructure proposals on the grounds that they may represent an unacceptable risk to the public. Heightened public scrutiny of LNG facilities has made it difficult to site new LNG terminals near major gas markets and has increased the cost and complexity of LNG terminal siting approval. Nonetheless, both industry and government officials acknowledge that enough new LNG infrastructure will likely be approved to meet long-term U.S. import requirements. Indeed, federal agencies have approved the construction of a number of new U.S. import terminals, several of them onshore. Numerous additional terminal proposals await federal approval. Together with the expansion of the existing U.S. import terminals and the construction of new LNG terminals in Canada and Mexico, the approved U.S. facilities would provide enough added capacity to meet the bulk of U.S. LNG demand for the next 20 years.

New U.S. LNG terminals may not be ideally located so as to minimize the cost of natural gas, but building them in these locations may be better than not building them at all. Furthermore, because their security has been subject to intense public scrutiny, new LNG terminal and tanker operations may be safer than they might have been without such scrutiny and their siting may be less likely to be challenged at a later time when construction is already underway. The construction and subsequent closure of the Shoreham nuclear power plant in the 1980's due to new public opposition offers an example of the need to resolve safety and security concerns before capital is invested. From a purely economic perspective, therefore, the added costs of building more heavily protected LNG terminals potentially farther from their primary markets may represent the U.S. public's willingness to pay for LNG security. Whether this implicit price of LNG security is reasonable is an open question, but the continued interest of private companies to invest billions of dollars in U.S. LNG terminals suggests that it will not prevent needed LNG development.

As Congress continues its oversight of LNG infrastructure development, it may decide to examine the public costs and resource requirements of LNG security,

especially in light of dramatically increasing LNG imports. In particular, Congress may consider whether future LNG security requirements will be appropriately funded, whether these requirements will be balanced against evolving risks, and whether the LNG industry is carrying its fair share of the security burden. Congress may also act to improve its understanding of LNG security risks. Costly "blanket" investments in LNG security might be avoided if more refined terror threat information were available to focus security spending on a narrower set of infrastructure vulnerabilities. Finally, Congress may initiate action to better understand the security and trade implications of efforts to promote U.S.-flagged LNG tankers.

In addition to these specific issues, Congress might consider how the various elements of U.S. LNG security activity fit together in the nation's overall strategy to protect critical infrastructure. Maintaining high levels of security around LNG tankers, for example, may be of limited benefit if other hazardous marine cargoes are less well-protected. U.S. LNG security also requires coordination among many groups: international treaty organizations, federal agencies, state and local agencies, trade associations and LNG infrastructure operators. Reviewing how these groups work together to achieve common security goals could be an oversight challenge for Congress.

RE: Draft Environmental Impact Statement for Port Dolphin LLC Deepwater Port License Application

Dear Mr. Martin:

Please find enclosed for inclusion in the referenced docket comments prepared for the Town of Longboat Key on the above-referenced DEIS, including technical comments by Coastal Planning & Engineering, Inc. and legal comments by Patton Boggs LLP.

As the comments make clear, the Town of Longboat Key is very concerned about the DEIS' failure to consider (1) the adverse impacts of Port Dolphin's proposed offshore pipeline on near-shore beach-compatible State-approved white sand resources that the Town needs in order to implement its Comprehensive Beach Management Plan and (2) what appear to be a number of viable alternatives that would not interfere with our ability to maintain the beauty and environmental functions of our beaches. 1, 2

The Town of Longboat Key does not oppose the Port Dolphin project, but we believe that a license cannot properly be issued for the port unless the project adopts an alternative to the proposed pipeline, or to the proposed route for the pipeline. We look forward to working with the Coast Guard, the Maritime Administration, and other agencies, as well as with Port Dolphin, to develop an acceptable alternative. 3

My best regards,

Hal Lenobel,
Mayor

cc: The Honorable Charlie Crist

1. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

2. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

3. Thank you for the comment.

POTENTIAL IMPACTS OF THE PORT DOLPHIN PIPELINE ON THE TOWN OF LONGBOAT KEY COMPREHENSIVE BEACH-MANAGEMENT PLAN: TOWN COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STAEMENT ON THE PORT DOLPHIN LLC DEEPWATER PORT LICENSE APPLICATION

EXECUTIVE SUMMARY

On March 29, 2007, Port Dolphin, LLC, submitted to the United States Coast Guard and the Maritime Administration an application for a Deepwater Port License. The proposed port would be a liquid natural gas re-gasification and offloading facility located approximately 28 miles offshore Anna Maria Island/Manatee County. As proposed, this facility would then be connected to Port Manatee via a subsea pipeline. On April 18, 2008 the United States Coast Guard and the United States Department of Transportation, Maritime Administration issued a Draft Environmental Impact Statement on the proposed Port Dolphin Project. The document is currently available for public comment, with comments due by June 2, 2008. The following information presented by the Town of Longboat Key summarizes both the Longboat Key Beach-management plan and the potential impacts the proposed Port Dolphin Project would have on the viability of this program.

The Town of Longboat Key manages an active beach-management plan for the entire coast of Longboat Key. This program is funded through Town revenue, State of Florida cost sharing, and the Tourist Development Council "Bed Tax" of both Manatee and Sarasota Counties, which is supported by the extensive tourism industry of these Counties (including Longboat Key). In addition to supporting the Bed Tax, the extensive tourism industry and natural beach environment of Longboat Key supports the existing ad valorem property tax base for the Town. 4

4. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

As of June 1, 2007, the Town of Longboat Key had a cumulative property valuation of $6,606,809,366. This valuation (and subsequent tax revenue) is significantly related to both the viability of the beaches of Longboat Key and the associated tourism industry. However, the beaches of Longboat Key are eroding and require maintenance through implementation of a comprehensive beach nourishment program. This beach-management plan relies on a proven, existing, native, white, but greatly-limited beach-compatible Gulf of Mexico sand resource located off the northwestern tip of Anna Maria Island as the ideal sand source for beach nourishment. Longboat Key has previously defined and permitted a beach-compatible mineral resource within the feature described above. This resource, was used for the 2005/2006 beach nourishment project, and still contains an additional 1,500,000 cubic yards of beach-compatible material available to Longboat Key for future beach-nourishment projects. The high similarity of this sand source with the native beach makes it an invaluable resource ideally suited for the geologic, biologic, and recreational needs of Longboat Key's white sandy beaches. It is these white sandy beaches that support the tourism driven economy of Longboat Key, Manatee County, Sarasota County, and the State of Florida. 4

The Town of Longboat Key Beach-management plan, and ultimately the beaches of Longboat Key, is in jeopardy due to the proposed location of Port Dolphin LLC's preferred and southern alternative routes for the Port Dolphin natural gas pipeline. This pipeline is proposed to be built directly through a previously permitted, ideal sand source that supports the current and future beach nourishment projects of Longboat Key, Borrow Area IX (Figures 1 and 2). A "borrow area" is an area specifically identified and delineated through geophysical and geotechnical investigations as the sediment source for a beach nourishment project. Borrow areas are also identified in permit documents as the allowable sediment source for a beach nourishment project. Nevertheless, the proposed preferred pipeline route impacts a much large area than just Borrow Area IX. The pipeline, as well as a large buffer zone which must be established along either side of the pipeline route, greatly impacts the volume of sand available for the Town of Longboat Key's Beach-management plan (Figures 1 and 2). Extraction of sand by

dredging would be prohibited over the pipe and in the buffer zone effectively eliminating the sand for future beach nourishment use. Direct impacts to this sand resource revolve around the fact that a significant volume of these beach-compatible sands will become permanently unavailable for future beach nourishment projects depending on the extent of the required buffer zone which is provided to protect the gas pipeline. This direct impact, while extreme by itself, could lead to significant cumulative impacts to the economy, public safety and the environment of the Town of Longboat Key. 5

If this existing borrow area (permitted for use under Florida Department of Environmental Protection Consolidated Joint Coastal Permit and Sovereign Submerged Lands Authorization Number 0202209-001-JC as "Borrow Area IX"), containing approximately 1,500,000 cubic yards of beach-compatible sand, is impacted by the construction of the pipeline (as currently proposed) and an associated safety buffer of potentially up to 1,000 meters, significant programmatic issues would arise. Specifically, the Town will lose access to most, if not all, of the remaining sand in the borrow area. Not only would this represent a direct loss of the time, money, and effort spent developing this as a fully permitted beach-compatible mineral source, but the Town would be forced to explore other as yet unknown sand resources to replace the remaining beach-compatible sand in Borrow Area IX. Assuming such high quality resources can be found, these resources will assuredly occur further away from the project area, causing an increase in the cost to construct future Longboat Key beach-nourishment projects. If this was to occur, the costs of future beach nourishment projects would increase substantially, up to a potential increase of $4,750,000 (or greater) depending on the final safety buffer imposed around the pipeline and the resulting additional distance to the new, as yet unknown replacement beach-compatible sand resource. 6

Additionally, the Town of Longboat Key has begun exploring offshore sand resources for potential as future, beach-compatible sand sources. The current proposed pipeline route crosses at least four of these individual sediment sources which occur in the form of 7

PAGE | 3
COASTAL PLANNING & ENGINEERING INC.
DOCKET NO. USCG-2007-28532

5. Representatives of FDEP have stated that they have no requirements for a buffer around pipelines. The Applicant has proposed a 400 foot buffer centered on the pipeline and the analysis in Section 4.4 is based on that buffer.

   In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

6. Representatives of FDEP have stated that they have no requirements for a buffer around pipelines. The Applicant has proposed a 400 foot buffer centered on the pipeline and the analysis in Section 4.4 is based on that buffer.

   In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

7. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

underwater "hills", impacting not only the Town of Longboat Key's current beach-compatible sand resource, but potential regional sand resources needed for the viability of Longboat Key and other regional shore-protection programs for the foreseeable future (Figure 1). 7

By forcing the Town of Longboat Key to abandon its permitted, existing beach-compatible sand resource, by impacting the larger sediment deposit adjacent to the borrow area, and by removing several offshore sand hills from the inventory of future sand resources, the construction of the pipeline may result in the Town of Longboat Kay having to use a more distant, potentially lesser-compatible sand resource for future beach-nourishment projects, at an increased cost to the overall project. This could result in the reduced effectiveness of future projects and may present permitting difficulties at the State level. 8

A weakened beach-management plan, due to lesser-compatible beach materials and more costly, more distant sand sources, could result in the continued erosion of Longboat Key's white sandy beaches. If this were allowed to happen, significant cumulative impacts to biological, recreational, and socioeconomic resources would occur, as well as the introduction of sensitive public safety issues, including: 9

1. A reduced or weakened beach-management plan could result in the increased erosion of Longboat Key's beaches resulting in the loss of the public beaches (a major public recreation resource) of Longboat Key;
2. A reduced or weakened beach-management plan could result in the erosion of Longboat Key's beaches resulting in the loss of tourists, affecting the local socioeconomic structure through a reduction in employment and tax revenues; 10
3. A reduced or weakened beach-management plan could result in the erosion of Longboat Key's beaches resulting in the loss of protection the beaches afford the island, resulting in the potential for increased flooding and undermining of vital hurricane and emergency evacuation routes for both Longboat Key and Anna Maria Island. Increased shoreline erosion will also threaten public and private infrastructure, including 11 12

8. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

9. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

10. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

11. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

12. Comment noted.

wastewater systems, telephone utilities, power utilities, and other existing critical systems along Longboat Key. 12

4. A reduced or eliminated shore protection program could result in the erosion of Longboat Key's beaches resulting in the loss of the beach as habitat, and loss of critical habitat needed for threatened and endangered sea turtle nesting; 13

These issues are vital to the continued well being of Longboat Key, yet none of these concerns are addressed in the Draft Environmental Impact Statement issued by the United States Coast Guard and Maritime Administration or the Deepwater Port License Application issued by the Port Dolphin, LLC. Longboat Key believes that all of these issues need to be included and comprehensively addressed within the Draft Environmental Impact Statement so that the United States Coast Guard and the United States Department of Transportation Maritime Administration, and the Governor of Florida (as a Governor of an adjacent coastal state) can make a fully informed decision on the Application for a Deepwater Port License submitted by Port Dolphin LLC. 14

The Town also feels that it important to state unequivocally that the Port Dolphin LLC Deepwater Port and associated pipeline and the Town of Longboat Key Beach-management plan are not mutually exclusive projects. In fact, several seemingly viable pipeline route alternatives exist that can allow the Port Dolphin project to be constructed without affecting the vital and highly limited sand resources required by Longboat Key for its beach-management plan (Figure 3). 15

These alternatives include:

1. Constructing the Port Dolphin pipeline from the deepwater port to an existing y-valve in the Gulfstream natural gas pipeline, where the Port Dolphin facility could then tie-into the existing pipeline. This option also eliminates many of the environmental impacts associated with the preferred route; 16

13. Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

14. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

15. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

16. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

2. A new alternative that would construct the pipeline route from the proposed deepwater port site straight to a spot approximately 2,000 feet south of where the existing Gulfstream pipeline crosses the Federal/State Boundary, approximately nine miles west of Egmont Key. At this point, the new pipeline could be collocated, or constructed parallel to, the existing Gulfstream pipeline all the way into Port Manatee. 17
3. A new alternative that would construct the pipeline straight from the offshore deepwater port site, directly to Southwest Passage (not Passage Key Inlet), crossing the Gulfstream Pipeline, and then continuing straight to its planned location in West-Central Lower Tampa Bay (all in one straight line). 18
4. Follow the preferred pipeline route as it is proposed, from the deepwater port toward Southwest Passage, where the pipeline would then deviate to the proposed northern alternative route as it enters Tampa Bay through Southwest Passage. Once inside of Tampa Bay, the pipeline could then deviate back to the preferred route. The vast majority of the preferred pipeline route could be retained with this minor adjustment. 19

Each of these alternatives results in no impacts (direct or cumulative) to Borrow Area IX or the beach-compatible mineral resources off Anna Maria Island that are vital to The Town of Longboat Key's beach-management plan. With this in mind, the Town strongly believes that a more detailed alternatives analysis needs to be presented in the DEIS. This analysis needs to build on the previously described alternatives, while adding the new alternatives suggested by the Town. Each alternative needs to be critically evaluated in terms of direct and cumulative environmental resource impacts, with the greatest weight given to the alternative(s) that have the least impacts to these environmental resources. In addition, the direct and cumulative impacts raised by the Town in these detailed comments need to be included and critically evaluated in the Draft Environmental Impact Statement. 20

In its current form, the Draft Environmental Impact Statement lacks a significant amount of information regarding alternatives and true resource impacts, and as such the Town feels 21

17. The Draft EIS included discussion of 3 port sites and 2 pipeline route alternatives. A 3rd alternative pipeline route (offshore interconnection with the Gulfstream Pipeline) has been added to the Final EIS in Section 2.1.4. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

18. Comment noted.

19. Comment noted.

20. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

21. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

another Draft Environmental Impact Statement needs to be issued that addresses these significant issues prior to going to the Final Environmental Impact Statement stage.

While the Town of Longboat Key has strong objections to the way the pipeline route is currently proposed, the Town feels that there are seemingly minor changes that can be made by Port Dolphin LLC to the preferred pipeline route that would result in no impacts to vital beach-compatible mineral resources. With this in mind, the Town is willing to work directly with the Port Dolphin LLC and/or the United States Coast Guard and the United States Department of Transportation, Maritime Administration to explore these alternatives in order to design a route that is mutually beneficial to both Longboat Key and Port Dolphin LLC. 21

"the Town"	Town of Longboat Key, Florida
USCG	United States Coast Guard

INTRODUCTION

The Town of Longboat Key (i.e. the Town) has been maintaining its beaches for both shore-protection and recreational purposes since the early 1990's. The Town's 1995 Comprehensive Beach-management plan, 1999 Beach Comprehensive Plan Update, and 2008 Comprehensive Plan Update were developed by Coastal Planning & Engineering, Inc. (CPE) to provide a framework for the Town's decision making process regarding their beach resources. Since 1995, the Town has proactively managed its resources and implemented many of the recommendations of the plan and the plan update. A large portion of the Plan relies on periodic "nourishment" of the Town's beaches from offshore sand sources. These sand sources undergo extensive exploration and testing in order to meet the stringent State of Florida beach-compatibility guidelines. These guidelines address engineering, geological, and biological standards required for matching offshore sand sources to the recipient beach.

HISTORY

The beaches of Longboat Key were critically eroded in the late 1980's and early 1990's. Short term structural solutions were implemented in an attempt to protect coastal infrastructure and buildings. Seawalls and revetments were used along most of the Key in an attempt to protect homes and roads, however, these structures may have contributed to further beach losses. Groins were also used with minimum success to hold sand along portions of the Key.

In 1993, a major beach nourishment project was constructed along the island with over 3 million cubic yards of fine white sand taken from the ebb shoals of Longboat Pass and New Pass. As part of this project, most groins were removed from Longboat Key as a permit condition.

22. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

    Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

This first project provided enough sand to widen the beach about 100 feet. Soon after the construction (1994-1995 timeframe), however, some sections of the beach narrowed significantly. The beach nourishment project did not provide enough sediment to offset volumetric losses which occurred prior to 1993. At the Bayport Condominium property the dry beach reduced to 25 feet as much of the fine sand moved offshore. In Section 2 and at the Islander Club Condominium property (section 4) the sand moved south leaving those sections of beach narrower than desired.

In 1995, a beach management program was developed to address these problems and improve long-term management of the beach. During the 1996/1997 nourishment, coarser gray sand was placed along portions of Section 3 and all of Section 4. Sand filled tubes were also employed to slow the movement of sand offshore at Bayport and alongshore at the Diplomat Condominium, Portobello, and Mark IV properties and at the Islander Club Condominium.

The coarser gray sand, which was obtained well offshore of Longboat Key, was placed on the beach at Bayport. Longshore losses were slowed at the Islander but not eliminated. However, public reaction to the non-native coarse gray sand was mixed as many residents and tourists did not like the color and texture which did not match the natural white sand. To address public concern, as well as the concerns of the State of Florida over potential impacts to turtle nesting from the coarse grey sand, the 2005/2006 beach nourishment was planned primarily as a white sand project along the entire Key using white colored sediments which matched the island's native sand. The native sediment buried a gray sand underlayer in three high-erosion areas (40% of the Key). This project was constructed in 2005/2006 and is currently being monitored for performance. Over 1,000,000 cubic yards of white sand for this project was taken from Borrow Area IX. Over 1,500,000 cubic yards of beach-compatible white sand remain available in this borrow area for future use.

22

TOWN COMMENTS ON THE PORT DOLPHIN DRAFT ENVIRONMENTAL IMPACT STATEMENT

The Town has reviewed the DEIS on the Port Dolphin LLC Deepwater Port License Application in order to determine what potential impacts the preferred alternatives may have on The Town of Longboat Key's Beach-management plan. Potential impacts (both major and minor), as well as areas where information identifying the potential impacts is missing and/or deficient, are outlined below, referenced to the specific DEIS sections.

Section 2: Detailed Description of Project and Alternatives

The Town reviewed Section 2 in order to understand how the preferred alternative pipeline route was selected. After a detailed review of the Alternatives Analysis, the Town found several areas where information was either contradictory to other public comments, lacking information, or missing altogether.

2.1. Alternatives Considered

2.1.1 Alternatives for Analysis

2.1.1.3 Port and Pipeline Location Alternatives

This section lists several criteria for identifying and evaluating the alternative pipeline corridor locations. Of particular interest to the Town is Criterion 3. This criterion states that "siting a project in an identified sand resource would be difficult, and likely would not be approved by the Minerals Management Service" (USCG and MARAD, 2008). With this statement, there is a strong acknowledgement that sand resources in Federal waters would be protected for such uses as beach nourishment. However, this statement and alternatives analysis, while true, does not fully describe the situation regarding mapped sand resources, specifically those within State of Florida jurisdictional waters. The MMS does have authority over identifying and permitting sand resources in Federal waters, but the proposed pipeline route also impacts offshore sovereign

22

submerged lands of the State of Florida. The MMS has no jurisdiction or authority for these lands. In regards to State of Florida sand and mineral resources, the FDEP BBCS has full authority for permitting the use of these sands as identified resources for shore protection projects through Florida Administrative Code 62B-41. In the case of this alternatives analysis, it does not appear that the USCG and MARAD, or Port Dolphin LLC in the Application (Port Dolphin, 2007a), coordinated with the FDEP BBCS in order to determine if the proposed alternatives impacted any sand resources.

22

There is reference to one report in which "Sand Resources" were identified. These resources are mapped on the Figure 2.1-10 (and many other figures) of the DEIS (USCG and MARAD, 2008). Upon further review of this referenced report, the "Sand Resources" as mapped within the DEIS are areas were the potential for sand resources may exist and not actual, beach-compatible mapped resources at all. The reliance of Port Dolphin LLC on this one source of mineral resource information resulted in the misinterpretation of true sand resources and the resulting location of the proposed pipeline route, which directly impacts a regionally limited, beach-compatible sand resource (Figures 1 and 2).

The exploration, identification, permitting, and use of sand resources are highly regulated actions by the State of Florida. As such, a great detail of time, money, and effort are expended to complete the regulatory process to the satisfaction of FDEP BBCS and the State of Florida. Applicants typically conduct both geophysical and geotechnical studies to identify appropriate, site-specific, beach-compatible sediment sources for beach nourishment use. Geophysical surveys are conducted after extensive research into existing and historical geological data to identify areas of potential beach-compatible sediment for application to specific beaches, such as the mineral resource off the northern end of Anna

23

23. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 4.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

Maria Island. These geophysical surveys include seismic sub-bottom investigations of the sub-surface sediment strata, sidescan sonar to map surficial ocean bottom features, bathymetric data to develop overlying water depths, magnetometer surveys to identify any potential cultural resources and/or hazards to borrow area development, and if necessary, diver surveys of the proposed borrow areas. After a borrow area is identified, a more detailed (30 meter spacing) seismic sub-bottom, sidescan sonar, and magnetometer survey is conducted under the supervision of a Marine Archaeologist to map all magnetic and geophysical anomalies for further study into cultural resource significance. Vibracores (sediment cores) are obtained, and the sediment layers within the vibracores are analyzed to determine sediment characteristics and compatibility with the recipient beach sediments. The vibracore and sediment data is then extrapolated to the seismic sub-bottom data in order to verify the geophysical survey data. If all of the surveys, studies, and analysis provide supportive results, a specific borrow area is identified and approved by the FDEP for use in the beach nourishment process. The sediments contained in the larger geologic feature in which the borrow area is located may also contain beach-compatible sediment resources that are suitable for future use in beach nourishment projects. This is true for the sediment deposit located next to Borrow Area IX off the north end of Anna Maria Island.

23

As part of the process to identify sediments which meet the stringent criteria for beach nourishment, easements and State of Florida "consent to use" decisions are issued for identified resources lying within State of Florida jurisdictional waters. Had Port Dolphin LLC contacted FDEP BBCS to determine if actual identified beach-compatible sand resources were going to be impacted, it would have been apparent that an existing, fully permitted existing borrow area, as well as a very-limited, highly-valuable, native, white sand mineral resource

24

24. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

currently used for beach nourishment projects would be directly impacted by the Preferred and Southern alternative pipeline routes (direct impacts to Geologic Resources will be discussed in greater detail in the comments on section 4.4 below). The northern pipeline route, as it approaches Egmont Key and enters Tampa Bay through Southwest Passage, does not impact any identified sand resources, and as such, the northern pipeline route alternative should be considered the preferred alternative in regards to Criterion 3. The decision to route the preferred and the southern routes through Passage Key Inlet has led to the direct impact to identified sand resources, whereas the routing of the pipeline through Southwest Passage results in no impacts to identified sand resources (Figures 1 and 2). Therefore, a route through Southwest Passage should be thoroughly reviewed in the alternatives analysis. 24

In response to the selected pipeline route, the Town requests a detailed analysis of the preferred pipeline route, but taking into consideration the actual identified and mapped sediment resources described above (and not the generic "potential sand resource" currently shown in the DEIS), which were not considered in the DEIS. There appear to be a number of alternatives which require additional analysis (Figure 3). 25

One option the Town requests that Port Dolphin LLC analyze is the potential use of a small portion of the northern route which deviates north of the sediment resource area. In this manner, the vast majority of the preferred route could be retained for use as the pipeline route. The Town believes that revision of the preferred pipeline route to incorporate that portion of the northern pipeline route that enters Tampa Bay through Southwest Passage, fully by-passing the beach-compatible sediment deposit, is a realistic alternative (Figure 3). 26

25. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

26. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

Another option is to connect into the existing Gulfstream pipeline (Figure 3). The Gulfstream pipeline apparently has both capacity and an offshore point of connection available to Port Dolphin, assuming a number of technical issues can be addressed. A major advantage to use of the Gulfstream line is avoidance of environmental impacts associated with the proposed Port Dolphin pipeline. Nevertheless, each alternative provides a satisfactory solution to the potential loss of sand resources which have been identified for use as the Longboat Key beach nourishment sediment source (addressed by the Town later in these comments). This alternative will be addressed in greater detail below. 27

A pipeline route which continues straight from the offshore Deepwater Port site, directly to Southwest Passage, crossing the Gulfstream Pipeline, and then continuing straight to its planned location in Central Tampa Bay (all in one straight line) is also an option, although not one specifically identified in the DEIS. This route may involve more study, but is a logical stand-alone pipeline route, and may actually result in a reduction of the overall length of pipeline, while maintaining the same number (2) of planned crossings of the Gulfstream Pipeline (Figure 3). 28

There is another alternative that is not addressed in the DEIS. This alternative would have the preferred pipeline route begin at the proposed Deepwater Port site and then continue to a spot approximately 2,000 feet south of where the existing Gulfstream Pipeline crosses the Federal/State Boundary, approximately nine miles west of Egmont Key. At this point, the new pipeline should be collocated, or constructed parallel to, the existing Gulfstream pipeline (Figure 3). In order to prevent impacts to either pipeline, the construction should occur outside of the easement of either Pipeline, but on a parallel path from offshore to Port Manatee. It would reduce the overall environmental impacts (addressed 29

27. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

28. In Response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

29. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

    An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

by the Town later in these comments) while maintaining access for the Port Dolphin pipeline. This route would also avoid impacts to all identified sand resources. Without an analysis of an alternative pipeline route based on collocating the Port Dolphin pipeline parallel to the existing Gulfstream pipeline in Florida State waters, the DEIS Alternatives Analysis is not complete. 29

The alternative of greatest viability may be the option of Port Dolphin LLC constructing their pipeline to, and connecting with the existing offshore piggable y-type valve already available as part of Gulfstream's existing pipeline at milepost 392.6. This valve was specifically constructed for this type of situation although as reported in the DEIS, technical issues would need to be addressed. This alternative was discussed in the DEIS, however, it was not addressed in detail and may have been dismissed after Port Dolphin LLC determined to use the preferred route. The DEIS lists several pipeline engineering reasons as to why this is not a feasible alternative, however, in response to the FERC proceeding for the onshore portion of the pipeline (and submitted as public comment to the DEIS proceeding) Gulfstream states that these issues can be successfully addressed. There is a minor discrepancy between the information presented in the DEIS and the information presented by Gulfstream regarding operating pressures of the Gulfstream Pipeline and of the re-vaporized gas at the Port Dolphin LLC terminal. However, minor revisions to the pipeline or vessel engineering systems should be considered more seriously if they result in significant reduction in impacts to environmental resources by tapping into an existing pipeline offshore, and avoid the beach-compatible sand resources required for beach nourishment projects. 30

A reduction in major and minor environmental impacts would be accomplished be eliminating over 20 miles of new pipeline construction. Additionally, the 31

30. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

31. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

Gulfstream pipeline was constructed with this valve in order to provide access to additional providers (like Port Dolphin). This appears to have been required by FERC in order to be in the public interest by allowing additional providers of natural gas access to the Gulfstream pipeline. The Town questions whether it is in the public interest to allow Port Dolphin to refuse this connection and to construct a new pipeline through sensitive and scarce resources that have significant environmental, economic, and public safety value to the Town (see later sections for detailed discussion of the impacts). 31

Based on these facts and observations it is the Town's opinion that the Alternatives Analysis presented in the DEIS is not complete, and that at least four potential alternatives need to be further explored, with greater importance given to the reduction in environmental impacts and avoidance of sand resources of each of these alternatives. These alternatives, shown in Figure 3 and listed below in order with the smallest potential for environmental impacts listed first (and Town preference) is: 32

1. A more detailed discussion regarding tapping into the Gulfstream pipeline at milepost 392.6, including a detailed analysis of the engineering issues involved and a qualitative and quantitative discussion on the reduction in environmental impacts by not having to construct 20+ miles of new pipeline;
2. A discussion of a new alternative that would construct the preferred pipeline route beginning at the proposed Deepwater Port site and then continue to a spot approximately 2,000 feet south of where the existing Gulfstream Pipeline crosses the Federal/State Boundary, approximately nine miles west of Egmont Key. At this point, the new pipeline could be collocated, or constructed parallel to, the existing Gulfstream pipeline all the way into Port Manatee.

32. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

3. A discussion of a new alternative of constructing the pipeline straight from the offshore Deepwater Port site, directly to Southwest Passage (not Passage Key Inlet), crossing the Gulfstream Pipeline, and then continuing straight to its planned location in West-Central Lower Tampa Bay (all in one straight line).
4. A discussion of the potential for diverting the pipeline to follow a small portion of the northern alternative route as it enters Tampa Bay via Southwest Passage to avoid the beach-compatible sediment resource areas, while retaining the greater majority of the preferred pipeline route.

32

Section 3: Affected Environment

Upon review of Section 3, the Town feels that the discussion relating to several resources was deficient in regards to issues specific to the West-Florida Coast. Additionally, information was missing in regards to the regulatory authority of State of Florida agencies on mineral resource management, which resulted in a major oversight of previously defined and active mineral resources directly in the path of the proposed pipeline route. These issues are discussed below.

3.2 Biological Resources

3.2.3 Threatened and Endangered Species

3.2.3.2 Threatened and Endangered Sea Turtles

The beaches of Longboat Key and the west coast of Florida provide valuable nesting habitat for sea turtles. Five sea turtle species have been known to nest on Florida beaches, including the threatened loggerhead sea turtle (*Caretta caretta*), endangered green sea turtle (*Chelonia mydas*), endangered leatherback sea turtle (*Dermochelys coriacea*), endangered hawksbill sea turtle (*Eretmochelys imbricata*), and endangered Kemp's ridley sea turtle (*Lepidochelys kempii*). On average, 223 sea turtle nests were laid annually on Longboat Key between the years 2000 and

33

33. Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

2006, with loggerheads accounting for approximately 99% of nesting (Tucker *et. al.*, 2007). Erosion of these beaches reduces available nesting habitat; however, Longboat Key's periodic beach nourishment with fill material that replicates the native beach sand increases the area that may be utilized for sea turtle nesting. 33

Sand source compatibility is a major consideration for the nourishment of a project area (NMFS and USFWS, 1991). Following beach nourishment, the increase in success of sea turtle hatchlings on a nourished beach environment is attributable to the type of sand (fill material) used in the project. Characteristics such as color, grain size, compaction and gas balance in the nest are major determinants in the success of nesting. Beach sand characteristics strongly influence the relative suitability of sea turtle nesting success (a choice to nest or false crawl) and hatchling success (the percentage of eggs that produce hatchlings) (T. Tucker, personal communication, 2008). According to Broadwell (1991), conditions favoring hatchling production may rely heavily on pore spacing and moisture content. The sand composition, color, and grain size can affect the incubation time, sex, and hatching success of turtle hatchlings (Street *et al.*, 2005). The color of the fill material can affect the temperature of the nest; increased nest temperatures have been linked to a strongly female-biased hatchling sex ratio among loggerhead sea turtles, which has serious implications for the reproductive success of the species (Mrosovsky and Provancha, 1992). 34

It is important that beach fill material be compatible with sea turtle nesting and hatching requirements. Fill material should resemble native grain size distribution and sorting level, color and shape to better maintain native beach habitats. The sediment source off of the north end of Anna Maria Island, including Borrow Area IX, meets the rigorous requirements of the State of Florida concerning "beach-compatible" sediment, and it is the only known economical sediment deposit with

34. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

    Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

similar sediment characteristics to that of the Longboat Key beach currently available to the Town of Longboat Key. The sediment very closely matches the existing beach sand, therefore utilization of this sand source for Longboat Key beach nourishment projects maintains the beaches as suitable and valuable sea turtle nesting habitat. 34

While The DEIS has a relatively extensive discussion on threatened and endangered sea turtles, it fails to discuss the importance of beaches and sediment characteristics required by threatened and endangered sea turtles to nest and successfully reproduce. This is a major oversight, and the Town considers the DEIS incomplete without a discussion on: 35

1. A description of the optimal native beach habitat required for threatened and endangered sea turtles to successfully nest and reproduce; 36
2. A discussion on the importance of quality beach material and access to successful sea turtle reproduction; 37
3. A discussion on the requirements of beach-compatible borrow sand quality and characteristics required for maintaining suitable beach habitat for threatened and endangered sea turtles to successfully nest and reproduce. 38

3.4 Geological Resources

3.4.2 Offshore Regional Geology (Mineral Resources)

As described in the Town's comments for Section 2.1.1.3, there was limited to no discussion of State of Florida sand and mineral resources. There was only a cursory mention of sand resources within Florida State waters, and that comment was incorrect. In both the application and DEIS, there are repeated assertions that the MMS has final regulatory authority over these resources. While this is true for Federal mineral resources, it is not true for State of Florida mineral resources which extend from the mean high water line out to a distance of nine (9) miles offshore. The FDEP BBCS has full 39

35. Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

36. Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

37. Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

38. Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

39. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

regulatory authority over the identification, permitting, and use of State of Florida sand resources for shore protection activities under Florida Administrative Code 62B-41. It is believed that Port Dolphin LLC failed to address the potential presence of beach-compatible mineral resources required for regional beach nourishment projects within the planned pipeline route with the FDEP BBCS, instead relying on one report that shows a large region of potential sand resources offshore of Anna Maria Island and Longboat Key, and not actual identified and mapped beach-compatible sand resources (*i.e.* mapped mineral resources as the NEPA process requires). However, even in considering this larger area of potential sand resources referenced in the DEIS, Port Dolphin LLC ignored that information and selected a pipeline route through the potential resource area even though there were other viable pipeline routes. 39

As stated earlier, potential sand deposits within the area mapped as potential sand resources in the DEIS are actually undefined, and most of them do not meet the current strict "beach compatibility" standards for use as borrow material in beach nourishment projects. The exploration and identification of beach-compatible sand resources is a highly-regulated process governed by the FDEP BBCS. The goals of these strict regulations are to identify and use only the best and most appropriate sand for beach nourishment activities, primarily seeking sediment which most closely matches the native beach sediment. In order to be deemed suitable, proposed offshore sand sources are reviewed in context with the recipient beach by the FDEP BBCS. The review includes comment by outside agencies (State Fish and Wildlife, State Historic Preservation Office, etc.) to insure that adverse environmental or cultural impacts will not occur. In addition, sediments must meet specific criteria. The performance of a beach nourishment project is related to the quality and quantity of sand used to nourish or replenish the eroding shoreline. State and federal regulatory agencies require that sand resources for nourishment be "beach-compatible" or similar to the natural sand for any given area. Various qualities like grain size, silt content, color, and mineralogical content are taken 40

40. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

into account. The quality of material that can be placed on Florida's beaches is governed by Rule 62B-41.007(2)(j) F.A.C. which states that:

> To protect the environmental functions of Florida's beaches, only beach-compatible fill shall be placed on the beach or in any associated dune system. Beach-compatible fill is material that maintains the general character and functionality of the material occurring on the beach and in the adjacent dune and coastal system. Such material shall be predominately of carbonate, quartz or similar material with a particle size distribution ranging between 0.062 mm (4.0 phi) and 4.76 mm (-2.25 phi) (classified as sand by either the Unified Soils or the Wentworth classification), shall be similar in color and grain size distribution (sand grain frequency, mean and median grain size, and sorting coefficient) to the material in the existing coastal system at the disposal site and shall not contain:
>
> 1. Greater than 5 percent, by weight, silt, clay or colloids passing the #230 sieve (4.0 phi);
> 2. Greater than 5 percent, by weight, fine gravel retained on the #4 sieve (-2.25 phi);
> 3. Coarse gravel, cobbles or material retained on the 3/4 inch sieve in a percentage or size greater than found on the native beach;
> 4. Construction debris, toxic material or other foreign matter; and
> 5. Not result in cementation of the beach.

If rocks or other non-specified materials appear on the surface of the filled beach in excess of 50% of background in any 10,000 square foot area, then surface rock should be removed from those areas. These areas shall also be tested for subsurface rock percentage and remediated as required. If the

40

natural beach exceeds any of the limiting parameters listed above, then the fill material shall not exceed the naturally occurring level for that parameter.

Once a borrow area is found to be compatible with the recipient beach, a detailed Quality Assurance/Quality Control (QA/QC) plan is developed (in conjunction with, and approved by the FDEP BBCS) which must be followed exactly during construction of the shore protection project. This plan specifies a range of sediment characteristics which are considered acceptable for placement. The characteristics typically include mean grain size, silt content, color and shell content. These plans are site specific and can include other parameters as well. A detailed sampling regimen is provided to determine if material placed meets the QA/QC criteria. The plan also provides guidance on mitigation in the event that material fails to meet the criteria. Mitigation often involves either removal of non-compliant material or mixing with other material in order to meet QA/QC standards.

Based on these strict standards and rules, the area mapped in Figure 2.1-10 of the DEIS (USCG and MARAD, 2008) is not an accurate representation of sand resources. It does show the area of potential resources based on available data, but unfortunately does not highlight high-quality, regionally-limited, beach-compatible sediment resources such as Borrow Area IX and the sediment deposit off the north end of Anna Maria Island. In fact, beach-compatible sand is a severely limited resource, and as such, needs to be conserved whenever possible for future use in beach-nourishment programs. Nevertheless, Port Dolphin LLC still selected a preferred pipeline route through the potential sediment resources when there were viable pipeline routes that would have preserved the limited beach-compatible sediment resources for shoreline protection.

Due to what appears to be a major oversight in not thoroughly investigating potential beach nourishment sediment resources in the path of the preferred pipeline, the

40

applicant missed the important beach-compatible beach nourishment sediment source for both Manatee County and the Town of Longboat Key. Port Dolphin LLC may not have been familiar with the strict rules governing the identification of a beach-compatible sand resource, not aware of the various criteria that must be met to receive approval of a beach-compatible, beach nourishment sediment source. Port Dolphin LLC may have not been aware of the fact that such resources are highly limited, and greatly sought after by communities which need the sediment to maintain their beaches. Communication with FDEP BBCS and local government agencies in charge of local beach-management plans (the Town of Longboat Key, Manatee County Department of Conservation Lands Management, Pinellas County Department of Environmental Resource Management, etc.) would have provided the applicant with information that would have been important in developing a pipeline route to avoid the beach-compatible sand resource area, as directed by the NPEA process. The Applicant apparently did consult with the ROSS database for potential sediments, however, the applicant did not follow up on the ROSS information to learn of the specific resources in the direct path of the preferred pipeline route. As a result, the Application and DEIS failed to identify the true beach-compatible sand resources along the preferred pipeline route. In addition to the sediment deposit as a whole, specifically, a fully permitted, active, existing Borrow Area IX for Longboat Key is directly bisected by the proposed pipeline route (see comments in section 4.4 for more impact information). This borrow area was permitted for use by the FDEP BBCS under Consolidated Joint Coastal Permit and Sovereign Submerged Lands Authorization Number 0202209-001-JC.

Due to the proposed pipeline route, a significant portion of the sediment deposit offshore the northwestern tip of Anna Maria Island, in addition to the specific borrow area mentioned above, will not be available for use on both Anna Maria Island and Longboat Key after construction. This sediment is the ideal sand mineral resource for shore protection projects on Longboat Key. The geologic character (as described above

40

in Florida Administrative Code 62B-41.007(2)(j)) is an excellent match for both Longboat Key and Anna Maria Island. In addition to being the sand source for the Longboat Key project, this sediment deposit has served as a successful sand source for the last three Anna Maria Island beach nourishment projects. Longboat Kay considers this shoal to be the current and long-term, white, beach-compatible sand source for its beach-management plan. Specific impacts to this sediment source, as well as offshore regional mineral resources, will be described in detail under comments for section 4.4 (below). 40

When defining a potential pipeline route, Port Dolphin LLC should conduct a title determination on the submerged lands to be included on, or near, the proposed pipeline route. It appears that this was not done, or not completed properly, for the Application or the DEIS. If it had been, the existing Longboat Key borrow area and historic Anna Maria Island borrow areas should have been mapped as identified sand resources.

In summary, the Town finds this section of the DEIS severely lacking in regard to information on actual geologic mineral resources within the proposed project area. As such, the Town considers the DEIS incomplete until a detailed discussion is included on: 41

1. The detailed and highly-regulated process by which mineral resources are identified in Florida State waters;
2. A detailed description of true identified mineral resources (including sand borrow areas permitted for use by FDEP BBCS) as opposed to a generic mention a large portion of seafloor that has limited potential for sand resources;
3. A detailed discussion on the regional needs for sand resources for beach-management plans in the vicinity of the project area.

3.6 Recreation and Aesthetics

3.6.1 Definition of the Resource

41. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

Although Longboat Key has an extensive white sand beach, no Longboat Key facilities were mentioned in the DEIS as important recreational resources. In particular, the section titled "Recreation on Local Islands" solely focused on island parks in Hillsborough and Pinellas County, with two of the mentioned parks (Caladesi and Honeymoon Island) occurring over 35 miles from the proposed project location, while Longboat Key is immediately south of the preferred pipeline route.

The Town believes that there was a significant oversight of the Longboat Key beaches themselves, which are in direct proximity to the project area. Longboat actively maintains all ten miles of island coastline as part of its beach-management plan. The beach-management plan is partly funded by the State of Florida, and the Manatee County and Sarasota County "Bed Tax" programs, as well as through special assessments from the Town itself. In order to qualify for State funds for shore protection, the Town has to maintain beach access and parking facilities for the general public along portions of the shoreline of Longboat Key. As part of the certification process, the FDEP BBCS identifies all available access points and provides funding based on actual availability. In the case of Longboat Key, over 10,000 feet of beachfront serves as direct access points to the general public. The process of determining public access and eligibility for State cost-sharing also includes the determination of an Erosion Control Line (ECL). Since the State of Florida cost-shares the construction (and related) costs of Longboat Key's beach nourishment projects, the ECL was determined and platted in relation to the existing mean-high water line prior to the construction of the first beach-nourishment project. Once determined, the ECL becomes the legal boundary between upland, private property and public, State of Florida sovereign lands, meaning that anything seaward of the ECL is State of Florida public property. This rule is critical to the Florida shore protection program by ensuring that all constructed beaches that are funded (at least partly) by the State of Florida are owned by the State and considered public property for the enjoyment of the citizens of the State of Florida.

42

42. Comment noted.

The goal of this process is to ensure, on behalf of the Governor and Board of Trustees for the Internal Improvement Trust Fund of the State of Florida, access to the general public to the sandy beaches of the State of Florida. In essence, this allows for a significant portion of the shoreline of Longboat Key to be accessed and enjoyed by the general public, and therefore, is a major public recreation area. Due to this fact, the maintenance of these public recreational resources through shore protection activities like beach nourishment is vital to the protection and continued availability to the general public. This is a major recreational resource enjoyed by the general public and tourists from all over the United States and abroad. 43

The DEIS does not identify or otherwise mention the beaches of Longboat Key as a major recreational resource. The Town considers the DEIS to be incomplete and misleading without the inclusion of a detailed discussion of the existing public beach access program present on Longboat Key and neighboring barrier islands.

3.9 Socioeconomic Resources and Environmental Justice

3.9.1 Definition of the Resource

The DEIS states that "NEPA requires an analysis of socioeconomic issues if socioeconomic effects are interrelated with environmental effects" and continues to define the resource as "the basic attributes and resources associated with the human environment, particularly population and economic activity" (USCG and MARAD, 2008). One of the largest economic sectors of the State of Florida, Manatee County, Sarasota County and the Town of Longboat Key is the tourism industry. The tourism industry in Florida and Longboat Key is highly dependent on the environment, in particular, to the access and health of Florida's white sandy beaches. The Town was dismayed to see that the DEIS discussion of socioeconomics was limited to fisheries and fisheries management as well as basic statistics as to general onshore economic industries, 44

43. Comment noted.

44. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

population, and employment. There is only brief mention of tourism, on DEIS page 3-116, that is inadequate at best. This reference is to recreational fishing as the only tourism related industry in the region is both highly misleading and incorrect.

The main economic engine for Longboat Key is tourism, which is based on the existence of the beaches of Longboat Key. Rental properties, transportation, retail, food and service industries primarily revolve around the beach–related tourism industry of Longboat Key. None of these economic issues are even addressed in the DEIS. 44

Additionally, the tax base of Longboat Key is dependent on Manatee and Sarasota County's Tourist Development "Bed Taxes", the retail sales tax, and ad valorem property taxes. Currently, it is a combination of these taxes and special assessments that directly fund the beach nourishment projects of Longboat Key. The DEIS fails to discuss any issues related to the extensive tourism industry of Manatee County, Sarasota County, or Longboat Key, or how these issues fund large socioeconomic programs, including environmentally based activities like beach nourishment.

Seeing that these activities are closely linked, the Town believes a detailed discussion of the total tourism industry and its direct impact to tax revenues in Manatee County, Sarasota County, and the Town of Longboat Key is required. Additionally, the links between the tourism industry, "Bed Taxes" and other tax revenue, and beach nourishment need to be addressed in the DEIS. It is important for the DEIS to accurately describe the interconnectivity of beach nourishment (including protection of available beach-compatible mineral resources) to tourism, tax revenue, and the continued support of the beach-management plan through beach nourishment. Without this discussion the DEIS is incomplete. 45

45. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9

Section 4: Environmental Consequences

In Section 4, the Town was able to identify a direct, major impact to a sensitive environmental resource that the Town relies on for shore-protection. The impact to this geologic resource is described below, and several major cumulative impacts due to this direct environmental impact are described later in the Town's comments to Section 6 of the DEIS.

Section 4.4: Geological Resources

The DEIS states that "Protection of unique geological features, minimization of soil erosion, and the siting of facilities in relation to mineral resources and potential geologic hazards are considered when evaluating potential impacts of the Port Dolphin project on geological resources. Generally, impacts on geological resources or caused by geologic hazards can be avoided or minimized through proper siting" (USCG and MARAD, 2008). Both the DEIS and the Application plainly state, in an effort to properly site the preferred pipeline route, that "the route avoids mapped mineral resources" with the DEIS stating the following: "geological resources generally would not be impacted by the project. Some localized, short-term changes in sedimentation would be expected. It is not expected that the project would cause destruction of any unique geologic feature, increase erosion potential, prevent recovery of mineral resources..." These statements are inaccurate, rendering this portion of the DEIS unacceptable. 46

As discussed earlier in the comments for Section 3.4.2, the DEIS maps a much larger area of potential sand resources instead of referencing actual permitted and identified sand resources (*i.e.* mapped mineral resources as the NEPA process requires). However, even in considering this larger area of potential sand resources referenced in the DEIS, Port Dolphin LLC ignored that information and selected a pipeline route through the potential resource area even though there were other viable pipeline routes. Yet, even with this clearly mapped on figures in the DEIS, the document still states that "It is not expected that the project would cause destruction of any unique geologic feature, increase erosion potential, prevent recovery of mineral 47

46. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

47. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9. Port Dolphin has requested a 400-foot buffer centered over the pipeline.

resources..." This is clearly contradictory to figure 2.1-10 (among others) presented in the DEIS which shows the preferred pipeline route going through the northern section of the potential sand resources. Also, as discussed earlier in the Town's comments on section 3.4.2, had Port Dolphin LLC considered the State of Florida's regulatory authority regarding mineral resources in State of Florida jurisdictional waters, it would have discovered the FDEP BBCS has full regulatory authority over the identification and permitting of mineral resources in Florida State jurisdictional waters. This, together with a properly performed title determination, may have led to the discovery that, as proposed, the preferred pipeline route bisects an existing, fully permitted borrow area used by Longboat Key (Borrow Area IX), as well as bisecting a much larger beach-compatible sand resource, containing an estimated 18,245,000 cy of beach-compatible sand resources, that is the historic and future source for beach-compatible sands for the Town of Longboat Key Beach-management plan and Manatee County's shore-protection program (Figures 1 and 2).

47

The borrow area bisected by the proposed pipeline route, Borrow Area IX permitted under the authority of the FDEP BBCS through Consolidated Joint Coastal Permit and Sovereign Submerged Lands Authorization Number 0202209-001-JC, was utilized by the Town for the 2005/2006 beach-nourishment project. At that time, over 1,000,000 cy of white, native, beach-compatible sand was dredged from Borrow Area IX and place along Longboat Key. After construction of the project, an estimated 1,500,000 cy of white, native, beach-compatible, FDEP-permitted sand remained in Borrow Area IX for use in future Longboat Key beach-nourishment projects. This is in addition to the larger volume of sand available in the overall geologic feature surrounding Longboat Key's Borrow Area IX, which is also impacted by the proposed pipeline route.

Due to the limited availability of similar beach-compatible sand resources, and to the fact that this resource has been used successfully on at least four occasions (three for Anna Maria Island and once for Longboat Key), this mineral resource qualifies as a unique geologic feature.

48

48. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

Referring back to the DEIS contention that "it is not expected that the project would cause destruction of any unique geologic feature, increase erosion potential, prevent recovery of mineral resources...", the Town disagrees, as the proposed pipeline route directly impacts a unique geologic feature while also preventing recovery of a substantial volume of vital, regionally-limited, beach-compatible mineral resources, including approximately 1,500,000 cy of material previously permitted by the FDEP BBCS for use by the Town of Longboat Key for future beach nourishment projects. 48

In addition to being the ideal sand source in regards to geologic and biologic native beach compatibility, this high quality sand source is the closest large sediment deposit of this quality to the recipient beaches of Longboat Key. This is one of only three sand resources known to Longboat Key that have the unique, beach specific qualities and proximity to the project area required for the Town's beach-management plan. Unfortunately one source, the Longboat Pass ebb shoal, presently does not qualify for the State of Florida permits required for excavation of those beach-compatible sands and New Pass does not contain sufficient sand volume for the Longboat Key program. This means that the beach-compatible sand resources within Borrow Area IX and the adjacent sediment deposit offshore the northern end of Anna Maria Island are the only sand resource that contains the readily available, ideal beach-compatible sand required by the State of Florida available to the Town for its current and future beach nourishment programs. Therefore, quantifying the impact of the proposed construction of the Port Dolphin natural gas pipeline directly through Borrow Area IX, and also impacting the adjacent sediment deposit, is vital to Longboat Key, as such an analysis will lead to the conclusion that a non-impactive pipeline route is absolutely necessary. 49

In order to determine the true impact that the proposed pipeline route would have on these geologic resources, the Town must consider not just the actual footprint of the pipeline itself, but a "safety buffer", restricting dredging or other bottom impacts, that would be employed around the constructed pipeline in order to avoid future impacts to the natural gas pipeline. In 50

49. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

50. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

the State of Florida, this is a common occurrence when defining boundaries for mineral resources (such as beach-compatible sand borrow areas) when they occur in proximity to cable routes, storm water, and waste water outfalls, and other buried obstructions. Unfortunately, there is no clear precedent for how wide a safety buffer around a natural gas pipeline is must be in the State of Florida. Its size would be determined through the State permitting process. Nevertheless, natural gas pipelines which are located in other areas of the country require buffer zones of 300 to 600 meters (or potentially more) to either side of the pipeline. In Louisiana, these pipelines are quite distant from highly-populated areas in many cases, yet the 300 – 600 meter buffer zones are common. The preferred Port Dolphin pipeline route, as it passes through Borrow Area IX and the surrounding beach-compatible sand source, is close to highly populated areas, and to areas of relatively high recreational boat traffic. Considering the proximity of the proposed pipeline to the populace, it is anticipated that the State of Florida could require at least a 300 meter buffer zone, if not more. In the case of defining and permitting a beach-compatible borrow area, the safety buffer would be negotiated during the permitting process between the beach nourishment project applicant (typically a County or municipality) and the FDEP BBCS, the State regulatory agency in charge of permitting beach-compatible mineral resources and the related beach nourishment projects. Due to the sensitive nature of a natural gas pipeline, it is assumed that the State would err on the side of caution and design a larger "no dredge" safety buffer. 50

Realistic assumptions must be made to try and determine what this safety buffer will be, prior to allowing construction of any pipeline. Louisiana and Texas have extensive oil and gas infrastructure, including widespread oil and gas pipelines throughout their State and Federal submerged lands. Borrow areas have been defined in proximity to these pipelines in the past, and recently, the safety buffer proposed by the MMS (the regulatory agency in charge of Federal oil, gas, and mineral resources) was 1,000 meters to either side of the pipeline, resulting in a 2,000 meter no-dredge corridor centered on the pipeline. This is a significant buffer and probably the worst case scenario regarding a safety buffer for the Port Dolphin

pipeline. In order to determine how a safety buffer may impact the mineral resources along the proposed pipeline route, the worst case scenario of 1,000 meters was considered along with a less restrictive, but still significant, 1,000 foot buffer (Figures 1 and 2).

When a 1,000 meter buffer is applied to the proposed pipeline route, all of Borrow Area IX becomes ineligible for future beach nourishment projects. If that buffer were reduced to 1,000 feet, approximately 50% of Borrow Area IX becomes inaccessible to Longboat Key for future beach-nourishment projects. This however, does not mean the other 50% would still be available, as the proposed pipeline would actually bisect Borrow Area IX, resulting in two separate and small borrow areas. By bisecting Borrow Area IX, the remaining areas would be too small to be effectively dredged for future beach nourishment projects. Therefore, any potential buffer of the proposed pipeline would result in the potential loss of all remaining sand in Borrow Area IX from the inventory of beach-compatible sands available to Longboat Key. This represents a major impact to an existing mineral resource, and to the economy and safety of Longboat Key. 50

As part of the planning and permitting process for the 2005/2006 beach nourishment project, the Town of Longboat Key spent over $500,000 exploring, analyzing, defining, and permitting Borrow Area IX. If the pipeline is constructed along the currently proposed route, removing the remaining material in the borrow area from the inventory of available beach-compatible materials, then that will essentially result in the loss of the $500,000 the Town previously spent on Borrow Area IX. In addition, The Town of Longboat Key would then have to try and locate a replacement, beach-compatible sand source. This will result in a new expenditure of at least $500,000 to try and locate this sand resource, and, due to the fact that beach-compatible sand is a severely limited resource regionally, there is no guarantee that a replacement sand resource could be located and eligible for a state permit. If one is found, it will undoubtedly be located in an area that is further from Longboat Key than Borrow Area IX. 51

51. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

In addition to the $1,000,000 of Town expenditures described above, the Town would have to pay the incremental cost difference of excavating and constructing a sand resource that occurs further away from the project than Borrow Area IX. For discussion purposes, it can be estimated that the incremental cost of construction due to an increase in distance is on the order of a minimum of $0.50/cy per mile based on direct distance traveled from the beach nourishment site to the borrow area. In order to try and quantify the impact in terms of replacing the sand in Borrow Area IX, assuming that a new borrow area would be found 5 miles further away from the project area (or 10 miles roundtrip for the dredge), would result in the incremental cost increase of $2.5/cubic yard of sediment. Borrow Area IX has more than 1,500,000 cy of beach-compatible material remaining within the permitted borrow area, to replace this material from a borrow area 5 miles further away from the project would result in the minimum cost of $3,750,000, at today's rates (which is highly affected by the cost of fuel, which may continue to increase). The construction of the pipeline (as currently proposed) would result in a ***minimum*** impact to the Town of Longboat Key of $4,750,000 for their next beach nourishment project. Depending on how far away a new sand source is, and the economics associated with dredging that borrow area in the future, this cost could rise dramatically. This is not a cumulative impact, or an impact to a potential sand resource; this is a direct impact to a fully designed and FDEP-permitted mineral resource. 51

In addition to the direct impact of the proposed pipeline route to Borrow Area IX, the proposed pipeline route crosses at least four offshore underwater sand hill features, all of which show promise as sediment resources for beach nourishment. These features are currently being investigated by Longboat Key to determine what potential they may have as future, beach-compatible sand resources. If the pipeline is constructed across them, then they will become unavailable for future beach nourishment projects, not only for Longboat Key, but for regional communities including Pinellas County, Manatee County, and Sarasota County. The currently proposed preferred pipeline route does not take into account regional beach-compatible sand resource needs, despite language stating so in the DEIS. This is a major issue to Longboat Key 52

52. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

and its neighbors, as regionally-limited, beach-compatible sand resources are a highly sought after commodity, uniquely qualified for beach nourishment and shore protection projects along Florida's west coast. If these sand resources become further restricted due to the construction of the Port Dolphin pipeline, the Longboat Key Beach-management plan, together with the other regional shore protection programs, will see increased competition for already limited regional resources, resulting in long-term project impacts that would result in the cumulative impacts addressed in the Town's comments on Section 6, addressed later in this document.

The DEIS entry overlooks the impacts to the unique mineral resources listed above. The DEIS describes the destruction of unique geological features as a major impact, and impacts due to siting of facilities to prevent recovery of mineral resources can have varying degrees of importance. With that knowledge, the DEIS then goes on to say that "Geological resources generally would not be impacted by the project. Some localized, short-term changes in sedimentation would be expected. It is not expected that the project would cause destruction of any unique geologic feature, increase erosion potential, prevent recovery of mineral resources, increase the potential for geologic hazards (e.g., seismicity), or alter soil composition or structure." This is inaccurate and misrepresents the true impacts to geologic resources due to the construction of the pipeline (as it is currently proposed) and the implementation of a "no-dredge" safety buffer around the pipeline. Without a discussion of the issues listed in the above comments, with specific details on existing, permitted, State of Florida borrow areas and unique, regionally-limited, beach-compatible sand resources, and how the proposed pipeline route directly impacts these mineral resources, the DEIS is incomplete and unacceptable, as well as misleading to the layperson. 52

4.11 Mitigation and Minimization Measures and Monitoring

As described above, there are major impacts to Geologic Resources due to the siting of the preferred pipeline route. This route has significant impacts on scarce beach-compatible sands, both those currently identified and permitted as existing Longboat Key Borrow Area IX and 53

53. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

those resources identified as the sole beach-compatible source for future Anna Maria Island beach nourishment needs. As such, the Town believes "avoidance" should be addressed in the DEIS since there are no plausible options for mitigation, and minimization can be accomplished through avoiding the limited beach-compatible sediment resources. However, no discussion exists in the current DEIS to address the presence of the sediment resource off the north end of Anna Maria Island, or the offshore sand hills impacted by the proposed pipeline route. 53 54

While no mitigation measures exist for the impacts on sand resources, there are specific minimization efforts that can be employed. These efforts are described in detail in the comments provided above for section 2.1.1.3. Impacts to Geologic Resources can be minimized, or actually completely avoided, by rerouting that portion of the pipeline route which impacts the sediment resource. Viable options exist which can achieve avoidance. For example, one potential option would be to utilize the northern pipeline route in the area of the sediment resources, retaining the majority of the preferred pipeline route. Another option would be to connect via an offshore subsea interconnection to the Gulfstream Pipeline. The subsea interconnection valve already exists. This is also an alternative deemed viable by Gulfstream. By rerouting the pipeline to connect to the Gulfstream pipeline offshore, all impacts to mineral resources will be removed. The Town would have no further objection to the project (in regards to mineral resource impacts) as the one major impact that greatly affects the future of its beach-management plan will be eliminated with the rerouting of the pipeline through the northern route, or selecting the subsea interconnection of the Port Dolphin pipeline to the existing Gulfstream pipeline. 55 56

If this is not deemed possible, following an extensive alternatives analysis, then perhaps the second minimization effort involves rerouting the pipeline to be collocated with the existing Gulfstream Pipeline in Florida State waters. The existence of the Gulfstream pipeline already creates a corridor where sand resources are no longer available. As an alternative to the subsea Gulfstream connection, a parallel, collocated pipeline along the existing Gulfstream Pipeline 57

54. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

55. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

56. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

57. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

route would reduce and/or eliminate the impacts the current proposed route has to mineral resources. 57

The final potential minimization measure involves rerouting the pipeline entirely. This route could take the pipeline on a direct route from the offshore deepwater port, into the central portion of Southwest Passage, and onto its planned route in West-Central Lower Tampa Bay, where it would continue along its currently proposed route to Port Manatee. Another option within this alternative could be routing the pipeline from the deepwater port to a location near the subsea interconnection valve on the Gulfstream Pipeline, at which point the route would follow the proposed northern pipeline alternative through Southwest Passage to Port Manatee. 58

All four of these potential minimization measures would result in the elimination of impacts to geologic resources, specifically those that the Town of Longboat Key relies on for its beach-management plan. Avoidance is the only measure that would result in a minimization to the impacts on geologic resources the proposed pipeline route would have. As stated before, once the resources are removed as a sand source due to the construction of the proposed pipeline, there are no realistic mitigation options available. Beach-compatible sands on the west-coast of Florida are a very scarce resource. There are no mitigation measures that provide relief from the destruction of these valuable and limited resources. Without seriously addressing potential measures to completely avoid the beach-compatible sediment resource, and considering the lack of realistic mitigation available for these impacts, the Town will consider the DEIS to be incomplete.

Section 6: Cumulative and Other Impacts

The major impacts to the existing Geologic Resources described in the Town's comments for section 4.4 above would lead to a series of reasonably foreseeable cumulative impacts to other resources. These major and minor impacts, described in the sections below, are not presented

58. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

in the DEIS and are vital for evaluating the overall impact the proposed project would have on environmental resources.

6.2 Past, Present, and Reasonable Foreseeable Cumulative Actions

6.2.4 Oil and Gas Leasing/Mineral Leasing

The Town was able to identify major impacts to the future mineral leasing activities in Florida State waters due to the previously described direct impacts to the beach-compatible geologic resource off the northwestern tip of Anna Maria Island and offshore sand waves if the Port Dolphin natural gas pipeline were constructed along the preferred route (described under our comments for section 4.4).

The geologic resource off Anna Maria Island has been used multiple times for beach nourishment and has proven time and time again to be an optimal source of beach-compatible sand for beach-management plans. Sands of this high-quality are difficult to find due to their limited existence on the west coast of Florida. By removing access to these mineral resources by constructing a pipeline and safety buffer directly though them, Port Dolphin LLC would be further restricting the available beach-compatible mineral resources on the west-coast of Florida. This is not in the public interest of Longboat Key or Florida citizens. 59

Several large, local communities rely on regional beach-compatible sand resources to support their beach-management plans. These include Pinellas County, Manatee County, Sarasota County, and the Town of Longboat Key. By eliminating access to this one large, beach-compatible mineral resource, a significant increase in competition will result for the remaining limited beach-compatible mineral resources. The impact to regional mineral resources is further described below in our comments on section 6.3.4: Cumulative Impacts to Geologic Resources.

59. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

In addition, if the proposed pipeline route impacts promising offshore sediment deposit features (offshore sand hills shown in Figure 1) that may contain beach-compatible sand (as currently proposed), there is the potential from removing the hills as future sand resources. Removing these hills from the inventory of potential sand resources further limits the supply of potential beach-compatible sand resources, further increasing the long-term competition between regional communities for an already limited supply of beach-compatible mineral resources.

59

After reviewing section 6.2.4 in the DEIS, the Town was surprised to see that there was no discussion of the impacts to State or Federal mineral resources. The discussion in this section focused solely on Oil and Gas leasing. There are no active Oil and Gas leases on Florida's west coast in the vicinity of the proposed project. In fact, there is currently a Congressional moratorium on Oil and Gas exploration within the immediate project area. Alternatively, there is a very long history of, and numerous active, mineral mining projects. All of the mineral mining projects focus on identifying and utilizing beach-compatible minerals sources for beach nourishment.

The fact that Oil and Gas issues are exclusively discussed within this section, and no discussion if offered on potential cumulative impacts to mineral resources, is a major oversight in the DEIS. The DEIS is incomplete without a discussion of the following items within section 6.2.4:

1. The extensive need for beach-compatible mineral resources for beach-nourishment projects along the west coast of Florida;
2. A discussion of the different regional beach-management plans (Pinellas County, Manatee County, the Town of Longboat Kay, and Sarasota County) and the specific mineral resource/leasing activities (present and future needs) of each program;

60

60. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

3. A discussion of the regulatory authority of the MMS and FDEP BBCS to explore, define, and permit beach-compatible mineral resources for beach nourishment activities, including a detailed discussion on the effort required to explore and define these resources;
4. A discussion on the cumulative impacts to regional sand management issues caused by the removal of a large volume of beach-compatible mineral resources due to the construction of the proposed pipeline route and associated safety buffer.

60

6.3 Overview of Cumulative Impacts

6.3.2 Biological Resources (Threatened and Endangered Species)

As described in the Town's comments to Section 4.4, construction of the proposed pipeline in its current configuration would result in the loss of all of Borrow Area IX and the loss of much of an optimal, proven, state-approved beach-compatible sand resource. This resource is highly limited, and primarily found only in relative close proximity to the barrier island, in shallower waters. The loss of this sediment resource due to establishment of the Port Dolphin pipeline will result in the Town having to attempt to locate a distant, less-compatible sand source elsewhere, assuming such a source would be permittable, or result in the potential reduction in scope or quality of the beach-management plan all together.

Threatened and endangered sea turtle species, specifically the threatened Loggerhead sea turtles, rely on the beaches of Longboat Key to reproduce. If the Town is forced to use a lesser-compatible sand source (i.e. darker and coarser), there could be cumulative impacts to endangered sea turtles. The less compatible beach material could impact the ability of nesting sea turtles to successfully construct nests and lay eggs on the beaches of Longboat Key. The increase in success of sea turtle hatchlings on a nourished beach environment is partially attributable to the type of sand fill used in the project.

61

61. Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

Characteristics such as color, grain size, compaction, and gas exchange in the nest are determinants in the success of nesting.

According to Mortimer (1990), conditions favoring hatchling production may rely heavily on moisture content. The idea that moisture content may play a role in the success of hatchlings is shown in evidence that suggests turtles may experience difficulties in constructing nests in coarse, dry sands. A positive correlation between mortality of clutches and the mean particle size of the sand has been found in studies conducted on nests of the endangered green sea turtle, which has nested on Longboat Key is small numbers. Typically, the coarser the sand is, the harder it is for the nesting female to dig the nest. The sand located in Borrow Area IX and the beach-compatible sediment resource located off the north end of Anna Maria Island, where the pipeline is proposed to be constructed, has been proven to be an ideal sand source for beach nourishment in terms of turtle nesting compatibility. If this sand becomes unavailable to future beach nourishment projects, then lesser-compatible material may have to be substituted for future projects, resulting in a potential cumulative impact to endangered sea turtles by reducing the quality of beach material (by having to use coarser, darker sand from a more distant source). 61

If the Longboat Key beach-management plan is eventually reduced or eliminated due to the cumulative impacts associated with the construction of the proposed pipeline through the beach-compatible sand source, then the shoreline will continue to erode until it begins to impact upland structures and infrastructure. This erosion will result in the direct loss of critical nesting habitat for endangered and threatened sea turtles. Without periodic beach nourishment, the beaches of Anna Maria Island and Longboat Key will disappear, leaving nowhere for engendered and threatened sea turtle species to nest. 62

62. Based on analysis of the revised pipeline route proposed by the Applicant, sufficient quantities of beach quality sand should be available as discussed in Section 4.4. Therefore, impacts to sea turtle nesting are not expected.

The DEIS lists biological resource impact evaluation criteria as follows:

1. Violate a legal standard for protection of a species or its critical habitat (major impact);
2. Degrade the commercial, recreational, ecological, or scientific importance of a biological resource or its critical habitat (minor to major impact depending on extent of degradation);
3. Measurably change the population size (density) or change the distribution of an important species in the region (minor to major depending on extent of change).

The cumulative impacts listed within the Town's comments above have the potential to satisfy all of these criteria over time. Without a discussion of the major cumulative impacts lesser-compatible beach sand and/or the lack of sands or funds to support a beach nourishment project on the ability of endangered and threatened sea turtles to successfully nest, the DEIS is incomplete.

62

6.3.4 Geological Resources

Locating the proposed pipeline in the only local native, white, beach-compatible sand resource available to Longboat Key and Manatee County, and thereby removing it from the inventory of optimal sand resources, will increase local competition for limited sand resources, assuming such resources can even be located at a distant location and would be available to Manatee County or the Town of Longboat Key. Secondly, by impacting offshore sand hills, the proposed pipeline route would further limit potential sand resources, removing them from availability to any future, regional beach-nourishment projects. In addition to increased local competition, regional sand management issues would arise, as the local communities are forced to look for beach-compatible sand further away from their own project areas, and closer to the project areas of neighboring communities.

63

63. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

In the case of west-central Florida, the removal of Borrow Area IX and the beach-compatible sediment source near Anna Maria Island from the inventory of beach-compatible sand resources, together with the partial removal of offshore sand hills of potential beach-compatibility, will result in Longboat Key having to explore further north and south to look for beach-compatible sand resources, which may not even be available for a variety of reasons. This takes Longboat Key into the local territories of Pinellas and Sarasota Counties, both of which have their own active beach-management plans requiring large amounts of beach-compatible sand. With the removal of up to 8,500,000 cy of beach-compatible material due to the construction and safety buffer associated with the proposed pipeline, competition for regional sand resources will be greatly increased among Pinellas County, Manatee County, Sarasota County, and the Town of Longboat Key, with each government trying to locate and develop beach-compatible sand resources from an ever shrinking pool of available material. 63

Without a discussion of how the removal of this sand source results in a cumulative effect to geologic resources by effecting regional sand management plans and multiple beach-management plans, the DEIS is incomplete and insufficient.

6.3.6 Recreation and Aesthetics

The discussion in this section focuses on recreational issues related almost exclusively to the marine environment, *i.e.* fishing, boating, etc. There is no mention of potential impacts to upland recreational facilities, in particular beaches. As explained in the Town's comments on Section 3.6.1 of the DEIS, little to no discussion exists in the DEIS on beaches immediately adjacent to the pipeline route. The beaches of Longboat Key are a major recreational resource, and are not mentioned as such in the DEIS. As explained in the comments on the sections above, significant cumulative impacts may arise due to the construction of the Port Dolphin pipeline in its proposed configuration. 64

64. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

As far as recreational resources are concerned, there is the potential of long-term, cumulative impacts on the health and accessibility of Longboat Key beaches (of which a significant portion is considered public beach), due to the proposed pipeline route. Specifically, if major impacts to the beach-compatible sand resource are realized by the construction of the pipeline and associated safety buffer, there could be significant impacts to the availability of beach-compatible mineral resources for the foreseeable future. If this were to happen, the viability of The Town of Longboat Key's beach-management plan would be in question. The beach-compatible sediments contained in Borrow Area IX and the sediment deposit off the north end of Anna Maria Island may not exist elsewhere in the needed volumes, or be permittable for use by the Town. Even if a sediment deposit of similar quality were discovered, a significant increase in cost, coupled with a significant decrease in available beach-compatible materials would conspire to reduce and/or eliminate the Town's ability to construct beach nourishment projects. If these projects are not constructed, then the beaches of Longboat Key will continue to erode, eating away at the public recreational beach along the entire coastline of Longboat Key. Without maintenance through beach nourishment, Longboat Key's public beach will eventually disappear, resulting in the loss of a major recreational resource for the general public. 65

65. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

The DEIS lists the following criteria for evaluating impacts to recreational resources:

1. Interference with access to coastal recreational shorelines or waterways (minor to moderate depending on extent of alteration);
2. Loss or displacement of an important recreational resource, such as impairment of recreational fishing activities and other water-dependent uses (minor to major depending on extent of alteration);
3. Degradation of recreational value (moderate);

66

66. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

4. Alter or impair a viewshed, scenic quality, or aesthetic value not consistent with applicable laws or regulations (minor to major depending on extent of alteration).

The construction of the Port Dolphin pipeline through Borrow Area IX and the adjacent beach-compatible sand resources, as currently proposed, could foreseeably result in cumulative adverse impacts to the Longboat Key shoreline as a recreational resource. These impacts, as described above, would satisfy all four of the decision criteria for evaluating impacts listed in the DEIS. Without a discussion of the cumulative impacts caused by the construction of the pipeline within beach-compatible mineral resources, and how these impacts relate to the decision criteria listed in the DEIS, the DEIS is incomplete. 66

6.3.9 Socioeconomics and Environmental Justice

Section 6.3.9 not only neglects to discuss potential major cumulative socioeconomic impacts, but misleads the reader by indicating that the impacts are mostly positive, with only some minor and isolated negative impacts. There is absolutely no discussion as to how cumulative impacts to the beach-compatible sand source for the Town of Longboat Key's beach-management plan, the potential degradation of future beach-nourishment projects, the potential implications to the tax structure, and potential long-term impacts to the tourism industry are related to the cumulative effects of construction of the pipeline (as it is currently proposed) directly through Borrow Area IX and the adjacent beach-compatible sand resource. 67

As described in the Town's comments on Section 3.9.1 above, a significant portion of the economy and tax base for The Town of Longboat Key revolves around the extensive tourism industry. This industry relies on healthy and accessible beaches as the main recreational draw for the tourism industry, and for the public in general (as described in 68

67. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9 and cumulative impacts are discussed in Section 6.

68. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9 and cumulative impacts are discussed in Section 6.

the Town's comments on Section 3.6.1). The cumulative socioeconomic impact as a result of the direct geologic impacts to Borrow Area IX and the beach-compatible sand resource offshore Anna Maria is not addressed in the DEIS. 68

This is a significant oversight, in that the direct impact to Borrow Area IX, a fully developed and permitted mineral resource, as described in the Town's comments on section 4.4 above, would significantly increase the cost of maintaining the Town of Longboat Key's beach-management plan via beach nourishment projects. The direct impacts to geologic beach-compatible sand resources (described in our comments on Section 4.4) due to the construction of the pipeline as currently proposed may result in an economic impact to Longboat Key's beach-management plan in the amount of at least $4,750,000 for the next beach nourishment project alone (at today's financial rates). This is a significant cost increase to the Town of Longboat Key Beach-management plan.

The funding for the Town of Longboat Key's Beach-management plan is generated through special assessments, State of Florida cost sharing, and the tourist development councils of Manatee and Sarasota Counties' "Bed Tax", which is generated from the large tourism industry within Manatee and Sarasota Counties. All of these funds are citizen derived, with the majority of them funded directly by the local tourism industry, or by the local businesses and property owners of Longboat Key who rely on the tourism industry to support their economy. If the Longboat Key Beach-management plan sustained significant cost increases due to the lack of availability of nearby, beach-compatible sands, or if Longboat Key had to rely on lesser-compatible material for future beach-nourishment projects, this could adversely affect both the tourism industry and, subsequently, the tax base and associated as valorem revenue. 69

69. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9 and cumulative impacts are discussed in Section 6.

As of June 1, 2007, the Town of Longboat Key had a property valuation of $6,606,809,366 ($4,732,518,406 within Sarasota County and $1,874,290,960 within Manatee County). This valuation is the base for the ad valorem tax revenue for both the Town and Sarasota and Manatee Counties. This tax base is greatly influenced by the continued viability of both the beaches and tourism industry of Longboat Key. If the natural environment of the beaches are degraded due to a reduced beach-management plan (due to a lack of available beach-compatible sand), the ad valorem tax base will decline significantly, resulting in reduced revenue for the Town, and impacts to the local and regional economy, inducing impacts to future school, fire, police, public safety, infrastructure, and other programs that are directly funded by the ad valorem tax assessment. It is important to recognize the interconnectivity of the shore-protection value of beach nourishment, to the tourism value of healthy and accessible beaches, to the revenue generated by the local tax base and tourism economy, that support the beach-nourishment projects of the Longboat Key Beach-management plan. If one of these interconnected components becomes weakened, then negative impacts will be felt by all the other components. 70

One of the evaluation criteria listed for determining potential impacts on socioeconomic resources states that "substantial change to the local or regional economy, population, housing, infrastructure (schools, police, and fire services), social conditions, or employment" would be considered a major impact. As described in the Town's comments on this section, the potential cumulative impacts to tourism and the property values and tax system of Longboat Key as a result of the impacts to Borrow Area IX and other regional beach-compatible sand resources due to the Port Dolphin pipeline route, as it is currently proposed, would satisfy this evaluation criterion as a major impact. The DEIS must include a detailed discussion of the potential socioeconomic impacts due to the cost increases associated with the removal of the beach-compatible sands from Borrow Area IX, from offshore of Anna Maria Island, and from offshore sand hills from 71

70. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9 and cumulative impacts are discussed in Section 6.

71. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

the inventory of available beach-compatible sands for future beach nourishment projects. Without this discussion, the DIES is incomplete and insufficient. The following specific items should be addressed in the DIES in terms of cumulative socioeconomic impacts:

1. The impacts to the socioeconomics of Longboat Key if significant changes to the current Longboat Key Beach-management plan funding structure are required to cover cost increases in future beach nourishment construction projects due to the removal of Borrow Area IX and the other beach-compatible sands in question, and exploration for, and use of, an as yet unknown more distant sand resource due to the construction of the Port Dolphin pipeline as currently proposed. This discussion should include both the option of increasing future taxes to cover the cost increase and the option of not increasing taxes, but cutting funding for existing programs in order to fund future beach nourishment projects.
2. The impacts to the socioeconomics of Longboat Key if the beach-management plan needs to be reduced and/or abandoned due to cost increases in future beach nourishment construction projects due to the removal of the beach-compatible sands in question, and exploration for, and use of, an as yet unknown more distant sand resource due to the construction of the Port Dolphin pipeline as currently proposed. This discussion should include a detailed analysis of the impacts this would have on the Tourism Industry, employment, and tax system (including the bed tax and property values).
3. The impacts to the socioeconomics of Longboat Key if the beach-management plan is forced to rely on lesser-compatible beach material due to the removal of the beach-compatible sands in question, and exploration for, and use of, an as yet unknown more distant sand resource due to the construction of the Port Dolphin pipeline as currently proposed. This discussion should include a detailed

71

analysis of the impacts this would have on the Tourism Industry, employment, and tax system (including the bed tax and property values). 71

6.3.11 Public Safety

As described in the comments for Section 4.4, 6.3.2, 6.3.4, and 6.3.9, the direct and cumulative impacts on the proposed pipeline route on geologic resources available for beach nourishment could cause irreparable harm to the Town of Longboat Key's Beach-management plan. These impacts would stress the current tax-based funding structure for the program while significantly limiting the available mineral resources required to construct future beach nourishment projects. The cumulative effect of these impacts can lead to the foreseeable reduction or elimination of the beach-management plan in the future. Without periodic beach nourishment, Longboat Key will continue to erode. As the erosion continues, the shoreline will retreat and begin to threaten upland structures and infrastructure, potentially including portions of the major hurricane evacuation route for Longboat Key, Gulf of Mexico Drive. Public and private facilities will face destruction due to the forces of the retreating shoreline. 72

As a result of unchecked erosion, Gulf of Mexico Drive, which serves as the hurricane and emergency evacuation route, could become compromised in the event of a major storm. Of even greater concern is the fact that Longboat Key has many sections which are low in elevation. These areas are subject to flooding in the event of a major storm. Studies indicate that some of the population is likely to wait until the storm is fairly close before deciding to evacuate the island. For the general public living on and visiting Longboat Key, there are only two evacuation routes, with both of them running parallel to the beach along Longboat Key to one bridge at either end of the 10-mile long barrier island. The northern Longboat Key evacuation route crosses over Longboat Pass and runs along Coquina Beach on Anna Maria Island. This evacuation route is relatively close to the shoreline (less than 250 feet in some places), and without maintenance of the 73

72. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

73. Comment noted.

shoreline though beach nourishment, can quickly become undermined, resulting in the stranding of a significant number of residents and visitors on Longboat Key and Southern Anna Maria Island. There are also areas within the central part of the barrier islands that have experienced water overwash in storm events. The water has been pushed over Gulf of Mexico Drive and the entire barrier island, eventually draining back into the bay on the back side of the island. Without a beach, this phenomenon may increase, especially in a major storm event. The public on the southern end of Longboat Key must also rely on a beach-parallel evacuation route that runs south to the one bridge (over New Pass) connecting Longboat Key to Lido Key. Longboat Key has no evacuation routes directly to the mainland, both evacuation routes connect Longboat Key to neighboring barrier islands (Anna Maria Island and Lido Key), both of which require beach-compatible mineral resources to maintain their beaches through beach-nourishment for shore-protection and recreational needs.

In addition to the vital emergency evacuation routes, significant critical infrastructure exists along the coast of Longboat Key. These include extensive wastewater management systems, telephone utilities, electrical utilities, and storm water management systems (among others). Increased shoreline erosion, due to the lack of beach-compatible sands for beach nourishment, would result in the potential destruction of components of these systems, if not the entire systems themselves. This would cause irreparable economic and standard of living impacts to the residents and visitors of Longboat Key

Without the shore protection benefits provided by periodic beach nourishment with available, nearby, beach-compatible sand resources, the existing hurricane and evacuation routes and critical infrastructure for Longboat Key face the very real possibility of being flooded or undermined due to a reduced or eliminated beach-management plan. This results in a major cumulative impact to Public Safety due to the

73

construction of the proposed pipeline in its current configuration. Without a discussion of the cumulative impact to Public Safety described above, the DEIS is incomplete. 73

In light of the information above, the Town feels that Table 6.3-1 of the DEIS (presented on pages 6-9 to 6-11) needs some major revisions. This table lists the different resources, past actions, background activities, the proposed action and alternatives, known future actions, and cumulative impacts. The past actions, known future actions, and cumulative impacts columns all need to be revised to include the shore-protection activities described above and the cumulative impacts to these resources (specifically the geologic, biologic, recreational, and socioeconomic resources) described in the Town comments for section 6.3. Without a detailed discussion of these major cumulative impacts and how they affect these resources, the DEIS is incomplete and inaccurate. 74

6.4 Unavoidable Impacts

6.4.4 Geological Resources

The DEIS describes unavoidable impacts as "those impacts that would result from the Proposed Action or any alternatives that cannot be mitigated." The complete DEIS entry for section 6.4.4 identifies "Unavoidable disturbance of surficial sediment or soils would occur during installation of the proposed Port and pipeline" (USCG and MARAD, 2008) as the only unavoidable geologic resource impact due to the proposed project or any presented alternatives. This statement is only true for one alternative proposed in the DEIS. The DEIS alternative of tapping into the Gulfstream subsea interconnection would result in only minor additional impacts to the surficial sediments and soils along the route of the proposed pipeline from the deepwater port to the interconnection site. 75

As proposed, the DEIS preferred pipeline route and associated buffer zone will cause direct and irreparable harm to the availability of already limited, beach-compatible mineral resources available for beach nourishment programs such as the Town's beach- 76

74. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9 and cumulative impacts are discussed in Section 6.

75. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

76. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

management plan. These impacts cannot be mitigated or avoided once the pipeline has been constructed through Borrow Area IX and the beach-compatible sediment resource off the north end of Anna Maria Island.

In order to assess "unavoidable impacts" the DEIS must comprehensively consider the impact to sediment resources for beach nourishment, and seriously address the Town's proposed alternatives (utilizing a portion of the northern route, rerouting the State portion of the pipeline to be collocated alongside the Gulfstream pipeline, or to reroute the entire pipeline to go straight through the Southwest Passage, possibly along the northern route alternative as it enters Tampa Bay). Without a more detailed discussion of all three alternatives proposed by the Town in the comments for section 2.1.1.3, section 6.4.4 needs to reflect the fact that, under the preferred alternative, unavoidable and unacceptable impacts will occur to geologic resources needed to support the beach-management plan of the Town of Longboat Key. These impacts will be major and could result in the expected reduction or elimination of the beach-management plan, leading to a series of cumulative impacts to geologic, biologic, recreational, and socioeconomic resources as well as public safety issues. 76

SUMMARY

The Town of Longboat Key manages an active beach-management plan for the entire coast of Longboat Key. This program is funded through Town revenue and the Tourist Development Council "Bed Tax" which is supported by the extensive tourism industry of Manatee and Sarasota Counties. The tourism industry, in turn, is highly dependent on the beaches within Manatee and Sarasota Counties, including those of Longboat Key. However, the beaches of Longboat Key are eroding and require maintenance through implementation of a comprehensive beach nourishment program. This beach-management plan relies on a proven, existing, native, white, beach-compatible Gulf of Mexico sand resource located off the

northwestern tip of Anna Maria Island as the ideal sand source for beach nourishment. The high similarity of this sand source with the native beach, coupled with its proximity to the project area, make it an invaluable resource ideally suited for the geologic, biologic, and recreational needs of Longboat Key's white sandy beaches. In addition, it is these white sandy beaches that support the tourism driven economy of Longboat Key, Manatee County, Sarasota County, and the State of Florida.

The Town of Longboat Key Beach-management plan, and ultimately the beaches of Longboat Key, are in jeopardy due to the proposed location of Port Dolphin LLC's preferred and southern alternative routes for the Port Dolphin natural gas pipeline. This pipeline is proposed to be built directly through a permitted, ideal sand source that supports the current and future beach nourishment projects of Longboat Key. The pipeline, as well as a large buffer zone which must be established along either side of the pipeline route, greatly impact sand available for the Town of Longboat Key Beach-management plan. Extraction of sand by dredging would be prohibited in the buffer zone effectively eliminating the sand for future beach nourishment use. Direct impacts to this sand resource revolve around the fact that a significant volume of these beach-compatible sands will become permanently unavailable for future beach nourishment projects depending on the extent of the required buffer zone which is provided to protect the gas pipeline. This direct impact, while extreme by itself, could lead to significant cumulative impacts to the economy, public safety and the environment of the Town of Longboat Key.

If this existing borrow area (permitted for use under FDEP Consolidated Joint Coastal Permit and Sovereign Submerged Lands Authorization Number 0202209-001-JC as "Borrow Area IX"), containing approximately 1,500,000 cy of beach-compatible sand, is impacted by the construction of the pipeline (as currently proposed) and an associated safety buffer of potentially up to 1,000 meters, significant programmatic issues would arise. Specifically, the Town will lose access to most, if not all, of the remaining sand in the borrow area. Not only would this represent a direct loss of the time, money, and effort spent developing this as a fully

permitted beach-compatible mineral source, but the Town would be forced to explore other as yet unknown sand resources to replace the remaining beach-compatible sand in Borrow Area IX. Assuming such high quality resources can be found, these resources will assuredly occur further away from the project area, causing an increase in the cost to construct future Longboat Key beach-nourishment projects. If this was to occur, the costs of future beach nourishment projects would increase substantially, up to a potential increase of $4,000,000 (or greater) depending on the final safety buffer imposed around the pipeline and the resulting additional distance to the new, as yet unknown replacement beach-compatible sand resource.

Additionally, the Town of Longboat Key has begun exploring offshore sand resources for potential as future, beach-compatible sand sources. The current proposed pipeline route crosses at least four of these individual sediment sources which occur in the form of underwater "hills", impacting not only the Town of Longboat Key's current beach-compatible sand resource, but potential regional sand resources needed for the viability of Longboat Key and other regional shore-protection programs for the foreseeable future.

By forcing the Town of Longboat Key to abandon its permitted, existing beach-compatible sand resource, by impacting the larger sediment deposit adjacent to the borrow area, and by removing several offshore sand hills from the inventory of future sand resources, the construction of the pipeline may result in the Town of Longboat Kay having to use a more distant, potentially lesser-compatible sand resource for future beach-nourishment projects, at an increased cost to the overall project. This could result in the reduced effectiveness of future projects and may present permitting difficulties at the State level.

A weakened beach-management plan, due to lesser-compatible beach materials and more costly, more distant sand sources, could result in the continued erosion of Longboat Key's white sandy beaches. If this were allowed to happen, significant cumulative impacts to biological,

recreational, and socioeconomic resources would occur, as well as the introduction of sensitive public safety issues, including:

1. A reduced or weakened beach-management plan could result in the increased erosion of Longboat Key's beaches resulting in the loss of the public beaches (a major public recreation resource) of Longboat Key;
2. A reduced or weakened beach-management plan could result in the erosion of Longboat Key's beaches resulting in the loss of tourists, effecting the local socioeconomic structure through a reduction in employment and tax revenues;
3. A reduced or weakened beach-management plan could result in the erosion of Longboat Key's beaches resulting in the loss of protection the beaches afford the island, resulting in the potential for increased flooding and undermining of vital hurricane and emergency evacuation routes for both Longboat Key and Anna Maria Island.
4. A reduced or eliminated shore protection program could result in the erosion of Longboat Key's beaches resulting in the loss of the beach as habitat, and loss of critical habitat needed for threatened sea turtle nesting;

These issues are vital to the continued well being of Longboat Key, yet none of these concerns are addressed in the Port Dolphin DEIS. Longboat Key believes that all of these issues need to be included and comprehensively addressed within the DEIS so that the USCG and MARAD, and the Governor of Florida (as a Governor of an adjacent coastal state) can make a fully informed decision on the Application for a Deepwater Port License submitted by Port Dolphin LLC.

The Town also feels that it important to state unequivocally that the Port Dolphin LLC Deepwater Port and associated pipeline and the Town of Longboat Key Beach-management plan are not mutually exclusive projects. In fact, several seemingly viable pipeline route alternatives exist that can allow the Port Dolphin project to be constructed without affecting the vital and highly limited sand resources required by Longboat Key for its beach-management plan.

These alternatives include:

1. Constructing the Port Dolphin pipeline from the deepwater port to an existing y-valve in the Gulfstream natural gas pipeline, where the Port Dolphin facility could then tie-into the existing pipeline. This option also eliminates many of the environmental impacts associated with the preferred route;
2. A new alternative that would construct the pipeline route from the proposed deepwater port site straight to a spot approximately 2,000 feet south of where the existing Gulfstream pipeline crosses the Federal/State Boundary, approximately nine miles west of Egmont Key. At this point, the new pipeline could be collocated, or constructed parallel to, the existing Gulfstream pipeline all the way into Port Manatee.
3. A new alternative that would construct the pipeline straight from the offshore deepwater port site, directly to Southwest Passage (not Passage Key Inlet), crossing the Gulfstream Pipeline, and then continuing straight to its planned location in West-Central Lower Tampa Bay (all in one straight line).
4. Follow the preferred pipeline route as it is proposed, from the deepwater port toward Southwest Passage, where the pipeline would then deviate to the proposed northern alternative route as it enters Tampa Bay through Southwest Passage. Once inside of Tampa Bay, the pipeline could then deviate back to the preferred route. The vast majority of the preferred pipeline route could be retained with this minor adjustment.

Each of these alternatives results in no impacts (direct or cumulative) to Borrow Area IX or the beach-compatible mineral resources off Anna Maria Island that are vital to The Town of Longboat Key's beach-management plan. With this in mind, the Town strongly believes that a more detailed alternatives analysis needs to be presented in the DEIS. This analysis needs to build on the previously described alternatives, while adding the new alternatives suggested by the Town. Each alternative needs to be critically evaluated in terms of direct and cumulative environmental resource impacts, with the greatest weight given to the alternative(s) that have

the least impacts to these environmental resources. In addition, the direct and cumulative impacts raised by the Town in these detailed comments need to be included and critically evaluated in the DEIS.

In its current form, the DEIS lacks a significant amount of essential information regarding alternatives and true resource impacts, and a revised DEIS needs to be issued that addresses these significant issues prior to going to the Final EIS stage.

While the Town of Longboat Key has strong objections to the way the project is currently proposed, the Town feels that there are seemingly minor changes that can be made by Port Dolphin LLC to the preferred pipeline route that would result in no impacts to vital beach-compatible mineral resources. With this in mind, the Town is willing to work directly with Port Dolphin LLC and/or the USCG and MARAD to explore these alternatives in order to design a route that is mutually beneficial to both Longboat Key and Port Dolphin LLC.

United States Coast Guard
2100 Second Street, S.W.
Washington, D.C. 20593-0001

Legal Deficiencies in USCG Draft Environmental Impact Statement
For Port Dolphin LLC Liquefied Natural Gas Deepwater Port License Application

On behalf of our client, the Town of Longboat Key, Florida ("Longboat Key" or the "Town"), we are providing the following comments on the Draft Environmental Impact Statement ("DEIS") issued April 18, 2008, in connection with proposed major federal actions by the United States Coast Guard, the Maritime Administration, and other federal agencies to authorize the proposed Port Dolphin LNG project. These comments complement, and incorporate by reference, the extensive technical comments filed on behalf of Longboat Key by Coastal Planning & Engineering, Inc. ("CPE"). The purpose of our comments is to explain why the DEIS' examination of alternate methods for transporting gas from the proposed offshore terminal to an onshore interconnection in Port Manatee is legally inadequate under the standards of the National Environmental Policy Act ("NEPA"), the rules of the Council on Environmental Quality ("CEQ") on preparation of environmental impact statements, and the Department of Transportation's regulations on siting and environmental review of facilities for which a license is

77

77. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

PATTON BOGGS LLP
ATTORNEYS AT LAW

sought under the Deepwater Port Act. The DEIS fails entirely to recognize a significant impact of the proposed pipeline, i.e., the fact that it would deprive Longboat Key and other local jurisdictions of access to proven and state-permitted reserves of near-shore white sand. This sand is an essential resource for the replenishment of beaches and the preservation of habitat for endangered and threatened species of sea turtles and shore birds.

77

Legal Background

Section 102(2)(C) of NEPA requires all federal agencies to "include in every recommendation or report on proposals for . . . major Federal actions significantly affecting the quality of the human environment, a **detailed statement** by the responsible official **on** (i) the **environmental impact** of the proposed action, (ii) any **adverse environmental effects which cannot be avoided should the proposal be implemented**, (iii) **alternatives** to the proposed action, (iv) the relationship between local short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and (v) any **irreversible and irretrievable commitments of resources** which would be involved in the proposed action should it be implemented." 42 U.S.C. 4332(2)(C) (emphasis added). The purpose of this EIS requirement is to focus the government's and the public's attention on a proposed permit or other federal action so that the environmental consequences can be studied before the action is implemented. *Marsh v. Oregon Natural Res. Council*, 490 U.S. 360, 371 (1989). NEPA's mandate for the performance of an EIS for actions significantly affecting the environment is "to insure a

fully informed and well-considered decision." *Vermont Yankee Nuclear Power Corp. v. Natural Res. Def. Council*, 435 U.S. 519, 558 (1978). "Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA." 40 C.F.R. § 1500.1(b). Under CEQ regulations, NEPA requires federal agencies to analyze not only the direct impacts of a proposed action in an environmental impact statement, but also the **indirect** and **cumulative** environmental effects of that action. 40 C.F.R. §§ 1508.8, 1508.9(b), 1508.14 (including economic effects), 1508.25; *see also C.A.R.E. Now, Inc. v. F.A.A.*, 844 F.2d 1569, 1574 (11th Cir. 1988 (NEPA requires the consideration of cumulative impacts, including both direct and indirect effects); CEQ, Considering Cumulative Effects under the National Environmental Policy Act at 4, Jan. 1997.[1] If its action is reviewed by a court, a federal agency must show that the EIS took a "hard look" at the project, including impacts and alternatives, and including cumulative impacts. *Druid Hills Civic Ass'n, Inc. v. Federal Highway Admin.*, 772 F.2d 700, 709 (11th Cir. 1985) (agency must take a "hard look" at the environmental consequences before undertaking a major action); *see also* 40 C.F.R. § 1508.25.

The regulations that govern the Coast Guard's and MARAD's processing of licenses for deepwater ports provide additional more stringent requirements for consideration of environmental impacts in siting ports and their associated facilities. The regulations specify siting criteria under which "the deepwater port *and* reasonable alternatives" will be evaluated on the

[1] Available at http://ceq.eh.doe.gov/nepa/ccenepa/ccenepa.htm.

basis of among other factors, "how well *each* (a) optimizes location to prevent or minimize detrimental environmental effects, . . . (i) minimizes the environmental impact of . . . facilities and access routes, . . . [and] (l) minimizes the displacement of existing or potential mining . . . uses." 33 C.F.R. § 148.720. MARAD's environmental review must evaluate "the completeness of environmental information and quality of assessment, probable environmental impacts, and identification of procedures or technology that might mitigate probable environmental impacts through avoiding, minimizing, rectifying, reducing, eliminating, or compensating for those impacts." 33 C.F.R. § 148.715(a). Ultimately, MARAD can issue a license only if "the applicant has demonstrated that the deepwater port will be fabricated, constructed, operated and decommissioned using the best available technology to prevent or minimize adverse effects to the environment." 33 C.F.R. § 148.710(a)(2). Unless MARAD intends to conduct further environmental review under the deepwater port licensing regulations, these pipeline alternatives must be thoroughly examined in the DEIS.

Finally, section 4(f) of the Department of Transportation Act of 1996, codified at 49 U.S.C. § 303, forbids the Secretary from approving any program or project which requires the use of "publicly owned land of a public park, recreation area, or wildlife and waterfowl refuge of national, State, or local significance, or land of an historic site of national State or local significance (as determined by the Federal, State or local officials having jurisdiction over the park, area, refuge, or site)" unless "(1) there is no prudent and feasible alternative to using that

PATTON BOGGS LLP
ATTORNEYS AT LAW

land; and (2) the program or project includes all possible planning to minimize harm to the park, recreation area, wildlife and waterfowl refuge, or historic site resulting from the use." The deepwater port licensing regulations expressly incorporate Section 4(f). 33 C.F.R. § 148.737. Courts have confirmed that "4(f) lands," e.g., a local park or recreation area, need not be directly occupied or taken by a DOT-approved action in order to trigger section 4(f)'s rigorous requirements.

> [O]ff-site activities are included if they could create sufficiently serious impacts that would substantially impair the value of the site in terms of its prior significance and enjoyment. . . . In fact, the determination as to what constitutes a "use" under Section 4(f) is essentially the same as the determination as to what constitutes a "significant impact" under NEPA.

Mullin v Skinner, 756 F.Supp.904, 924 (E.D.N.C. 1990) (*citing Adler v Lewis*, 675 F.2d 1085, 1092(9th Cir. 1982); *see also Coalition Against a Raised Expressway v Dole*, 835 F.2d 803, 810 (11th Cir. 1988)("Section 4(f) is triggered if the [project] either directly or indirectly uses the protected land.").

Summary of Legal Deficiencies in the DEIS

The DEIS for the Port Dolphin project overlooks major environmental impacts that would unavoidably and irretrievably occur if the pipeline were routed, as proposed, through offshore white sand resources that Longboat Key and other jurisdictions use to maintain their beaches. The pipeline would bisect, and in conjunction with its "buffer zone," likely preclude

78

78. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

PATTON BOGGS LLP
ATTORNEYS AT LAW

access to, sand reserves that the Florida Department of Environmental Protection ("FDEP") has approved as "beach-compatible sand" for use by Longboat Key. Longboat Key has invested substantial amounts of money and effort to identify and permit these sand resources. If the pipeline puts this specific, proven and permitted sand deposit off-limits for dredging, the impact of the lost resource on Longboat Key's beach protection program will be substantial and direct. 78

The pipeline also would be routed in the vicinity of promising future sand reserves for use by Longboat Key and other local jurisdictions. As a result, the pipeline may foreclose other locations at which the localities could otherwise obtain the kind of FDEP-approved sand that must be applied periodically to maintain beaches both for tourism and to protect critical habitat for endangered and threatened species of sea turtles and shore birds. The DEIS needs to be supplemented with further analysis of these impacts and republished for public comment before a final EIS can be issued. 79

Furthermore, the DEIS fails to identify, seek comment on, or adequately consider several alternatives to, or alternative routes for, the pipeline that would eliminate these impacts. *See Druid Hills Civic Ass'n, Inc., supra.*, 772 F.2d at 712 (alternatives analysis in EIS must provide sufficient information and reasoning to enable readers to consider and evaluate the comparative merits of the alternatives on their own and to comment on the EIS). It is not a commenter's obligation to identify and analyze alternatives to a proposed major federal action under NEPA; if, as, in this case, it is clear that alternatives exist, the federal agency must thoroughly examine them. 80

79. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

80. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

Page 7

For the proposed Port Dolphin pipeline, several obvious alternatives exist, including (1) connecting the Port Dolphin terminal to the existing offshore pipeline operated by Gulfstream Natural Gas System ("Gulfstream"), which connects to the same location onshore as would the proposed Port Dolphin pipeline, thereby eliminating the need for a new pipeline and (2) re-routing the pipeline to avoid the near-shore white sand resources on which Longboat Key relies, as well as the larger area of high-quality sand where other jurisdictions have approved deposits, and where, in the future, Longboat Key and other jurisdictions will explore, under FDEP supervision, for additional beach- and habitat-compatible sand deposits. The DEIS must be revised and supplemented with a detailed analysis of these alternatives and republished for public comment before an FEIS can be issued. *See* 40 C.F.R 1502.9(c)(1): "Agencies shall prepare supplements to . . . draft . . . environmental impact statements if: . . . .(ii) There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts." 80

The federal agencies also failed in preparing the DEIS to follow NEPA's admonition to consult with local governments regarding the impact of a proposed action on local plans and programs, such as Longboat Key's Comprehensive Beach Management Plan. Moreover, by depriving Longboat Key of the sand it needs to preserve its public beaches, the proposed pipeline approval would trigger section 4(f), requiring rejection of the proposed pipeline route in the face of prudent and feasible alternatives, i.e., offshore interconnection or re-routing. As a 81

4961384

81. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

matter of law, MARAD cannot issue a license to Port Dolphin for the project as currently planned. 81

Discussion

(1) The DEIS Fails to Examine Environmental Impacts Resulting From the Elimination of Known White Sand Resources Near Anna Maria Island and Nearby Potential Reserves.

Section 1502.16 of CEQ's regulations prescribes in detail the review of environmental impacts in an EIS that constitutes the "hard look" required under NEPA:

> The discussion will include the environmental impacts of . . . the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented.

40 C.F.R. § 1502.16. The discussion of environmental impacts must include both direct and indirect effects. *Id.* Importantly, the EIS must examine "[p] ossible conflicts between the proposed action and the objectives of . . . regional, State, and local land use plans, policies and controls for the area concerned." *Id.* The CEQ rules also require consideration of: "[n] atural or depletable resource requirements and conservation potential of various alternatives and mitigation measures." *Id.* 82

The DEIS reflects little understanding of the environmental impacts of the proposed pipeline from the offshore terminal to the proposed interconnection onshore in Port Manatee,

4961384

82. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

PATTON BOGGS LLP
ATTORNEYS AT LAW

Page 9

the conflicts that the pipeline will cause with Longboat Key's and other jurisdictions' plans and policies for beach preservation, or the degree to which the Town's ability to mine and utilize its current sand resources would be adversely affected. If constructed along the proposed alignment, this 36-inch pipeline and an associated no-dredge buffer zone would run through a shoal area just offshore from Anna Maria Island that serves Longboat Key and other jurisdictions as a source for the fine white sand that the State of Florida requires them to use in their beach nourishment programs. 82

As discussed in more detail in the DEIS comments submitted by CPE on behalf of Longboat Key[2], the Town's beaches have been eroding for some time. To address this problem, the Town adopted and implements a comprehensive beach nourishment program. This beach-management plan currently relies on a proven deposit of native white beach-compatible sand in a shallow shoal located in state waters of the Gulf of Mexico, just off the northwestern tip of Anna Maria Island. Longboat Key has previously defined, and secured an FDEP permit to use, sand from an area within the shoal designated as Borrow Area IX.[3] Longboat Key used sand from this area for the 2005/2006 beach nourishment project, but Borrow Area IX still contains some 83

[2] Potential Impacts of the Port Dolphin Pipeline on the Town of Longboat Key Comprehensive Beach Management Plan: Town Comments on the Draft Environmental Impact Statement on the Port Dolphin LLC Deepwater Port Licenses Application (hereinafter "CPE Comments").

[3] Borrow Area IX is permitted for use under FDEP Consolidated Joint Coastal Permit and Sovereign Submerged Lands Authorization Number 0202209-001-JC.

4961384

83. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

1,500,000 cubic yards of beach-compatible material available to the Town for future beach-nourishment projects. Because this near-shore, shallow deposit of sand is highly similar to the native white beach sand, it is ideally suited to maintain the white sandy beaches that support the tourism-driven economy of Longboat Key, Manatee County, Sarasota County, and the State of Florida. Equally important, this mineral resource is ideally suited to maintain the fine white sand habitat that supports several threatened and endangered species of sea turtles.[4] Alternative sources of coarser brown sand are not an adequate substitute for beach maintenance or habitat protection.

83

CPE has explained in detail how the proposed pipeline would jeopardize the Town of Longboat Key's beach management plan, and ultimately the beaches of Longboat Key. Under

[4] The DEIS reflects serious misinformation on the part of MARAD and USCG about offshore sand resources. It identifies an area of about 150-square miles offshore of Anna Maria Island and Longboat Key in State waters as "sand resources." *See, e.g.*, Figure 2.3-1 at 2-31. The DEIS discusses "avoidance of mapped sand resources" as a criterion for "pipeline route analysis," and notes that "siting a project in an identified sand resource would be difficult and likely would not be approved by Minerals Management Service (MMS)." DEIS at 2-17. This discussion is factually wrong -- the mapped sand resources shown in the DEIS are under the jurisdiction of FDEP, not MMS, and the proposed pipeline would in fact pass through the northern end of this "sand resources" area. More importantly, the DEIS ignores the fact that, within this large area lying in State waters, FDEP has issued permits for use of sand from only a few specific areas, including Longboat Key's current high-quality sand deposit, Borrow Area IX. In identifying the "sand resources" area, the DEIS authors apparently did not examine current FDEP records that identify Borrow Area IX. An agency violates NEPA when it relies upon outdated or incomplete data. *See, e.g., Lands Council v Powell*, 395 F.3d 1019, 1031 (9th Cir. 2005). "Accurate scientific analysis . . . [is] essential to implementing NEPA." 40 C.F.R. § 1500.1(b). Overlooking the proven sand resources that actually lie within the path of the pipeline route is not "accurate scientific analysis." *See also North Buckhead Civic Ass'n v Skinner*, 903 F.2d 1533, 1543 (11th Cir. 1990)(EIS may be invalidated if it relied on incomplete or inaccurate information).

PATTON BOGGS LLP
ATTORNEYS AT LAW

both the preferred and southern alternative routes, *see* DEIS Figure 2.1-10 at 2-14, for the Port Dolphin natural gas pipeline, the line would bisect Borrow Area IX. *See* CPE Comment Figure 3. Assuming dredging would be prohibited in a buffer zone extending between 1000 feet and 1000 meters from the pipeline, the pipeline's footprint could occupy up to 100 percent of Borrow Area IX. CPE Comments at 38. A 1000-foot buffer would still put half the sand off-limits, and would make dredging in the remaining parts of Borrow Area IX more difficult and costly. *Id.* The Town has invested upwards of $500,000 to explore, identify and permit Borrow Area IX. *Id.* at 39. This investment will be worth little or nothing if much and perhaps all of these beach-compatible sands become permanently unavailable for future beach nourishment projects. In that event, the Town would have to explore for other potential sand resources, with any such investigation likely to cost on the order of another $500,000. *Id.* Assuming deposits of high quality white sand could be found, these resources will necessarily be located further away from the near-shore area that encompasses Borrow Area IX and will cost more to dredge and transport, thereby causing an increase in the cost to construct future Longboat Key beach-nourishment projects. CPE puts the increased costs of using such an alternate, more distant sand resource (assuming one exists) for future beach nourishment project to Longboat Key at up to $3,750,000 (or greater), depending how far offshore Longboat Key would have to go to find replacement beach-compatible sand. *Id.* Indeed, the current proposed pipeline route crosses at least four promising sediment sources that occur in the form of underwater "hills," where

83

Longboat Key hoped to find future beach-compatible sand. The proposed pipeline route would place these future or alternate sand sources off-limits, requiring Longboat Key and other jurisdictions to go farther afield to find sand that meets Bureau of Beaches and Coastal Systems ("BBCS") criteria for beach application.

Because the DEIS fails to recognize and assess these direct impacts on Longboat Key's beach protection program and policy, the document necessarily fails to consider associated important indirect impacts. A weakened beach-management plan, utilizing inferior or more costly sand from more distant sources, could result in less effective, more infrequent, or reduced application of sand to Longboat Key's beaches, resulting in increased erosion and degradation. If this happens, significant cumulative impacts to biological, recreational, and socioeconomic resources would occur, as well as potential compromise of public safety if serious erosion occurs. 83

First and foremost, perhaps, would be the impact of diminished beach nourishment on critical nesting habitat for the threatened loggerhead sea turtles that frequent Longboat Key's beaches, as well as for lesser numbers of the endangered green sea turtles and leatherback sea turtles. The native sand on the island's beaches is highly favorable for turtle nesting, reproduction and hatching. Incompatible sand from other locations with different mineralogy or particle size could adversely affect turtles and other species. Indeed, this is one reason why Florida law requires a permit from FDEP for any application of sand to beaches, where such sand must closely correspond to native sand. *See* Florida Administrative Code, Rule 62B-41.007(2)(j) (beach- 84

84. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9. In addition, impacts to threatened and endangered sea turtles are addressed in Section 4.2.1.3.

compatible fill material is required in order to "protect the environmental functions of Florida's beaches."). Clearly, the impact of the proposed pipeline on endangered species is a crucially important consideration that must be addressed in the DEIS and is specifically required in MARAD's review of the siting and environmental effects of the project. *See* 33 C.F.R. § 148.707(b)(1)(i) ("environmental evaluation will determine . . . the effect on the environment, including but not limited to . . . impacts on endangered species.").

Other indirect and cumulative impacts of a weakened beach protection program include adverse effects on tourism and, consequently, a reduction in employment and tax revenues, all of which must be identified and analyzed in the EIS process. *See* 40 C.F.R. § 1508.8; *see also* 40 C.F.R. § 1508.14; *see also* 33 C.F.R. § 148.707(b)(4) (MARAD environmental evaluation will determine . . . the effect on human health and welfare, including socioeconomic risks"). As explained in the CPE comments, erosion of Longboat Key's beaches due to inadequate replenishment could cause increased flooding and undermining of vital hurricane and emergency evacuation routes for Longboat Key and Anna Maria Island, as well as decreased capacity of the barrier island to buffer the impacts of hurricanes on infrastructure onshore. All these impacts on the white sand resource, and on the natural and human environment – direct, indirect and cumulative – must be addressed in a new or supplemental DEIS so that the public can comment on the adequacy of the information that is ultimately available to the federal decision makers who must approve the pipeline route under the Deepwater Port Act and other federal statutes.

84

85

85. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

Attn. Ray Martin (CG-5225)
May 29, 2008
Page 14

(2) The DEIS Fails to Examine Apparently Feasible Alternatives to the Pipeline or its Route that Would Eliminate or Mitigate the Environmental Impacts on the White Sand Resources.

Identification and consideration of alternatives to the proposed action is a critical part of NEPA review. Section 102(2)(E) of NEPA requires an agency proposing major federal action to "study, develop, and describe appropriate alternatives to the recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources." 42 U.S.C. § 4332(2)(E). CEQ rules require that: 'Federal agencies shall to the fullest extent possible: . . . (e) Use the NEPA process to identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions upon the quality of the human environment." 40 C.F.R. § 1500.2. CEQ rules call the alternatives analysis "the heart of the environmental impact statement" and emphasize that the EIS "should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public." 40 C.F.R. § 1502.14(a). Under those rules, agencies must devote "substantial treatment" to and "rigorously explore and objectively evaluate all reasonable alternatives." 40 C.F.R. § 1502.14(a),(b). Any alternative that achieves the purpose and need of the agency's proposed action is "reasonable" and should be evaluated. *Sierra Club v. Lynn*, 502 F.2d 43, 62 (5th Cir. 1974).

86

4961384

86. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

Moreover, NEPA requires the agency proposing a major federal action to shoulder the burden of studying and evaluating alternatives. *County of Suffolk v. Secretary of Interior*, 562 F.2d 1368, 1385 (2d Cir. 1977); *see also* Susannah T. French, *Judicial Review of the Administrative Record in NEPA Litigation*, 81 CAL. L. REV. 929, 977 (1993). Nothing in NEPA jurisprudence requires the public or commenters who may support an alternative to conduct a study of the alternative as a condition for its consideration by the agency – that is the federal agency's obligation.

It is apparent that several promising alternatives exist to running a new pipeline from Port Dolphin through the near-shore beach-compatible sand deposits adjacent to Anna Maria Island, or the nearby area that may contain additional beach-compatible sand. The most obvious alternative is to connect the Port Dolphin terminal to the existing offshore pipeline operated by Gulfstream Natural Gas System ("Gulfstream"), which connects to the same location onshore as would the proposed Port Dolphin pipeline, thereby eliminating the need for a new pipeline. In comments filed with the Federal Energy Regulatory Commission on or about April 21, 2008, with a copy to the Coast Guard and MARAD[5], Gulfstream strongly advocates this interconnection alternative due to what it says are safety concerns associated with the proposed routing of the Port Dolphin pipeline in proximity to the Gulfstream line onshore at Port Manatee. Gulfstream Comments at 8-11. The proposed interconnection would be located

86

[5] *In re Port Dolphin Energy LLC*, Supplement to Protest and Additional Comments of Gulfstream Natural Gas System, L.L.C, FERC Docket Nos. CP07-191-001; CP7-192-000 (April 21, 2008) ("Gulfstream Comments").

approximately 26 miles upstream from the shoreline on the Gulfstream pipeline would utilize an existing piggable Y-fitting on the pipeline. Gulfstream states that:

> Port Dolphin readily can interconnect with Gulfstream at that point. The Port Dolphin 36-inch Offshore Pipeline had a maximum allowable operating pressure of 1750 psig and the maximum offloading pressure of the SRVs is 1740 psig. These pressures can be accommodated by Gulfstream to accept receipts of regasified LNG from Port Dolphin at Gulfstream's East Subsea Tie-In location.

Gulfstream Comments at 21-21.

The DEIS indicates that technical issues need to be resolved to evaluate this alternative, primarily relating to possible pressure differences between the regasified gas and the Gulfstream pipeline. The DEIS notes that the proposed maximum pressure for the vaporization and send-out system at Port Dolphin is 1643 psi and that the pressurization capability of Shuttle and Revaporization Vessels (SRVs) used in other offshore LNG projects does not exceed 1740 psig. According to the DEIS, the operating pressure of the Gulfstream pipeline is 2180 psi, regulated down to 1470 at an onshore location near its interconnection point. The DEIS concludes that it would not be possible for SRVs to pressurize revaporized gas to a high enough pressure to cause it to flow into the higher-pressure pipeline, absent permanent offshore auxiliary compression capability. DEIS at 2-18 through 2-19. However, nothing in the DEIS indicates whether there is compression anywhere on the Gulfstream line except where gas is introduced into the line some 400 miles upstream. If not, pressure in the line could be significantly lower than the initial 2180 psi – and possibly lower than the 1643-1740 range that SRVs achieve, thus making delivery of

86

87

87. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

PATTON BOGGS LLP
ATTORNEYS AT LAW

DOT Docket No. USCG-2007-28532
Attn. Ray Martin (CG-5225)
May 29, 2008
Page 17

revaporized gas by the SRVs into the Gulfstream line technically feasible. MARAD and the Coast Guard must resolve this issue of fact before they can simply reject interconnection as technically infeasible. 87

Similarly, the DEIS states that capacity does not exist in the Gulfstream pipeline to accommodate deliveries of gas from Port Dolphin, at least at the maximum eventual throughput of 1.2 billion cubic feet per day. DEIS at 2-19. Gulfstream's Comments do not indicate any such constraint. But even if, as the DEIS suggests, the Gulfstream pipeline would have to be expanded eventually to transport all the gas delivered by Port Dolphin, the DEIS incorrectly rejects this alternative as having environmental impacts "that would most likely be similar to the Port Dolphin pipeline." *Id.* This is not correct. The existing Gulfstream line lies well north of the white beach-compatible sand deposits that are vital to the environment and to turtle habitat on Longboat Key and the other affected islands. The existing pipeline does not impede access to these sand resources and neither would an expanded pipeline or a second Gulfstream pipeline adjacent to the existing one. Thus, the DEIS is fundamentally incorrect in equating the environmental impact of an expanded Gulfstream pipeline with the proposed Port Dolphin pipeline. 88

Other alternatives, discussed in more detail in CPE's comments, would re-route the proposed pipeline away from the Anna Maria Island sand deposits, and from other promising near-shore deposits. One alternate route would run from the proposed terminal location 89

4961384

88. An evaluation of a pipeline route paralleling Gulfstream has been added to Section 2.1. An offshore interconnection with the Gulfstream Pipeline has been added in Section 2.1 and its impacts evaluated in Section 4.

89. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

northeast toward the Gulfstream pipeline and then turn east and parallel the existing pipeline all the way into Port Manatee. Another alternate route would run from the terminal location and enter Tampa Bay through Southwest Passage, approximately a mile north of the existing location through Passage Key Inlet. Relocation of the pipeline clearly is the sort of alternative that must be considered in this situation, not only under NEPA, but under the Deepwater Port Act's siting and environmental review regulations. As noted, under these rules MARAD requires consideration of how well the proposed location "optimizes location to prevent or minimize detrimental environmental effects," "minimizes the environmental impact of . . . facilities and access routes," and "minimizes the displacement of existing or potential mining . . . uses." 33 C.F.R. §§ 148.720(a), (i), (j), (l). Clearly, there are any number of alternate paths that a pipeline could take from the Port Dolphin terminal to an entry to Tampa Bay, including many that would "mitigate probable environmental impacts [to sand resources and local governments' beach protection programs] through avoiding, minimizing, rectifying, reducing, eliminating, or compensating for those impacts." *See* 33 C.F.R. § 148.715(a). Moreover, MARAD can issue a license only if "the applicant has demonstrated that the deepwater port will be fabricated, constructed, operated and decommissioned using the best available technology to prevent or minimize adverse effects to the environment." 33 C.F.R. § 148.710(a)(2). "Best available technology" may involve other means to avoid white sand resources, such as deep burial of the

89

line at those locations. All reasonable alternatives to the presently proposed pipeline must be identified and evaluated. 89

3) The Federal Agencies Did Not Comply With NEPA's Requirements for Consultation With Local Governments.

The DEIS's failure to discuss the impact of the proposed pipeline on the white sand resources utilized by Longboat Key and other jurisdictions, to evaluate alternative routes for the pipeline, or adequately to analyze the feasibility of the Gulfstream interconnection alternative, reflects Port Dolphin, MARAD or the Coast Guard's failure to communicate with local governments (including Longboat Key). The DEIS falls far short of NEPA's requirement that federal agencies prepare NEPA analyses and documentation "in cooperation with State and local governments." 42 U.S.C. § 4331(a). CEQ rules require federal agencies specifically to harmonize their actions with local plans, such as the Longboat Key Comprehensive Beach Management Plan: 90

> To better integrate environmental impact statements into State or local planning processes, statements shall discuss any inconsistency of a proposed action with any approved State or local plan and laws (whether or not federally sanctioned). Where an inconsistency exists, the statement should describe the extent to which the agency would reconcile its proposed action with the plan or law.

40 C.F.R. §1506.2(d). CEQ's regulations stress the importance of cooperation with State and local governments early in the NEPA process, particularly when they have "*special expertise with respect to all reasonable alternatives or significant environmental, social or economic impacts*[.]" *See* January

90. The USCG and the Maritime Administration initiated the public scoping process on July 12, 2007, with the publication of a Notice of Intent (NOI) to prepare an EIS in the *Federal Register*. The NOI included information on public meetings and informational open houses; requested public comments on the scope of the EIS; and provided information on how the public could submit comments by mail, hand delivery, facsimile, or electronic means. In addition, an Interested Party Letter, the *Federal Register* NOI, and a fact sheet describing the Project were sent to approximately 190 Federal, state, and local agency representatives, and other potentially interested parties (see Appendix A of the Final EIS).

30, 2002 Memorandum from James Connaughton to Heads of Federal Agencies, Subject: Cooperating Agencies in Implementing the *Procedural Requirements* of the National Environmental Policy Act at 1 (emphasis added) [attached hereto as Attachment 1]. These coordination regulations impose *mandatory* obligations. *See id.* Had Port Dolphin, MARAD or the Coast Guard consulted with Longboat Key well in advance of preparing the DEIS, it would have become clear that, by interfering with the Town's proven beach-compatible white sand resource, the proposed pipeline would be seriously inconsistent with the Longboat Key comprehensive beach management plan and with Florida DEP's beach protection program. Port Dolphin's failure to consult or perform due diligence regarding Longboat Key's plan, the Anna Maria Island shallow-shoal sand resource, and Longboat Key's state-permitted Borrow Area IX does not alter the legal requirement that the Port Dolphin license must be reconciled with the Longboat Key plan by evaluating reasonable alternatives and selecting a feasible one. 40 C.F.R. §1506.2(d). 90

(4) The DEIS Contains No Section 4(f) Determination for the Pipeline, Nor Could Such A Determination Properly Be Made For the Current Proposal.

As discussed above and explained in detail in the CPE Comments, the proposed pipeline will eliminate Longboat Key's proven, FDEP-approved white sand reserves, making that sand unavailable for application to Longboat Key's beaches, consequently interfering with Longboat Key's beach sand replenishment plan and degrading its beaches, both esthetically and environmentally. It appears beyond question that Longboat Key's beaches are 4(f) lands, inasmuch as the beaches are publicly owned and open to the public as "recreation areas." *See* 91

91. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1 and sand resources are described in Section 3.4, impacts are discussed in Section 4.4, and socioeconomic impacts on tourism are discussed in Section 4.9.

CPE Comments at 30-31. When BBCS establishes an Erosion Control Line ("ECL") based on the mean highwater line, for beaches with approved shore protection programs, all lands seaward of ECL become public property of the State with right of public access. Longboat Key has an ECL, which precludes private ownership of its beaches and establishes their character as public recreation areas. Nor could there be any dispute that local officials have determined the beaches to be of "local significance," both by adopting and periodically updating an official Comprehensive Beach Management Plan[6] (under which Longboat Key contributes to the cost of implementing the plan) and otherwise.

Longboat Key's beaches would be "used" by the pipeline because of the significant adverse impact the current route would have on the sand resource and, indirectly, on the beaches, on sea turtle habitat, on tourism, and on public safety. These impacts will substantially impair the environmental and economic values of the beaches, are "significant" under NEPA, and therefore are "uses" of the beaches. *Mullin v. Skinner*, *supra*, 756 F.Supp. at 924. MARAD cannot approve the Port Dolphin license unless and until it determines "there is no prudent and feasible alternative to using that land" and "the program or project includes all possible planning to minimize harm to the park, recreation area, wildlife and waterfowl refuge, or historic site resulting from the use." The DEIS does not appear to discuss Section 4(f)'s application to the

91

[6] Longboat Key adopted its Comprehensive Beach Management Plan in 1995. The Town adopted updates to the Comprehensive Beach Management Plan in 1999 and 2008.

PATTON BOGGS LLP
ATTORNEYS AT LAW

Port Dolphin pipeline in any detail (if at all). Given promising alternatives to the proposed pipeline, it clearly does not contain information upon which MARAD could reasonably base a Section 4(f) approval for the proposed pipeline. Clearly, for the reasons discussed above, the proposed pipeline's interference with Longboat Key's sand resources for the replenishment of the island's beach recreation areas triggers Section 4(f)'s requirements for selection of an alternative to the pipeline. 91

Respectfully submitted,

Duane A. Siler

MEMORANDUM FOR THE HEADS OF FEDERAL AGENCIES

FROM: JAMES CONNAUGHTON, Chair

SUBJECT: COOPERATING AGENCIES IN IMPLEMENTING THE PROCEDURAL REQUIREMENTS OF THE NATIONAL ENVIRONMENTAL POLICY ACT

The purpose of this Memorandum is to ensure that all Federal agencies are actively considering designation of Federal and non-federal cooperating agencies in the preparation of analyses and documentation required by the National Environmental Policy Act (NEPA), and to ensure that Federal agencies actively participate as cooperating agencies in other agency's NEPA processes. The CEQ regulations addressing cooperating agencies status (40 C.F.R. §§ 1501.6 & 1508.5) implement the NEPA mandate that Federal agencies responsible for preparing NEPA analyses and documentation do so "in cooperation with State and local governments" and other agencies with jurisdiction by law or special expertise. (42 U.S.C. §§ 4331(a), 4332(2)). Despite previous memoranda and guidance from CEQ, some agencies remain reluctant to engage other Federal and non-federal agencies as a cooperating agency. In addition, some Federal agencies remain reluctant to assume the role of a cooperating agency, resulting in an inconsistent implementation of NEPA.

Studies regarding the efficiency, effectiveness, and value of NEPA analyses conclude that stakeholder involvement is important in ensuring decisionmakers have the environmental information necessary to make informed and timely decisions efficiently. Cooperating agency status is a major component of agency stakeholder involvement that neither enlarges nor diminishes the decisionmaking authority of any agency involved in the NEPA process. This memo does not expand requirements or responsibilities beyond those found in current laws and regulations, nor does it require an agency to provide financial assistance to a cooperating agency.

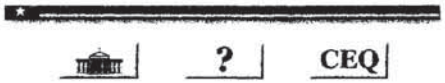
The benefits of enhanced cooperating agency participation in the preparation of NEPA analyses include: disclosing relevant information early in the analytical process; applying available technical expertise and staff support; avoiding duplication with other Federal, State, Tribal and local procedures; and establishing a mechanism for addressing intergovernmental issues. Other benefits of enhanced cooperating agency participation include fostering intra- and intergovernmental trust (e.g., partnerships at the community level) and a common understanding and appreciation for various governmental roles in the NEPA process, as well as enhancing agencies' ability to adopt environmental documents. It is incumbent on Federal agency officials to identify as early as practicable in the environmental planning process those Federal, State, Tribal and local government agencies that have jurisdiction by law and special expertise with respect to all reasonable alternatives or significant environmental, social or economic impacts associated with a proposed action that requires NEPA analysis.

The Federal agency responsible for the NEPA analysis should determine whether such agencies are interested and appear capable of assuming the responsibilities of becoming a cooperating agency under 40 C.F.R. §

1501.6. Whenever invited Federal, State, Tribal and local agencies elect not to become cooperating agencies, they should still be considered for inclusion in interdisciplinary teams engaged in the NEPA process and on distribution lists for review and comment on the NEPA documents. Federal agencies declining to accept cooperating agency status in whole or in part are obligated to respond to the request and provide a copy of their response to the Council. (40 C.F.R. § 1501.6(c)).

In order to assure that the NEPA process proceeds efficiently, agencies responsible for NEPA analysis are urged to set time limits, identify milestones, assign responsibilities for analysis and documentation, specify the scope and detail of the cooperating agency's contribution, and establish other appropriate ground-rules addressing issues such as availability of pre-decisional information. Agencies are encouraged in appropriate cases to consider documenting their expectations, roles and responsibilities (e.g., Memorandum of Agreement or correspondence). Establishing such a relationship neither creates a requirement nor constitutes a presumption that a lead agency provides financial assistance to a cooperating agency.

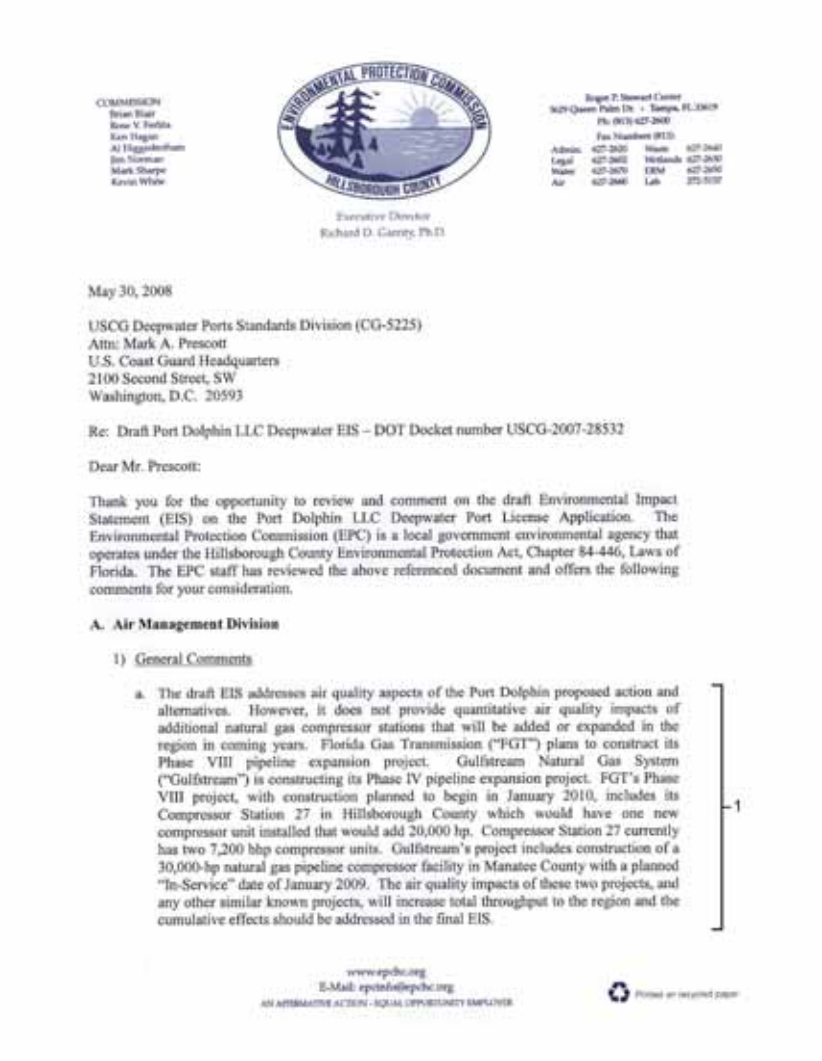
Once cooperating agency status has been extended and accepted, circumstances may arise when it is appropriate for either the lead or cooperating agency to consider ending cooperating agency status. This Memorandum provides factors to consider when deciding whether to invite, accept or end cooperating agency status. These factors are neither intended to be all-inclusive nor a rote test. Each determination should be made on a case-by-case basis considering all relevant information and factors, including requirements imposed on State, Tribal and local governments by their governing statutes and authorities. We rely upon you to ensure the reasoned use of agency discretion and to articulate and document the bases for extending, declining or ending cooperating agency status. The basis and determination should be included in the administrative record.



CEQ regulations do not explicitly discuss cooperating agencies in the context of Environmental Assessments (EAs) because of the expectation that EAs will normally be brief, concise documents that would not warrant use of formal cooperating agency status. However, agencies do at times – particularly in the context of integrating compliance with other environmental review laws – develop EAs of greater length and complexity than those required under the CEQ regulations. While we continue to be concerned about needlessly lengthy EAs (that may, at times, indicate the need to prepare an Environmental Impact Statement (EIS)), we recognize that there are times when cooperating agencies will be useful in the context of EAs. For this reason, this guidance is recommended for preparing EAs. However, this guidance does not change the basic distinction between EISs and EAs set forth in the regulations or prior guidance.

To measure our progress in addressing the issue of cooperating agency status, by October 31, 2002 agencies of the Federal government responsible for preparing NEPA analyses (e.g., the lead agency) shall provide the first bi-annual report regarding all EISs and EAs begun during the six-month period between March 1, 2002 and August 31, 2002. This is a periodic reporting requirement with the next report covering the September 2002 – February 2003 period due on April 30, 2003. For EISs, the report shall identify: the title; potential cooperating agencies; agencies invited to participate as cooperating agencies; agencies that requested cooperating agency status; agencies which accepted cooperating agency status; agencies whose cooperating agency status ended; and the current status of the EIS. A sample reporting form is at attachment 2. For EAs, the report shall provide the number of EAs and those involving cooperating agency(s)

as described in attachment 2. States, Tribes, and units of local governments that have received authority by Federal law to assume the responsibilities for preparing NEPA analyses are encouraged to comply with these reporting requirements.



If you have any questions concerning this memorandum, please contact Horst G. Greczmiel, Associate Director for NEPA Oversight at 202-395-5750, Horst_Greczmiel@ceq.eop.gov, or 202-456-0753 (fax).

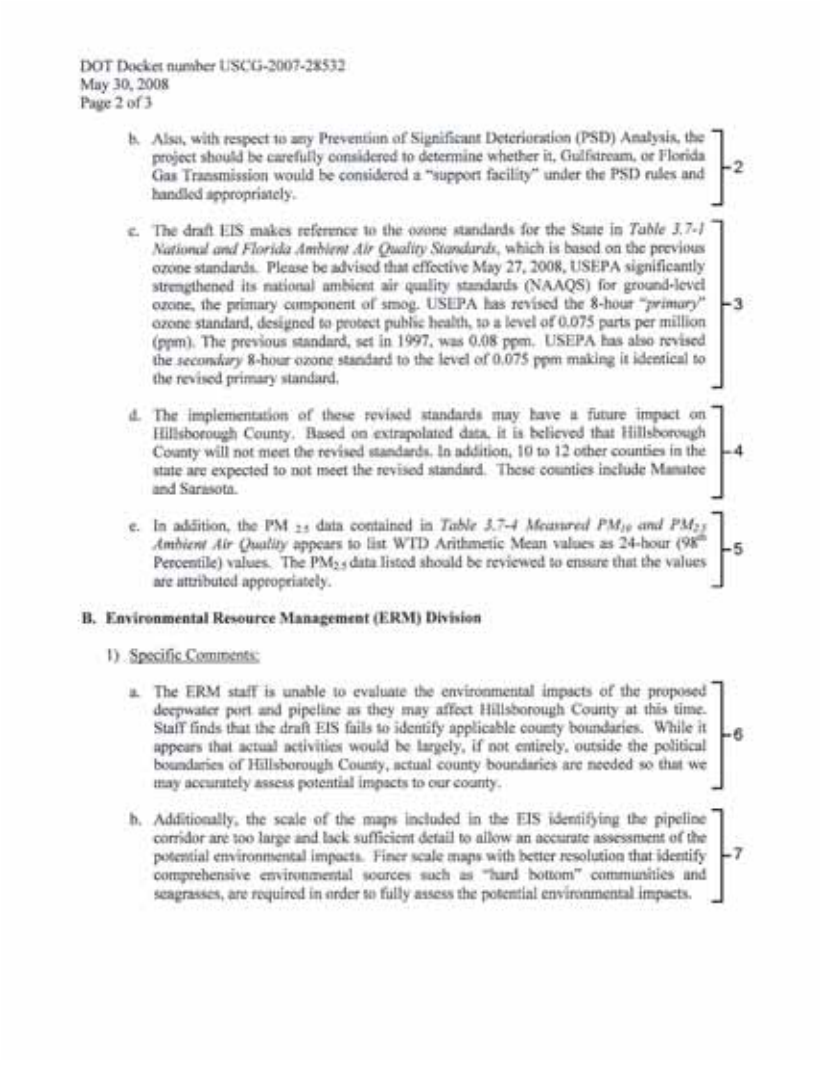
Re: Draft Port Dolphin LLC Deepwater EIS – DOT Docket number USCG-2007-28532

Dear Mr. Prescott:

Thank you for the opportunity to review and comment on the draft Environmental Impact Statement (EIS) on the Port Dolphin LLC Deepwater Port License Application. The Environmental Protection Commission (EPC) is a local government environmental agency that operates under the Hillsborough County Environmental Protection Act, Chapter 84-446, Laws of Florida. The EPC staff has reviewed the above referenced document and offers the following comments for your consideration.

A. Air Management Division



1) General Comments

a. The draft EIS addresses air quality aspects of the Port Dolphin proposed action and alternatives. However, it does not provide quantitative air quality impacts of additional natural gas compressor stations that will be added or expanded in the region in coming years. Florida Gas Transmission ("FGT") plans to construct its Phase VIII pipeline expansion project. Gulfstream Natural Gas System ("Gulfstream") is constructing its Phase IV pipeline expansion project. FGT's Phase VIII project, with construction planned to begin in January 2010, includes its Compressor Station 27 in Hillsborough County which would have one new compressor unit installed that would add 20,000 hp. Compressor Station 27 currently has two 7,200 bhp compressor units. Gulfstream's project includes construction of a 30,000-hp natural gas pipeline compressor facility in Manatee County with a planned "In-Service" date of January 2009. The air quality impacts of these two projects, and any other similar known projects, will increase total throughput to the region and the cumulative effects should be addressed in the final EIS. 1

www.epchc.org
E-Mail: epcinfo@epchc.org
AN AFFIRMATIVE ACTION - EQUAL OPPORTUNITY EMPLOYER

Printed on recycled paper

1. Text added to Section 6.3.7 to address cumulative air impacts resulting from additional compression from other projects discussed in Section 6.2.2. However, quantitative air impacts from those projects would be discussed in the regulatory documents required for those actions, and outline mitigation measures for their additive impacts to regional air quality.

DOT Docket number USCG-2007-28532
May 30, 2008
Page 2 of 3

b. Also, with respect to any Prevention of Significant Deterioration (PSD) Analysis, the project should be carefully considered to determine whether it, Gulfstream, or Florida Gas Transmission would be considered a "support facility" under the PSD rules and handled appropriately. -2

c. The draft EIS makes reference to the ozone standards for the State in *Table 3.7-1 National and Florida Ambient Air Quality Standards*, which is based on the previous ozone standards. Please be advised that effective May 27, 2008, USEPA significantly strengthened its national ambient air quality standards (NAAQS) for ground-level ozone, the primary component of smog. USEPA has revised the 8-hour "*primary*" ozone standard, designed to protect public health, to a level of 0.075 parts per million (ppm). The previous standard, set in 1997, was 0.08 ppm. USEPA has also revised the *secondary* 8-hour ozone standard to the level of 0.075 ppm making it identical to the revised primary standard. -3

d. The implementation of these revised standards may have a future impact on Hillsborough County. Based on extrapolated data, it is believed that Hillsborough County will not meet the revised standards. In addition, 10 to 12 other counties in the state are expected to not meet the revised standard. These counties include Manatee and Sarasota. -4

e. In addition, the PM $_{2.5}$ data contained in *Table 3.7-4 Measured PM_{10} and $PM_{2.5}$ Ambient Air Quality* appears to list WTD Arithmetic Mean values as 24-hour (98th Percentile) values. The $PM_{2.5}$ data listed should be reviewed to ensure that the values are attributed appropriately. -5

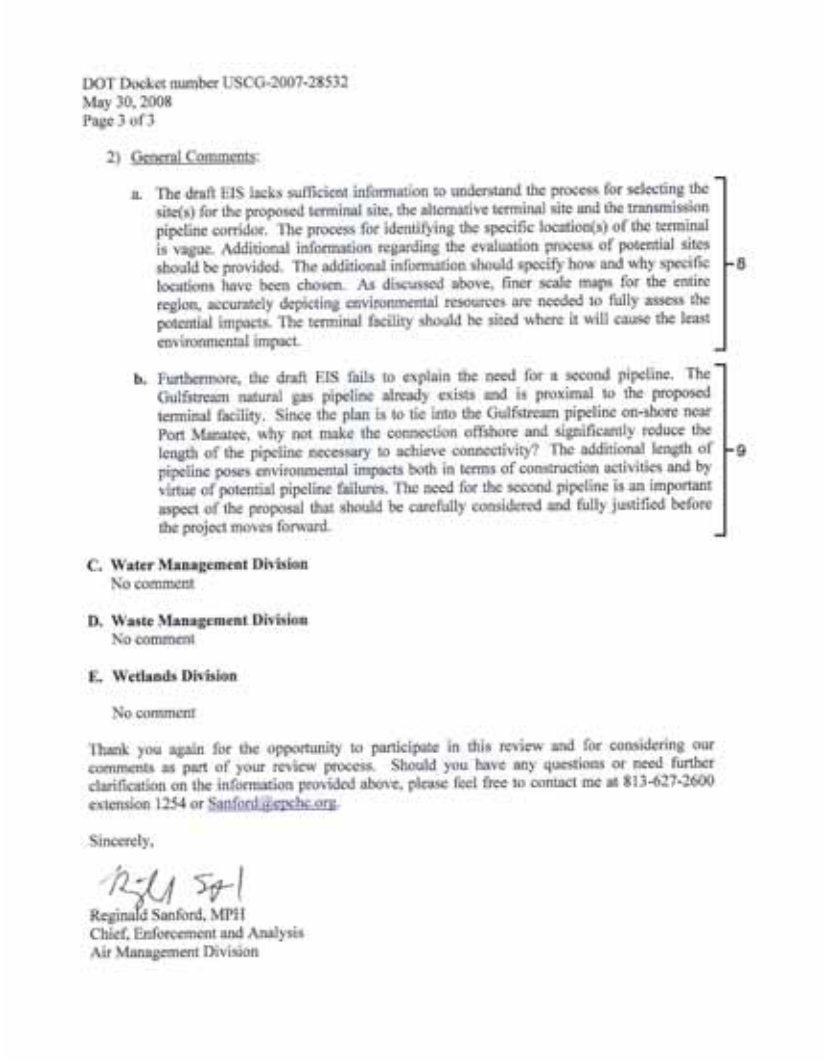
B. Environmental Resource Management (ERM) Division

1) Specific Comments:

a. The ERM staff is unable to evaluate the environmental impacts of the proposed deepwater port and pipeline as they may affect Hillsborough County at this time. Staff finds that the draft EIS fails to identify applicable county boundaries. While it appears that actual activities would be largely, if not entirely, outside the political boundaries of Hillsborough County, actual county boundaries are needed so that we may accurately assess potential impacts to our county. -6

b. Additionally, the scale of the maps included in the EIS identifying the pipeline corridor are too large and lack sufficient detail to allow an accurate assessment of the potential environmental impacts. Finer scale maps with better resolution that identify comprehensive environmental sources such as "hard bottom" communities and seagrasses, are required in order to fully assess the potential environmental impacts. -7

2. We have characterized the regulatory requirements for the Port Dolphin onshore station under PSD as discussed in Section 4.7.1. From a PSD permitting standpoint, FGT and Gulfstream are completely separate entities from Port Dolphin.



3. Table 3.7-1 revised to discuss the changes.

4. Ozone levels in Hillsborough, Manatee and Sarasota Counties are currently classified as attainment, and PSD permitting would conform to this classification until the State Implementation Plan is revised to address the new limits. The regulatory background in Section 1.6 discussion in Section 1.6 was changed to address the recent EPA classification changes.

5. The heading was revised per the comment on the bottom section of Table 3.7-4 (below "$PM_{2.5}$ (continued)" from "24-hour (98th percentile)" to "Annual Average."

6. The maps have been clarified so boundaries are visible.

7. The maps have been enlarged.

DOT Docket number USCG-2007-28532
May 30, 2008
Page 3 of 3

2) General Comments:

a. The draft EIS lacks sufficient information to understand the process for selecting the site(s) for the proposed terminal site, the alternative terminal site and the transmission pipeline corridor. The process for identifying the specific location(s) of the terminal is vague. Additional information regarding the evaluation process of potential sites should be provided. The additional information should specify how and why specific locations have been chosen. As discussed above, finer scale maps for the entire region, accurately depicting environmental resources are needed to fully assess the potential impacts. The terminal facility should be sited where it will cause the least environmental impact. 8

b. Furthermore, the draft EIS fails to explain the need for a second pipeline. The Gulfstream natural gas pipeline already exists and is proximal to the proposed terminal facility. Since the plan is to tie into the Gulfstream pipeline on-shore near Port Manatee, why not make the connection offshore and significantly reduce the length of the pipeline necessary to achieve connectivity? The additional length of pipeline poses environmental impacts both in terms of construction activities and by virtue of potential pipeline failures. The need for the second pipeline is an important aspect of the proposal that should be carefully considered and fully justified before the project moves forward. 9

Thank you again for the opportunity to participate in this review and for considering our comments as part of your review process. Should you have any questions or need further clarification on the information provided above, please feel free to contact me at 813-627-2600 extension 1254 or Sanford@epchc.org.

Sincerely,

Reginald Sanford, MPH
Chief, Enforcement and Analysis
Air Management Division

8. The EIS describes the process of evaluating the sites proposed by the Applicant and identifying the viable sites reviewed in detail. More detailed figures for near shore areas have been included in the Final EIS in Section 2.1, and Appendix F to clarify the restrictions on landfall locations.

9. The discussion of an offshore interconnection with the Gulfstream Pipeline is included in Section 2.1.1.3. An alternative pipeline interconnection to the Gulfstream Pipeline has been added and its impacts discussed in Section 4.

Mr. Mark A. Prescott
Chief, Deepwater Ports Standards Division
U.S. Coast Guard
2100 Second Street, S.W.
Washington, D.C. 20593-0001

Dear Mr. Prescott:

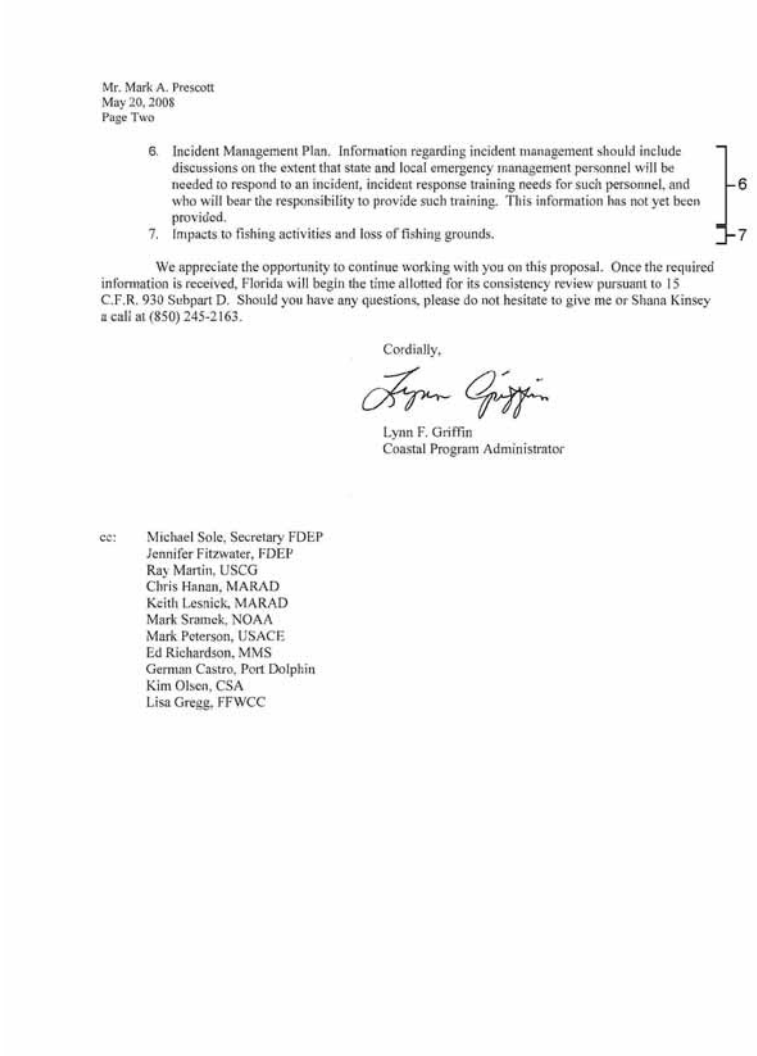
The State of Florida has received the U.S. Maritime Administration and the U.S. Coast Guard's Draft Environmental Impact Statement (DEIS) for the Port Dolphin LLC Deepwater Port License Application, DOT Docket Number: USCG-2007-28532. The Port Dolphin Deepwater Port (DWP) is proposed to be constructed in federal waters of the Outer Continental Shelf in St. Petersburg blocks PB545 and PB589 approximately 28 miles southwest of Tampa, Florida in 100 feet water depth. The port is to connect to a pipeline that would make landfall at Port Manatee in Manatee County, FL and once onshore connect to the existing Gulfstream Pipeline interstate natural gas transmission line and the TECO pipeline system.

In its August 31, 2007 letter, the state outlined the information necessary for the state to assess the consistency of the project with the federally approved Florida Coastal Management Program (FCMP) under the Coastal Zone Management Act (CZMA). The letter noted that pursuant to 15 C.F.R. 930.60, Florida would begin the time allotted for its CZMA consistency review of the proposed project when all of the necessary information was received by the state.

Florida is currently reviewing the DEIS and will provide detailed comments which may address additional issues and information needed for the state's consistency review. However, preliminary review of the DEIS shows that several issues are not adequately addressed and additional information is necessary for the state's CZMA consistency review. These include:

1. CZMA consistency certification and analyses. While the Port Dolphin DWP application included a preliminary consistency analysis, a copy of the final analysis and a signed consistency certification have not been received. These should be included with the final environmental impact statement. — 1
2. Icthyoplankton data and effects assessment. Florida is continuing to work with Port Dolphin and federal agencies to resolve ichthyoplankton plankton assessment issues. — 2
3. Benthic Habitat Assessments. Florida is continuing to work with Port Dolphin and federal agencies to adequately describe and evaluate affected benthic habitats and to maximize avoidance of impacts to those benthic habitats. — 3
4. Construction techniques involving horizontal directional drill (HDD). The DEIS did not include documentation supporting the technical feasibility of successfully completing HDD installations and contingency plans addressing possible problems with installation. — 4
5. Mitigation or Monitoring Plans. For those impacts that cannot be avoided, a quantification of impacts and mitigation/monitoring is required. — 5

"More Protection, Less Process"
www.dep.state.fl.us



1. It is the responsibility of the Applicant to complete the consistency determination. The status of the Applicant's actions and an assessment of the Project's consistency with Florida's CZM Program is included in Section 3.5.3.

2. Comment noted.

3. Comment noted.

4. Potential impacts of HDD are discussed in Section 4 of the Final EIS. The Application describes the HDD techniques in Section 10 Volume II and is available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.

5. Quantification of potential impacts has been discussed in Section 4 when sufficient information is available to quantify the impacts. Otherwise, qualitative discussions are included. Proposed mitigation and monitoring is discussed in Section 4.11.

Mr. Mark A. Prescott
May 20, 2008
Page Two

6. Incident Management Plan. Information regarding incident management should include discussions on the extent that state and local emergency management personnel will be needed to respond to an incident, incident response training needs for such personnel, and who will bear the responsibility to provide such training. This information has not yet been provided. 6
7. Impacts to fishing activities and loss of fishing grounds. 7

We appreciate the opportunity to continue working with you on this proposal. Once the required information is received, Florida will begin the time allotted for its consistency review pursuant to 15 C.F.R. 930 Subpart D. Should you have any questions, please do not hesitate to give me or Shana Kinsey a call at (850) 245-2163.

Cordially,

Lynn F. Griffin
Coastal Program Administrator

Ray Martin, USCG
Chris Hanan, MARAD
Keith Lesnick, MARAD
Mark Sramek, NOAA
Mark Peterson, USACE
Ed Richardson, MMS
German Castro, Port Dolphin
Kim Olsen, CSA
Lisa Gregg, FFWCC

6. Incident management would be discussed in detail in the Project's Operations Manual, which would be required by a condition in the license, if issued. USCG would coordinate with state and local officials during the development and approval of the Operations Manual.

7. Impacts to fishing and loss of fishing grounds are addressed in Section 4.2 and Section 4.8 of the Final EIS.

RE: Port Dolphin LNG LLC Deepwater Port License Application – Docket number USCG-2007-28532: Draft Environmental Impact Statement – April 2008

Dear Mr. Prescott:

The Florida Department of Environmental Protection has coordinated the State's review of the above-referenced Draft Environmental Impact Statement (DEIS) under the National Environmental Policy Act (NEPA). 42 U.S.C. §§ 4321, 4331-4335, as amended. The DEIS was prepared by the U.S. Coast Guard and the U.S. Maritime Administration, in cooperation with other federal agencies, to satisfy the NEPA requirements regarding the Port Dolphin LNG LLC's (Port Dolphin) application to own, construct and operate a deepwater port offshore southwest Florida. Governor Crist will have 45 days from the last public hearing to approve or disapprove the proposed deepwater port. In addition, the federal permits to construct and operate the proposed deepwater port require the concurrence of the State of Florida for consistency with the enforceable policies of the federally approved Florida Coastal Management Program, pursuant to section 307 of the Coastal Zone Management Act (CZMA).

The Port Dolphin Deepwater Port (port) is proposed to be constructed in federal waters of the Outer Continental Shelf in areas designated by the U.S. Department of the Interior Mineral Management Service as Lease Blocks St. Petersburg (PB) 546 and PB 589 approximately 28 miles southwest of Tampa, Florida in 100 feet water depth. The pipeline from the port would make landfall at Port Manatee in Manatee County, FL. Once onshore the pipeline would interconnect with the existing Gulfstream Pipeline interstate natural gas transmission line and the Tampa Electric Company pipeline system. As proposed, gas will be fed to the pipeline directly from closed-loop shuttle and regasification vessels through a turret-and-buoy system. Port Dolphin would have an average throughput capacity of approximately 800 million standard cubic feet of gas per day (Mmscfd) with peak capacity of 1,200 Mmscfd.

Outlined below are major issues regarding the proposed port that must be resolved and/or adequately addressed in the environmental impact statement (EIS). A more detailed discussion of all of our comments is attached.

Mr. Mark A. Prescott
June 2, 2008
Page Two

Air Emissions
Because Florida has over 1,300 miles of coastline with a majority of its residents living in coastal communities, the state is extremely vulnerable to the effects of global climate change. Florida has committed to decreasing its greenhouse gas emissions including carbon emissions, which plays a role in changing global climate. To assist in reducing emissions, the state requests that a more detailed evaluation of the ambient air vaporization technology be included in the EIS and considered as a viable option for this project. This technology appears feasible and could both reduce greenhouse gas emissions and decrease possible impacts on plankton resources. 1

Ichthyoplankton Assessment
To date, issues regarding impacts to important ichthyoplankton resources have not yet been resolved. The Florida Fish and Wildlife Conservation Commission (FWCC) has on several occasions raised concerns about the lack of availability of ichthyoplankton data necessary to adequately evaluate the impacts of the proposed port. Most recently the FWCC stated in a May 23, 2008 memo that, while it agrees with the use of the empirical transport model, the data proposed for use in the model is not appropriate. In order to fully evaluate the impacts of the port on the plankton resources, the EIS should include an analysis of at least one year of data collected in the area where the port is to be located. 2

Pipeline Interconnect
An offshore interconnect into the Gulfstream pipeline would reduce impacts to hard-bottom/ live-bottom habitats, as well as valuable sand resources located along the proposed pipeline path. While the DEIS addressed the issue, there remains technical disagreements about whether an offshore interconnect is feasible. Therefore, the state requests that all cooperating agencies with expertise thoroughly evaluate the feasibility of an offshore interconnect and resolve this issue before the release of the EIS. 3

Sand
The state is concerned that the proposed pipeline route will eliminate access to large quantities of beach compatible sand needed to help restore and maintain Florida's critically eroded beaches. Protection of beach sand sources is a high priority, especially in light of increased hurricane activity and potential sea level rise. Therefore, Florida requests that the EIS thoroughly evaluate alternate routes to avoid beach quality sand reserves. 4

Mitigation and Monitoring Plan
The DEIS does not include plans for mitigation or monitoring for impacts to Florida's biological resources, including benthic habitats. The proposed port and associated pipeline would directly and indirectly impact over 2,100 acres of hard-bottom habitat. The EIS should include appropriate plans to mitigate and monitor impacts to Florida's biological resources.

As mentioned, these are the major issues regarding the proposed port that need to be addressed. The enclosed comments and the state's May 20, 2008 letter identify and explain where information necessary to evaluate the environmental effects of the proposed port is inadequate. Moreover, specific information regarding the proposed project has yet to be determined which limits the accuracy of the impact analysis. Additionally, the DEIS contains 5

1. AAV technology has been added as an alternative Section 2.1 and impacts addressed in Section 4 of the Final EIS.

2. Limitations on SEAMAP data and the adjustments made to accommodate those limitations are detailed in Section 4.1.2.12 and Appendix G of the Final EIS. Use of closed-loop vaporization technology was identified by NMFS as the principal mitigation for ichthyoplankton impacts, and the Applicant has proposed a closed-loop system. The impacts modeled for the Project are extremely low. Therefore, additional data is not considered necessary for the EIS. However, if a license is issued, a sampling program will be required as a condition of the license. If ichthyoplankton data demonstrates the need for additional mitigation, appropriate plans would be developed then.

3. An offshore interconnection with the Gulfstream Pipeline has been included in Section 2.1, Alternatives Analysis.

4. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

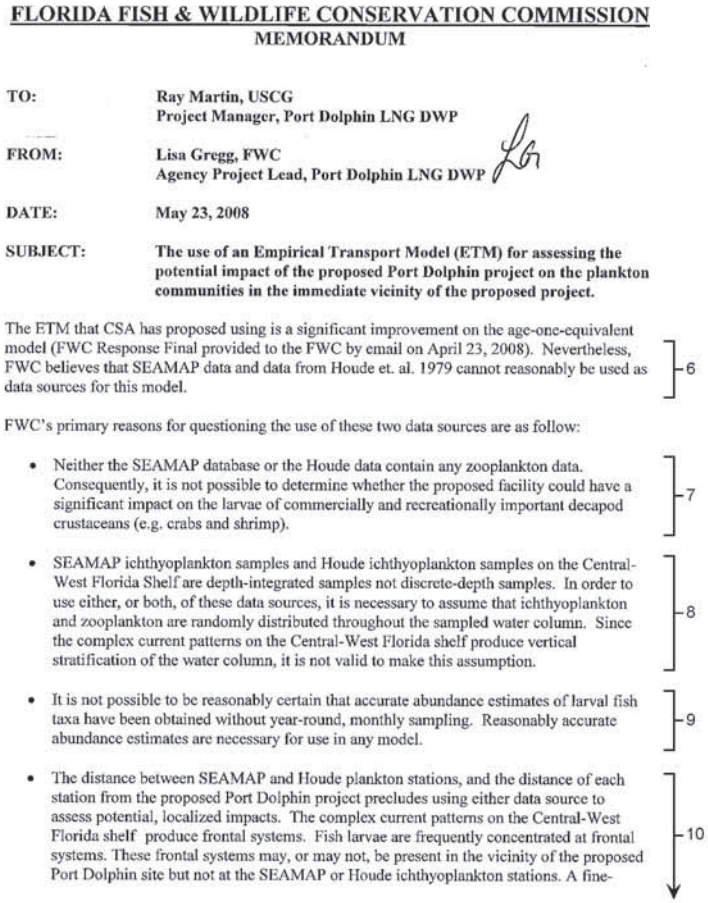
5. Based on additional geophysical and geotechnical evaluations, the benthic impacts discussion has been revised (see Section 4.2.1.6.). Additional mitigation has been included in Section 4.11.

numerous inconsistencies in the information presented which results in a document that is difficult to analyze and often inadequate for assessing impacts. Therefore, you may wish to consider developing a revised NEPA document for public review prior to finalizing the EIS.

Florida requests that the applicant work to obtain necessary data and coordinate with agency staff as information is developed and any modifications to the proposed port plan and operations are made. This will allow accurate assessment of potential impacts and acceptable preferred alternatives to be proposed in the EIS and allow the federal consistency review under the CZMA to be completed in a timely manner. 5

We appreciate the opportunity to review the DEIS and look forward to continue working with you, Port Dolphin and other federal agencies on this proposal. Please address any questions regarding the enclosed comments to Lynn Griffin or Shana Kinsey at (850) 245-2163.

Sincerely,



Jennifer L. Fitzwater

FLORIDA FISH & WILDLIFE CONSERVATION COMMISSION
MEMORANDUM

TO: Ray Martin, USCG
Project Manager, Port Dolphin LNG DWP

FROM: Lisa Gregg, FWC
Agency Project Lead, Port Dolphin LNG DWP

DATE: May 23, 2008

SUBJECT: **The use of an Empirical Transport Model (ETM) for assessing the potential impact of the proposed Port Dolphin project on the plankton communities in the immediate vicinity of the proposed project.**

The ETM that CSA has proposed using is a significant improvement on the age-one-equivalent model (FWC Response Final provided to the FWC by email on April 23, 2008). Nevertheless, FWC believes that SEAMAP data and data from Houde et. al. 1979 cannot reasonably be used as data sources for this model. 6

FWC's primary reasons for questioning the use of these two data sources are as follow:

- Neither the SEAMAP database or the Houde data contain any zooplankton data. Consequently, it is not possible to determine whether the proposed facility could have a significant impact on the larvae of commercially and recreationally important decapod crustaceans (e.g. crabs and shrimp). 7
- SEAMAP ichthyoplankton samples and Houde ichthyoplankton samples on the Central-West Florida Shelf are depth-integrated samples not discrete-depth samples. In order to use either, or both, of these data sources, it is necessary to assume that ichthyoplankton and zooplankton are randomly distributed throughout the sampled water column. Since the complex current patterns on the Central-West Florida shelf produce vertical stratification of the water column, it is not valid to make this assumption. 8
- It is not possible to be reasonably certain that accurate abundance estimates of larval fish taxa have been obtained without year-round, monthly sampling. Reasonably accurate abundance estimates are necessary for use in any model. 9
- The distance between SEAMAP and Houde plankton stations, and the distance of each station from the proposed Port Dolphin project precludes using either data source to assess potential, localized impacts. The complex current patterns on the Central-West Florida shelf produce frontal systems. Fish larvae are frequently concentrated at frontal systems. These frontal systems may, or may not, be present in the vicinity of the proposed Port Dolphin site but not at the SEAMAP or Houde ichthyoplankton stations. A fine- 10

6. In September 2008 FWC rejected the ETM proposed by the Applicant. Therefore, modeling was not performed.

7. Comment noted. Section 4.2.1.11 of the EIS qualitatively evaluates impacts on crustaceans. If a license is issued, a sampling program will be required as a condition of the license. If zooplankton data demonstrates the need for additional mitigation, appropriate plans would be developed then.

8. Limitations on SEAMAP data and the adjustments made to accommodate those limitations are detailed in Section 4.1.2.12 and Appendix G of the Final EIS. Use of closed-loop vaporization technology was identified by NMFS in prior LNG deepwater port projects as the principal mitigation for ichthyoplankton impacts, and the Applicant has proposed a closed-loop system. The impacts modeled for the Project are extremely low. Therefore, additional data is not considered necessary for the EIS. However, if a license is issued, a sampling program will be required as a condition of the license. If ichthyoplankton data demonstrates the need for additional mitigation, appropriate plans would be developed then.

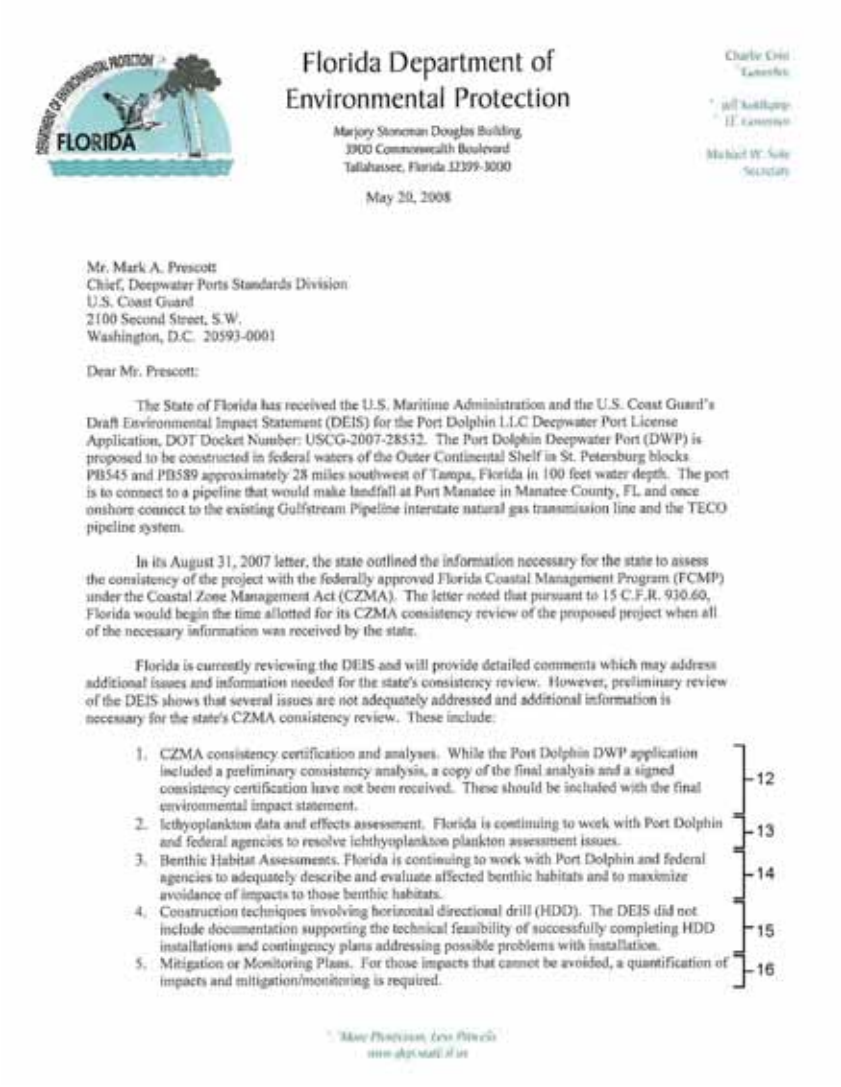
9. Limitations on SEAMAP data and the adjustments made to accommodate those limitations are detailed in Section 4.1.2.12 and Appendix G of the Final EIS. Use of closed-loop vaporization technology was identified by NMFS as the principal mitigation for ichthyoplankton impacts in prior LNG deepwater port projects, and the Applicant has proposed a closed-loop system. The impacts modeled for the Project are extremely low. Therefore, additional data is not considered necessary for the EIS. However, if a license is issued, a sampling program will be required as a condition of the license. If ichthyoplankton data demonstrates the need for additional mitigation, appropriate plans would be developed then.

10. In September 2008 FWC rejected the ETM proposed by the Applicant. Therefore, modeling was not performed.

    Limitations on SEAMAP data and the adjustments made to accommodate those limitations are detailed in Section 4.1.2.12 and Appendix G of the Final EIS. Use of closed-loop vaporization technology was identified by NMFS as the principal mitigation for ichthyoplankton impacts in prior LNG deepwater port projects, and the Applicant has proposed a closed-loop system. The impacts modeled for the Project are extremely low. Therefore, additional data is not considered necessary for the EIS. However, if a license is issued, a sampling program will be required as a condition of the license. If ichthyoplankton data demonstrates the need for additional mitigation, appropriate plans would be developed then.

scale sampling grid centered on all of the proposed Port Dolphin deep-water port site alternatives is necessary to obtain sufficient, reasonably accurate, plankton data for analysis.

10



Conclusions:

FWC agrees that the ETM, as detailed in the CSA memo, is a suitable model for assessing Port Dolphin's potential environmental impacts. FWC does not agree that SEAMAP or Houde et. al. data are suitable data sources for the model.

The FWC maintains that, to our knowledge, a plankton sampling program similar to the one outlined in our December 11, 2006 email regarding the Ichthyoplankton Data Synthesis, is the only suitable source of data adequate for use in the proposed Empirical Transport Model. For FWC to determine if this project would be consistent under the Florida Coastal Management Program/Coastal Zone Consistency Act, we would require at least one year's worth of data collected by the above-referenced sampling program used in conjunction with the Empirical Transport Model to determine potential project impacts to plankton communities, and this information would need to be included in the Final Environmental Impact Statement for the Port Dolphin project.

11

11. Limitations on SEAMAP data and the adjustments made to accommodate those limitations are detailed in Section 4.1.2.12 and Appendix G of the Final EIS. Use of closed-loop vaporization technology was identified by NMFS as the principal mitigation for ichthyoplankton impacts in prior LNG deepwater port projects, and the Applicant has proposed a closed-loop system. The impacts modeled for the Project are extremely low. Therefore, additional data is not considered necessary for the EIS. However, if a license is issued, a sampling program will be required as a condition of the license. If ichthyoplankton data demonstrates the need for additional mitigation, appropriate plans would be developed then.

Florida Department of
Environmental Protection

Marjory Stoneman Douglas Building
3900 Commonwealth Boulevard
Tallahassee, Florida 32399-3000

May 20, 2008

Mr. Mark A. Prescott
Chief, Deepwater Ports Standards Division
U.S. Coast Guard
2100 Second Street, S.W.
Washington, D.C. 20593-0001

Dear Mr. Prescott:

The State of Florida has received the U.S. Maritime Administration and the U.S. Coast Guard's Draft Environmental Impact Statement (DEIS) for the Port Dolphin LLC Deepwater Port License Application, DOT Docket Number: USCG-2007-28532. The Port Dolphin Deepwater Port (DWP) is proposed to be constructed in federal waters of the Outer Continental Shelf in St. Petersburg blocks PB545 and PB589 approximately 28 miles southwest of Tampa, Florida in 100 feet water depth. The port is to connect to a pipeline that would make landfall at Port Manatee in Manatee County, FL and once onshore connect to the existing Gulfstream Pipeline interstate natural gas transmission line and the TECO pipeline system.

In its August 31, 2007 letter, the state outlined the information necessary for the state to assess the consistency of the project with the federally approved Florida Coastal Management Program (FCMP) under the Coastal Zone Management Act (CZMA). The letter noted that pursuant to 15 C.F.R. 930.60, Florida would begin the time allotted for its CZMA consistency review of the proposed project when all of the necessary information was received by the state.

Florida is currently reviewing the DEIS and will provide detailed comments which may address additional issues and information needed for the state's consistency review. However, preliminary review of the DEIS shows that several issues are not adequately addressed and additional information is necessary for the state's CZMA consistency review. These include:

1. CZMA consistency certification and analyses. While the Port Dolphin DWP application included a preliminary consistency analysis, a copy of the final analysis and a signed consistency certification have not been received. These should be included with the final environmental impact statement. 12
2. Ichthyoplankton data and effects assessment. Florida is continuing to work with Port Dolphin and federal agencies to resolve ichthyoplankton plankton assessment issues. 13
3. Benthic Habitat Assessments. Florida is continuing to work with Port Dolphin and federal agencies to adequately describe and evaluate affected benthic habitats and to maximize avoidance of impacts to those benthic habitats. 14
4. Construction techniques involving horizontal directional drill (HDD). The DEIS did not include documentation supporting the technical feasibility of successfully completing HDD installations and contingency plans addressing possible problems with installation. 15
5. Mitigation or Monitoring Plans. For those impacts that cannot be avoided, a quantification of impacts and mitigation/monitoring is required. 16

12. The Applicant is responsible for processing the CZM consistency determination. An assessment of environmental impacts to coastal resources in included in Section 4.2.1 of the Final EIS.

13. Comment Noted. USCG and the Maritime Administration appreciate FDEP's continuing cooperation in this effort.

14. Comment Noted. USCG and the Maritime Administration appreciate FDEP's continuing cooperation in this effort.

15. HDD technology has been used in pipeline construction for years. Evaluations of potential problems, such as frac-out of drilling mud, are included in Section 2 of the Final EIS.

16. Unavoidable impacts are discussed in Section 4 and Section 6.4 of the Final EIS. Mitigation measures are discussed throughout Section 4 and compiled in Section 4.11.

Mr. Mark A. Prescott
May 20, 2008
Page Two

6. Incident Management Plan. Information regarding incident management should include discussions on the extent that state and local emergency management personnel will be needed to respond to an incident, incident response training needs for such personnel, and who will bear the responsibility to provide such training. This information has not yet been provided. 17
7. Impacts to fishing activities and loss of fishing grounds. 18

We appreciate the opportunity to continue working with you on this proposal. Once the required information is received, Florida will begin the time allotted for its consistency review pursuant to 15 C.F.R. 930 Subpart D. Should you have any questions, please do not hesitate to give me or Shana Kinsey a call at (850) 245-2163.

Cordially,

Lynn F. Griffin
Coastal Program Administrator

cc: Michael Sole, Secretary FDEP
Jennifer Fitzwater, FDEP
Ray Martin, USCG
Chris Hanan, MARAD
Keith Lesnick, MARAD
Mark Sramek, NOAA
Mark Peterson, USACE
Ed Richardson, MMS
German Castro, Port Dolphin
Kim Olsen, CSA
Lisa Gregg, FFWCC

17. Incident management would be included in the Operations Manual that would be developed and approved by the USCG if a license is issued.

18. Impacts to fishing and loss of fishing grounds are discussed in Section 4.9, Socioeconomics and Environmental Justice.

STATE OF FLORIDA
COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
PORT DOLPHIN LNG DEEPWATER PORT (DWP) LICENSE APPLICATION

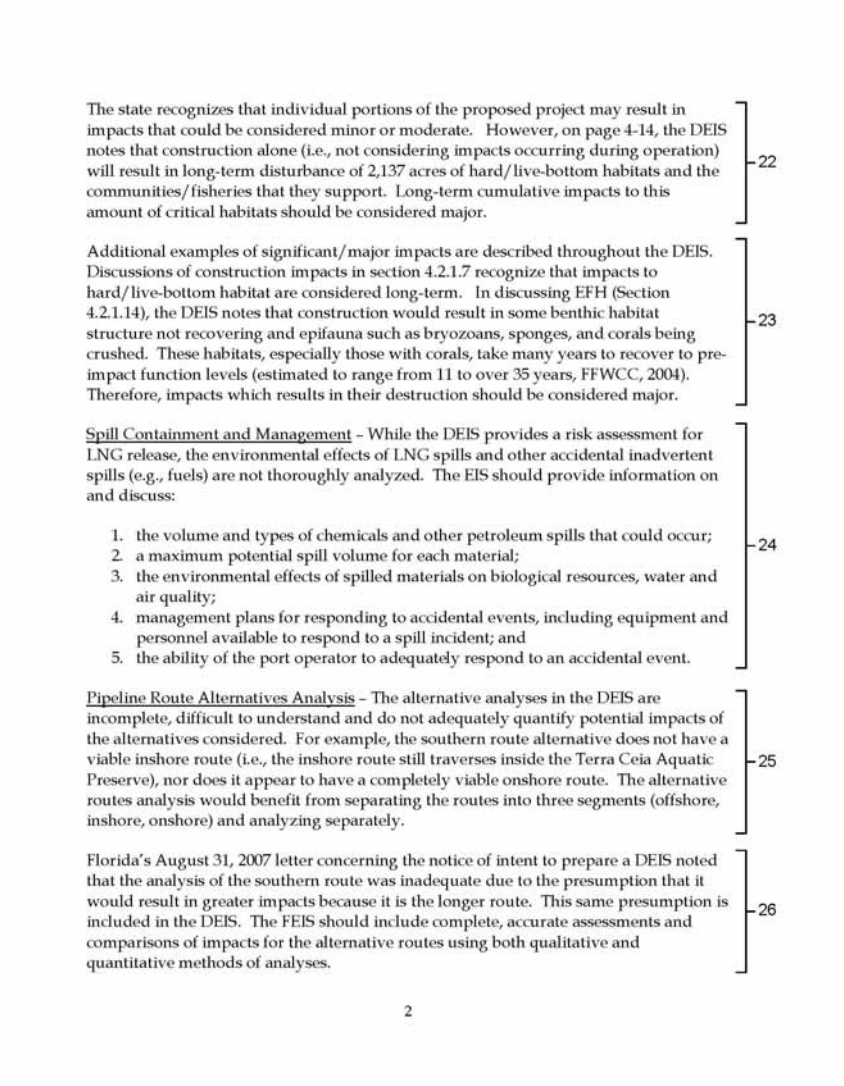
Comments received by the Florida Department of State; the Fish and Wildlife Conservation Commission; and the Department of Environmental Protection: Southwest District, Bureau of Beaches and Coastal Systems, Division of Air Resource Management and Florida Geological Survey are attached and should be considered in developing the EIS.

Please note that the use of "the proposed project" in the discussions below refers to the deepwater port (DWP) and associated pipelines.

Organization of the Draft Environmental Impact Statement (DEIS) – The overall organization of the DEIS makes it difficult to follow and accurately determine the potential for and level of impacts. A complete description of the project as proposed, before alternatives are discussed would allow the reader to fully understand the project and evaluate impacts against alternatives discussed. In addition, many sections in the document include technical descriptions that would be made clearer with the use of maps, diagrams, and figures to assist in explanations. 19

Data Gaps Analysis – In several areas of the DEIS, summary information is cited back to information supplied by the applicant to fill data gaps at the request of the Unites States Coast Guard (USGC). More specific information, including actual data, figures, maps, and diagrams taken from the data gap information supplied should be incorporated into the EIS to more accurately describe the proposal and potential effects. 20

Impact Assessment – The DEIS defines impacts as:



> minor - impacts that might be perceptible, but generally cannot be measured;
> moderate - impacts that are more perceptible and more amenable to quantification and measurement; and
> major - impacts due to their severity have the potential to meet thresholds for significance as set forth in 40 CFR 1508.27.

The state is concerned that almost all of the impacts described in the DEIS are rated at a minor to moderate level. Impacts described, should in some cases, be defined as major based on their significance to local area habitats and the communities that they support. Hard/live-bottom habitats located in the area of the proposed project support important benthic communities/species and are essential fish habitats (EFH) supporting local fisheries. Impacts to these hard/live-bottom habitats resulting from the construction and operation of the proposed project seem to meet significance thresholds described in NEPA regulations to be considered major impacts. 21

19. The project description is placed after the alternatives analysis to ensure that the proposed project is not given undue consideration in the selection of alternatives for review. The same organization is used for the Final EIS.

20. Data gap responses are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.

21. Based on the evaluations described in Section 4 and mitigations discussed in Section 4 and compiled in Section 4.11, impact assessments are considered to be accurate.

The state recognizes that individual portions of the proposed project may result in impacts that could be considered minor or moderate. However, on page 4-14, the DEIS notes that construction alone (i.e., not considering impacts occurring during operation) will result in long-term disturbance of 2,137 acres of hard/live-bottom habitats and the communities/fisheries that they support. Long-term cumulative impacts to this amount of critical habitats should be considered major. 22

Additional examples of significant/major impacts are described throughout the DEIS. Discussions of construction impacts in section 4.2.1.7 recognize that impacts to hard/live-bottom habitat are considered long-term. In discussing EFH (Section 4.2.1.14), the DEIS notes that construction would result in some benthic habitat structure not recovering and epifauna such as bryozoans, sponges, and corals being crushed. These habitats, especially those with corals, take many years to recover to pre-impact function levels (estimated to range from 11 to over 35 years, FFWCC, 2004). Therefore, impacts which results in their destruction should be considered major. 23

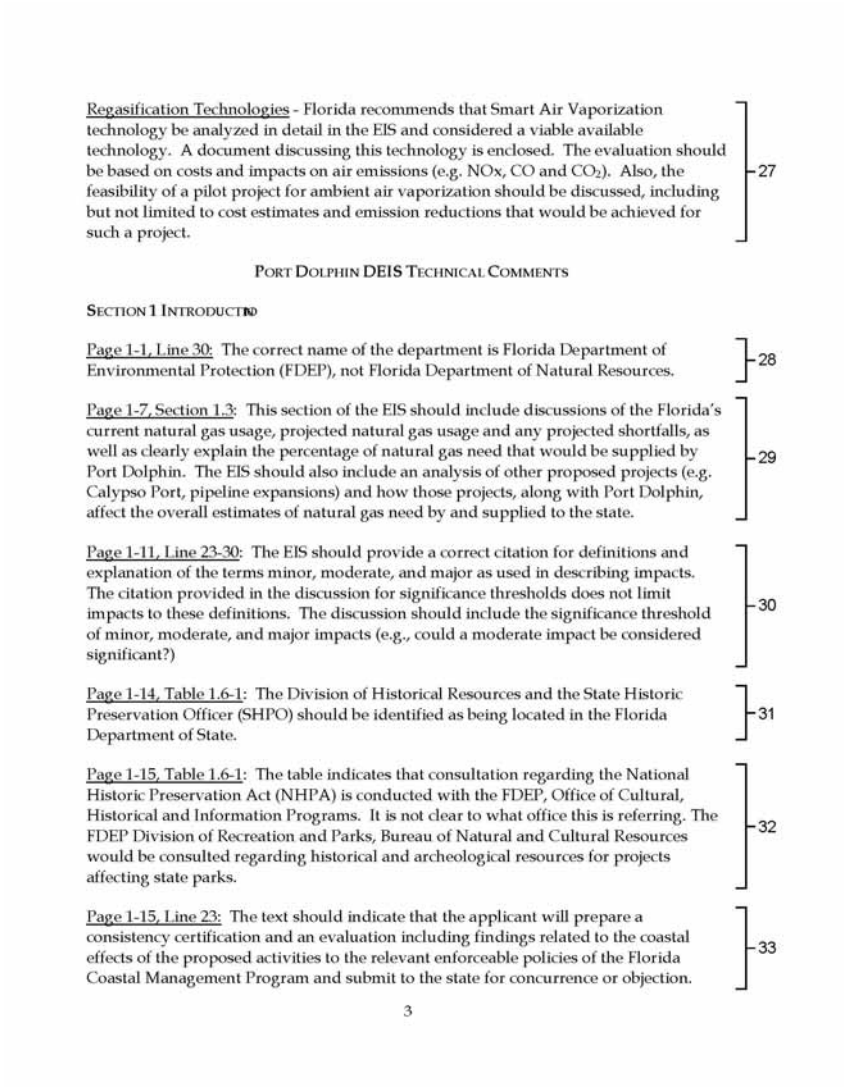
Spill Containment and Management – While the DEIS provides a risk assessment for LNG release, the environmental effects of LNG spills and other accidental inadvertent spills (e.g., fuels) are not thoroughly analyzed. The EIS should provide information on and discuss: 24

1. the volume and types of chemicals and other petroleum spills that could occur;
2. a maximum potential spill volume for each material;
3. the environmental effects of spilled materials on biological resources, water and air quality;
4. management plans for responding to accidental events, including equipment and personnel available to respond to a spill incident; and
5. the ability of the port operator to adequately respond to an accidental event.

Pipeline Route Alternatives Analysis – The alternative analyses in the DEIS are incomplete, difficult to understand and do not adequately quantify potential impacts of the alternatives considered. For example, the southern route alternative does not have a viable inshore route (i.e., the inshore route still traverses inside the Terra Ceia Aquatic Preserve), nor does it appear to have a completely viable onshore route. The alternative routes analysis would benefit from separating the routes into three segments (offshore, inshore, onshore) and analyzing separately. 25

Florida's August 31, 2007 letter concerning the notice of intent to prepare a DEIS noted that the analysis of the southern route was inadequate due to the presumption that it would result in greater impacts because it is the longer route. This same presumption is included in the DEIS. The FEIS should include complete, accurate assessments and comparisons of impacts for the alternative routes using both qualitative and quantitative methods of analyses. 26

2



22. Based on additional geophysical and geotechnical evaluations, the benthic impacts discussion in Section 4.2.1.6 has been revised. Additional mitigation has been included in Section 4.11.

23. Based on additional geophysical and geotechnical evaluations, the benthic impacts discussion in Section 4.2.1.6 has been revised. Additional mitigation has been included in Section 4.11.

24. Potential impacts from spills of petroleum products and chemicals are discussed in appropriate sections of Section 4. Incident management would be included in the Operations Manual that would be developed and approved by the USCG if a license is issued.

25. Comment noted.

26. Assessment of impacts based on geophysical surveys has been included in the Final EIS. Survey data provided by the Applicant in response to data gap questions are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.

Regasification Technologies - Florida recommends that Smart Air Vaporization technology be analyzed in detail in the EIS and considered a viable available technology. A document discussing this technology is enclosed. The evaluation should be based on costs and impacts on air emissions (e.g. NOx, CO and CO_2). Also, the feasibility of a pilot project for ambient air vaporization should be discussed, including but not limited to cost estimates and emission reductions that would be achieved for such a project. 27

PORT DOLPHIN DEIS TECHNICAL COMMENTS

SECTION 1 INTRODUCTION

Page 1-1, Line 30: The correct name of the department is Florida Department of Environmental Protection (FDEP), not Florida Department of Natural Resources. 28

Page 1-7, Section 1.3: This section of the EIS should include discussions of the Florida's current natural gas usage, projected natural gas usage and any projected shortfalls, as well as clearly explain the percentage of natural gas need that would be supplied by Port Dolphin. The EIS should also include an analysis of other proposed projects (e.g. Calypso Port, pipeline expansions) and how those projects, along with Port Dolphin, affect the overall estimates of natural gas need by and supplied to the state. 29

Page 1-11, Line 23-30: The EIS should provide a correct citation for definitions and explanation of the terms minor, moderate, and major as used in describing impacts. The citation provided in the discussion for significance thresholds does not limit impacts to these definitions. The discussion should include the significance threshold of minor, moderate, and major impacts (e.g., could a moderate impact be considered significant?) 30

Page 1-14, Table 1.6-1: The Division of Historical Resources and the State Historic Preservation Officer (SHPO) should be identified as being located in the Florida Department of State. 31

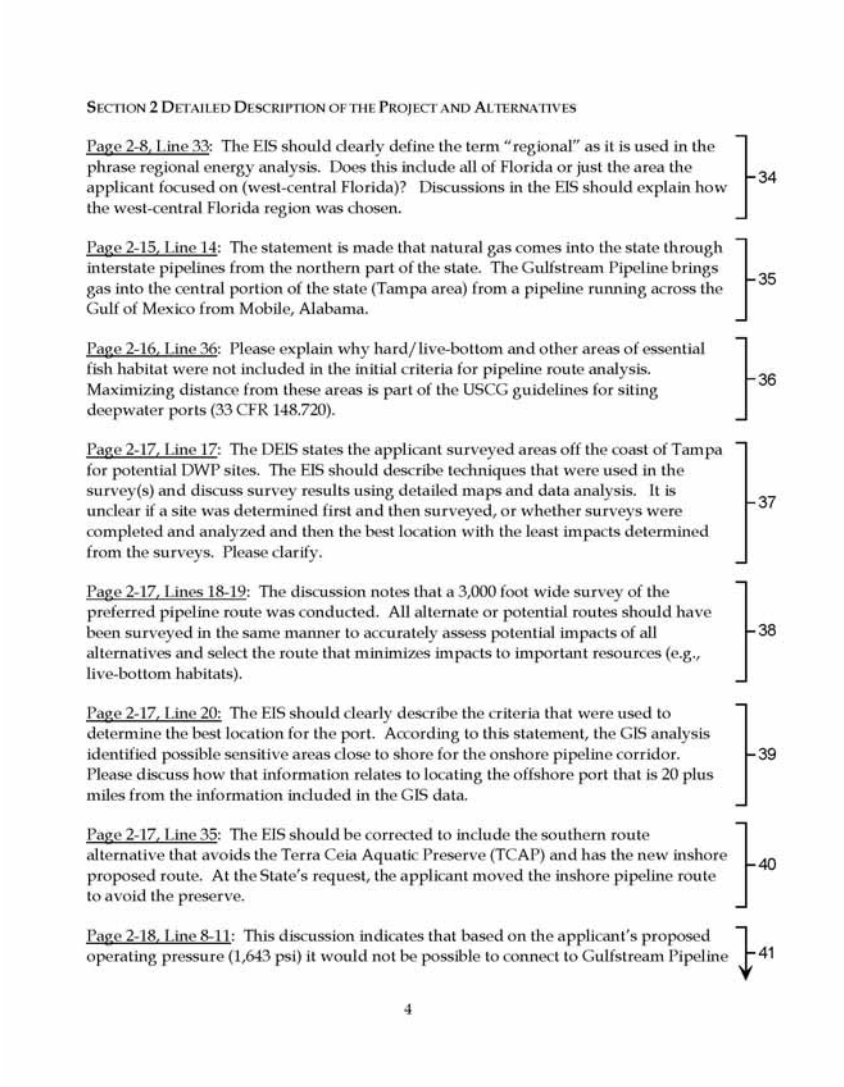
Page 1-15, Table 1.6-1: The table indicates that consultation regarding the National Historic Preservation Act (NHPA) is conducted with the FDEP, Office of Cultural, Historical and Information Programs. It is not clear to what office this is referring. The FDEP Division of Recreation and Parks, Bureau of Natural and Cultural Resources would be consulted regarding historical and archeological resources for projects affecting state parks. 32

Page 1-15, Line 23: The text should indicate that the applicant will prepare a consistency certification and an evaluation including findings related to the coastal effects of the proposed activities to the relevant enforceable policies of the Florida Coastal Management Program and submit to the state for concurrence or objection. 33

3

27. AAV technology has been added as an alternative Section 2.1 and impacts addressed in Section 4 of the Final EIS.

28. Text revised per comment.



29. Florida usage of natural gas and other energy sources are discussed in Section 2.1. Other potential sources of natural gas, including the Calypso Project and expansion of existing natural gas pipelines are included in the discussion. Since the proposed project is independent of other projects, estimates of the total potential supply are not appropriate to the evaluation of this project. As demonstrated by the recent withdrawal of the license application for the Calypso Project, each project should be evaluated on its own merits.

30. The definitions supplied are based upon best professional judgment for the information of the reader on evaluation criteria used in the EIS to ensure consistent descriptions in all resource areas. Evaluation criteria for determining environmental consequences are further defined by resource area in Table 4.0-1 in Section 4.

31. Text revised per comment.

32. Text revised per comment.

33. Text revised per comment.

SECTION 2 DETAILED DESCRIPTION OF THE PROJECT AND ALTERNATIVES

Page 2-8, Line 33: The EIS should clearly define the term "regional" as it is used in the phrase regional energy analysis. Does this include all of Florida or just the area the applicant focused on (west-central Florida)? Discussions in the EIS should explain how the west-central Florida region was chosen. 34

Page 2-15, Line 14: The statement is made that natural gas comes into the state through interstate pipelines from the northern part of the state. The Gulfstream Pipeline brings gas into the central portion of the state (Tampa area) from a pipeline running across the Gulf of Mexico from Mobile, Alabama. 35

Page 2-16, Line 36: Please explain why hard/live-bottom and other areas of essential fish habitat were not included in the initial criteria for pipeline route analysis. Maximizing distance from these areas is part of the USCG guidelines for siting deepwater ports (33 CFR 148.720). 36

Page 2-17, Line 17: The DEIS states the applicant surveyed areas off the coast of Tampa for potential DWP sites. The EIS should describe techniques that were used in the survey(s) and discuss survey results using detailed maps and data analysis. It is unclear if a site was determined first and then surveyed, or whether surveys were completed and analyzed and then the best location with the least impacts determined from the surveys. Please clarify. 37

Page 2-17, Lines 18-19: The discussion notes that a 3,000 foot wide survey of the preferred pipeline route was conducted. All alternate or potential routes should have been surveyed in the same manner to accurately assess potential impacts of all alternatives and select the route that minimizes impacts to important resources (e.g., live-bottom habitats). 38

Page 2-17, Line 20: The EIS should clearly describe the criteria that were used to determine the best location for the port. According to this statement, the GIS analysis identified possible sensitive areas close to shore for the onshore pipeline corridor. Please discuss how that information relates to locating the offshore port that is 20 plus miles from the information included in the GIS data. 39

Page 2-17, Line 35: The EIS should be corrected to include the southern route alternative that avoids the Terra Ceia Aquatic Preserve (TCAP) and has the new inshore proposed route. At the State's request, the applicant moved the inshore pipeline route to avoid the preserve. 40

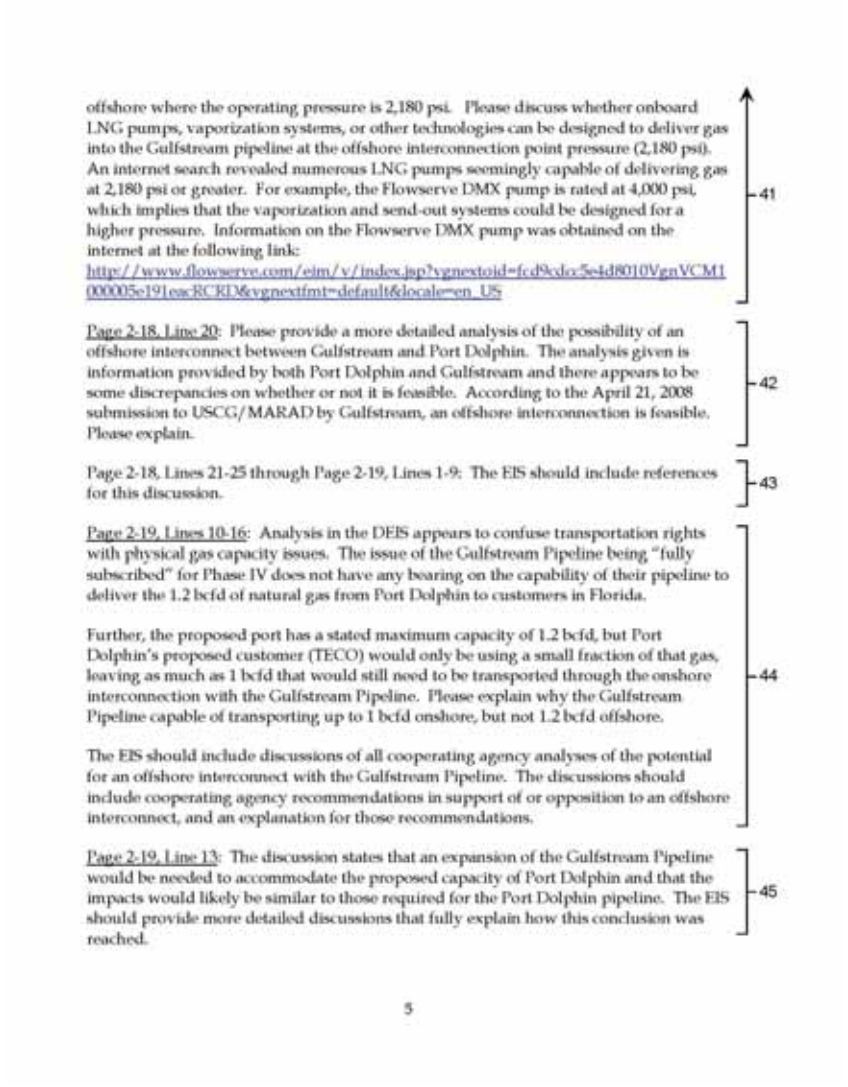
Page 2-18, Line 8-11: This discussion indicates that based on the applicant's proposed operating pressure (1,643 psi) it would not be possible to connect to Gulfstream Pipeline 41

4

34. The west central Florida region was identified by the Applicant as their intended market. A reference to Section 1.2 was added for clarity. The text in Section 2.1.1.3 clearly identifies proximity to an existing pipeline as an essential screening criterion and identifies the existing pipelines.

35. Text revised per comment.

36. The criteria of 33 CFR 148.720 are listed on pages 2-10 and 2-15 of the Draft EIS. Avoiding hard/live bottom areas is not specifically included in the criteria; however, avoiding impacts to EFH is included in the criteria, and EFH includes hard/live bottom areas.



37. Details of the Applicant's surveys are available in the Application that is available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532

38. The 2 alternative routes have been surveyed in a similar manner as addressed in Section 4.5.1 of the Final EIS.

39. The discussion of screening has been revised to clarify the selection of potential port locations.

40. The pipeline alternatives have been changed to reflect new pipeline routes proposed by the Applicant.

41. An offshore interconnection with the Gulfstream Pipeline has been included in Section 2.1, Alternatives Analysis.

offshore where the operating pressure is 2,180 psi. Please discuss whether onboard LNG pumps, vaporization systems, or other technologies can be designed to deliver gas into the Gulfstream pipeline at the offshore interconnection point pressure (2,180 psi). An internet search revealed numerous LNG pumps seemingly capable of delivering gas at 2,180 psi or greater. For example, the Flowserve DMX pump is rated at 4,000 psi, which implies that the vaporization and send-out systems could be designed for a higher pressure. Information on the Flowserve DMX pump was obtained on the internet at the following link:
http://www.flowserve.com/eim/v/index.jsp?vgnextoid=fcd9cdcc5e4d8010VgnVCM1000005e191eacRCRD&vgnextfmt=default&locale=en_US

41

Page 2-18, Line 20: Please provide a more detailed analysis of the possibility of an offshore interconnect between Gulfstream and Port Dolphin. The analysis given is information provided by both Port Dolphin and Gulfstream and there appears to be some discrepancies on whether or not it is feasible. According to the April 21, 2008 submission to USCG/MARAD by Gulfstream, an offshore interconnection is feasible. Please explain.

42

Page 2-18, Lines 21-25 through Page 2-19, Lines 1-9: The EIS should include references for this discussion.

43

Page 2-19, Lines 10-16: Analysis in the DEIS appears to confuse transportation rights with physical gas capacity issues. The issue of the Gulfstream Pipeline being "fully subscribed" for Phase IV does not have any bearing on the capability of their pipeline to deliver the 1.2 bcfd of natural gas from Port Dolphin to customers in Florida.

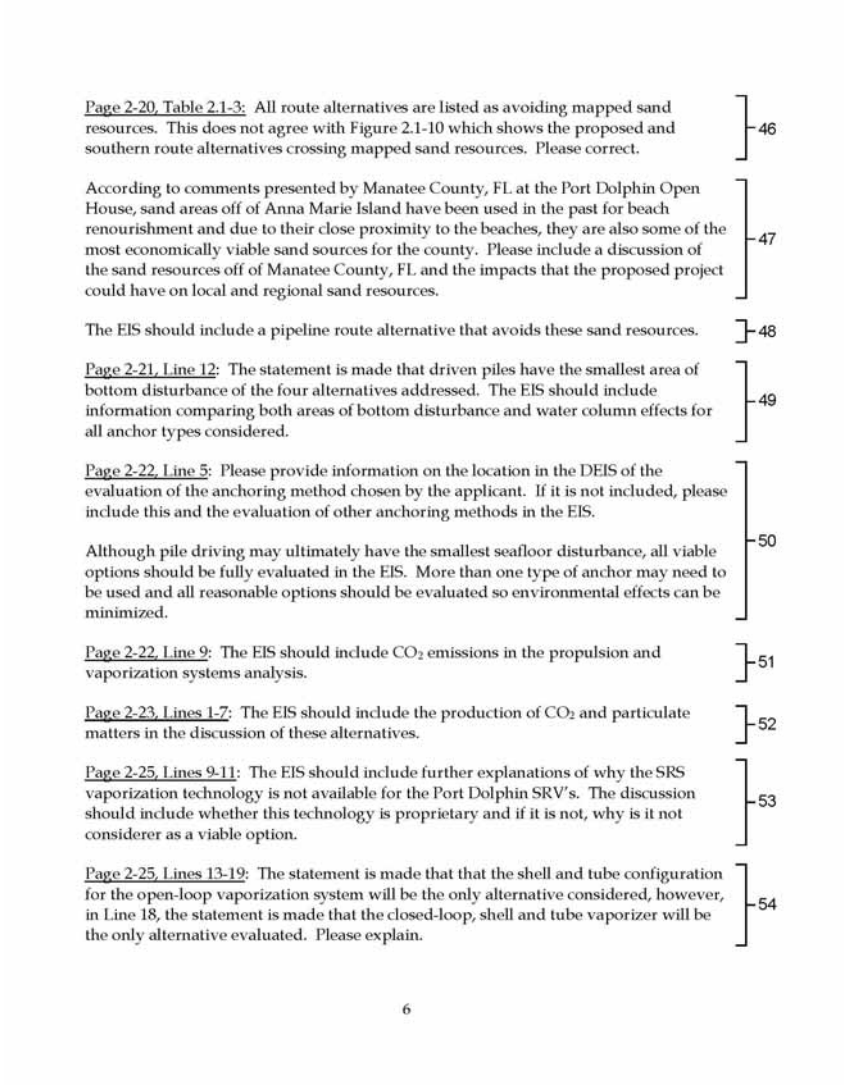
Further, the proposed port has a stated maximum capacity of 1.2 bcfd, but Port Dolphin's proposed customer (TECO) would only be using a small fraction of that gas, leaving as much as 1 bcfd that would still need to be transported through the onshore interconnection with the Gulfstream Pipeline. Please explain why the Gulfstream Pipeline capable of transporting up to 1 bcfd onshore, but not 1.2 bcfd offshore.

The EIS should include discussions of all cooperating agency analyses of the potential for an offshore interconnect with the Gulfstream Pipeline. The discussions should include cooperating agency recommendations in support of or opposition to an offshore interconnect, and an explanation for those recommendations.

44

Page 2-19, Line 13: The discussion states that an expansion of the Gulfstream Pipeline would be needed to accommodate the proposed capacity of Port Dolphin and that the impacts would likely be similar to those required for the Port Dolphin pipeline. The EIS should provide more detailed discussions that fully explain how this conclusion was reached.

45



5

42. An offshore interconnection with the Gulfstream Pipeline has been included in Section 2.1, Alternatives Analysis.

43. The subject text has been deleted from the Final EIS.

44. The subject text has been deleted from the Final EIS.

45. The subject text has been deleted from the Final EIS.

Page 2-20, Table 2.1-3: All route alternatives are listed as avoiding mapped sand resources. This does not agree with Figure 2.1-10 which shows the proposed and southern route alternatives crossing mapped sand resources. Please correct. 46

According to comments presented by Manatee County, FL at the Port Dolphin Open House, sand areas off of Anna Marie Island have been used in the past for beach renourishment and due to their close proximity to the beaches, they are also some of the most economically viable sand sources for the county. Please include a discussion of the sand resources off of Manatee County, FL and the impacts that the proposed project could have on local and regional sand resources. 47

The EIS should include a pipeline route alternative that avoids these sand resources. 48

Page 2-21, Line 12: The statement is made that driven piles have the smallest area of bottom disturbance of the four alternatives addressed. The EIS should include information comparing both areas of bottom disturbance and water column effects for all anchor types considered. 49

Page 2-22, Line 5: Please provide information on the location in the DEIS of the evaluation of the anchoring method chosen by the applicant. If it is not included, please include this and the evaluation of other anchoring methods in the EIS.

Although pile driving may ultimately have the smallest seafloor disturbance, all viable options should be fully evaluated in the EIS. More than one type of anchor may need to be used and all reasonable options should be evaluated so environmental effects can be minimized. 50

Page 2-22, Line 9: The EIS should include CO_2 emissions in the propulsion and vaporization systems analysis. 51

Page 2-23, Lines 1-7: The EIS should include the production of CO_2 and particulate matters in the discussion of these alternatives. 52

Page 2-25, Lines 9-11: The EIS should include further explanations of why the SRS vaporization technology is not available for the Port Dolphin SRV's. The discussion should include whether this technology is proprietary and if it is not, why is it not considerer as a viable option. 53

Page 2-25, Lines 13-19: The statement is made that that the shell and tube configuration for the open-loop vaporization system will be the only alternative considered, however, in Line 18, the statement is made that the closed-loop, shell and tube vaporizer will be the only alternative evaluated. Please explain. 54

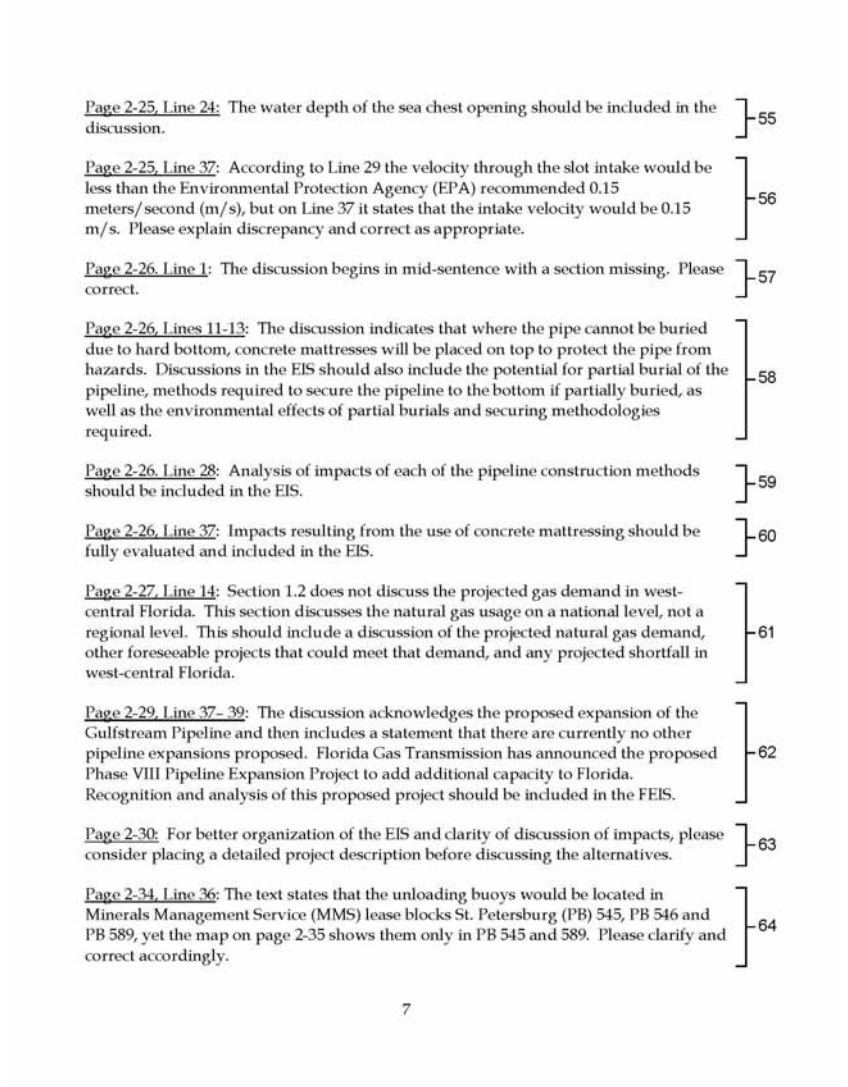
6

46. Text revised per comment.

47. Additional discussion of sand resources has been added to Section 3.4 and 4.4.

48. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

49. Alternative anchoring methods are compared in Section 2.1.1.4 and in Section 4 as appropriate using the information that is available.



50. The anchoring method used by the applicant is driven piles. Impacts of alternative anchoring methods are discussed in appropriate sections of Section 4. Additional clarification on selection of the anchoring method evaluated has been added to Section 2.1.2.4.

51. CO_2 emissions are considered Section 7, Greenhouse Gasses.

52. See response to comment 51. Particulate emissions are evaluated in Section 4.7.

53. The SRS vaporization technology design presented in the Calypso Project is not available for the Port Dolphin SRVs and, therefore, SRS vaporization technology is not a viable alternative for the SRV design. However, the closed engine cooling system option has been added as an alternative for the FSRU port design and is discussed in Section 2.1.7.4.

54. The text has been corrected to identify the closed-loop shell and tube vaporizer as one alternative that is evaluated in detail.

Page 2-25, Line 24: The water depth of the sea chest opening should be included in the discussion. 55

Page 2-25, Line 37: According to Line 29 the velocity through the slot intake would be less than the Environmental Protection Agency (EPA) recommended 0.15 meters/second (m/s), but on Line 37 it states that the intake velocity would be 0.15 m/s. Please explain discrepancy and correct as appropriate. 56

Page 2-26, Line 1: The discussion begins in mid-sentence with a section missing. Please correct. 57

Page 2-26, Lines 11-13: The discussion indicates that where the pipe cannot be buried due to hard bottom, concrete mattresses will be placed on top to protect the pipe from hazards. Discussions in the EIS should also include the potential for partial burial of the pipeline, methods required to secure the pipeline to the bottom if partially buried, as well as the environmental effects of partial burials and securing methodologies required. 58

Page 2-26, Line 28: Analysis of impacts of each of the pipeline construction methods should be included in the EIS. 59

Page 2-26, Line 37: Impacts resulting from the use of concrete mattressing should be fully evaluated and included in the EIS. 60

Page 2-27, Line 14: Section 1.2 does not discuss the projected gas demand in west-central Florida. This section discusses the natural gas usage on a national level, not a regional level. This should include a discussion of the projected natural gas demand, other foreseeable projects that could meet that demand, and any projected shortfall in west-central Florida. 61

Page 2-29, Line 37 – 39: The discussion acknowledges the proposed expansion of the Gulfstream Pipeline and then includes a statement that there are currently no other pipeline expansions proposed. Florida Gas Transmission has announced the proposed Phase VIII Pipeline Expansion Project to add additional capacity to Florida. Recognition and analysis of this proposed project should be included in the FEIS. 62

Page 2-30: For better organization of the EIS and clarity of discussion of impacts, please consider placing a detailed project description before discussing the alternatives. 63

Page 2-34, Line 36: The text states that the unloading buoys would be located in Minerals Management Service (MMS) lease blocks St. Petersburg (PB) 545, PB 546 and PB 589, yet the map on page 2-35 shows them only in PB 545 and 589. Please clarify and correct accordingly. 64

7

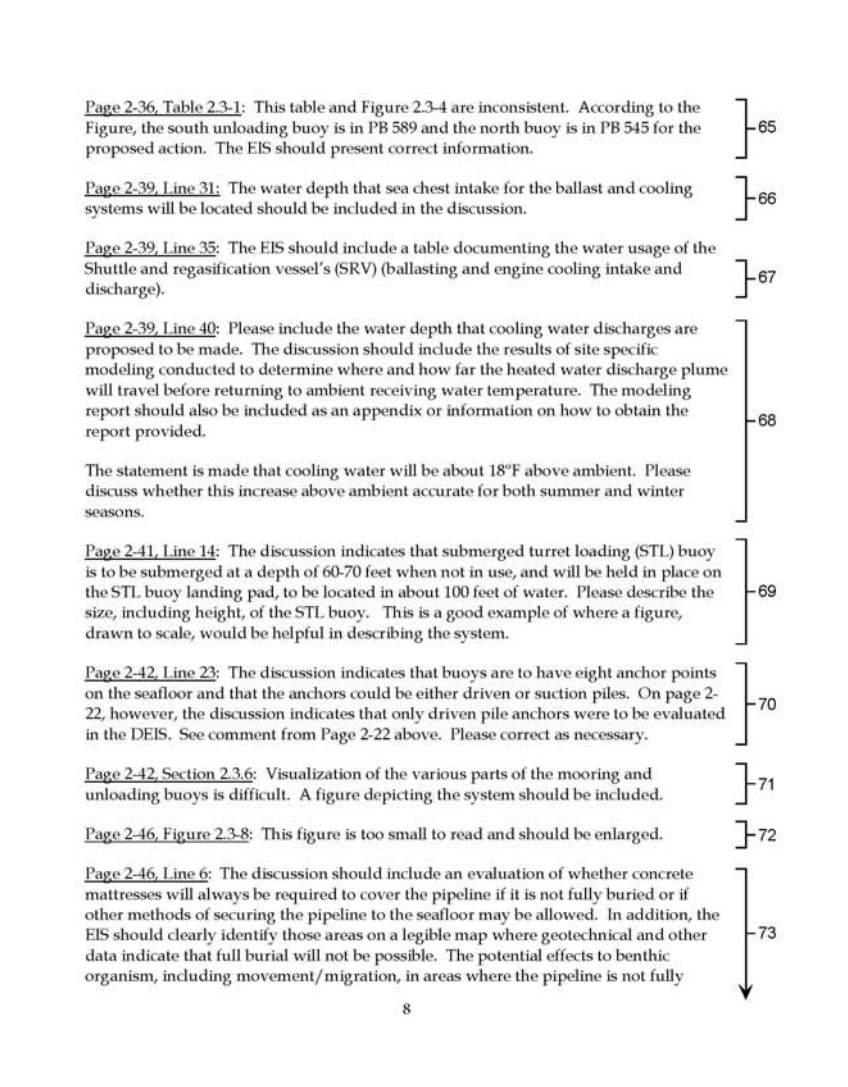
55. The sea chest depths have been added to Section 2.1.8 and 2.3.4.

56. Text revised to "less than or equal to" in both places.

57. The missing section heading and text has been restored.

58. Burial methods and associated impacts are discussed in Sections 4.1.1, 4.2.1, and 4.4.1.

59. Impact analysis based on pipeline construction methods is included in Section 4.5.1.



60. Burial methods and associated impacts are discussed in Sections 4.1.1, 4.2.1, and 4.4.1.

61. Florida usage of natural gas and other energy sources are discussed in Section 2.1. Other potential sources of natural gas, including the Calypso Project and expansion of existing natural gas pipelines are included in the discussion. Since the proposed project is independent of other projects, estimates of the total potential supply are not appropriate to the evaluation of this project. As demonstrated by the recent withdrawal of the license application for the Calypso Project, each project should be evaluated on its own merits.

62. The Final EIS has been updated to include developments since the Draft EIS was published (see Section 6.2).

63. The project description is placed after the alternatives analysis to ensure that the proposed project is not given undue consideration in the selection of alternatives for review. The same organization is used for the Final EIS.

64. Text revised per comment.

Page 2-36, Table 2.3-1: This table and Figure 2.3-4 are inconsistent. According to the Figure, the south unloading buoy is in PB 589 and the north buoy is in PB 545 for the proposed action. The EIS should present correct information. 65

Page 2-39, Line 31: The water depth that sea chest intake for the ballast and cooling systems will be located should be included in the discussion. 66

Page 2-39, Line 35: The EIS should include a table documenting the water usage of the Shuttle and regasification vessel's (SRV) (ballasting and engine cooling intake and discharge). 67

Page 2-39, Line 40: Please include the water depth that cooling water discharges are proposed to be made. The discussion should include the results of site specific modeling conducted to determine where and how far the heated water discharge plume will travel before returning to ambient receiving water temperature. The modeling report should also be included as an appendix or information on how to obtain the report provided.

The statement is made that cooling water will be about 18°F above ambient. Please discuss whether this increase above ambient accurate for both summer and winter seasons. 68

Page 2-41, Line 14: The discussion indicates that submerged turret loading (STL) buoy is to be submerged at a depth of 60-70 feet when not in use, and will be held in place on the STL buoy landing pad, to be located in about 100 feet of water. Please describe the size, including height, of the STL buoy. This is a good example of where a figure, drawn to scale, would be helpful in describing the system. 69

Page 2-42, Line 23: The discussion indicates that buoys are to have eight anchor points on the seafloor and that the anchors could be either driven or suction piles. On page 2-22, however, the discussion indicates that only driven pile anchors were to be evaluated in the DEIS. See comment from Page 2-22 above. Please correct as necessary. 70

Page 2-42, Section 2.3.6: Visualization of the various parts of the mooring and unloading buoys is difficult. A figure depicting the system should be included. 71

Page 2-46, Figure 2.3-8: This figure is too small to read and should be enlarged. 72

Page 2-46, Line 6: The discussion should include an evaluation of whether concrete mattresses will always be required to cover the pipeline if it is not fully buried or if other methods of securing the pipeline to the seafloor may be allowed. In addition, the EIS should clearly identify those areas on a legible map where geotechnical and other data indicate that full burial will not be possible. The potential effects to benthic organism, including movement/migration, in areas where the pipeline is not fully 73

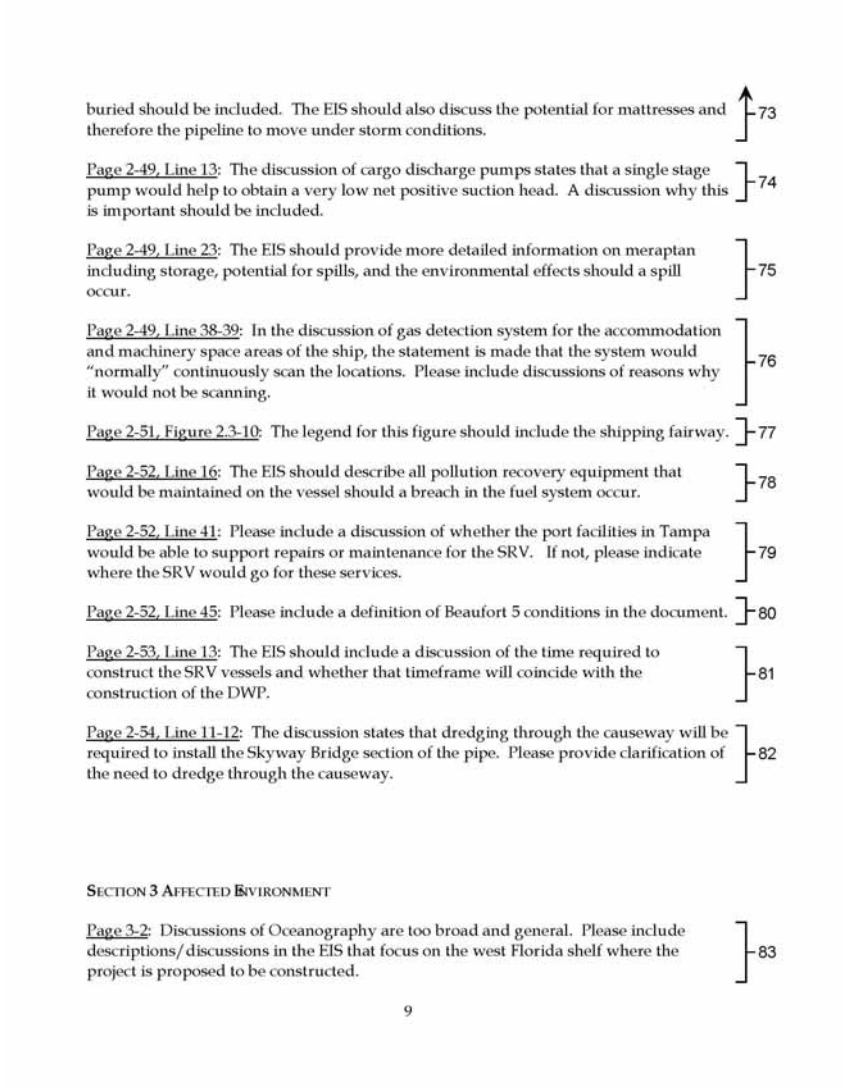
8

65. Text revised per comment.

66. The sea chest depths have been added to Section 2.1.8 and 2.3.4.

67. There are only 2 numbers involved; ballast water intake (no discharge), and cooling water intake and discharge (which are the same) (see Section 2.3.4).

68. Details of the water discharge are included in Sections 4.1.2.1, 4.2.1.7, and 4.2.1.11.



69. A figure of the STL buoy has been added (see Figure 2.1-6).

70. Suction piles have been evaluated as an alternative anchoring method in Section 2.1.5 and throughout Section 4 as appropriate.

71. A figure of the STL buoy has been added (see Figure 2.1-6).

72. The figure has been replaced for clarity.

73. Discussion of burial methods and impacts are included in Section 4.5.1.

buried should be included. The EIS should also discuss the potential for mattresses and therefore the pipeline to move under storm conditions. 73

Page 2-49, Line 13: The discussion of cargo discharge pumps states that a single stage pump would help to obtain a very low net positive suction head. A discussion why this is important should be included. 74

Page 2-49, Line 23: The EIS should provide more detailed information on meraptan including storage, potential for spills, and the environmental effects should a spill occur. 75

Page 2-49, Line 38-39: In the discussion of gas detection system for the accommodation and machinery space areas of the ship, the statement is made that the system would "normally" continuously scan the locations. Please include discussions of reasons why it would not be scanning. 76

Page 2-51, Figure 2.3-10: The legend for this figure should include the shipping fairway. 77

Page 2-52, Line 16: The EIS should describe all pollution recovery equipment that would be maintained on the vessel should a breach in the fuel system occur. 78

Page 2-52, Line 41: Please include a discussion of whether the port facilities in Tampa would be able to support repairs or maintenance for the SRV. If not, please indicate where the SRV would go for these services. 79

Page 2-52, Line 45: Please include a definition of Beaufort 5 conditions in the document. 80

Page 2-53, Line 13: The EIS should include a discussion of the time required to construct the SRV vessels and whether that timeframe will coincide with the construction of the DWP. 81

Page 2-54, Line 11-12: The discussion states that dredging through the causeway will be required to install the Skyway Bridge section of the pipe. Please provide clarification of the need to dredge through the causeway. 82

SECTION 3 AFFECTED ENVIRONMENT

Page 3-2: Discussions of Oceanography are too broad and general. Please include descriptions/discussions in the EIS that focus on the west Florida shelf where the project is proposed to be constructed. 83

9

74. Low NPSH is necessary to minimize vapor formation. Text added.

75. Odorization will not be used on the SRVs. Text deleted.

76. During times of system maintenance or outage, the system would not continuously scan. Details of the allowable downtimes and alternative monitoring would be included in the operations Manual that would be developed if a license is issued. This level of detail is not required for environmental analysis.

77. Text added to legend.

78. Fixed shipboard systems are described in the discussion of Pollution Prevention Equipment and Waste Treatment Equipment. Other spill response equipment would be identified during permit development or in the Operations Manual.

79. The SRVs will be contracted by the Applicant to deliver cargoes to the Port by 3rd party operators who will be responsible for their maintenance and repair.

80. It is not possible to include all details in the EIS and maintain a reasonable length. Beaufort scale definitions can be readily referenced.
See *http://www.spc.noaa.gov/faq/tornado/beaufort.html*.

81. SRV construction activities are outside the scope of this EIS. The SRVs will be contracted by the Applicant to deliver cargoes to the Port by 3rd party operators who will be responsible for their construction.

82. Construction of the pipeline under the bridge will be done using a clam shell dredge.

83. A general discussion of the Gulf of Mexico oceanography is included in Section 3.1.2.1 and a more specific discussion of regional/Tampa Bay oceanography is included in Section 3.1.2.2. Impacts to seafloor topography are discussed in Sections 4.4.1 and 4.4.2.

Page 3-6, Lines 24-25: The discussion indicates that there is no data on parameters such as metals in the project area of the Gulf of Mexico. While it is older data, the Department of the Interior sponsored Mississippi-Alabama-Florida (MAFLA) study had a transect just north of the proposed DWP and one south of the DWP that collected sediment and epifauna trace metal data. 84

Page 3-6: The EIS should be updated to include results of geotechnical data collected for the project. 85

Page 3-7, Line 40: The text in the EIS should be expanded to include a thorough discussion of the contaminated area or "hot spot" off of Anna Maria Island, including specific contaminants that are expected to be disturbed by the proposed project. The EIS should include a discussion of the results of modeling of the deposition of contaminated sediments and include deposition maps overlaying habitats impacted. 86

Page 3-9, Lines 25-26: The reference to 30 CFR 250.130 appears to be incorrect. While 30 CFR 250.103 defines Notices to Lessees (NTL), it does not directly speak to restricting outer continental shelf activities in biologically sensitive areas less than 400 m water depth. Please verify and correct accordingly. 87

Page 3-9, Lines 38-40: The discussion states that determining habitats and species occurring in the project area was accomplished through literature reviews and coordination with federal and state experts. Biological surveys conducted for the project should provide the most accurate and site-specific information available and should be used in describing the affected environment, as well as, acknowledged in providing this information. 88

Page 3-11, Figure 3.2-1: This map is supposed to depict Marine Protected Areas (MPA); however, with all of the other information presented on the map, it is difficult to ascertain which areas are actually the MPA's. The EIS should provide clear visuals. 89

Page 3-13, Line 4: The discussion indicates that the Reef Fish Stressed Area is delineated in Figure 3.2-1; however, it does not appear to be included. The EIS should include an appropriate figure. 90

Page 3-13, Line 35: Please confirm that the date of December 22, 2005 for initiating information consultation with U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) is correct. 91

Page 3-13, Line 36: Has a determination been made on whether or not the proposed port and associate pipeline would adversely affect federally listed species and their critical habitat? If not, when is a determination expected? Results of the determination and any recommended conditions and/or mitigation should be included in the EIS. 92

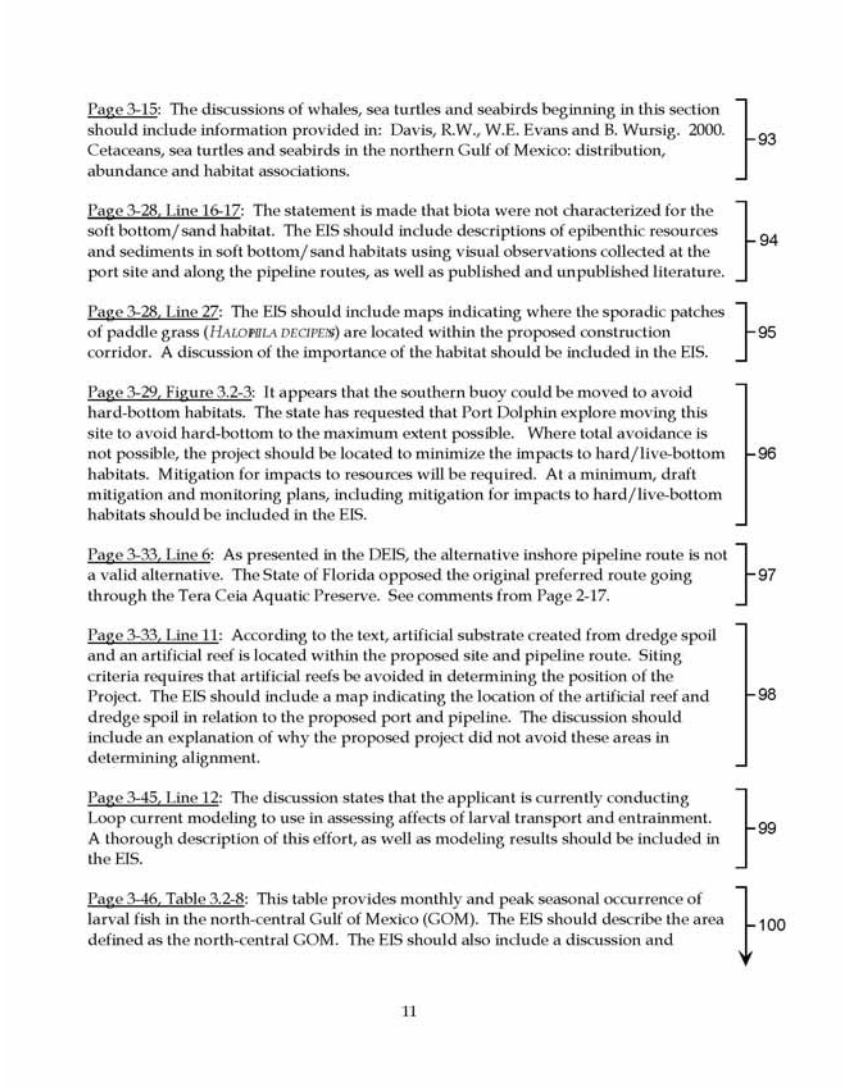
10

84. Comment noted.

85. The Final EIS has been updated with new geotechnical data.

86. The text regarding the hot spot off of Anna Maria Island has been removed, based on more recent information obtained from the Tampa Bay Estuary Program (see Section 3.1.3.4).

87. Text revised to clarify.



88. Comment noted.

89. Map has been updated to increase visibility of MPAs.

90. Text revised per comment.

91. Text revised per comment.

92. Text revised per comment.

Page 3-15: The discussions of whales, sea turtles and seabirds beginning in this section should include information provided in: Davis, R.W., W.E. Evans and B. Wursig. 2000. Cetaceans, sea turtles and seabirds in the northern Gulf of Mexico: distribution, abundance and habitat associations. 93

Page 3-28, Line 16-17: The statement is made that biota were not characterized for the soft bottom/sand habitat. The EIS should include descriptions of epibenthic resources and sediments in soft bottom/sand habitats using visual observations collected at the port site and along the pipeline routes, as well as published and unpublished literature. 94

Page 3-28, Line 27: The EIS should include maps indicating where the sporadic patches of paddle grass (*HALOPHILA DECIPENS*) are located within the proposed construction corridor. A discussion of the importance of the habitat should be included in the EIS. 95

Page 3-29, Figure 3.2-3: It appears that the southern buoy could be moved to avoid hard-bottom habitats. The state has requested that Port Dolphin explore moving this site to avoid hard-bottom to the maximum extent possible. Where total avoidance is not possible, the project should be located to minimize the impacts to hard/live-bottom habitats. Mitigation for impacts to resources will be required. At a minimum, draft mitigation and monitoring plans, including mitigation for impacts to hard/live-bottom habitats should be included in the EIS. 96

Page 3-33, Line 6: As presented in the DEIS, the alternative inshore pipeline route is not a valid alternative. The State of Florida opposed the original preferred route going through the Tera Ceia Aquatic Preserve. See comments from Page 2-17. 97

Page 3-33, Line 11: According to the text, artificial substrate created from dredge spoil and an artificial reef is located within the proposed site and pipeline route. Siting criteria requires that artificial reefs be avoided in determining the position of the Project. The EIS should include a map indicating the location of the artificial reef and dredge spoil in relation to the proposed port and pipeline. The discussion should include an explanation of why the proposed project did not avoid these areas in determining alignment. 98

Page 3-45, Line 12: The discussion states that the applicant is currently conducting Loop current modeling to use in assessing affects of larval transport and entrainment. A thorough description of this effort, as well as modeling results should be included in the EIS. 99

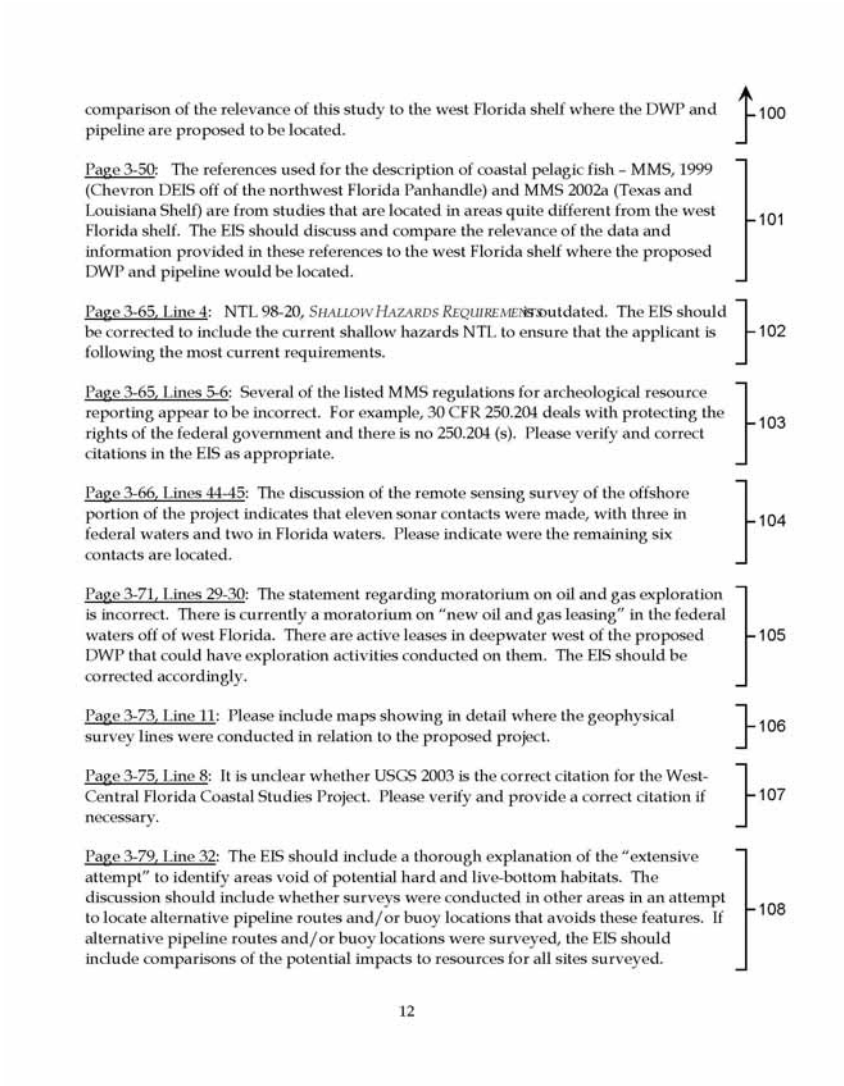
Page 3-46, Table 3.2-8: This table provides monthly and peak seasonal occurrence of larval fish in the north-central Gulf of Mexico (GOM). The EIS should describe the area defined as the north-central GOM. The EIS should also include a discussion and 100

11

93. The suggested reference was used in Section 3.2.4.2.

94. A table of species (Table 3.2-4) identified during the survey was added to the subsection, "Benthic Community Survey in Section 3.2.5." A description of species associated with soft sediments is provided 3 paragraphs above the "Benthic Community Survey" subsection.

95. Paddlegrass maps are not available. Discussions of paddlegrass have been added to Section 4.2.1.3 and 4.2.1.6.



96. The Applicant has altered their Proposed Action to include the revised mooring scheme discussed in the December 2008 addendum, and has altered the preferred pipeline route to balance Federal, state, and local concerns for various natural resources including benthic resource areas. The Proposed Action and alternatives are discussed in Section 2.3, and the discussion is carried throughout the EIS. Development of compensatory mitigation for unavoidable impacts on seagrasses and live- and hard- bottom habitats is discussed in Section 4.11 and would be developed during the permitting process.

97. Based on comments on the initial site and route evaluation discussed in the Draft EIS, additional alternatives have been considered (see Section 2.1.4.6).

98. Artificial reefs and spoils areas are indicated on Figure 3.2-1.

99. In June of 2008, the Applicant proposed the use of an Empirical Transport Model (ETM) to strengthen the Ichthyoplankton Assessment, but FWC did not think the ETM would be meaningful without preconstruction modeling to verify data from that model. Therefore it was not carried forward. If a license is issued, the USCG and the Maritime Administration would require the Applicant develop a site specific monitoring plan. The details of would be designed in consultation with the FWCC, NOAA/NMFS, and USEPA.

100. Text revised per comment.

comparison of the relevance of this study to the west Florida shelf where the DWP and pipeline are proposed to be located. 100

Page 3-50: The references used for the description of coastal pelagic fish – MMS, 1999 (Chevron DEIS off of the northwest Florida Panhandle) and MMS 2002a (Texas and Louisiana Shelf) are from studies that are located in areas quite different from the west Florida shelf. The EIS should discuss and compare the relevance of the data and information provided in these references to the west Florida shelf where the proposed DWP and pipeline would be located. 101

Page 3-65, Line 4: NTL 98-20, *Shallow Hazards Requirements* is outdated. The EIS should be corrected to include the current shallow hazards NTL to ensure that the applicant is following the most current requirements. 102

Page 3-65, Lines 5-6: Several of the listed MMS regulations for archeological resource reporting appear to be incorrect. For example, 30 CFR 250.204 deals with protecting the rights of the federal government and there is no 250.204 (s). Please verify and correct citations in the EIS as appropriate. 103

Page 3-66, Lines 44-45: The discussion of the remote sensing survey of the offshore portion of the project indicates that eleven sonar contacts were made, with three in federal waters and two in Florida waters. Please indicate were the remaining six contacts are located. 104

Page 3-71, Lines 29-30: The statement regarding moratorium on oil and gas exploration is incorrect. There is currently a moratorium on "new oil and gas leasing" in the federal waters off of west Florida. There are active leases in deepwater west of the proposed DWP that could have exploration activities conducted on them. The EIS should be corrected accordingly. 105

Page 3-73, Line 11: Please include maps showing in detail where the geophysical survey lines were conducted in relation to the proposed project. 106

Page 3-75, Line 8: It is unclear whether USGS 2003 is the correct citation for the West-Central Florida Coastal Studies Project. Please verify and provide a correct citation if necessary. 107

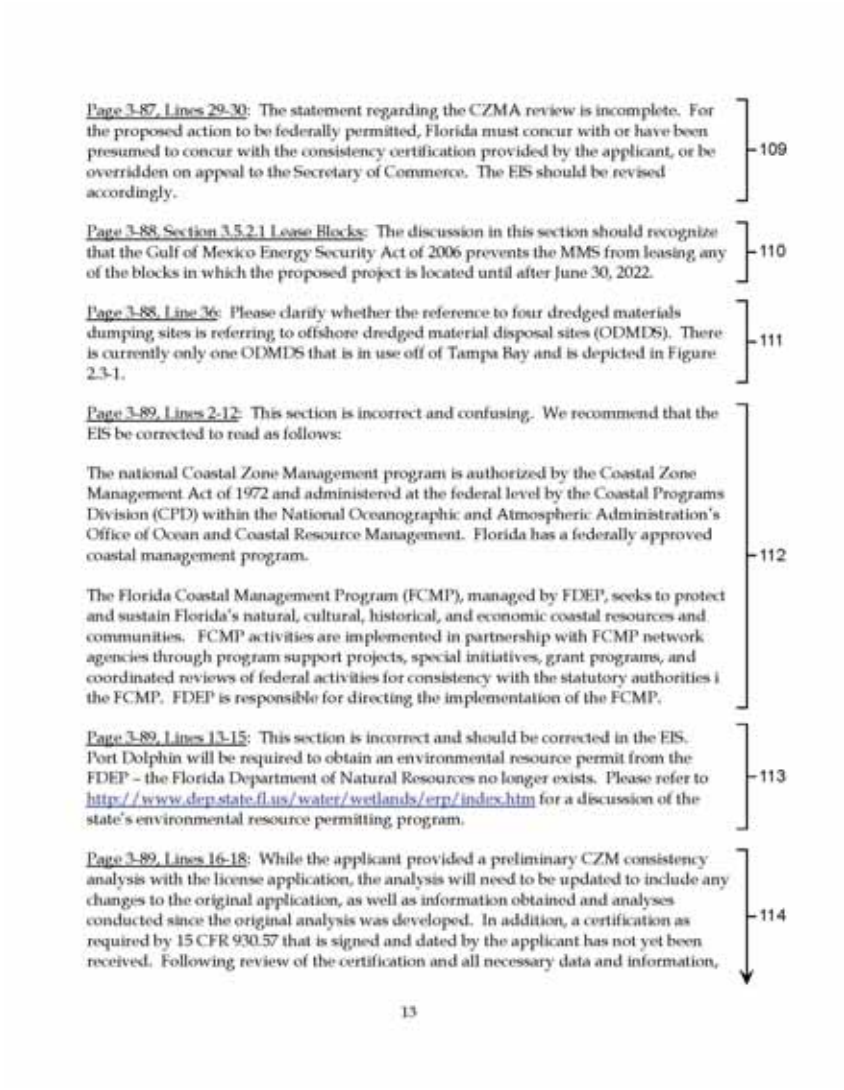
Page 3-79, Line 32: The EIS should include a thorough explanation of the "extensive attempt" to identify areas void of potential hard and live-bottom habitats. The discussion should include whether surveys were conducted in other areas in an attempt to locate alternative pipeline routes and/or buoy locations that avoids these features. If alternative pipeline routes and/or buoy locations were surveyed, the EIS should include comparisons of the potential impacts to resources for all sites surveyed. 108

12

101. References revised per comment.

102. The most current requirements are included in the document.

103. Text revised per comment.



104. Text revised per comment.

105. Text revised per comment.

106. Map revised per comment.

107. Citation included per comment.

108. Geophysical and geotechnical studies were conducted to identify live/hard bottom habitats. The studies are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532. Benthic habitats are discussed in sections 3.2 and 4.2. Mitigation measures are discussed in Section 4.11.

Page 3-87, Lines 29-30: The statement regarding the CZMA review is incomplete. For the proposed action to be federally permitted, Florida must concur with or have been presumed to concur with the consistency certification provided by the applicant, or be overridden on appeal to the Secretary of Commerce. The EIS should be revised accordingly. — 109

Page 3-88, Section 3.5.2.1 Lease Blocks: The discussion in this section should recognize that the Gulf of Mexico Energy Security Act of 2006 prevents the MMS from leasing any of the blocks in which the proposed project is located until after June 30, 2022. — 110

Page 3-88, Line 36: Please clarify whether the reference to four dredged materials dumping sites is referring to offshore dredged material disposal sites (ODMDS). There is currently only one ODMDS that is in use off of Tampa Bay and is depicted in Figure 2.3-1. — 111

Page 3-89, Lines 2-12: This section is incorrect and confusing. We recommend that the EIS be corrected to read as follows:

The national Coastal Zone Management program is authorized by the Coastal Zone Management Act of 1972 and administered at the federal level by the Coastal Programs Division (CPD) within the National Oceanographic and Atmospheric Administration's Office of Ocean and Coastal Resource Management. Florida has a federally approved coastal management program.

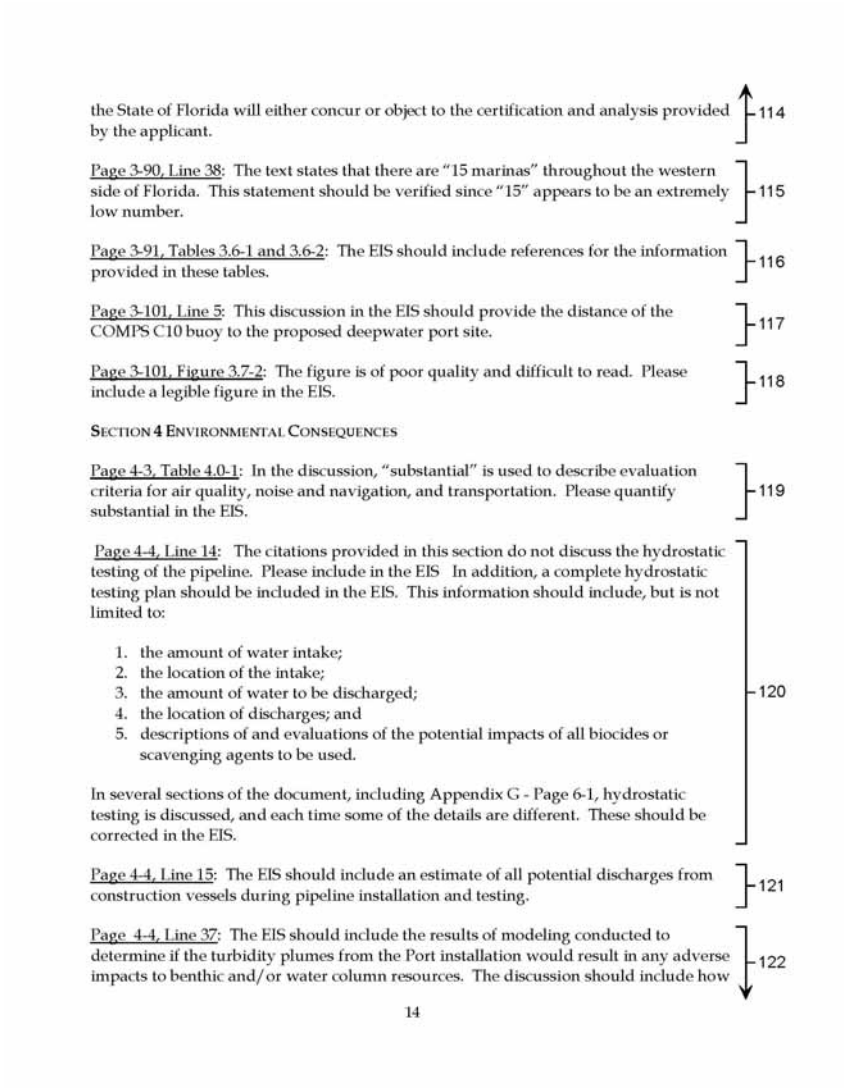
The Florida Coastal Management Program (FCMP), managed by FDEP, seeks to protect and sustain Florida's natural, cultural, historical, and economic coastal resources and communities. FCMP activities are implemented in partnership with FCMP network agencies through program support projects, special initiatives, grant programs, and coordinated reviews of federal activities for consistency with the statutory authorities i the FCMP. FDEP is responsible for directing the implementation of the FCMP. — 112

Page 3-89, Lines 13-15: This section is incorrect and should be corrected in the EIS. Port Dolphin will be required to obtain an environmental resource permit from the FDEP – the Florida Department of Natural Resources no longer exists. Please refer to http://www.dep.state.fl.us/water/wetlands/erp/index.htm for a discussion of the state's environmental resource permitting program. — 113

Page 3-89, Lines 16-18: While the applicant provided a preliminary CZM consistency analysis with the license application, the analysis will need to be updated to include any changes to the original application, as well as information obtained and analyses conducted since the original analysis was developed. In addition, a certification as required by 15 CFR 930.57 that is signed and dated by the applicant has not yet been received. Following review of the certification and all necessary data and information, — 114

13

109. The Applicant is responsible for processing the CZM consistency determination. An assessment of environmental impacts to coastal resources in included in Section 4.2.1 of the Final EIS.



110. Text revised per comment.

111. Text revised per comment.

112. Text revised per comment.

113. Text revised per comment.

114. The Applicant is responsible for processing the CZM consistency determination. An assessment of environmental impacts to coastal resources in included in Section 4.2.1 of the Final EIS.

the State of Florida will either concur or object to the certification and analysis provided by the applicant. 114

Page 3-90, Line 38: The text states that there are "15 marinas" throughout the western side of Florida. This statement should be verified since "15" appears to be an extremely low number. 115

Page 3-91, Tables 3.6-1 and 3.6-2: The EIS should include references for the information provided in these tables. 116

Page 3-101, Line 5: This discussion in the EIS should provide the distance of the COMPS C10 buoy to the proposed deepwater port site. 117

Page 3-101, Figure 3.7-2: The figure is of poor quality and difficult to read. Please include a legible figure in the EIS. 118

SECTION 4 ENVIRONMENTAL CONSEQUENCES

Page 4-3, Table 4.0-1: In the discussion, "substantial" is used to describe evaluation criteria for air quality, noise and navigation, and transportation. Please quantify substantial in the EIS. 119

Page 4-4, Line 14: The citations provided in this section do not discuss the hydrostatic testing of the pipeline. Please include in the EIS In addition, a complete hydrostatic testing plan should be included in the EIS. This information should include, but is not limited to:

1. the amount of water intake;
2. the location of the intake;
3. the amount of water to be discharged;
4. the location of discharges; and
5. descriptions of and evaluations of the potential impacts of all biocides or scavenging agents to be used.

In several sections of the document, including Appendix G - Page 6-1, hydrostatic testing is discussed, and each time some of the details are different. These should be corrected in the EIS. 120

Page 4-4, Line 15: The EIS should include an estimate of all potential discharges from construction vessels during pipeline installation and testing. 121

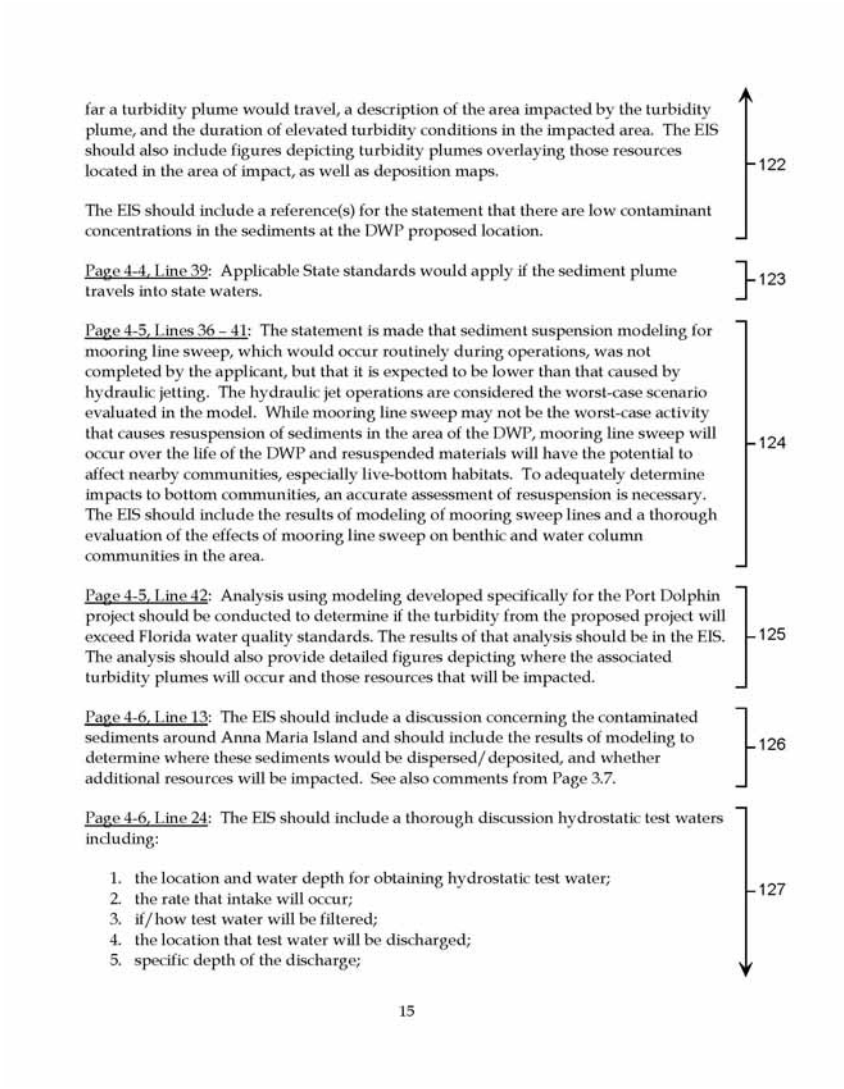
Page 4-4, Line 37: The EIS should include the results of modeling conducted to determine if the turbidity plumes from the Port installation would result in any adverse impacts to benthic and/or water column resources. The discussion should include how 122

14

115. Text revised per comment.

116. Reference added per comment.

117. The distance has been added to the EIS.



118. Figure changed per comment.

119. Text revised per comment.

120. The information requested is included in the Final EIS, but a complete hydrostatic test plan is beyond the level of detail necessary for the EIS analysis. Data for the hydrostatic tests have been made consistent throughout the EIS (see Sections 2.3.11 and 4.2.1.7).

121. The discharges are described in Table 4.1-1.

122. The text has been changed to include information on the modeling of sediment disturbance due to pipeline construction.

far a turbidity plume would travel, a description of the area impacted by the turbidity plume, and the duration of elevated turbidity conditions in the impacted area. The EIS should also include figures depicting turbidity plumes overlaying those resources located in the area of impact, as well as deposition maps.

The EIS should include a reference(s) for the statement that there are low contaminant concentrations in the sediments at the DWP proposed location. 122

Page 4-4, Line 39: Applicable State standards would apply if the sediment plume travels into state waters. 123

Page 4-5, Lines 36 – 41: The statement is made that sediment suspension modeling for mooring line sweep, which would occur routinely during operations, was not completed by the applicant, but that it is expected to be lower than that caused by hydraulic jetting. The hydraulic jet operations are considered the worst-case scenario evaluated in the model. While mooring line sweep may not be the worst-case activity that causes resuspension of sediments in the area of the DWP, mooring line sweep will occur over the life of the DWP and resuspended materials will have the potential to affect nearby communities, especially live-bottom habitats. To adequately determine impacts to bottom communities, an accurate assessment of resuspension is necessary. The EIS should include the results of modeling of mooring sweep lines and a thorough evaluation of the effects of mooring line sweep on benthic and water column communities in the area. 124

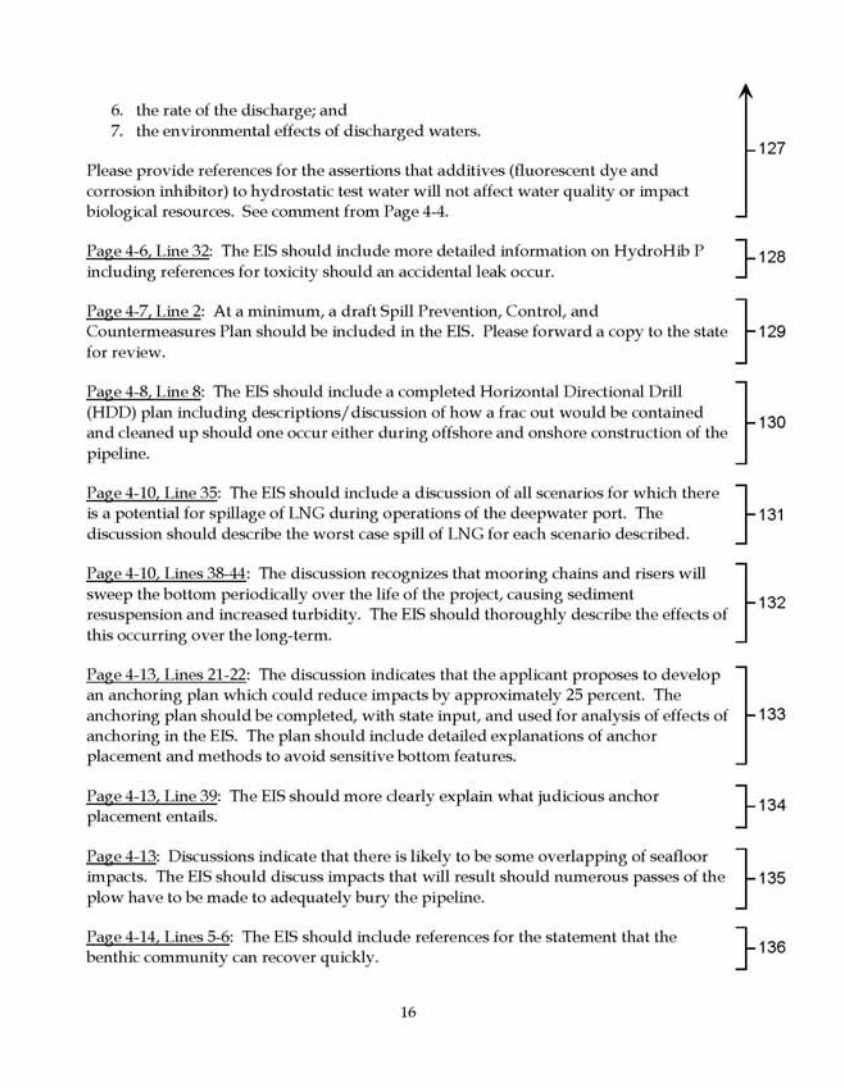
Page 4-5, Line 42: Analysis using modeling developed specifically for the Port Dolphin project should be conducted to determine if the turbidity from the proposed project will exceed Florida water quality standards. The results of that analysis should be in the EIS. The analysis should also provide detailed figures depicting where the associated turbidity plumes will occur and those resources that will be impacted. 125

Page 4-6, Line 13: The EIS should include a discussion concerning the contaminated sediments around Anna Maria Island and should include the results of modeling to determine where these sediments would be dispersed/deposited, and whether additional resources will be impacted. See also comments from Page 3.7. 126

Page 4-6, Line 24: The EIS should include a thorough discussion hydrostatic test waters including:

1. the location and water depth for obtaining hydrostatic test water;
2. the rate that intake will occur;
3. if/how test water will be filtered;
4. the location that test water will be discharged;
5. specific depth of the discharge; 127

15



123. Text revised per comment.

124. Text revised per comment. The mooring sweep modeling has been obtained and incorporated.

125. The modeling and qualitative analysis in the text show that Florida turbidity standards will be exceeded, but in a localized area and for a short period of time. Based on that analysis, the impact is concluded to be minor. No changes have been made in the text.

126. The text regarding the hot spot off of Anna Maria Island has been modified

127. The information requested is included in the Final EIS, but a complete hydrostatic test plan is beyond the level of detail necessary for the EIS analysis. Data for the hydrostatic tests have been made consistent throughout the EIS (see Sections 2.3.11 and 4.2.1.7).

6. the rate of the discharge; and
7. the environmental effects of discharged waters.

Please provide references for the assertions that additives (fluorescent dye and corrosion inhibitor) to hydrostatic test water will not affect water quality or impact biological resources. See comment from Page 4-4. 127

Page 4-6, Line 32: The EIS should include more detailed information on HydroHib P including references for toxicity should an accidental leak occur. 128

Page 4-7, Line 2: At a minimum, a draft Spill Prevention, Control, and Countermeasures Plan should be included in the EIS. Please forward a copy to the state for review. 129

Page 4-8, Line 8: The EIS should include a completed Horizontal Directional Drill (HDD) plan including descriptions/discussion of how a frac out would be contained and cleaned up should one occur either during offshore and onshore construction of the pipeline. 130

Page 4-10, Line 35: The EIS should include a discussion of all scenarios for which there is a potential for spillage of LNG during operations of the deepwater port. The discussion should describe the worst case spill of LNG for each scenario described. 131

Page 4-10, Lines 38-44: The discussion recognizes that mooring chains and risers will sweep the bottom periodically over the life of the project, causing sediment resuspension and increased turbidity. The EIS should thoroughly describe the effects of this occurring over the long-term. 132

Page 4-13, Lines 21-22: The discussion indicates that the applicant proposes to develop an anchoring plan which could reduce impacts by approximately 25 percent. The anchoring plan should be completed, with state input, and used for analysis of effects of anchoring in the EIS. The plan should include detailed explanations of anchor placement and methods to avoid sensitive bottom features. 133

Page 4-13, Line 39: The EIS should more clearly explain what judicious anchor placement entails. 134

Page 4-13: Discussions indicate that there is likely to be some overlapping of seafloor impacts. The EIS should discuss impacts that will result should numerous passes of the plow have to be made to adequately bury the pipeline. 135

Page 4-14, Lines 5-6: The EIS should include references for the statement that the benthic community can recover quickly. 136

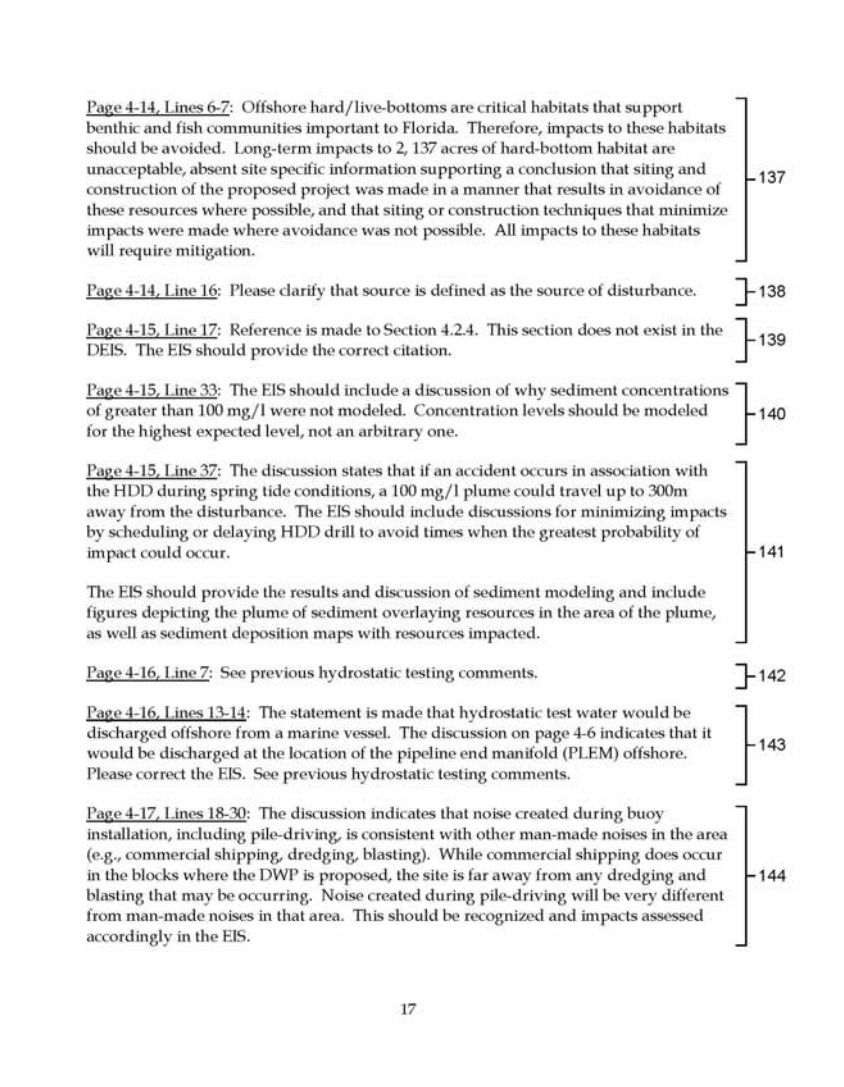
16

128. Detailed information on chemicals to be used for the project would be included within the post licensing reviews of the Operations Manual, if a license is issued.

129. Development of a Spill Prevention, Control, and Countermeasures Plan and the ability of the Applicant to respond to spills will be included in the post licensing reviews of the Operations Manual, if a license is issued.

130. The HDD plan referred to would be included in the Operations Manual, which would be developed and reviewed post-license, if a license is issued.

131. A detailed discussion of potential LNG spillage scenarios is presented in Section 5.



132. Text revised per comment. The mooring sweep modeling has been obtained and incorporated.

133. Text revised per comment

134. The Applicant performed additional surveys and analysis to optimize anchor placement and minimize benthic impacts. The revised anchor configuration was described in detail in Application Addendum II filed in December 2008. The Final EIS was updated to reflect this configuration.

135. Text revised per comment.

136. Added “soft” prior to substrate to improve accuracy of statement.

Page 4-14, Lines 6-7: Offshore hard/live-bottoms are critical habitats that support benthic and fish communities important to Florida. Therefore, impacts to these habitats should be avoided. Long-term impacts to 2, 137 acres of hard-bottom habitat are unacceptable, absent site specific information supporting a conclusion that siting and construction of the proposed project was made in a manner that results in avoidance of these resources where possible, and that siting or construction techniques that minimize impacts were made where avoidance was not possible. All impacts to these habitats will require mitigation. 137

Page 4-14, Line 16: Please clarify that source is defined as the source of disturbance. 138

Page 4-15, Line 17: Reference is made to Section 4.2.4. This section does not exist in the DEIS. The EIS should provide the correct citation. 139

Page 4-15, Line 33: The EIS should include a discussion of why sediment concentrations of greater than 100 mg/l were not modeled. Concentration levels should be modeled for the highest expected level, not an arbitrary one. 140

Page 4-15, Line 37: The discussion states that if an accident occurs in association with the HDD during spring tide conditions, a 100 mg/l plume could travel up to 300m away from the disturbance. The EIS should include discussions for minimizing impacts by scheduling or delaying HDD drill to avoid times when the greatest probability of impact could occur. 141

The EIS should provide the results and discussion of sediment modeling and include figures depicting the plume of sediment overlaying resources in the area of the plume, as well as sediment deposition maps with resources impacted.

Page 4-16, Line 7: See previous hydrostatic testing comments. 142

Page 4-16, Lines 13-14: The statement is made that hydrostatic test water would be discharged offshore from a marine vessel. The discussion on page 4-6 indicates that it would be discharged at the location of the pipeline end manifold (PLEM) offshore. Please correct the EIS. See previous hydrostatic testing comments. 143

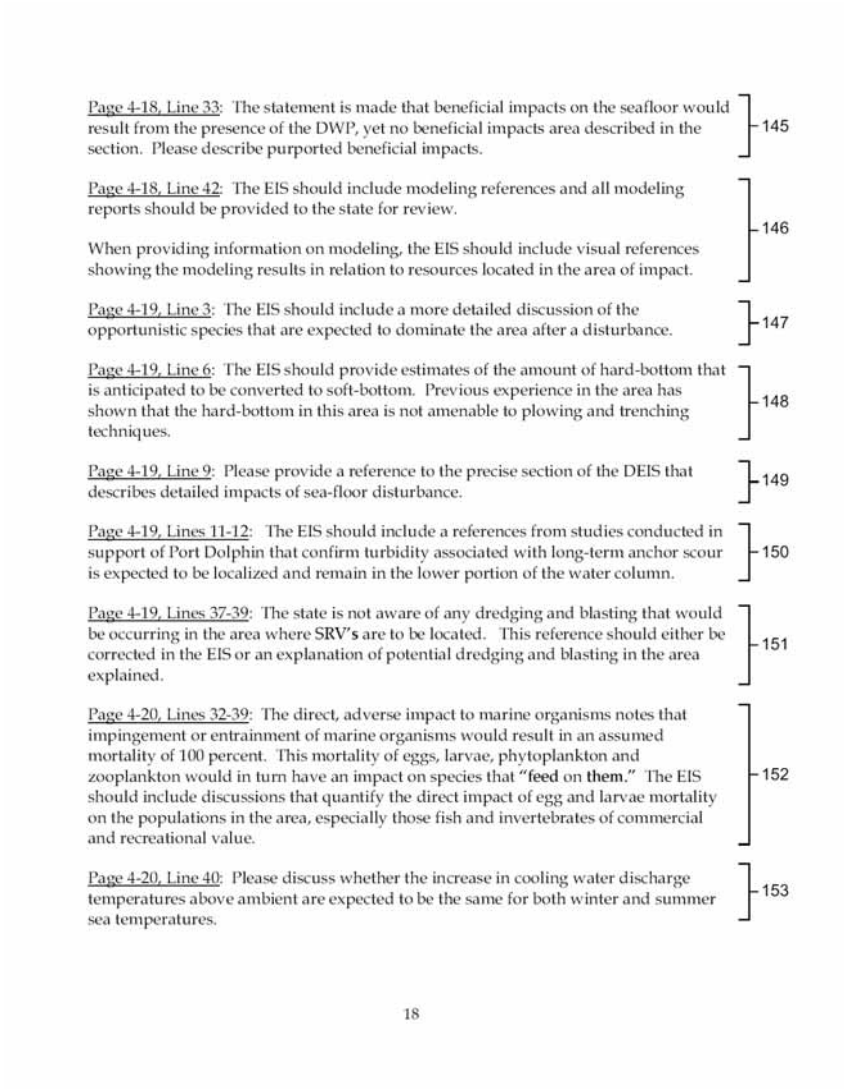
Page 4-17, Lines 18-30: The discussion indicates that noise created during buoy installation, including pile-driving, is consistent with other man-made noises in the area (e.g., commercial shipping, dredging, blasting). While commercial shipping does occur in the blocks where the DWP is proposed, the site is far away from any dredging and blasting that may be occurring. Noise created during pile-driving will be very different from man-made noises in that area. This should be recognized and impacts assessed accordingly in the EIS. 144

17

137. Based on additional geophysical and geotechnical evaluations, the benthic impacts discussion has been revised. Additional mitigation has been included in Section 4.11.

138. Text revised per comment

139. The reference was deleted.



140. Sediment concentrations greater than 100mg/l are unlikely to travel in the water column through a turbidity curtain or other spill containment material should a frac-out occur (see Section 4.2.1).

141. The FERC procedures (see **Section 2.3.9**) require the Applicant to develop an HDD Plan that includes a description of how a frac-out would be contained and cleaned up. The Applicant would file all HDD plans with the FERC staff prior to construction.

142. Text has been made consistent throughout the EIS.

143. Text has been made consistent throughout the EIS.

144. Text has been made consistent throughout the EIS

Page 4-18, Line 33: The statement is made that beneficial impacts on the seafloor would result from the presence of the DWP, yet no beneficial impacts area described in the section. Please describe purported beneficial impacts. 145

Page 4-18, Line 42: The EIS should include modeling references and all modeling reports should be provided to the state for review.

When providing information on modeling, the EIS should include visual references showing the modeling results in relation to resources located in the area of impact. 146

Page 4-19, Line 3: The EIS should include a more detailed discussion of the opportunistic species that are expected to dominate the area after a disturbance. 147

Page 4-19, Line 6: The EIS should provide estimates of the amount of hard-bottom that is anticipated to be converted to soft-bottom. Previous experience in the area has shown that the hard-bottom in this area is not amenable to plowing and trenching techniques. 148

Page 4-19, Line 9: Please provide a reference to the precise section of the DEIS that describes detailed impacts of sea-floor disturbance. 149

Page 4-19, Lines 11-12: The EIS should include a references from studies conducted in support of Port Dolphin that confirm turbidity associated with long-term anchor scour is expected to be localized and remain in the lower portion of the water column. 150

Page 4-19, Lines 37-39: The state is not aware of any dredging and blasting that would be occurring in the area where SRV's are to be located. This reference should either be corrected in the EIS or an explanation of potential dredging and blasting in the area explained. 151

Page 4-20, Lines 32-39: The direct, adverse impact to marine organisms notes that impingement or entrainment of marine organisms would result in an assumed mortality of 100 percent. This mortality of eggs, larvae, phytoplankton and zooplankton would in turn have an impact on species that "feed on them." The EIS should include discussions that quantify the direct impact of egg and larvae mortality on the populations in the area, especially those fish and invertebrates of commercial and recreational value. 152

Page 4-20, Line 40: Please discuss whether the increase in cooling water discharge temperatures above ambient are expected to be the same for both winter and summer sea temperatures. 153

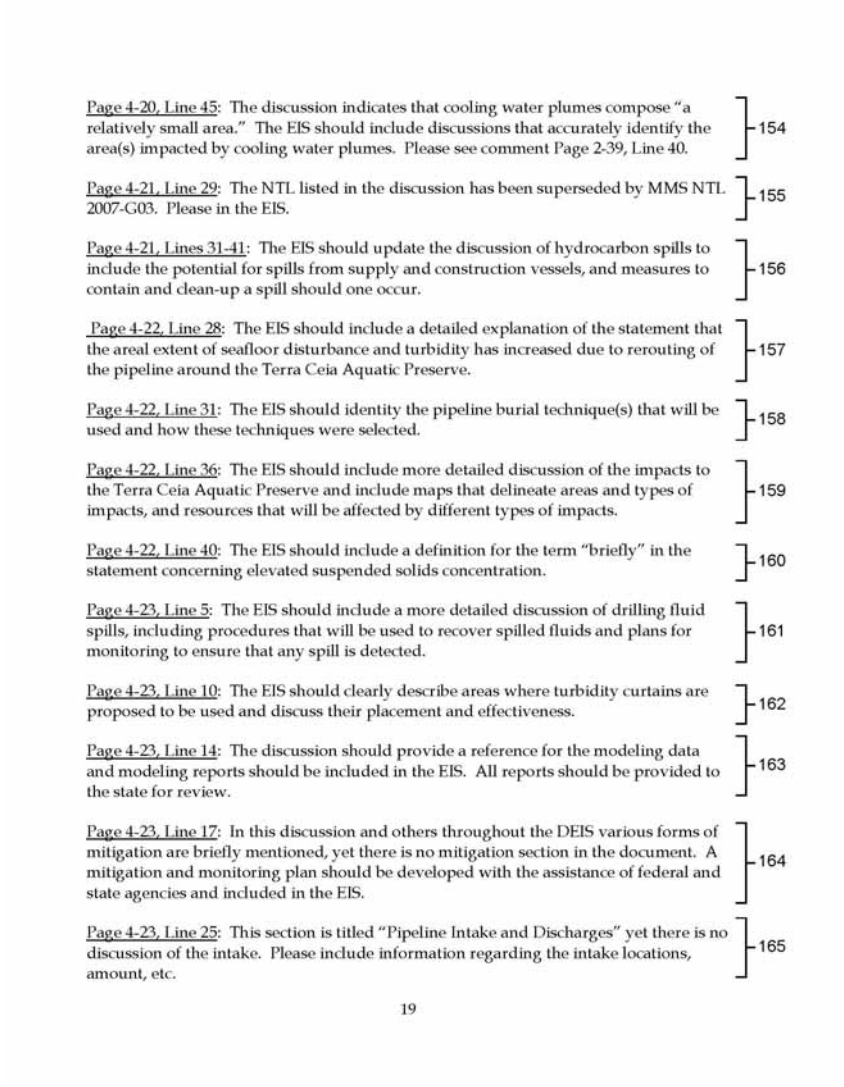
18

145. Deleted "beneficial impacts" from statement.

146. Noise modeling is included in section 4.8.

147. Text revised per comment.

148. Text revised per comment (see Section 4.2.1.6.1).



149. Text revised per comment. Benthic resources are discussed in Section 4.2.1.7.

150. Text revised per comment (include reference to turbidity modeling).

151. Deleted all references of blasting throughout biological resources. Blasting is not proposed as part of the project.

152. Impacts are quantified in Section 4.2.1.12

153. The increase in cooling water temperature is dependent on the system load. The maximum temperature rise, which is the condition analyzed in the EIS, is expected to be the same in summer and winter. See Section 4.1.1.

Page 4-20, Line 45: The discussion indicates that cooling water plumes compose "a relatively small area." The EIS should include discussions that accurately identify the area(s) impacted by cooling water plumes. Please see comment Page 2-39, Line 40. 154

Page 4-21, Line 29: The NTL listed in the discussion has been superseded by MMS NTL 2007-G03. Please in the EIS. 155

Page 4-21, Lines 31-41: The EIS should update the discussion of hydrocarbon spills to include the potential for spills from supply and construction vessels, and measures to contain and clean-up a spill should one occur. 156

Page 4-22, Line 28: The EIS should include a detailed explanation of the statement that the areal extent of seafloor disturbance and turbidity has increased due to rerouting of the pipeline around the Terra Ceia Aquatic Preserve. 157

Page 4-22, Line 31: The EIS should identity the pipeline burial technique(s) that will be used and how these techniques were selected. 158

Page 4-22, Line 36: The EIS should include more detailed discussion of the impacts to the Terra Ceia Aquatic Preserve and include maps that delineate areas and types of impacts, and resources that will be affected by different types of impacts. 159

Page 4-22, Line 40: The EIS should include a definition for the term "briefly" in the statement concerning elevated suspended solids concentration. 160

Page 4-23, Line 5: The EIS should include a more detailed discussion of drilling fluid spills, including procedures that will be used to recover spilled fluids and plans for monitoring to ensure that any spill is detected. 161

Page 4-23, Line 10: The EIS should clearly describe areas where turbidity curtains are proposed to be used and discuss their placement and effectiveness. 162

Page 4-23, Line 14: The discussion should provide a reference for the modeling data and modeling reports should be included in the EIS. All reports should be provided to the state for review. 163

Page 4-23, Line 17: In this discussion and others throughout the DEIS various forms of mitigation are briefly mentioned, yet there is no mitigation section in the document. A mitigation and monitoring plan should be developed with the assistance of federal and state agencies and included in the EIS. 164

Page 4-23, Line 25: This section is titled "Pipeline Intake and Discharges" yet there is no discussion of the intake. Please include information regarding the intake locations, amount, etc. 165

19

154. Text revised per comment.

155. Text revised per comment.

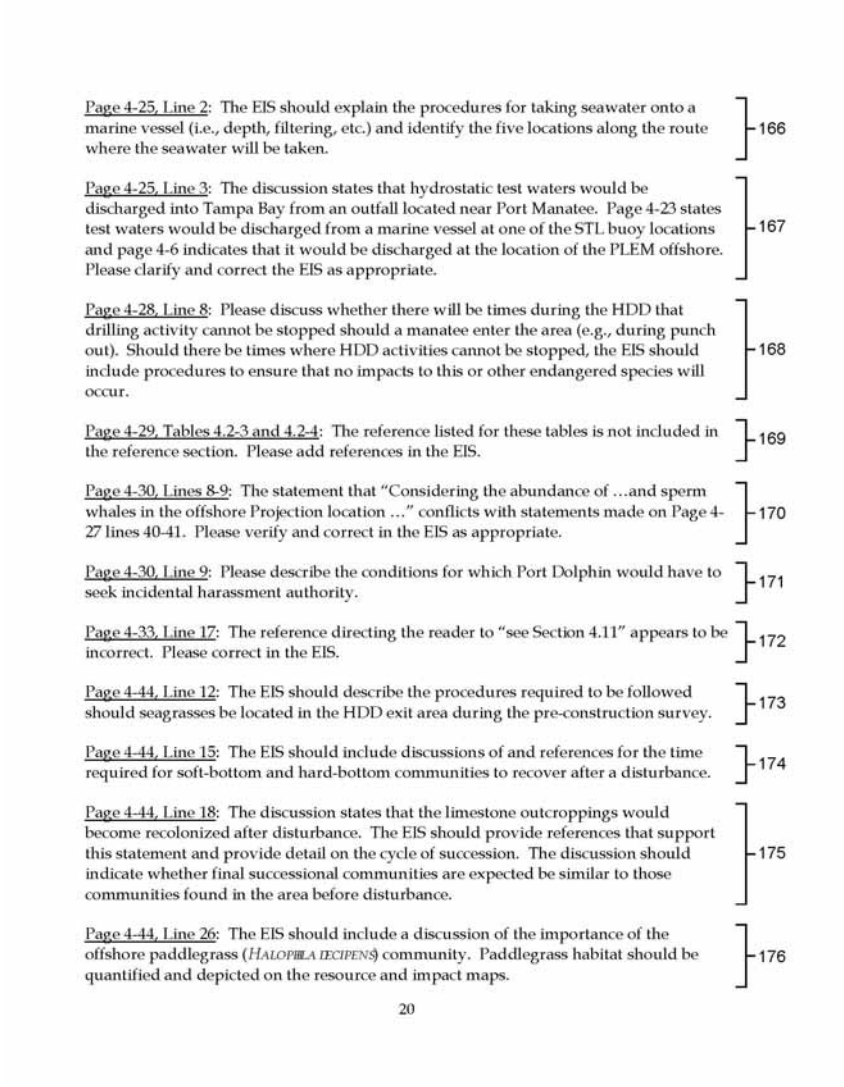
156. Text revised per comment.

157. At 80.4 km, the Southern Route Alternative is approximately the same length as the Proposed Route, and therefore the total area impacted would be the same. Text revised to reflect comment.

158. Pipeline burial techniques are discussed in Section 2.1.1.9.

159. The proposed pipeline route does not pass through Terra Ceia Aquatic Preserve. See Figure 3.2-1.

160. Text revised to reflect comment.



161. A contingency plan will be developed for potential loss of drilling fluids. See minimization measures and BMPs in Section 4.11.1. Text revised to reflect comment.

162. Turbidity curtains will be used when installation is performed by clam shell dredge under the Skyway Bridge and during HDD. See minimization measures and BMPs in Section 4.11.1.

163. Modeling reports will not be included in the EIS.

164. Mitigation and Minimization Measures and Monitoring are identified in Section 4.11.

165. Pipeline Intakes and Discharges are discussed in Section 4.2.1.1. The text for general impacts will be carried throughout the section for Marine Mammals. Text revised to reflect comment.

Page 4-25, Line 2: The EIS should explain the procedures for taking seawater onto a marine vessel (i.e., depth, filtering, etc.) and identify the five locations along the route where the seawater will be taken. 166

Page 4-25, Line 3: The discussion states that hydrostatic test waters would be discharged into Tampa Bay from an outfall located near Port Manatee. Page 4-23 states test waters would be discharged from a marine vessel at one of the STL buoy locations and page 4-6 indicates that it would be discharged at the location of the PLEM offshore. Please clarify and correct the EIS as appropriate. 167

Page 4-28, Line 8: Please discuss whether there will be times during the HDD that drilling activity cannot be stopped should a manatee enter the area (e.g., during punch out). Should there be times where HDD activities cannot be stopped, the EIS should include procedures to ensure that no impacts to this or other endangered species will occur. 168

Page 4-29, Tables 4.2-3 and 4.2-4: The reference listed for these tables is not included in the reference section. Please add references in the EIS. 169

Page 4-30, Lines 8-9: The statement that "Considering the abundance of …and sperm whales in the offshore Projection location …" conflicts with statements made on Page 4-27 lines 40-41. Please verify and correct in the EIS as appropriate. 170

Page 4-30, Line 9: Please describe the conditions for which Port Dolphin would have to seek incidental harassment authority. 171

Page 4-33, Line 17: The reference directing the reader to "see Section 4.11" appears to be incorrect. Please correct in the EIS. 172

Page 4-44, Line 12: The EIS should describe the procedures required to be followed should seagrasses be located in the HDD exit area during the pre-construction survey. 173

Page 4-44, Line 15: The EIS should include discussions of and references for the time required for soft-bottom and hard-bottom communities to recover after a disturbance. 174

Page 4-44, Line 18: The discussion states that the limestone outcroppings would become recolonized after disturbance. The EIS should provide references that support this statement and provide detail on the cycle of succession. The discussion should indicate whether final successional communities are expected be similar to those communities found in the area before disturbance. 175

Page 4-44, Line 26: The EIS should include a discussion of the importance of the offshore paddlegrass (*HALOPHILA DECIPENS*) community. Paddlegrass habitat should be quantified and depicted on the resource and impact maps. 176

20

166. Pipeline Intakes and Discharges are discussed in Section 4.2.1.1. The test waters will be discharged offshore from a marine vessel. Text revised to reflect comment.

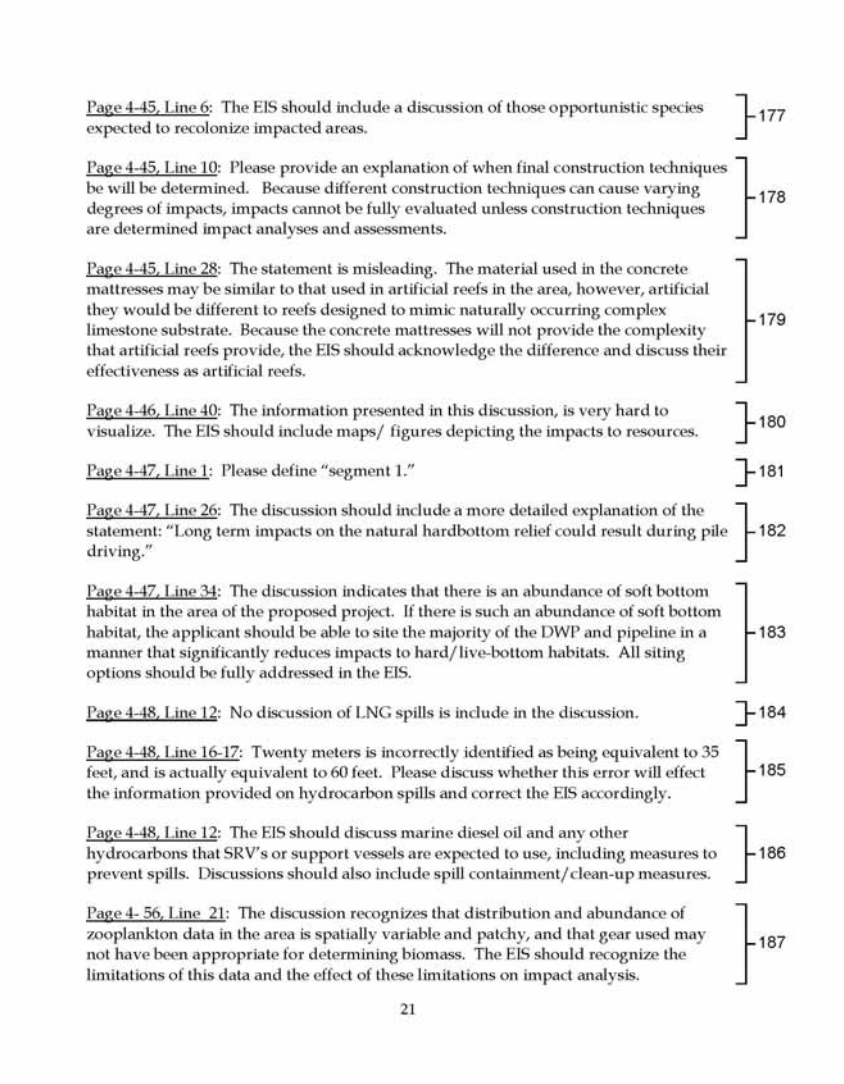
167. No seawater intake will be discharged near Port Manatee. The test waters will be discharged offshore from a marine vessel. Text revised to reflect comment.

168. Text revised per comment.

169. Table changed to reflect comment.

170. Text revised per comment.

171. Text revised per comment.



172. The section number is correct for the Final EIS.

173. This mitigation information has been added to the list of mitigation measures in Section 4.11. The Applicant would conduct surveys just prior to construction to identify SAV that may have not been present during the original SAV surveys. A Mitigation Plan to compensate for unavoidable impacts on seagrasses and live- and hard- bottom habitats would be developed during the permitting process.

174. Text revised per comment.

175. Additional detail has been added to Section 4.2.1.6.

176. Text revised per comment.

Page 4-45, Line 6: The EIS should include a discussion of those opportunistic species expected to recolonize impacted areas. 177

Page 4-45, Line 10: Please provide an explanation of when final construction techniques be will be determined. Because different construction techniques can cause varying degrees of impacts, impacts cannot be fully evaluated unless construction techniques are determined impact analyses and assessments. 178

Page 4-45, Line 28: The statement is misleading. The material used in the concrete mattresses may be similar to that used in artificial reefs in the area, however, artificial they would be different to reefs designed to mimic naturally occurring complex limestone substrate. Because the concrete mattresses will not provide the complexity that artificial reefs provide, the EIS should acknowledge the difference and discuss their effectiveness as artificial reefs. 179

Page 4-46, Line 40: The information presented in this discussion, is very hard to visualize. The EIS should include maps/ figures depicting the impacts to resources. 180

Page 4-47, Line 1: Please define "segment 1." 181

Page 4-47, Line 26: The discussion should include a more detailed explanation of the statement: "Long term impacts on the natural hardbottom relief could result during pile driving." 182

Page 4-47, Line 34: The discussion indicates that there is an abundance of soft bottom habitat in the area of the proposed project. If there is such an abundance of soft bottom habitat, the applicant should be able to site the majority of the DWP and pipeline in a manner that significantly reduces impacts to hard/live-bottom habitats. All siting options should be fully addressed in the EIS. 183

Page 4-48, Line 12: No discussion of LNG spills is include in the discussion. 184

Page 4-48, Line 16-17: Twenty meters is incorrectly identified as being equivalent to 35 feet, and is actually equivalent to 60 feet. Please discuss whether this error will effect the information provided on hydrocarbon spills and correct the EIS accordingly. 185

Page 4-48, Line 12: The EIS should discuss marine diesel oil and any other hydrocarbons that SRV's or support vessels are expected to use, including measures to prevent spills. Discussions should also include spill containment/clean-up measures. 186

Page 4- 56, Line 21: The discussion recognizes that distribution and abundance of zooplankton data in the area is spatially variable and patchy, and that gear used may not have been appropriate for determining biomass. The EIS should recognize the limitations of this data and the effect of these limitations on impact analysis. 187

21

177. Text revised per comment.

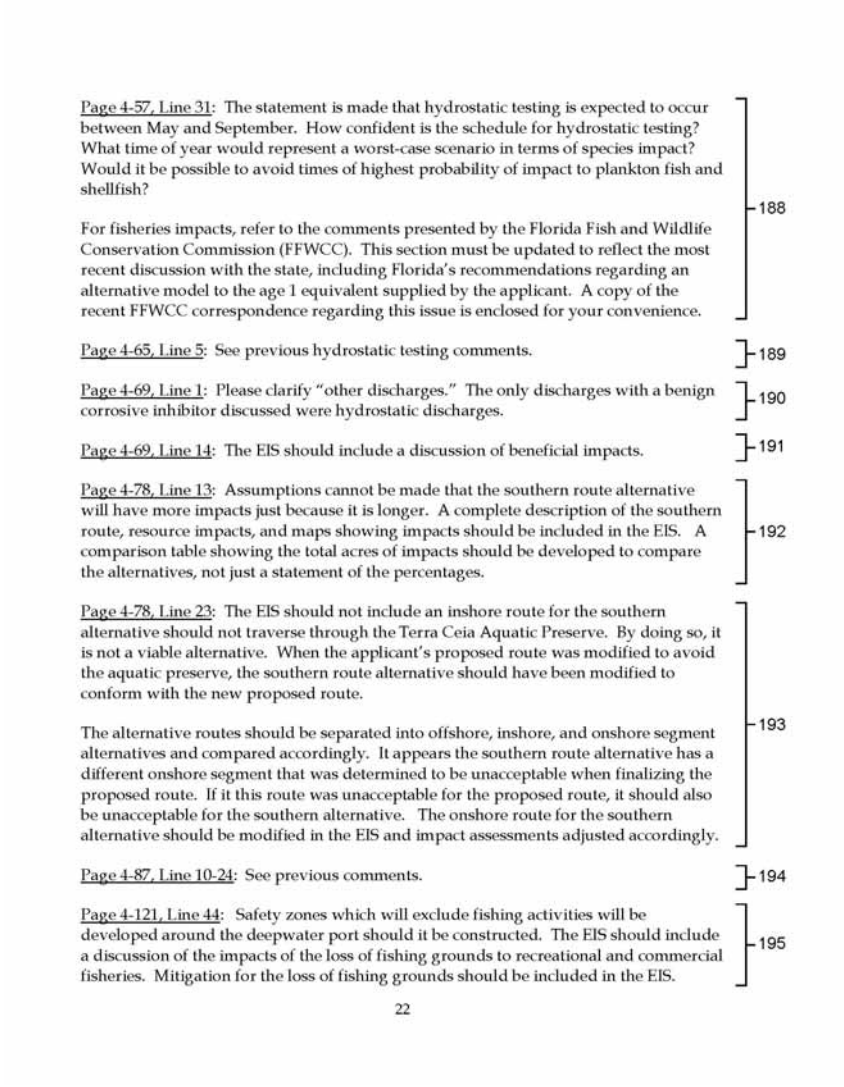
178. Text revised per comment.

179. Additional discussion per comment was added to Section 4.2.1.6.

180. Text revised per comment.

181. Text revised per comment.

182. Text deleted.



183. Text has been added.

184. Text revised to reflect comment.

185. Text revised to reflect comment.

186. Comment noted.

187. Limitations of the SEAMAP data are discussed in Section 4.2.1.11 and appendix G of the Final EIS.

Page 4-57, Line 31: The statement is made that hydrostatic testing is expected to occur between May and September. How confident is the schedule for hydrostatic testing? What time of year would represent a worst-case scenario in terms of species impact? Would it be possible to avoid times of highest probability of impact to plankton fish and shellfish?

For fisheries impacts, refer to the comments presented by the Florida Fish and Wildlife Conservation Commission (FFWCC). This section must be updated to reflect the most recent discussion with the state, including Florida's recommendations regarding an alternative model to the age 1 equivalent supplied by the applicant. A copy of the recent FFWCC correspondence regarding this issue is enclosed for your convenience. 188

Page 4-65, Line 5: See previous hydrostatic testing comments. 189

Page 4-69, Line 1: Please clarify "other discharges." The only discharges with a benign corrosive inhibitor discussed were hydrostatic discharges. 190

Page 4-69, Line 14: The EIS should include a discussion of beneficial impacts. 191

Page 4-78, Line 13: Assumptions cannot be made that the southern route alternative will have more impacts just because it is longer. A complete description of the southern route, resource impacts, and maps showing impacts should be included in the EIS. A comparison table showing the total acres of impacts should be developed to compare the alternatives, not just a statement of the percentages. 192

Page 4-78, Line 23: The EIS should not include an inshore route for the southern alternative should not traverse through the Terra Ceia Aquatic Preserve. By doing so, it is not a viable alternative. When the applicant's proposed route was modified to avoid the aquatic preserve, the southern route alternative should have been modified to conform with the new proposed route.

The alternative routes should be separated into offshore, inshore, and onshore segment alternatives and compared accordingly. It appears the southern route alternative has a different onshore segment that was determined to be unacceptable when finalizing the proposed route. If it this route was unacceptable for the proposed route, it should also be unacceptable for the southern alternative. The onshore route for the southern alternative should be modified in the EIS and impact assessments adjusted accordingly. 193

Page 4-87, Line 10-24: See previous comments. 194

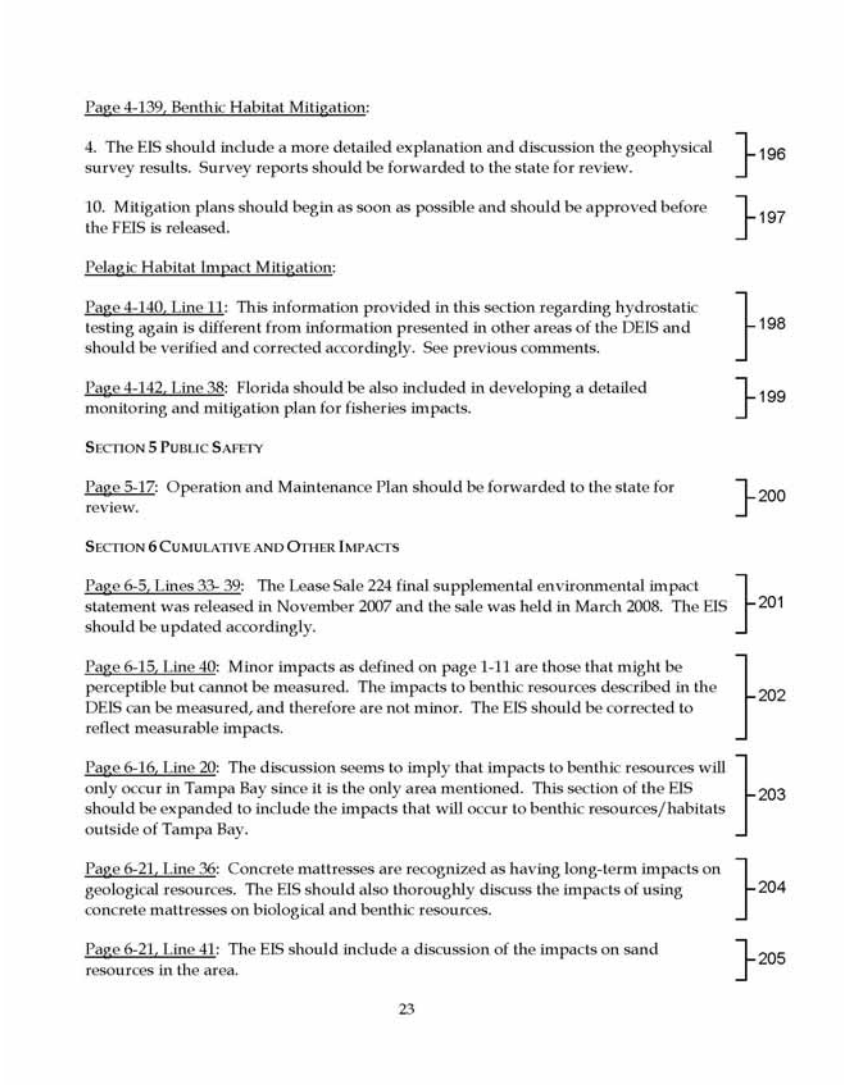
Page 4-121, Line 44: Safety zones which will exclude fishing activities will be developed around the deepwater port should it be constructed. The EIS should include a discussion of the impacts of the loss of fishing grounds to recreational and commercial fisheries. Mitigation for the loss of fishing grounds should be included in the EIS. 195

22

188. The Applicant maintains that hydrostatic testing is expected to occur between May and September during the construction of the proposed pipeline, however specific construction schedules have not been set. However, if a license is issued, a sampling program will be required as a condition of the license. If ichthyoplankton data demonstrates the need for additional mitigation, appropriate plans would be developed then. Discussions with FWC are reflected the analyses in Section 4.2.1.11. Responses to FWC comments are included in this Appendix.

189. Comment noted.

190. Text revised per comment.



191. Comment noted.

192. The southern route is analyzed in Section 2.1.4.6.

193. At 80.4 km, the Southern Route Alternative is approximately the same length as the Proposed Route, and therefore the total area impacted would be the same. Text revised to reflect comment. The Southern Route Alternative would potentially impact the Terra Ceia Aquatic Preserve and a mapped sand resource. However, it will be carried forward for detailed review to determine the extent of these impacts.

194. Comment noted.

195. In Section 4.9 the impacts to commercial and recreational fisheries are analyzed. Safety Zones are discussed in Section 5.5.

Page 4-139, Benthic Habitat Mitigation:

4. The EIS should include a more detailed explanation and discussion the geophysical survey results. Survey reports should be forwarded to the state for review. 196

10. Mitigation plans should begin as soon as possible and should be approved before the FEIS is released. 197

Pelagic Habitat Impact Mitigation:

Page 4-140, Line 11: This information provided in this section regarding hydrostatic testing again is different from information presented in other areas of the DEIS and should be verified and corrected accordingly. See previous comments. 198

Page 4-142, Line 38: Florida should be also included in developing a detailed monitoring and mitigation plan for fisheries impacts. 199

SECTION 5 PUBLIC SAFETY

Page 5-17: Operation and Maintenance Plan should be forwarded to the state for review. 200

SECTION 6 CUMULATIVE AND OTHER IMPACTS

Page 6-5, Lines 33- 39: The Lease Sale 224 final supplemental environmental impact statement was released in November 2007 and the sale was held in March 2008. The EIS should be updated accordingly. 201

Page 6-15, Line 40: Minor impacts as defined on page 1-11 are those that might be perceptible but cannot be measured. The impacts to benthic resources described in the DEIS can be measured, and therefore are not minor. The EIS should be corrected to reflect measurable impacts. 202

Page 6-16, Line 20: The discussion seems to imply that impacts to benthic resources will only occur in Tampa Bay since it is the only area mentioned. This section of the EIS should be expanded to include the impacts that will occur to benthic resources/habitats outside of Tampa Bay. 203

Page 6-21, Line 36: Concrete mattresses are recognized as having long-term impacts on geological resources. The EIS should also thoroughly discuss the impacts of using concrete mattresses on biological and benthic resources. 204

Page 6-21, Line 41: The EIS should include a discussion of the impacts on sand resources in the area. 205

23

196. Geophysical survey results are discussed in Sections 4.3.1 and 4.5.1.1.

197. Please see Section 4.9.1.

198. Text deleted.

199. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies (see Section 4.11). Specific monitoring requirements would be developed after a license is issued.

200. The Operations Manual is approved by the USCG. Operations Manual will be available to the state agencies, but not the facility Security Plan that contains Sensitive Security Information.

201. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies (see Section 4.11). Specific monitoring requirements would be developed after a license is issued.

202. Discussion of impacts to benthic resources has been refined with the incorporation of new geophysical and geotechnical data, and some impact categories have been changed (see Section 4.2.1.6).

203. Text revised per comment.

204. Additional discussion per comment was added to Section 4.2.1.6.

205. The discussion of sand resources in sections 3.4 and 4.4 has been revised.

Page 6-22, Line 5: According to the section, the impact to recreational and commercial fisheries during construction of Port Dolphin would be minor, short-term and adverse. What impact will the permanent avoidance area that that will be established around the Port Dolphin DWP have on recreational boaters, recreational fisheries, and commercial fisheries in terms of possible loss of fishing grounds? 206

24

206. Impacts to fishing due to operations are discussed in Section 4.9.

FLORIDA DEPARTMENT OF STATE
Kurt S. Browning

Tallahassee, Florida 32399-3000

Re: SAI#: FL200804184178C US Coast Guard and US Maritime Administration – Draft Environmental Impact Statement – Port Dolphin LNG Deepwater Port License Application / Offshore and Manatee County / DHR Project File No. 2008-2374

Dear Ms. Tucker:

The review of the above referenced document was carried out in accordance with the provisions of Florida's Coastal Zone Management Act and Chapter 267: the Historical Resources Act (*Florida Statutes*), as well as Section 106 of the National Historic Preservation Act of 1966 (Public Law 102-575), as amended in 1992, and 36 C.F.R., Part 800: Protection of Historic Properties. The State Historic Preservation Officer is to advise and assist federal agencies or their designees when identifying historic properties, assessing effects upon them, and considering alternatives to avoid or reduce a project's effect on them.

We reviewed the Draft Environmental Impact Statement and find that historic resource concerns have been adequately addressed. We note that both terrestrial and underwater cultural resource assessment surveys have been conducted for areas of potential impact by this project. Any areas not yet surveyed should be a condition of any permitting. Onshore cultural resources surveys did not locate any historic resources meeting the criteria for National Register eligibility. Offshore cultural resource surveys identified multiple side-scan sonar contacts and unidentified magnetic anomalies. Avoidance requirements of offshore archaeologically sensitive areas is adequately described in Chapter 3 Affected Environmental, under section 3.3.2, Port Site and Offshore Routes. 207

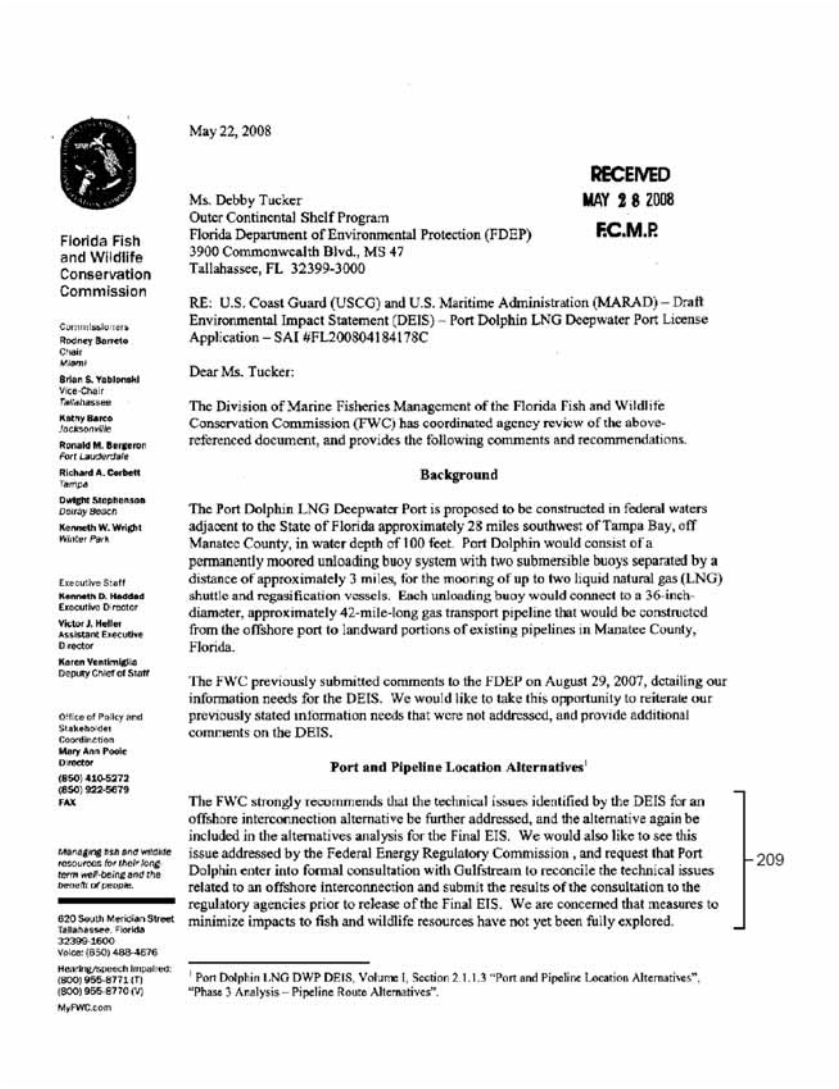
Thus, conditioned upon the completion of the required onshore survey work including the avoidance of any significant historic resources should any be encountered in future surveys, and the avoidance of referenced sensitive offshore areas, it is the opinion of this office that the proposed project will have no effect on historic properties listed, or eligible for listing in the *National Register of Historic Places*, or otherwise of historical or archaeological value. 208



If you have any questions concerning our comments, please do not hesitate to contact Susan Harp at (850) 245-6333. Thank you for your interest in protecting Florida's historic resources.

Sincerely,

Frederick P. Gaske

RE: U.S. Coast Guard (USCG) and U.S. Maritime Administration (MARAD) – Draft Environmental Impact Statement (DEIS) – Port Dolphin LNG Deepwater Port License Application – SAI #FL200804184178C

Dear Ms. Tucker:

The Division of Marine Fisheries Management of the Florida Fish and Wildlife Conservation Commission (FWC) has coordinated agency review of the above-referenced document, and provides the following comments and recommendations.

Background

The Port Dolphin LNG Deepwater Port is proposed to be constructed in federal waters adjacent to the State of Florida approximately 28 miles southwest of Tampa Bay, off Manatee County, in water depth of 100 feet. Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately 3 miles, for the mooring of up to two liquid natural gas (LNG) shuttle and regasification vessels. Each unloading buoy would connect to a 36-inch-diameter, approximately 42-mile-long gas transport pipeline that would be constructed from the offshore port to landward portions of existing pipelines in Manatee County, Florida.

The FWC previously submitted comments to the FDEP on August 29, 2007, detailing our information needs for the DEIS. We would like to take this opportunity to reiterate our previously stated information needs that were not addressed, and provide additional comments on the DEIS.

Port and Pipeline Location Alternatives[1]

The FWC strongly recommends that the technical issues identified by the DEIS for an offshore interconnection alternative be further addressed, and the alternative again be included in the alternatives analysis for the Final EIS. We would also like to see this issue addressed by the Federal Energy Regulatory Commission , and request that Port Dolphin enter into formal consultation with Gulfstream to reconcile the technical issues related to an offshore interconnection and submit the results of the consultation to the regulatory agencies prior to release of the Final EIS. We are concerned that measures to minimize impacts to fish and wildlife resources have not yet been fully explored. 209

[1] Port Dolphin LNG DWP DEIS, Volume I, Section 2.1.1.3 "Port and Pipeline Location Alternatives", "Phase 3 Analysis – Pipeline Route Alternatives".

209. An offshore interconnection with the Gulfstream Pipeline has been included in Section 2.1, Alternatives Analysis.

Fish and Fisheries Resources[2]

Minerals Management Service regulations require that pipelines in less than 200 feet of water must be buried at least 3 feet under grade. From past experience with the Gulfstream Pipeline project, we understand that all of the Port Dolphin pipeline may not be able to be buried to this depth due to the density of the substrate. In addition, the DEIS states in Section 4.2.1.7 that concrete mattresses would also be placed in some soft bottom areas. The information that is missing from the DEIS for us to be able to evaluate potential impacts on horseshoe crab spawning activities/juvenile development, and hardbottom resources is as follows: 210

1) How much of the pipeline and in which locations will not be able to be buried to this depth?
2) Will all of the pipeline areas that cannot be buried to this depth be mattressed, and if not, what are the alternative anchoring methods that will be used to secure the pipeline?
3) We would like to see evidence that the proposed concrete mats have functioned as suggested in previous pipeline projects. There is evidence in coral restoration projects that concrete mats have moved during storm events resulting in damage to nearby hardbottom resources. 211

Horseshoe Crabs

The FWC is concerned with the potential for loss of beach habitat for spawning horseshoe crabs due to pipeline placement and orientation, and use of concrete mattresses. If a concrete mattress is to be placed over sandy beach area, it will certainly affect spawning through the reduction of spawning habitat. Horseshoe crabs nest in the upper-tidal areas of sandy beaches along the high-tide line, and the FWC has received reports of them using even small beach areas throughout Tampa Bay. Staff has also witnessed horseshoe crabs coming up on boat ramps looking for beach area. 212

If the pipeline is oriented perpendicular to the beach, the crabs should be able to enter the beach from either side; however, in areas such as Anna Maria Island, where the pipeline is proposed to be oriented parallel to the beach, concrete mattressing could serve as a barrier for both mating and mate selection. For spawning, a male horseshoe crab attaches to the rear of the carapace of a female and they walk into the beach together. It would be very difficult for them to walk over a concrete barrier that is raised 12 inches above grade. If the concrete was as level to the sediments as possible and if the sides were sloped to allow easy portage across, mattressing would not likely present a barrier. 213

Another potential concern with parallel orientation is how close to the shore the pipeline would be located. Although male and female horseshoe crabs are paired when they move up to the beach to spawn, single males called satellites cruise along in the shallow waters parallel to the beach searching for mating pairs. A nesting pair may accumulate quite a few satellite males, which basically join the pair and also release sperm when the female releases her eggs. Research has shown multiple paternity for horseshoe crab eggs, so this is a viable strategy for satellite males but it does depend on them having access to 214

[2] Port Dolphin LNG DWP DEIS, Volume I, Section 3.2.8 "Fish and Fisheries Resources".

210. The proposed project is under the Deepwater Port Act, not the OCSA administered by MMS, therefore, the MMS requirements do not apply. However, the Applicant has committed to bury the pipeline to a depth of 3 feet. In areas that burial is not possible, the pipeline will be covered with concrete mattresses as discussed in the Final EIS.

211. Details of pipeline construction based on geotechnical surveys are included in Sections 4.3.1 and 4.5.1.1. Mattress covers are the only alternative burial method proposed.

212. The proposed pipeline will be installed using HDD from onshore to offshore as described in Section 4.4.1. The landing area is adjacent to a seawall so no beach impacts would occur.

213. The offshore pipeline would be perpendicular to the seawall and buried, therefore no barrier would be created.

214. The proposed pipeline will be installed using HDD from onshore to offshore as described in Section 4.4.1. The landing area is adjacent to a seawall so no beach impacts would occur.

The offshore pipeline would be perpendicular to the seawall and buried, therefore no barrier would be created.

shallow waters parallel to the beaches. A pipeline covered with a concrete mattress in deeper waters and again sloped to allow easy passage over it, would not likely present a barrier. 214

The final concern with placement and orientation of the pipeline and concrete mattressing is that juvenile horseshoe crabs leave their nests on the beaches and move onto adjacent flats to grow for several years. Concrete mattresses have the potential to reduce juvenile habitat and act as a barrier for juvenile passage to the flats. 215

Mitigation, Minimization and Monitoring[3]

Biological Resources
The DEIS does not provide mitigation or monitoring plans for impacts to biological resources (including benthic habitats). The FWC strongly recommends that mitigation and monitoring plans are included in the Final EIS to ensure that such plans will be acceptable and appropriate to mitigate for impacts to biological resources managed by the State of Florida. 216

Impacts to Fishing Activities
In our August 29 letter, we recommended that the DEIS provide mitigation alternatives for loss of fishing grounds to the fishing community due to safety zones and Areas to be Avoided (ATBA). Mitigation for the loss of fishing grounds was not addressed in the DEIS. The FWC strongly recommends that the applicant include mitigation alternatives for the loss of fishing grounds in the Final EIS. 217

Incident Management Plan
In our August 29 letter, we recommended that the DEIS provide information that outlined the extent of obligation on FWC Law Enforcement to respond to an incident. Such information was referred to in the DEIS by the statement that "*Spill response plan and emergency response plans would be implemented,*" but was not included in the DEIS and remains a primary concern for the FWC. 218

Seawater Intake
The DEIS states that "*An intake rate of 9.5 MGD of seawater for engine-cooling purposes would substantially reduce the potential for entrainment of plankton individuals compared to open-loop vaporization systems, which can use five times more volume*". It is unclear if this rate is calculated per vessel, and it does not include intake amounts for ballast. We would request that the applicant provide a tabular summary and a comprehensive description of water intake and discharge volume for the project. This information should specify the maximum and average water volume (ballast and engine cooling) for all vessels that will utilize the deepwater port (including SRVs and LNG carriers). It should also describe the anticipated frequency of each vessel at the port, and the frequency of vaporization operations versus open-loop operations. Similar tables may be found in the Calypso LNG Data Gaps document dated October 27, 2007 (docket 219

[3] Port Dolphin LNG DWP DEIS, Volume I, Section 4.11 "Mitigation, Minimization and Monitoring", 4.11.1 "Applicant-Proposed BMPs and Minimization Measures", "Benthic Habitat Impact Mitigation" and "Pelagic Habitat Impact Mitigation".

215. The proposed pipeline will be installed using HDD from onshore to offshore as described in Section 4.4.1. The landing area is adjacent to a seawall so no beach impacts would occur.

The offshore pipeline would be perpendicular to the seawall and buried, therefore no barrier would be created.

216. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies (see Section 4.11). Specific monitoring requirements would be developed after a license is issued.

217. It is anticipated that fishing activities would be allowed in the ATBA, and therefore there would be no loss of fishing grounds associated with the ATBA. Please see Section 4.9.1 for discussion of fishing impacts.

218. If a License is issued by the Maritime Administration, the USCG would require development and approval of an Operating Plan that would include security provisions. The plan would be coordinated with Federal, state and local officials responsible for enforcement or response.

219. Seawater intake volumes are discussed in Section 2.1.7.4 for SRV and FSRU alternatives. The data are used on the Ichthyoplankton Impact Assessment as discussed in section 4.2.1.12 and Appendix G.

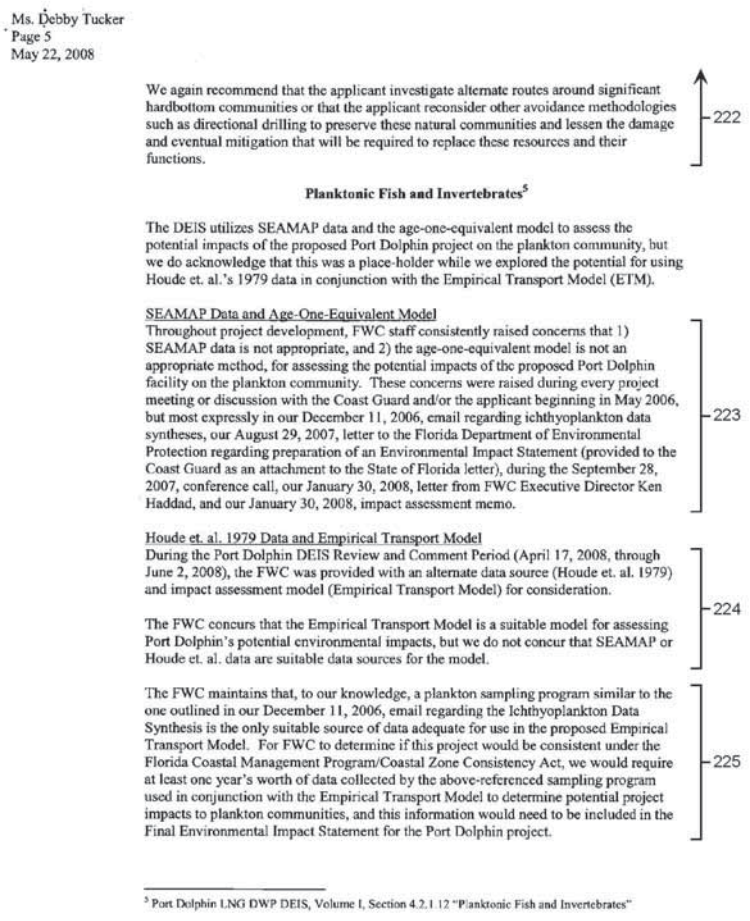
#26009 at www.Regulations.gov), specifically data gap #29. This information may be more appropriate for inclusion in Volume I, Section 4.2.1.12 "Planktonic Fish and Invertebrates." 219

We request clarification that Port Dolphin would only allow vessels to utilize the port if they are closed-loop for vaporization purposes, and we would also request that the applicant address the issue as to why they are not utilizing vessels that are closed-loop for engine cooling purposes. 220

Benthic Resources[4]

In our August 29 letter, we identified that the primary benthic communities expected to be affected by this project are hard bottom with both hard and soft corals, shallow and deep-water seagrasses, and live-bottom communities. Adverse effects to these benthic resources include impacts due to plowing and burial of the pipeline or covering the pipeline with concrete mats. Additional benthic impacts may occur from the construction of the shuttle and regasification vessel anchoring system, as well as the Standard Triangulation Language buoy landing pad.

We also stated in our letter that although the application materials were substantial, almost all of the information was directed at the proposed route, with little or no marine resource information provided for the alternate northern and southern routes. Although it may be presumed that the proposed preferred pipeline route would result in fewer adverse effects because it has the least amount of impacts based on the selection criteria and it is the shortest route, without some level of reconnaissance information of the resources present in the other two pipeline routes, this presumption cannot be confirmed. In order to determine if adverse effects would be greater or less to the resources of Florida, additional information verifying that the northern and southern routes are less desirable is necessary. 221



This issue has not been clearly resolved in the DEIS. The applicant states that there would be an eight-acre increase in the project footprint for the southern route alternative causing an increase in the adverse affects; however, the applicant also states that the proposed alternative would affect five benthic habitat types with Type A = 5%, Type B = 18% and Type D = 9%, of the affected areas, while in the southern alternative adverse affects would be proportioned as follows: Type A = 4%, Type B = 5% and Type D = 28%. The southern alternative does affect more benthic habitat as stated by the applicant, but it also appears to affect almost 50% less hard bottom habitat Types A and B. The significant increase in habitat impacts comes in Type D habitat, which is sand and soft substrate in proximity to reef/hard bottom areas. This is not to suggest that Type D habitat is less important than the other habitats described, only that it is more prevalent and due to that, it is not as limiting to obligate species as habitat Types A and B. At this time we are not convinced that the proposed alternative is the best alternative to minimize adverse affects to benthic communities when other criteria, other than total area affected, are considered. 222

[4] Port Dolphin LNG DWP DEIS, Volume I, Section 4.2.1.7 "Benthic Resources".

220. A complete discussion of the proposed vaporization alternatives is included in Section 2.1.7.

221. The Final EIS has been updated with geophysical survey data on the Southern Route Alternative. See resource discussions in Section 4.

222. Based on additional geophysical and geotechnical evaluations, the benthic impacts discussion has been revised. Additional mitigation has been included in Section 4.11.

Ms. Debby Tucker
Page 5
May 22, 2008

We again recommend that the applicant investigate alternate routes around significant hardbottom communities or that the applicant reconsider other avoidance methodologies such as directional drilling to preserve these natural communities and lessen the damage and eventual mitigation that will be required to replace these resources and their functions. 222

Planktonic Fish and Invertebrates[5]

The DEIS utilizes SEAMAP data and the age-one-equivalent model to assess the potential impacts of the proposed Port Dolphin project on the plankton community, but we do acknowledge that this was a place-holder while we explored the potential for using Houde et. al.'s 1979 data in conjunction with the Empirical Transport Model (ETM).

SEAMAP Data and Age-One-Equivalent Model

Throughout project development, FWC staff consistently raised concerns that 1) SEAMAP data is not appropriate, and 2) the age-one-equivalent model is not an appropriate method, for assessing the potential impacts of the proposed Port Dolphin facility on the plankton community. These concerns were raised during every project meeting or discussion with the Coast Guard and/or the applicant beginning in May 2006, but most expressly in our December 11, 2006, email regarding ichthyoplankton data syntheses, our August 29, 2007, letter to the Florida Department of Environmental Protection regarding preparation of an Environmental Impact Statement (provided to the Coast Guard as an attachment to the State of Florida letter), during the September 28, 2007, conference call, our January 30, 2008, letter from FWC Executive Director Ken Haddad, and our January 30, 2008, impact assessment memo. 223

Houde et. al. 1979 Data and Empirical Transport Model

During the Port Dolphin DEIS Review and Comment Period (April 17, 2008, through June 2, 2008), the FWC was provided with an alternate data source (Houde et. al. 1979) and impact assessment model (Empirical Transport Model) for consideration.

The FWC concurs that the Empirical Transport Model is a suitable model for assessing Port Dolphin's potential environmental impacts, but we do not concur that SEAMAP or Houde et. al. data are suitable data sources for the model. 224

The FWC maintains that, to our knowledge, a plankton sampling program similar to the one outlined in our December 11, 2006, email regarding the Ichthyoplankton Data Synthesis is the only suitable source of data adequate for use in the proposed Empirical Transport Model. For FWC to determine if this project would be consistent under the Florida Coastal Management Program/Coastal Zone Consistency Act, we would require at least one year's worth of data collected by the above-referenced sampling program used in conjunction with the Empirical Transport Model to determine potential project impacts to plankton communities, and this information would need to be included in the Final Environmental Impact Statement for the Port Dolphin project. 225

[5] Port Dolphin LNG DWP DEIS, Volume I, Section 4.2.1.12 "Planktonic Fish and Invertebrates"

223. The Draft EIS disclosed data adequacy issues, and agrees that there are deficiencies in the available data. However, the USCG and Maritime Administration feel that available data are sufficient to describe impacts under NEPA and the DWPA in a manner consistent with impact analyses of prior LNG deepwater port projects. The license, if issued, will contain a condition requiring additional monitoring and appropriate mitigation if data demonstrate ichthyoplankton densities that exceed those used in the estimates.

224. In September 2008 FWC rejected the ETM proposed by the Applicant. Therefore, modeling was not performed.

225. Limitations on SEAMAP data and the adjustments made to accommodate those limitations are detailed in Section 4.1.2.12 and Appendix G of the Final EIS. Use of closed-loop vaporization technology was identified by NMFS as the principal mitigation for ichthyoplankton impacts for prior LNG deepwater port projects, and the Applicant has proposed a closed-loop system. The impacts modeled for the Project are extremely low. Therefore, additional data is not considered necessary for the EIS. However, if a license is issued, a sampling program will be required as a condition of the license. If ichthyoplankton data demonstrates the need for additional mitigation, appropriate plans would be developed then.

We appreciate the opportunity to provide comments on the DEIS for the Port Dolphin LNG DWP project. Should you require additional assistance regarding our comments, please contact Lisa Gregg at (850) 487-0554 or lisa.gregg@myfwc.com.

Sincerely,

Mary Ann Poole

Port Dolphin DEIS Comments
FL DEP SW District

Comments to the Draft Environmental Impact Statement on the Port Dolphin LLC Deepwater Port License Application

(ichthyoplankton, hard-bottom, sand)

Volume I

Abstract lines 21, 22, 29, and 30:
Which SRV class and natural gas throughput were ichthyoplankton impact and/or any other impact calculations based upon? 226

ES-1, line 10:
The new pipeline route was intended to avoid the Terra Ceia Aquatic Preserve rather than sensitive biological resource areas, as sensitive biological resource areas were not mapped in the new pipeline route prior, correct? 227

ES-1, line 24:
Florida Department of Natural Resources is now Florida Department of Environmental Protection. 228

ES-7, lines 19-22:
What area of benthic habitat lies in the footprint of the pipeline and what area of hard-bottom, including that covered by a shifting sand veneer, lies in the footprint of the pipeline? 229

ES-7, lines 25-30 and 36-37:
Provide documentation of approval from the NMFS and USCG for both the assessment methodology developed and for limitation of the evaluation to only six species. 230

ES-7, lines 43-44:
Provide rationale for the assumption that impacts to all other species would be similar to the six species identified as representative. 231

ES-8, lines 1-2:
Define equivalent yield and describe from what data average landings in Florida was calculated. Describe what is indicated by placing "gag grouper" in parenthesis after "any species". 232

ES-8, lines 11-12:
Provide an estimate for the percentage of increase in vessel traffic associated with construction and operation of the pipeline/port and how a probability of risk of collision cannot be quantified. If the risk of collision cannot be quantified, provide why it could also not be estimated based on known numbers and general locations of manatee within the project area? 233

ES-8, line 26:
For what percentage of waterbodies in proximity to and including Tampa Bay would usage be limited for the life of the Port? 234

226. Impacts were analyzed using the maximum throughput of the 217,000 m^3 SRVs.

227. Correct; the new pipeline route was intended to avoid the Terra Ceia Aquatic Preserve.

228. Text changed per document.

229. The Final EIS has been updated with information from additional geophysical and geotechnical surveys. See resource discussion in Section 4

230. Documentation of consultation can be found in Appendix B, *Agency Consultation.*

231. As stated in the Executive Summary and in Section 4.2.1.11.1, the representative species were selected (in cooperation with NMFS) based on economic and ecological importance, availability of life history data, and the similarity to other population types.

232. Definition provided. Text revised to clarify per comment in section 4.2.1.12 App. G.

233. Text added to clarify per comment.

234. Usage would be limited only in the Safety Zone and No Anchoring Area, if designated, around the Port. The area involved is discussed in Section 2.3.10.

Port Dolphin DEIS Comments
FL DEP SW District

ES-9, LINES 21-23:
Is the hard-bottom to be impacted, considered essential fish habitat, protected? Do the proposed facilities traverse any conditionally approved or approved shellfish harvesting areas? 235

ES-9, LINES 27-28:
Provide how it was determined that operation of the Port will not reduce any commercially or recreationally important species, and provide the level of or degree of uncertainty in making this determination. 236

ES-9, LINES 29-30:
Will the pipeline exclude any areas or routes used by recreational vessels or commercial fisherman? 237

ES-10, LINES 6-7:
What amount of greenhouse gas will the construction of the Port and pipeline produce as a percentage of greenhouse gas produced for the Tampa Bay region? What is the percent of the Tampa Bay region's greenhouse gas that will be imported as opposed to the national or statewide percent? 238

ES-11, LINES 35-36:
What is the percent loss of fishing area for the Tampa Bay region as opposed to the GOM? 239

ES-11, LINE 37:
Define benthic substrata. 240

3-2, LINES 25-29:
Describe how the location of the pipeline was selected to avoid wind and tidal currents for minimization of water quality impacts from turbidity during construction, particularly for shallow areas, including impacts to shallow areas stemming from activity in deeper areas. 241

3-3, LINES 6-7:
Describe how it was determined that the presence of the pipeline in near-shore waters will not affect erosion to any beach or island in its vicinity, particularly during storm events, and particularly to national wildlife refuges and critical erosion control areas or areas in need of erosion control management. 242

3-7, LINES 38, AND 41-42:
Describe how contaminants from the sediment 'hot spot' near Anna Maria Island will not be released into the water column during construction of the pipeline through this area, or data used to determine that this would not be of concern. 243

3-9, LINES 37-38:
Were mollusks, cephalopoda, and crustaceans included in the fisheries resources evaluated – as species from these genera are later identified as "commercially important shellfish species on the western Florida shelf" (*3-44, LINES 16-19*)? 244

235. Discussion of impacts to EFH is included in section 4.2.1.13. The proposed facilities do not traverse shellfish harvesting areas.

236. See discussion in Section 4.2.1.11 and Appendix G.

237. During construction of the pipeline access to the active construction zone (not the entire pipeline route) would be restricted. There would be no restrictions during operations. Please refer to discussion in Section 4.9.

238. Greenhouse gas is discussed in Section 7.

239. Information added to Executive Summary and Section 4.9.1.

240. Section 3 identifies existing conditions. Potential impacts to water quality including turbidity modeling are discussed in Section 4.1.

241. Section 3 identifies existing conditions. Impacts to soils and sediments are discussed in Section 4.3.

242. Section 3 identifies existing conditions. Impacts to soils and sediments are discussed in Section 4.3.

243. After receiving revised data, the original map was incorrect, and there are no "hot spots" near Anna Maria Island. Text revised to clarify.

244. Discussion of impacts to commercial and recreational fisheries including, shellfish is included in Section 4.9.

Port Dolphin DEIS Comments
FL DEP SW District

3-27, LINES14-16 AND 22-34:
Please provide as to why in-fauna, or organisms living within rocky substrate, was not listed for Rocky bottom or limestone in nearshore benthic habitat or hard-bottom habitats in Tampa Bay. 245

3-28, LINES 6-10:
Describe the reliability of the side scan sonar used and any other surveys method used to accurately detect hard bottom. How was the survey reliability verified? Describe the quantity and methodology of the diver surveys performed. 246

3-28, LINES18-29:
Habitat types do not include situations where there is >20% cover and less than 0.25 m relief, and <5% cover or >20% cover with < 0.25 m relief and no sand veneer – describe why the habitat types listed need not include these situations. 247

3-43, LINES12-16 AND 34:
Please clarify that meroplankton include nektonic as well as benthic invertebrates and vertebrates, and that zooplankton include meroplankton. 248

3-44, LINES 7-8:
How are meroplankton considered to be more important in estuaries of western Florida than in shelf waters, as much reference is made to ichthyoplankton in particular in shelf waters (*3-45, LINES 5-34*)? Is the general quantity of meroplankton compared to zooplankton in shelf waters versus estuaries of western Florida known, and if so what is it? 249

3-44, LINE 45 AND 3-45, LINES 1-2:
Explain why larval densities are greatest for planktonic fish and shellfish (meroplankton) during the summer, when zooplankton was reported to be more abundant in cooler upwelled water than warmer surface water (*3-43, LINES 40-41*). 250

3-45, LINES 35-36:
In what proximity to the proposed Port Dolphin Terminal are plankton survey data obtained, and is an alternative Port location in closer proximity? 251

3-45, LINES 35-36:
Describe how the measurement of ichthyoplankton will or will not account for the presence of the commercially important mollusk, cephalopoda, and crustacean plankton species identified (*3-44, LINES 16-19*). 252

3-48, LINE 5:
Figure 3.2-3 does not indicate any SEAMAP locations or information. 253

3-48, LINES 2-4:
If species likely to occur in the project area are distributed in depths less than 100 feet, what percentage of these species (particularly those of recreational and commercial importance) is at risk of not being accurately represented by survey data obtained in depths greater than 120 feet. 254

245. Text revised to clarify per comment.

246. Text added per comment.

247. Text added per comment.

Port Dolphin DEIS Comments
FL DEP SW District

What percentage of the survey data was taken at 120 feet and what percentage was taken at 300 feet? 254

3-48, LINES 10-15:
What percentage of the taxa represented are likely to be distributed in depths of less than 100 feet? 255

3-48, LINES 18-19:
Would any commercially or recreationally important species to the Tampa Bay fishery or any species whose population would directly impact any commercially or recreationally important species to the Tampa Bay fishery be expected to have higher egg or larval or plankton densities from December-April? Is this information known? 256

3-49, LINES 4-11:
Explain how multiplying sample estimates by 3 accounts for the 8-fold underestimation described. 257

3-49, LINES 29-32:
What are the limitations to the sampling method in relation to the commercially and recreationally important species of the Tampa Bay fishery, or any species whose population would directly affect commercially or recreationally important species in the Tampa Bay fishery? Is this information known?

Is it possible to quantify representative plankton abundance for the commercially and recreationally important species to the Tampa Bay fishery and species whose populations are known to directly impact commercially and recreationally important species to the Tampa Bay fishery at the actual proposed project site within a few years time? Why or why not? 258

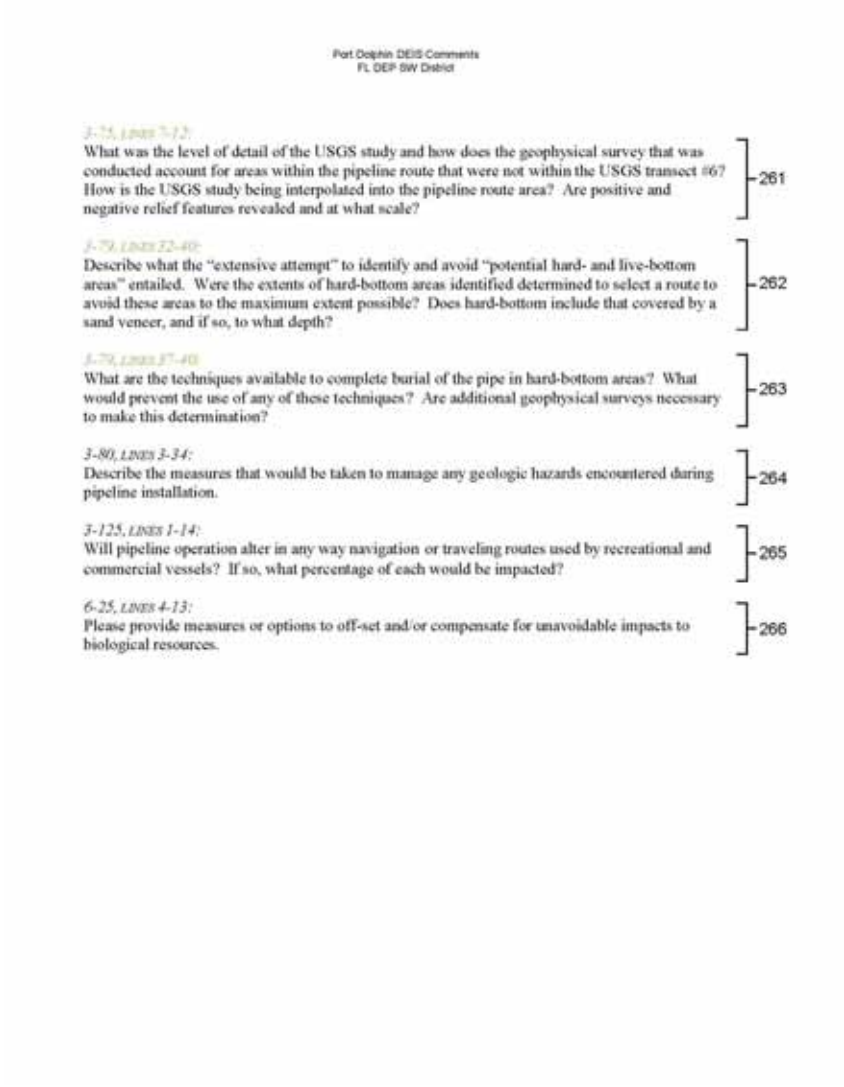
Describe the methodology that "was developed in conjunction with NMFS Gulf Landing LLC Deepwater Port Application EIS" for data from the 17 year sampling period and how this was applied to assess impacts to the marine fishery of the Tampa Bay region. Explain how this is the best approach to assess impacts to the marine fishery of the Tampa Bay region from the proposed Port and pipeline.

3-71, LINES 16-30:
Does the proposed route impact or prevent access to any mineral resources, such as beach re-nourishment quality sand and hydrocarbons, and what are the types, locations, and quantities of these resources? 259

3-73, LINES 11-22:
Is this the best available technology in terms of reliability, accuracy, and precision, and what are the reliability, accuracy, and precision of this technology? 260

255. Text added per comment.

256. Text added per comment.



257. Text added to clarify per comment.

258. Limitations are described in Appendix G.

USCG requested input from FDEP and FWC to identify species "whose populations are known to directly affect commercially and recreationally important species." In January 2008, FWC submitted a list of 4 species, and two of those species were included in an expanded ichthyoplankton impact assessment, as described in the EIS. An additional species was added in response to comments on the Draft EIS. The revised ichthyoplankton analysis can be found in Section 4.2.1.11 and Appendix G. The methodology is described in Appendix G.

259. Yes. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route is described in Section 2.1 and sand resources are discussed in Sections 3.4 and 4.4.

260. Surveys were conducted in accordance with MMS criteria.

Port Dolphin DEIS Comments
FL DEP SW District

3-75, LINES 7-12:
What was the level of detail of the USGS study and how does the geophysical survey that was conducted account for areas within the pipeline route that were not within the USGS transect #6? How is the USGS study being interpolated into the pipeline route area? Are positive and negative relief features revealed and at what scale? 261

3-79, LINES 32-40:
Describe what the "extensive attempt" to identify and avoid "potential hard- and live-bottom areas" entailed. Were the extents of hard-bottom areas identified determined to select a route to avoid these areas to the maximum extent possible? Does hard-bottom include that covered by a sand veneer, and if so, to what depth? 262

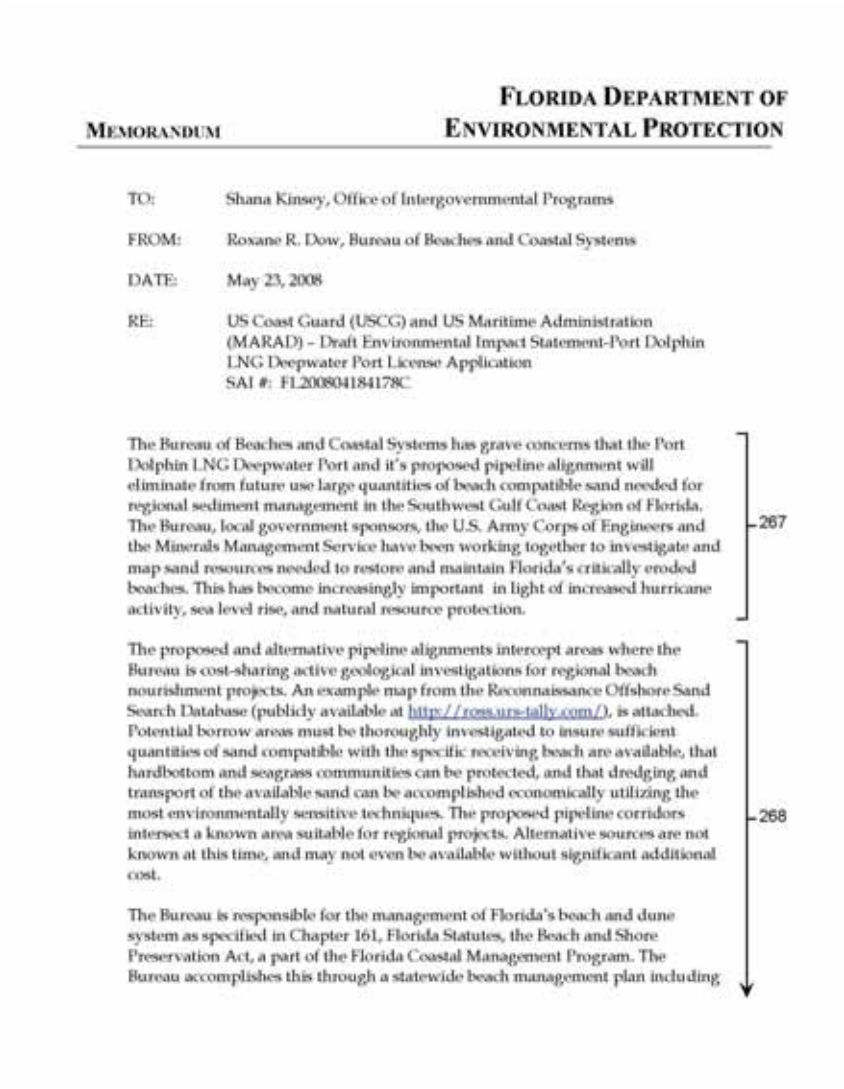
3-79, LINES 37-40:
What are the techniques available to complete burial of the pipe in hard-bottom areas? What would prevent the use of any of these techniques? Are additional geophysical surveys necessary to make this determination? 263

3-80, LINES 3-34:
Describe the measures that would be taken to manage any geologic hazards encountered during pipeline installation. 264

3-125, LINES 1-14:
Will pipeline operation alter in any way navigation or traveling routes used by recreational and commercial vessels? If so, what percentage of each would be impacted? 265

6-25, LINES 4-13:
Please provide measures or options to off-set and/or compensate for unavoidable impacts to biological resources. 266

261. The geophysical survey information are discussed in Sections 4.3.1 and 4.5.1.1 and available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.



262. Text added per comment

263. Burial techniques are discussed in the Application and the Final EIS in Section 2.2.11.

264. Text added to reflect comment.

265. No, pipeline operation will not impact vessel operation.

266. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements would be developed after a license is issued.

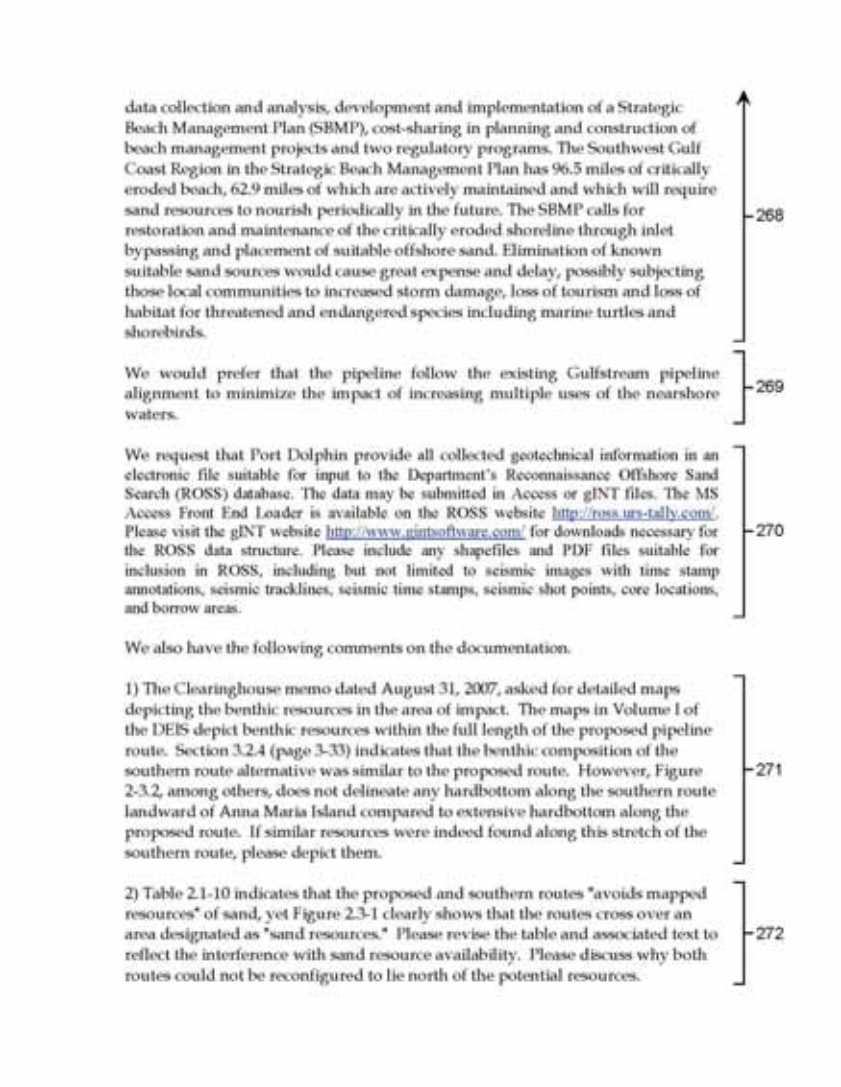
MEMORANDUM **FLORIDA DEPARTMENT OF ENVIRONMENTAL PROTECTION**

TO: Shana Kinsey, Office of Intergovernmental Programs

FROM: Roxane R. Dow, Bureau of Beaches and Coastal Systems

DATE: May 23, 2008

RE: US Coast Guard (USCG) and US Maritime Administration (MARAD) – Draft Environmental Impact Statement-Port Dolphin LNG Deepwater Port License Application
SAI #: FL200804184178C



The Bureau of Beaches and Coastal Systems has grave concerns that the Port Dolphin LNG Deepwater Port and it's proposed pipeline alignment will eliminate from future use large quantities of beach compatible sand needed for regional sediment management in the Southwest Gulf Coast Region of Florida. The Bureau, local government sponsors, the U.S. Army Corps of Engineers and the Minerals Management Service have been working together to investigate and map sand resources needed to restore and maintain Florida's critically eroded beaches. This has become increasingly important in light of increased hurricane activity, sea level rise, and natural resource protection. 267

The proposed and alternative pipeline alignments intercept areas where the Bureau is cost-sharing active geological investigations for regional beach nourishment projects. An example map from the Reconnaissance Offshore Sand Search Database (publicly available at http://ross.urs-tally.com/), is attached. Potential borrow areas must be thoroughly investigated to insure sufficient quantities of sand compatible with the specific receiving beach are available, that hardbottom and seagrass communities can be protected, and that dredging and transport of the available sand can be accomplished economically utilizing the most environmentally sensitive techniques. The proposed pipeline corridors intersect a known area suitable for regional projects. Alternative sources are not known at this time, and may not even be available without significant additional cost. 268

The Bureau is responsible for the management of Florida's beach and dune system as specified in Chapter 161, Florida Statutes, the Beach and Shore Preservation Act, a part of the Florida Coastal Management Program. The Bureau accomplishes this through a statewide beach management plan including

267. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route is described in Section 2.1 and sand resources are discussed in Sections 3.4 and 4.4.

268. In response to public comments the Applicant revised the proposed pipeline route to avoid permitted sand resources. Please see the discussion in Sections 2.1.4.6, 3.3 and 4.3.

data collection and analysis, development and implementation of a Strategic Beach Management Plan (SBMP), cost-sharing in planning and construction of beach management projects and two regulatory programs. The Southwest Gulf Coast Region in the Strategic Beach Management Plan has 96.5 miles of critically eroded beach, 62.9 miles of which are actively maintained and which will require sand resources to nourish periodically in the future. The SBMP calls for restoration and maintenance of the critically eroded shoreline through inlet bypassing and placement of suitable offshore sand. Elimination of known suitable sand sources would cause great expense and delay, possibly subjecting those local communities to increased storm damage, loss of tourism and loss of habitat for threatened and endangered species including marine turtles and shorebirds.

268

We would prefer that the pipeline follow the existing Gulfstream pipeline alignment to minimize the impact of increasing multiple uses of the nearshore waters.

269

We request that Port Dolphin provide all collected geotechnical information in an electronic file suitable for input to the Department's Reconnaissance Offshore Sand Search (ROSS) database. The data may be submitted in Access or gINT files. The MS Access Front End Loader is available on the ROSS website http://ross.urs-tally.com/. Please visit the gINT website http://www.gintsoftware.com/ for downloads necessary for the ROSS data structure. Please include any shapefiles and PDF files suitable for inclusion in ROSS, including but not limited to seismic images with time stamp annotations, seismic tracklines, seismic time stamps, seismic shot points, core locations, and borrow areas.

270

We also have the following comments on the documentation.

1) The Clearinghouse memo dated August 31, 2007, asked for detailed maps depicting the benthic resources in the area of impact. The maps in Volume I of the DEIS depict benthic resources within the full length of the proposed pipeline route. Section 3.2.4 (page 3-33) indicates that the benthic composition of the southern route alternative was similar to the proposed route. However, Figure 2-3.2, among others, does not delineate any hardbottom along the southern route landward of Anna Maria Island compared to extensive hardbottom along the proposed route. If similar resources were indeed found along this stretch of the southern route, please depict them.

271

2) Table 2.1-10 indicates that the proposed and southern routes "avoids mapped resources" of sand, yet Figure 2.3-1 clearly shows that the routes cross over an area designated as "sand resources." Please revise the table and associated text to reflect the interference with sand resource availability. Please discuss why both routes could not be reconfigured to lie north of the potential resources.

272

269. Evaluation of an alternative route parallel to the Gulfstream Pipeline is included in Section 2.1.4.6.

270. This request should be made directly to the Applicant. All publicly available data submitted to USCG is available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.

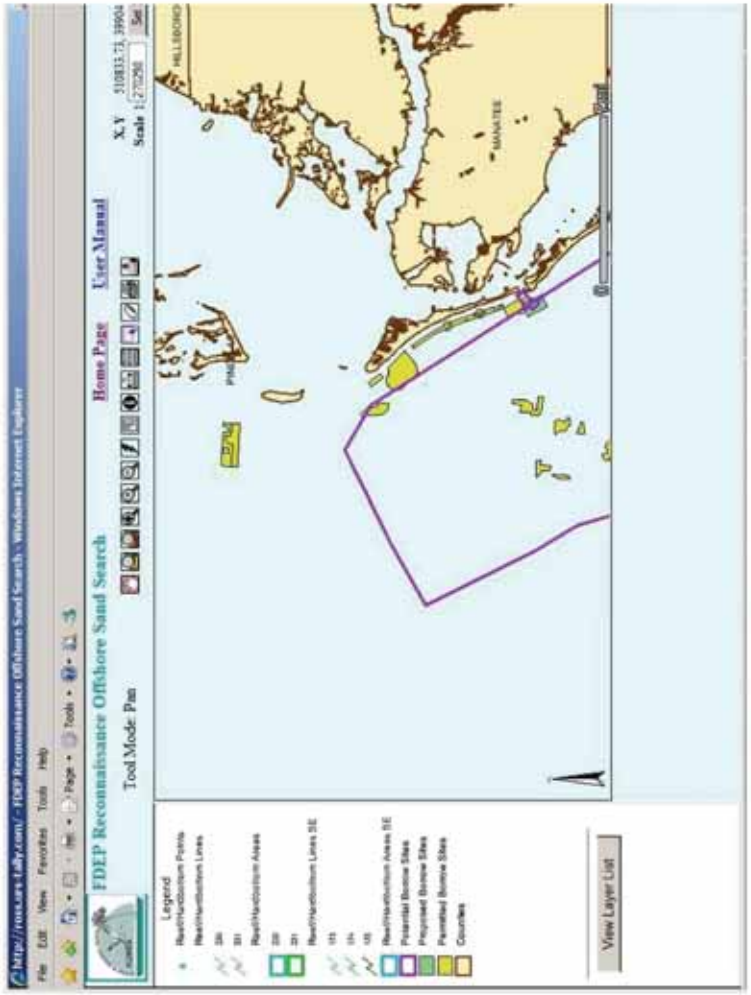
271. Updated detailed maps have been added to the Final EIS.

272. Table revised per comment. Discussion of alternative pipeline routes is included in Section 2.1.4.6.

3) The DEIS notes that directional drilling (HDD) will be used to avoid resources at the land-approach, but would be impractical to utilize for most of the route. However, Section 2.1.1.8 (page 2-26) says "as with the nearshore to onshore transition that the Applicant has proposed to directional drill, some pipeline segments could be installed using direction drillling if particularly sensitive habitat areas would be traversed." Based on the Applicant's benthic survey, please identify the sections that might be considered particularly sensitive and/or help reduce the most substantial portion of impact to exposed hardbottom resources. The results of this analysis could be included in the "Benthic Habitat Impact Mitigation" section on pages 4-139 — 273

4) The Clearinghouse memo dated August 31, 2007, recommends that the DEIS discuss mitigation for unavoidable habitat. The "Benthic Habitat Impact Mitigation" section on page 4-139 discusses minimization and avoidance efforts, but only loosely states that "A Mitigation Plan to compensate for unavoidable impacts on hard bottom would be developed during the permitting process." More specific alternatives should be developed prior to submittal of the permit application, perhaps in conjunction with a pre-application meeting. When eveloping mitigation strategies, be advised that newly exposed hardbottom in the Tampa area may facilitate colonization by the invasive, exotic green mussel, which could reduce or negate the value of some mitigation strategies. — 274

5) References to the Department of Natural Resources should be corrected to the Department of Environmental Protection. — 275



Thank you for the opportunity to comment. Should you have any questions, please do not hesitate to call.

cc. Michael Barnett
Paden Woodruff
Jennifer Koch
Steve MacLeod
Catherine Florko

273. Text revised to clarify. Because hard bottom areas are dispersed along the proposed pipeline route, it would not be practical to use HDD to avoid impacts to hard bottom areas (See Section 4.2.1.6). Construction methods proposed by the applicant have been evaluated based on geotechnical data and impacts to hard bottom areas have been minimized. The values in Section 4.2.1.7 and the BA have been made consistent.

274. If a License is issued by the Maritime Administration and USCG, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies (see Section 4.11). Specific mitigation and monitoring requirements would be developed after a license is issued.

275. Text changed per comment.

To: Kinsey, Shana; Tucker, Debby;
cc: Hoenstine, Ron (FGS); Scott, Thomas;
Subject: RE: SAI#: FL200804184178C -- Port Dolphin LNG Deepwater Port Draft Environmental Impact Statement
Date: Sunday, May 18, 2008 3:53:59 PM

Shana and Debbie,

Here is the FGS staff review of the EIS:

In response to FGS's prior concern for the potential impact of the proposed pipeline route: The draft EIS states that "Minor direct adverse impacts from port and offshore pipeline installation would be expected. Impacts would be localized and short-term. Subsea sediments are the primary geological resource that would be affected by the Project." It also states that "No sensitive geological resources were identified."
"The potential sand source area located to the south of the Tampa Bay Inlet identified as a 'potential borrow site' is based on information derived from an earlier study conducted by the Reconnaissance Offshore Sand Search (ROSS) project (Hatchett et al. 2006). The preferred pipeline route crosses the extreme northern edge of this potential sand resource. Assuming that the northern boundary of the sandy area is precise, the proposed pipeline route 'footprint' would only affect an extremely negligible area when compared with the overall sand harvest areas ..."
Specifically, "The total area of sequestered sand from the Port Dolphin pipeline passing through this potential sand source area was calculated by measuring the length of the route multiplied by a 50 feet wide corridor. This allows for a 25 feet buffer zone on either side of the pipeline, which would be unavailable as a sand resource area for the operating lifetime of the proposed pipeline system. This impact area was determined to be 2,219,650 sq. ft. (50.9 acres). When compared with a total available sand source area of 7,471,689,697 sq. ft. or 171,526 acres, the proposed pipeline route would only impact 0.03% of these potential sand source areas."
They provided the following estimate of the volume of sequestered sediments that potentially could be used for beach restoration, "...395,576 cubic yards of the potential 901,863,600 cubic yards available, or 0.04% of the potential volume available within the entire potential area." These estimates indicate that the volume of beach restoration quality sediments potentially sequestered by the project would be considered "de minimis", i.e. insignificant.
The other FGS issue concerning the impact on potential submarine springs that may be present along the pipeline route was addressed in the EIS in a review of the sub-bottom profiler data. Specifically, the FGS suggested that the investigators look for occurrences that might match or perhaps resemble a panhandle sub-bottom profiler data example of a suspected occurrence the FGS provided. Concerning the possible presence of fresh water submarine springs, the contractor (T. Baker Smith Inc) has stated that an examination of the sub-bottom data shows no evidence supporting the existence of fresh water submarine springs.
While it is not indicated that the investigators revisited the side scan sonar and bathymetric data collected prior to responding to FGS's second set of comments, it is reasonable to assume that any feature potentially associated with a submarine spring evidenced on those data would have been significant enough in areal extent to have been noted in their initial data review and investigated by them at that time.
We have no additional unresolved issues regarding the draft EIS. FGS would request that any additional geological and geophysical data collected in support of the Project be made available for the FGS Data Repository and to be contacted when such data as has been supplied is no longer considered proprietary. 276

276. Comment noted.

Please contact Dr. Ron Hoenstine if you have any questions about the review.

Thanks,

Jon Arthur

Shana,

Thank you for the reminder message. We put together some short comments from the air division and forwarded them to Carla on May 12. I've attached that message with our comments. The division's comments are really just items 1 and 2, with the related attachment to which item 1 refers. Please let me know if you have any questions.

Joe
I was wondering if your section had any comments on the Port Dolphin DEIS. I fyou do I will need the asap. I am trying to put together the letter and it will have to be approved before sending it off to MARAD/Coast Guard.

If you have any questions let me know.
Thanks

Carla,

Attached are comments from DARM on the Dolphin LNG proposal. Basically, we are asking the project's developer to completely evaluate the use of ambient air vaporization, and to consider a pilot project to demonstrate the technology. Are you consolidating regulatory comments to pass on to the Office of Intergovernmental Programs? Please let me or Trina know if you have any questions. Thanks.

Attachments: Mustang - Smart Air Vaporization Presentation_05May08.pdf

Joe,

The CO2 emission projections from the Dolphin project are 900,000 metric tons/ year. We don't have concerns on the BACT proposal.

The email below is an estimate for ambient air vaporization for the Calypso project. We should ask the Dolphin folks about this as well:

1. Attached, please find a presentation about an ambient air vaporization technology called smart air vaporization. This technology appears to be technically feasible. Please evaluate the use of this technology, costs and its impact on air emissions (e.g. NOx, CO and CO2) for this project.

2. Please explain the feasibility of a pilot project for ambient air vaporization. Please provide cost estimates and emission reductions that would be achieved for such a project (e.g. NOx, CO and CO2).

This is the discussion contained in the Dolphin application if you wanted to read it:

AAV technology blows ambient air down through finned tubes that contain LNG to regasify the liquid.

Large surface areas are needed to achieve the required heat transfer rates. Because of space constraints on

SRVs, air vaporization is not technically feasible without supplemental heating in addition to the ambient

air. Supplemental heating would require either open- or closed-loop vaporization, reducing some of the

benefits of using AAV as the vaporization system. The applicant for the Ocean Way Project in California

has proposed to use purpose built vessels called Regasification LNG

Carriers (RLNGCs) that would use

AAV as the principal heat source for vaporization. Each vessel would have AAV modules installed to

supplement heat available from the propulsion and power generation waste heat systems. The AAV and

waste heat recovery would be capable of providing 90 percent of the energy required to vaporize the LNG

at rates comparable to those required for Port Dolphin. Supplemental heating from combustion of boil-off

gas would also be necessary. However, the Ocean Way vessels would be designed for operation at or

near the port site. LNG would be transported from its origination points to the port site in conventional

LNGCs and transferred to the RLNGC. The RLNGC would then moor with an unloading buoy, vaporize,

and send out the natural gas. The RLNGC would be limited to a top speed of 15 knots, and it is not clear

from available information if it would be capable of open ocean crossings during heavy weather

conditions because of the heavy topside structures required to house the AAV modules (OceanWay

2007). The RLNGC has not been commercially proven for applications that require a vessel that can

transport LNG from an overseas liquefaction facility to the port and vaporize the LNG using onboard

equipment. Therefore, air vaporization is not considered further.

Julie.

Here is the cost estimate for the pilot LNG system that we included in the items for mitigation on the Calypso project.

Trina, Sandra, Robert.

This may also relate to the Dolphin application (that I have simply not read) and which requires comment by May 20.

Will need an updated asssessment regarding the feasibility of air varization so Trina/Sandra/Julie will know from whom to collect comments when our Intergovernmental Afaairs people ask for them.

Thanks.

Al.

SENT: Mon 5/5/2008 4:33 PM
TO: Linero, Alvaro; Arif, Syed
CC: Mariott, Carol; Trocquet, Bryan; Franklin, David; Baudat, Ned
SUBJECT: Mustang Smart Air Vaporization Process, SAV

Dear Sayed,

Thank-you for taking our call today. Al Linero and Bryan Trocquet have been trading emails on the idea of a pilot plant test with Mustang's Smart Air Vaporization (SAV) on an offshore LNG FSRU and asked that we respond by mid-May.

As discussed in our telecom a pilot plant test is feasible and the cost for the installed facilities would be on the order of $2 mm. We made this high level

estimate on the following basis:

- 1 each 2-fan air heater unit good for vaporizing 20 mmscfd of LNG
- 1 each vaporizer, shell and tube
- 1 each potassium formate (KF) pump to circulate the KF intermediate fluid
- 1 each KF surge tank

The Mustang Smart Air Vaporization is presently being installed in the Trunkline LNG regas terminal in Lake Charles for a vaporization capacity of 2.1 bcfd. The primary advantage of the SAV is that heat for LNG vaporization is taken from the air which eliminates the need to burn gas for heat and avoids the cost and air emissions associated with that. Attached is a presentation that explains SAV. We have proposed SAV for several floating applications and we know it will work on a LNG FSRU.

We would be pleased to meet with you and explain our technology.

We have a small SAV demonstration plant here in Houston that we have used to test performance over the past few years and have developed confidence that we can predict the SAV behavior for any site onshore or offshore. All we need is the historical air temperature and relative humidity for the location. It is very likely that 100% of the heat of vaporization could be obtained from the air for the Florida east coast and west coast offshore locations.

Please call if we can be of further assistance.

SAV Benefits Summary

- Cost savings over fuel gas burning systems
- Reduces air emissions significantly
- Uses no sea water
- Horsepower requirements comparable to SCV and ORV
- Area requirements comparable to SCV
- Suitable for onshore or offshore facilities
- Condenses moisture from air – dehumidifier, defogger
- Allows for NGL extraction integration and flexible BTU control

RE: Comments on the proposed Port Dolphin Deepwater Port License
Docket # USGC-2007-28532.

The proposed project consists of construction of a deep water port approximately 28 miles offshore from Tampa. Three site and route alternatives are proposed. Offshore activity should not impact Boca Ciega Bay (area# 42) and Lower Tampa Bay (area# 48) conditionally approved shellfish harvesting areas. However, installation of a pipeline within 2 miles of these conditionally approved shellfish areas would be expected. The location of the proposed pipelines is in between Boca Ciega Bay (area# 42) and Lower Tampa Bay (area# 48). The basis for the following comments by the Shellfish Environmental Assessment Section is solely on shellfish classification and management for public health reasons.

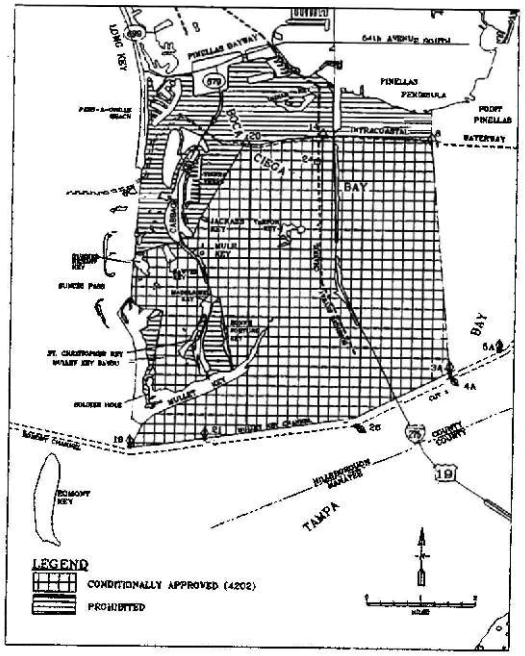
It is stated in the application that short-term and long-term, minor to moderate, direct and indirect, adverse impacts on demersal (i.e. bottom-dwelling) fish and shellfish would occur as a result of seafloor disturbance during the installation of the Port and pipeline. Completion of the dredging operation and installation of pipelines between November and February is preferred, since this will minimize interference with oyster spawning. Construction activities associated with the proposed project could adversely impact water quality in the conditionally approved shellfish harvesting area. 1

Fresh from Florida
Florida Agriculture and Forest Products

1. Construction of the deepwater port components would be expected to take 11 months, with operations planned to commence in the second quarter of 2011. Under this timetable, the months of November through February would be utilized for construction activities, which would include dredging and installation of pipelines. Geophysical investigations, including video photography of the proposed pipeline route, did not reveal any shellfish beds in the vicinity of the proposed route (see Section 4.2). Turbidity modeling confirmed that impacts to benthic communities would be short-term and minor.

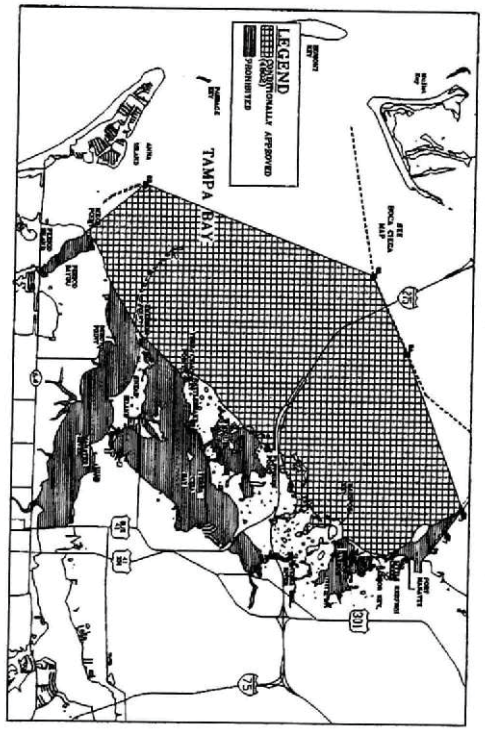
Please specify in the permit that an adequate number of self-contained sanitary facilities are required in upland areas to prevent contamination of nearby conditionally approved waters. Thank you for the opportunity to comment.]-2

Sincerely,



Jill Fleiger
Environmental Specialist II

cc: Chris Brooks



2. FERC would require the contractor to have an Environmental Inspector (EI) as discussed in Section 4.11.3, to monitor water quality during construction. Compliance with state and local sanitary and local sanitary facility regulations would be required.

Commander Mark A. Prescott
Chief, Deepwater Ports Standards Division
U.S. Coast Guard
2100 Second Street, SW
Washington, DC 20593-0001

Dear Commander Prescott:

The Gulf States Marine Fisheries Commission (Commission) has reviewed the Draft Environmental Impact Statement (DEIS) for license application USCG-2006-28532 for the Port Dolphin Energy Liquefied Natural Gas Deepwater Port. Port Dolphin Energy, LLC proposes to construct a permanently moored unloading buoy system with two submersible buoys along with 42 miles of 36-inch diameter pipeline that would connect the deepwater port with the Gulfstream Natural Gas pipeline in Port Manatee, Florida. The deepwater port would be approximately 28 miles west of Tampa, Florida in 100 feet of water. After careful deliberation, the Commission remains concerned over potential impacts such a project will have on marine fish habitat.]-1

The Commission is an organization of the five states whose coastal waters are the Gulf of Mexico. Established in 1949 by state statutes and authorized under Public Law 81-66, the principal objective of the Commission is the conservation, development, and full utilization of the fishery resources of the Gulf of Mexico to provide food, employment, income, and recreation to the people of the United States. Fifteen commissioners, three from each state, work to set Commission policy related to the conservation and management of fisheries resources in the Gulf of Mexico. One of the most important functions of the Commission is to serve as a forum for the discussion of various estuarine and marine problems and to develop a coordinated policy to address those issues for the betterment of these resources and the public that enjoys them.

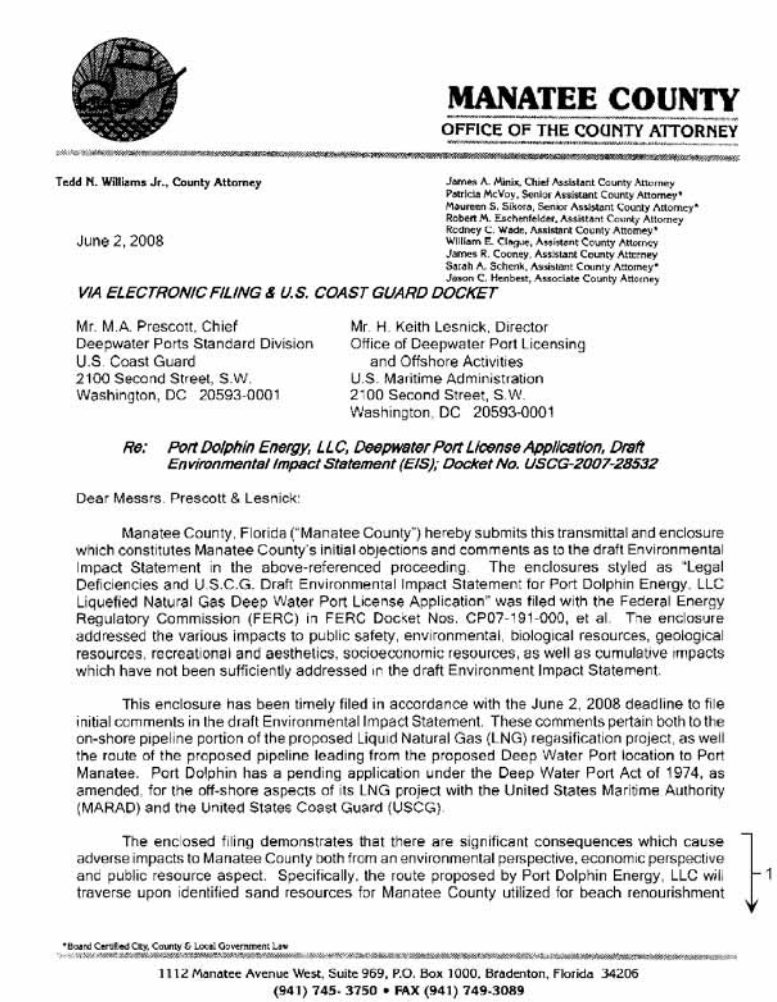
Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately 3 miles. The buoys would

-Alabama- -Florida- -Louisiana- -Mississippi- -Texas-

1. Comment Noted. The EFH discussion has been expanded in Appendix H, and impacts to Essential Fish Habitat are discussed in Final EIS Section 4.2.1.13 and in Section 6.2. The Maritime Administration and USCG would require the Applicant conduct monitoring of impacts with regards to EFH and alter operations to mitigate to predicted level of impacts as discussed in the EIS.

be designed to moor a specialized type of liquefied natural gas (LNG) vessel called a Shuttle and Regasification Vessel. A closed-loop, glycol/water-brine heat transfer system would be used to vaporize the liquefied natural gas (LNG). Over the past several years, the Commission has shown concern over LNG facilities proposing to use seawater as heat source in open loop vaporization systems because of their potential impacts on marine fisheries. The Commission is pleased to see that Port Dolphin Energy, LLC has decided to not use seawater as a heat source for their LNG vaporization system. Impacts to marine fisheries should therefore be reduced. -2

The Commission does have concerns about the proposed pipeline route from the deepwater port into Port Manatee. The applicant's benthic survey of the pipeline route indicated that approximately 2,137 acres of hard bottom or live bottom habitat would be impacted by pipeline installation. The benthic survey also indicates that approximately 195 acres of seagrass were located in the pipeline route near Port Manatee. Hard bottom and seagrass serve as high quality habitat for a variety of commercially and recreationally important species. Therefore, the Commission recommends that all impacts to hard bottom and seagrass habitats resulting from pipeline installation be avoided. If impacts are unavoidable, they should be minimized to the extent practicable and be fully mitigated. Long-term monitoring of all mitigation areas should be required to make sure that the mitigation projects are successful. -3



The Commission appreciates the opportunity to provide comments on the DEIS for the Port Dolphin Energy LNG Deepwater Port. If you have any questions regarding our comments, please do not hesitate to contact us.

Sincerely,

Joe Gill
Commission Chairman

2. Comment noted.

3. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements would be developed after a license is issued.

Re: Port Dolphin Energy, LLC, Deepwater Port License Application, Draft Environmental Impact Statement (EIS); Docket No. USCG-2007-28532

Dear Messrs. Prescott & Lesnick:

Manatee County, Florida ("Manatee County") hereby submits this transmittal and enclosure which constitutes Manatee County's initial objections and comments as to the draft Environmental Impact Statement in the above-referenced proceeding. The enclosures styled as "Legal Deficiencies and U.S.C.G. Draft Environmental Impact Statement for Port Dolphin Energy, LLC Liquefied Natural Gas Deep Water Port License Application" was filed with the Federal Energy Regulatory Commission (FERC) in FERC Docket Nos. CP07-191-000, et al. The enclosure addressed the various impacts to public safety, environmental, biological resources, geological resources, recreational and aesthetics, socioeconomic resources, as well as cumulative impacts which have not been sufficiently addressed in the draft Environment Impact Statement.

This enclosure has been timely filed in accordance with the June 2, 2008 deadline to file initial comments in the draft Environmental Impact Statement. These comments pertain both to the on-shore pipeline portion of the proposed Liquid Natural Gas (LNG) regasification project, as well the route of the proposed pipeline leading from the proposed Deep Water Port location to Port Manatee. Port Dolphin has a pending application under the Deep Water Port Act of 1974, as amended, for the off-shore aspects of its LNG project with the United States Maritime Authority (MARAD) and the United States Coast Guard (USCG).

The enclosed filing demonstrates that there are significant consequences which cause adverse impacts to Manatee County both from an environmental perspective, economic perspective and public resource aspect. Specifically, the route proposed by Port Dolphin Energy, LLC will traverse upon identified sand resources for Manatee County utilized for beach renourishment

1

(941) 745-3750 • FAX (941) 749-3089

1. Alternatives that avoid/reduce impacts on sand resources are discussed in Sections 2.1.4.5 and 2.1.4.6 of the EIS. Impacts from these alternatives are discussed in Sections 4.2.1.6.1, 4.4.1, 4.4.2, 4.5.1, 4.5.2, and 4.9.1.

projects on coastal islands such as Anna Maria Island and specifically public beaches. There are maps attached to the appendix of the enclosure delineating the location of identified mapped sand resources and alternative routes which have not been addressed by Port Dolphin in the draft Environmental Impact Statement. These alternate routes would avoid entirely the identified mapped sand resources and require additional analysis in the draft Environmental Impact Statement. The MARAD/USCG should consider the alternate routes as part of its overall review of the Port Dolphin project and these alternate routes should be addressed in the draft Environmental Impact Statement as required by the National Environmental Policy Act. 1

Manatee County requests that it be served with copies of all communication, notices and issuances associated with the pending proceeding. In this regard, it is requested that such copies be sent to the undersigned:

Sarah A. Schenk, Assistant County Attorney
Manatee County Attorney's Office
1112 Manatee Avenue West, Suite 969

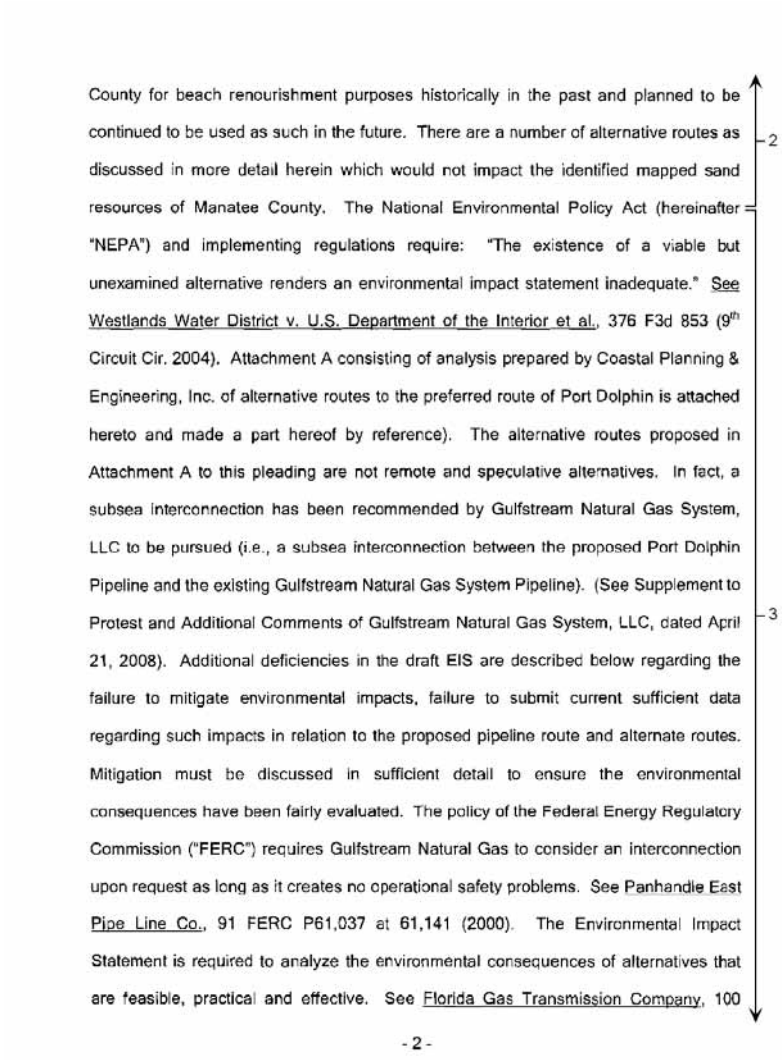
In the Matter of:	§	Docket Nos. CP07-191-000
	§	CP07-191-001
Port Dolphin Energy LLC	§	

LEGAL DEFICIENCIES AND U.S.C.G. DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR PORT DOLPHIN ENERGY, LLC LIQUEFIED NATURAL GAS DEEP WATER PORT LICENSE APPLICATION

Manatee County, Florida ("Manatee County") hereby submits this pleading as comments and list of legal insufficiencies in the United States Coast Guard draft Environmental Impact Statement for Port Dolphin LLC Liquefied Natural Gas Deep Water Port License Application. The draft Environmental Impact Statement (DEIS), dated April 2008, pertains both to the off-shore route of the proposed gas line and deep water port as well as the on-shore route entering Manatee County by way of Port Manatee and terminating at a point on-shore within Manatee County, Florida to interconnect with the existing Gulfstream Natural Gas System Pipeline. Manatee County's comments address both the off-shore and the on-shore portions of the proposed pipeline since they are interdependent.

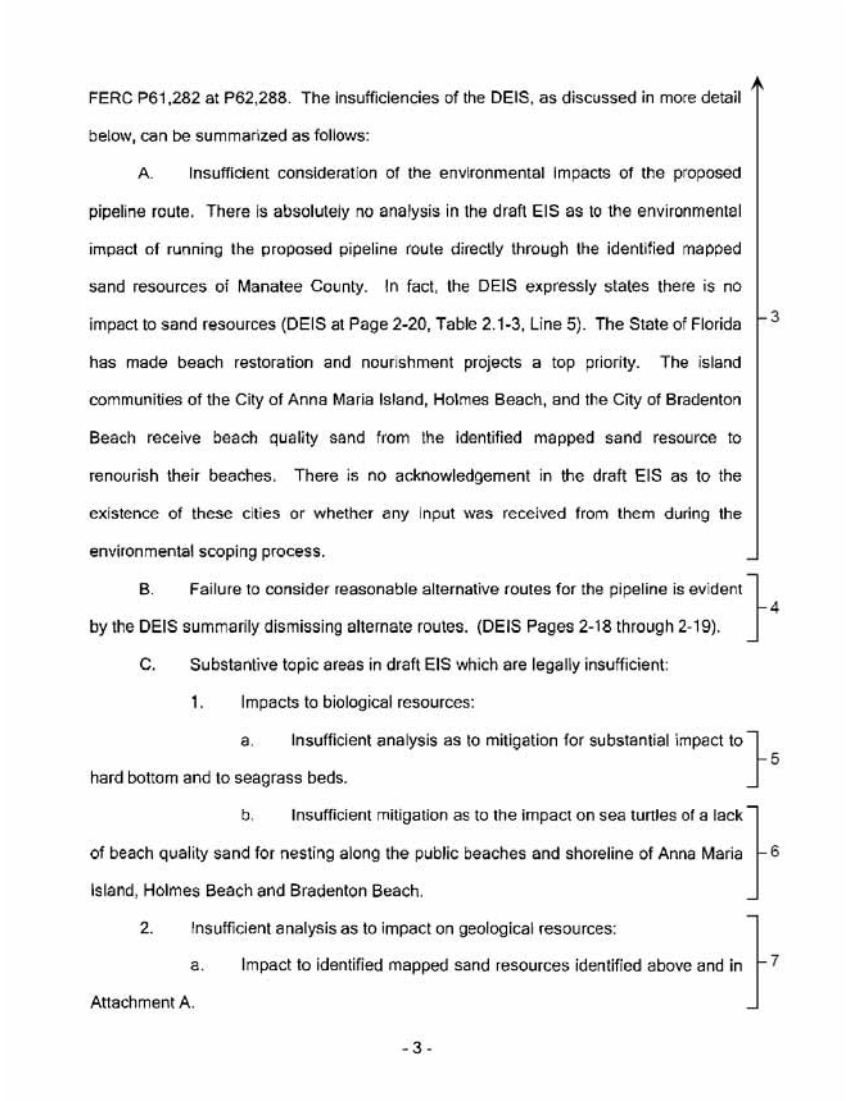


I. **Executive Summary:**

The DEIS is legally insufficient and deficient principally because it fails to address reasonable alternative routes for the pipeline off-shore. Specifically as proposed, the off-shore pipeline route bisects an identified mapped sand resource utilized by Manatee

2

- 1 -



2. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

County for beach renourishment purposes historically in the past and planned to be continued to be used as such in the future. There are a number of alternative routes as discussed in more detail herein which would not impact the identified mapped sand resources of Manatee County. The National Environmental Policy Act (hereinafter "NEPA") and implementing regulations require: "The existence of a viable but unexamined alternative renders an environmental impact statement inadequate." See Westlands Water District v. U.S. Department of the Interior et al., 376 F3d 853 (9th Circuit Cir. 2004). Attachment A consisting of analysis prepared by Coastal Planning & Engineering, Inc. of alternative routes to the preferred route of Port Dolphin is attached hereto and made a part hereof by reference). The alternative routes proposed in Attachment A to this pleading are not remote and speculative alternatives. In fact, a subsea interconnection has been recommended by Gulfstream Natural Gas System, LLC to be pursued (i.e., a subsea interconnection between the proposed Port Dolphin Pipeline and the existing Gulfstream Natural Gas System Pipeline). (See Supplement to Protest and Additional Comments of Gulfstream Natural Gas System, LLC, dated April 21, 2008). Additional deficiencies in the draft EIS are described below regarding the failure to mitigate environmental impacts, failure to submit current sufficient data regarding such impacts in relation to the proposed pipeline route and alternate routes. Mitigation must be discussed in sufficient detail to ensure the environmental consequences have been fairly evaluated. The policy of the Federal Energy Regulatory Commission ("FERC") requires Gulfstream Natural Gas to consider an interconnection upon request as long as it creates no operational safety problems. See Panhandle East Pipe Line Co., 91 FERC P61,037 at 61,141 (2000). The Environmental Impact Statement is required to analyze the environmental consequences of alternatives that are feasible, practical and effective. See Florida Gas Transmission Company, 100

- 2 -

3. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

FERC P61,282 at P62,288. The insufficiencies of the DEIS, as discussed in more detail below, can be summarized as follows:

A. Insufficient consideration of the environmental impacts of the proposed pipeline route. There is absolutely no analysis in the draft EIS as to the environmental impact of running the proposed pipeline route directly through the identified mapped sand resources of Manatee County. In fact, the DEIS expressly states there is no impact to sand resources (DEIS at Page 2-20, Table 2.1-3, Line 5). The State of Florida has made beach restoration and nourishment projects a top priority. The island communities of the City of Anna Maria Island, Holmes Beach, and the City of Bradenton Beach receive beach quality sand from the identified mapped sand resource to renourish their beaches. There is no acknowledgement in the draft EIS as to the existence of these cities or whether any input was received from them during the environmental scoping process. 3

B. Failure to consider reasonable alternative routes for the pipeline is evident by the DEIS summarily dismissing alternate routes. (DEIS Pages 2-18 through 2-19). 4

C. Substantive topic areas in draft EIS which are legally insufficient:

1. Impacts to biological resources:

a. Insufficient analysis as to mitigation for substantial impact to hard bottom and to seagrass beds. 5

b. Insufficient mitigation as to the impact on sea turtles of a lack of beach quality sand for nesting along the public beaches and shoreline of Anna Maria Island, Holmes Beach and Bradenton Beach. 6

2. Insufficient analysis as to impact on geological resources:

a. Impact to identified mapped sand resources identified above and in Attachment A. 7

- 3 -

4. Additional information on the review of alternative pipeline routes has been added to Section 2.1.4.6.

5. Mitigation measures have been added to Section 4.11. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.

6. Mitigation measures have been added to Section 4.11. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.

7. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

3. Insufficient analysis of the impact of a State required buffer between gas pipeline and identified sand resources on beach restoration projects. 8

4. Recreation and aesthetics:

a. No analysis upon impact of lack of lack of beach-quality sand on the beaches resulting in insufficient public beach access. (Refer to map of Anna Maria Island in Appendix B for location of public beaches). 9

5. Lack of analysis of socioeconomic issues and environmental justice concerns:

a. There is no analysis of the economic impact as to the tourism industry if beach quality standards are not maintained such that the quality of the public beaches of the island cities of Holmes Beach, Bradenton Beach and Anna Maria Island are neglected. In fact, the application for the Deep Water Port states there is no economic benefit to the proposed pipeline route to Manatee County. Thus, there is no economic benefit to offset the economic loss to the tourism industry. See amended Application for Deep Water Port, Page E-9 of Volume as follows: "Overall economic benefit to Manatee County would be minor." See Appendix A, Page 33, indicating estimated cost increase for beach renourishment due to running the pipeline route through Manatee County's identified mapped sand resource estimated to be approximately $38 million to $53.2 million. The cost benefit analysis of the proposed pipeline route versus impact to identified mapped sand resources is clearly weighted against Manatee County and its island cities of Anna Marie, Holmes Beach and Bradenton Beach. 10

6. Cumulative impacts ignored in DEIS:

a. There is no "avoidance" analysis and no plausible options for mitigation of lost identified mapped sand resource. 11

- 4 -

8. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

9. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

10. This is outside the scope of the EIS. The Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

11. This is outside the scope of the EIS. The Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

7. Adverse affect to public safety not analyzed in draft EIS:

a. Gulfstream Natural Gas System raises in its responsive pleading, dated April 21, 2008, public safety issues regarding the close proximity of the on-shore pipeline route to the existing Gulfstream Pipeline in Manatee County. Insufficient analysis of the impacts upon the existing utility lines in close proximity to the proposed pipeline route. 12

b. Insufficient analysis for homeland security issues cited in more detail herein. 13

8. The on-shore pipeline route within Manatee County lacks the following analysis in the DEIS:

a. Environmental Impact: No seagrass mitigation is proposed; no wetland mitigation is proposed; the Coastal Element in the Manatee County Comprehensive Plan is ignored; Issues are raised regarding passing a pipeline route beneath the existing FP&L tank farm. No mitigation to hard bottom impact and benethic mitigation. Seabird nesting impacts and impacts upon Bean Point are ignored. 14

b. Transportation Issues: There are transportation issues not addressed in the DEIS regarding the close proximity of proposed pipeline route of Port Dolphin to planned improvements to roads within both the boundaries of Port Manatee and outside the boundaries of Port Manatee within Manatee County as further detailed herein. 15

c. Local permits required for Manatee County for the on-shore portion of the route are ignored. 16

II. BACKGROUND:

A. In regard to the Amended Application filed by Port Dolphin on January 18, 2008, Manatee County filed a Motion to Intervene in the FERC proceeding on February

- 5 -

12. Comment noted. Pipeline safety for construction and operations is discussed in Section 5. FERC and PHSMA would require the pipeline be constructed and operated in a manner that meets Federal regulations for pipeline safety.

13. See responses to detailed comments.

14. Mitigation measures have been added to Section 4.11. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.

15. See responses to detailed comments.

16. All local ordinances would be compiled with by the Applicant if a license is issued.

21, 2008. Manatee County had previously filed a Motion to Intervene in Docket Nos. CP07-191-000 and CP07-192-000 on May 30, 2007. The Manatee County Port Authority ("Port Authority") is a dependent Special District of the State of Florida, and has filed a Motion to Intervene in these proceedings on February 27, 2008 and is represented by separate legal counsel. On February 4, 2008, the Commission issued its request for scoping comments regarding environmental issues and established a comment deadline of March 5, 2008. Manatee County submitted substantive scoping comments on the Amended Application in the FERC proceeding on March 4, 2008. Manatee County's scoping comments raised environmental issues known to Manatee County at the time of filing the comments and the pleading expressly stated: "The comments in Exhibit A are limited to the proposed on-shore pipeline and related facilities and are based upon a preliminary review of the Amended Application submitted within the limited period of time allowed for comment."

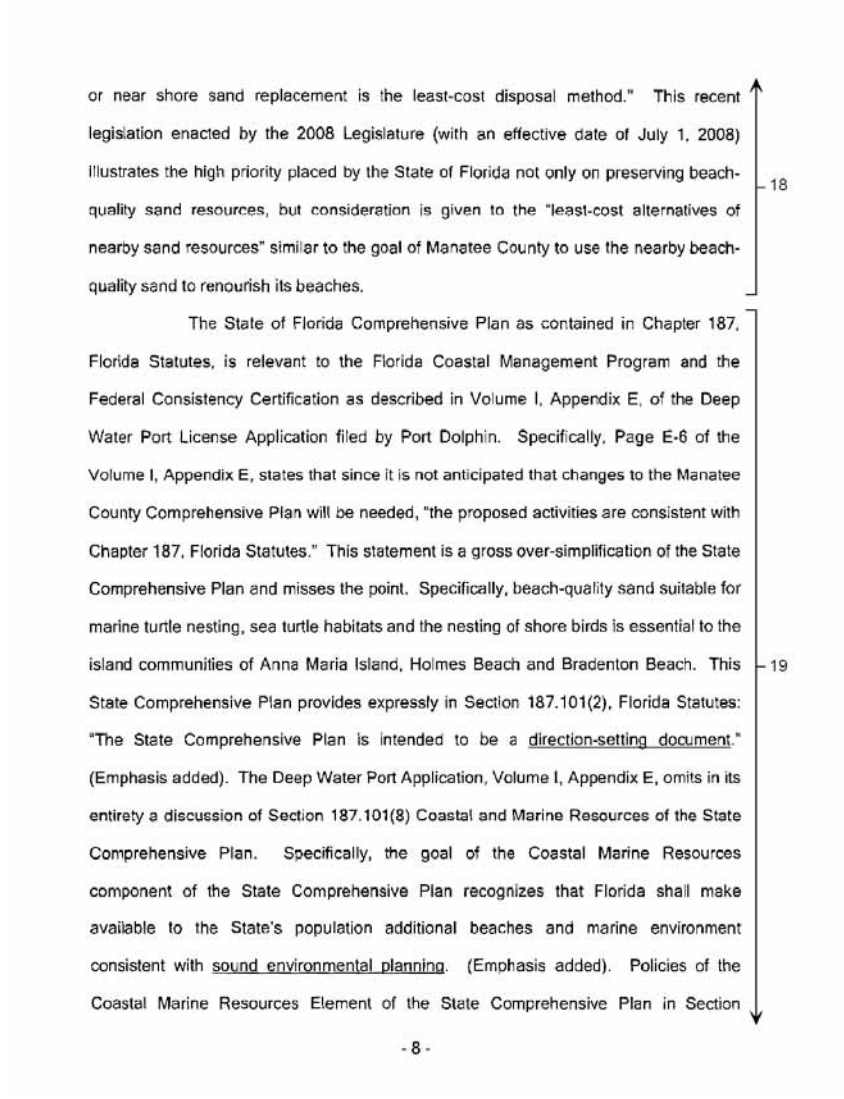
III. INSUFFICIENCIES OF THE DRAFT ENVIRONMENTAL IMPACT STATEMENT REGARDING THE OFF-SHORE PORTION OF THE PROPOSED PORT DOLPHIN PIPELINE ROUTE:

A. Port Dolphin's preferred route for its natural gas pipeline runs directly through the ideal sand source which supports the current and future beach nourishment projects of Anna Maria Island. A significant volume of beach compatible sands will become permanently unavailable for future beach nourishment projects dependent upon the size of the required buffer zone to protect the gas pipeline. 17

Manatee County does not dispute the Purpose and Need set forth in the DEIS on Pages ES-2 and ES-3 expressly stating that the Purpose is to "provide a reliable and timely supply of natural gas to increase energy diversity while considering impacts on the environment and serve the growing demand for natural gas, residential,

- 6 -

17. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.



industrial and electric generation within West-Central Florida." The Need statement is summarized in the DEIS on Page ES-3 as: "The Port Dolphin Project will provide a source of natural gas to Western Florida that is independent of both the Gulf of Mexico supply disruptions and the pipeline constraints of existing interstate pipelines."

However, as stated in All Indian Pueblo Council v. United States of America 975 F.2d 1437 at 1444 (10th Cir.): "The discussion of alternatives that Section 42 U.S.C. 4332(2)(C)(iii) requires is 'the heart of the environmental impact statement.' " NEPA requires a "detailed" EIS to "ensure that each agency decision maker has before him and takes into proper account all possible approaches to a particular project (including total abandonment of the project) which would alter the environmental impact and the cost-benefit balance." Calvert Cliffs' Coordinating Comm. Inc. v. U.S. Atomic Energy Comm'n. 449 F.2d 1109. "As another court observed, [i]t is absolutely essential to the NEPA process that the decisionmaker be provided with a detailed and careful analysis of the relative environmental merits and demerits of the proposed action and possible alternatives, a requirement that we have characterized as 'the linch-pin of the entire impact statement.' " 17

Legislation recently enacted by the 2008 Legislature (CS/HB-1427) states a legislative public policy in Section 161.142, Florida Statutes, to "ensure that beach-quality sand is placed on adjacent eroding beaches" when referring to the interference with the natural drift of sand interrupted or altered by inlets. The Legislative goal is stated: "To extend the life of proximate beach-restoration projects so that periodic nourishment is needed less frequently." CS/HB-1427 further creates Section 163.142(5), Florida Statutes, to state: "The State recognizes that due to the growing demand for beach-quality sand resources for beach restoration and nourishment projects, the limited supply of such sand resources and the cost of such projects, beach 18

- 7 -

18. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

or near shore sand replacement is the least-cost disposal method." This recent legislation enacted by the 2008 Legislature (with an effective date of July 1, 2008) illustrates the high priority placed by the State of Florida not only on preserving beach-quality sand resources, but consideration is given to the "least-cost alternatives of nearby sand resources" similar to the goal of Manatee County to use the nearby beach-quality sand to renourish its beaches. 18

The State of Florida Comprehensive Plan as contained in Chapter 187, Florida Statutes, is relevant to the Florida Coastal Management Program and the Federal Consistency Certification as described in Volume I, Appendix E, of the Deep Water Port License Application filed by Port Dolphin. Specifically, Page E-6 of the Volume I, Appendix E, states that since it is not anticipated that changes to the Manatee County Comprehensive Plan will be needed, "the proposed activities are consistent with Chapter 187, Florida Statutes." This statement is a gross over-simplification of the State Comprehensive Plan and misses the point. Specifically, beach-quality sand suitable for marine turtle nesting, sea turtle habitats and the nesting of shore birds is essential to the island communities of Anna Maria Island, Holmes Beach and Bradenton Beach. This 19
State Comprehensive Plan provides expressly in Section 187.101(2), Florida Statutes: "The State Comprehensive Plan is intended to be a direction-setting document." (Emphasis added). The Deep Water Port Application, Volume I, Appendix E, omits in its entirety a discussion of Section 187.101(8) Coastal and Marine Resources of the State Comprehensive Plan. Specifically, the goal of the Coastal Marine Resources component of the State Comprehensive Plan recognizes that Florida shall make available to the State's population additional beaches and marine environment consistent with sound environmental planning. (Emphasis added). Policies of the Coastal Marine Resources Element of the State Comprehensive Plan in Section

- 8 -

19. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

187.101(8)(b)(6), Florida Statutes, provide: "Encourage land and water uses which are compatible with the protection of sensitive coastal resources" and in Subparagraph (8): "Avoid the exploration and development of mineral resources which threaten marine aquatic and estuarine resources."

Additional policies in the Natural Systems and Recreational Lands component of the State Comprehensive Plan (Section 187.101(9)), Florida Statutes, provides: "Conserve forests, wetlands, fish, marine life, and wildlife to maintain their environmental, economic, aesthetic and recreational values." Section 187.101(9)(b)(6), Florida Statutes, Natural Systems and Recreational Lands, also refers to the importance of erosion control.

The Manatee County Comprehensive Plan, Coastal Element, Policy 4.4.2.5 provides: "Minimize the disturbance of natural shore line resources that provides shore line stabilization and protect landward areas from the affects of storm events." 19
The impact to the sole identified mapped sand resource of Manatee County to nourish the beaches of Anna Maria Island, Holmes Beach and Bradenton Beach needs to be addressed in the context of the above-cited goals and policies of the Florida Legislature, the State Comprehensive Plan and the Manatee County Comprehensive Plan. This is particularly important because the Governor of an adjacent coastal state, in this instance the State of Florida, will be relying upon the analysis performed by the Florida Department of Environmental Protection (FDEP) as to consistency with the Florida Coastal Management Program. The analysis prepared by Coastal Planning Engineering, Inc., entitled: "Potential Impacts of the Port Dolphin Pipeline on the Manatee County Shore-Protection Program, dated May 29, 2008, is labeled Attachment A. Figures 1 and 2 of Attachment A delineate the boundaries of the historic Anna Maria Island Borrow areas and illustrate how the proposed Port Dolphin Pipeline route (noted

in black on the maps) bifurcates the sand resources. This is especially true when the possible buffers of 1,000 foot safety buffer and 1,000 meter safety buffers are indicated on Figures 1 and 2. Attachment B provides a larger map of the island of Anna Maria with specific locations of Coquina Public Beach, the City of Bradenton Beach, Manatee County Public Beach, the City of Holmes Beach, the City of Anna Maria, Bayfront Park, Bean Point and Bradenton Beach City Pier. The unique geographic location of these beaches and island communities, in close proximity to each other, make it cost effective to share the same nearby beach compatible sand resource. 19

IV. The DEIS is insufficient and legally deficient due to its lack of analysis regarding alternate routes having less of an environmental impact on identified sand resources than the proposed pipeline route:

The Coastal Planning & Engineering Report, at Attachment A, Page 4, states there are at least 4 possible alternate routes for the proposed pipeline to travel subsea toward Port Manatee. All of these viable pipeline route alternatives are available with no impact (direct or cumulative) to the beach-compatible mineral resources off Anna Maria Island utilized by Manatee County's Shore Protection Program. A more detailed analysis of the alternatives described on Page 4 of Attachment A need to be addressed 20

in the DEIS. One option would be to require a second DEIS be prepared such that all concerned members of the public, the island communities of Anna Maria Island, Holmes Beach and Bradenton Beach, in Manatee County, Longboat Key and environmental organizations could all review and comment on all of the alternative routes being considered. Transparency and public comments are at the heart of the requirements of the National Environmental Protection Act (NEPA) and are vital to preserve the integrity of the process. It should be noted that the Board of County Commissioners in Manatee County have not taken a position as to which of these alternate routes are preferred as 21

- 10 -

20. Additional off shore pipeline route alternatives have been analyzed in Section 2.1.4 of the Final EIS.

21. Comment noted.

that determination would need to await the detailed data and analysis required to be submitted by Port Dolphin in a supplemental draft of the Environmental Impact Statement. At least one of the viable alternatives, consisting of a subsea connection to the existing Gulfstream Natural Pipeline, has been supported as an alternate route in pleadings filed by Gulfstream Natural Gasline, LLC.

Maps of these detailed alternate routes are contained in Attachment A, report prepared by Coastal Planning & Engineering, as Figure 3, and are labeled respectively: 21

1. Potential Alternative: Co-locate with Gulfstream;
2. Potential Alternative: Tap into Gulfstream;
3. Potential Alternative: Straight into Southwest Passage;
4. Potential Alternative: Deviate to Section of Northern Alternate.

The four alternative routes detailed in Attachment A, report of Coastal Planning & Engineering, Inc. are overlooked in the DEIS, a fatal legal flaw in the process. See All Indian Pueblo Council, 975 F2d 1437, 1444.

V. The DEIS is insufficient as to its analysis of the environmental impacts of the proposed pipeline route both off-shore and on-shore as to biological resources:

A. Based on the results of the geotechnical survey detailed in Volume I, Appendix E, of the Deep Water Port License Application, there are benthic communities present along the pipeline corridor. Volume I, Appendix E, of the Deep Water Port License Application states at Page E-10 that it was determined that 36.5% of the seafloor area was classified as hard/live bottom. At Page E-10, Line1, Appendix E, the Deep Water Port Application states there would be long-term impacts to approximately 55.91 acres of benthic habitat along the pipeline route as a result of the pipeline construction. There is no discussion in the DEIS as to what the methods are to avoid impacting hard bottom/benthic communities. There is no discussion in the DEIS as to a 22 23

- 11 -

22. Comment noted. Geotechnical information has been added to the discussion of the EIS. The Applicant would bury the pipeline under concrete mattresses in hard bottom areas resulting in a net increase of hardbottom habitat.

23. Mitigation measures have been added to Section 4.11. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.

mitigation plan regarding the impact to the hard bottom. If such impacts to the hard bottom are unavoidable, what is the minimization plan to minimize the impacts? A plan to mitigate needs to be described in detail and the mitigation alternatives evaluated in the draft EIS. These issues regarding benthic habitat assessments, mitigation and monitoring plans and the technological feasibility of using horizontal directional drill as a construction technique regarding these communities are appropriately raised by the Florida Department of Environmental Protection by way of letter filed in the Coast Guard docket in this case, dated May 20, 2008. 23

B. Impacts to seagrasses near the shore of Port Manatee need to be addressed in the DEIS. Detailed maps need to be prepared that demonstrate the location of the impact of seagrasses both with respect to areas previously enhanced , preserved or restored either by the Port Authority or Gulfstream Natural Gas, LLC as valuable seagrass mitigation areas nearing the area where the proposed pipeline route enters Port Manatee. If there is impact to the seagrass mitigation areas, what alternatives are proposed by Port Dolphin to mitigate seagrass impact? These issues need to be addressed in the DEIS as part of an analysis of the proposed pipeline route, particularly if the preferred alternative route of Port Dolphin is pursued as a separate pipeline entering Port Manatee in lieu of a subsea tie into the existing Gulfstream pipeline. 24

C. Impacts to wetland areas on-shore within Manatee County with particular reference to an area running north and south to the west of US41, along the proposed on-shore pipeline route. Is there an avoidance plan as to these wetlands? Is there wetland mitigation proposed? These issues need data and analysis in the DEIS. 25

D. Page E-10, Volume I, Appendix E, of the Deep Water Port License Application states that: "It is expected that the sound produced from the proposed Port 26

- 12 -

24. Impacts to seagrass are discussed in Section 4.2 of the EIS. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.

25. Wetland impacts are discussed in Section 4.2 of the EIS. Mitigation measures have been added to Section 4.11. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.

26. Noise impacts to marine species are addressed in Section 4.2 of the EIS.

Dolphin Energy, LLC Project would likely pose no acoustic impacts to marine mammals." However, the draft DEIS states that there are no specific data on ambient underwater sound levels for the area of the proposed port and pipeline route. (DEIS at Page 3-111). The DEIS needs to address the fact that marine mammals and many fishes are highly dependent on sound for communication, navigation, foraging and predatory avoidance. The DEIS should address the on-going studies by the NOAA National Marine Fisheries Service to help develop a global monitoring network for ocean noise. The DEIS should address the monitoring of the noise budget within this urbanized highly productive ecosystem.[1] 26

E. Hard bottom and seagrasses serve as high quality habitat for a variety of commercially and recreational important species. A compensatory mitigation plan for impacts due to hard bottom marine habitats should include elements such as those noted by comments submitted in this proceeding by the Gulf of Mexico Fishery Management Council.[2] These mitigation measures include materials and methods to be used to achieve intended mitigation and a comprehensive monitoring schedule with contingency plans if the proposed mitigation fails. 27

F. Impacts to geological resources are insufficiently analyzed by data analysis in the DEIS. See Attachment A, report prepared by Coastal Planning & Engineering, Inc. regarding impact on the geological resources of identified mapped sand resources for Manatee County and a required buffer area around the pipeline. 28

V. Recreational and aesthetic impacts as well as socioeconomic issues are insufficiently addressed by the DEIS.

[1] NOAA National Marine Fisheries Service "Researches to Develop Ocean Sensory 'Noise Budget' to Evaluate Potential Impact of Marine Mammals" Press Release dated April 1, 2008 a copy attached hereto as Attachment C for reference.

[2] See letter dated May 28, 2008 from the Gulf of Mexico Fishery Management Council to Commander Prescott.

- 13 -

27. Mitigation measures have been added to Section 4.11. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.

28. Comment noted. Project alternatives are discussed in detail in Sections 2 of the EIS.

A. As noted in Attachment A (Page 26) of the report by Coastal Planning & Engineering, Inc., the public park system of Manatee County includes the beach front on Anna Maria Island known as Cortez Beach Park, Coquina Beach Park, Manatee Beach Park and Bayfront Park. All these parks provide public access to the beach without being walled off by tall buildings. This is a unique characteristic within the State of Florida given the high growth the State has experienced along its coastal shores. To supplement statements made in Attachment A, the public beach access is important not only as a major recreational and economic engine for Manatee County and the State of Florida, but also serves as an important free recreational resource. Specifically, the DEIS is required to address socioeconomic issues and environmental justice issues. This free public beach access provided on Anna Maria Island would be adversely impacted if the sand were permitted to be eroded. The negative impact created is not only as to the tourism industry, but disproportionately affects those of limited income who cannot afford the cost to travel to distant recreational establishments and the expense of admission fees. Free public recreation is a public service provided by Manatee County and would be negatively impacted by the loss of public beach sand. There are over 100 separate public beach access points not counting the park system on Anna Maria alone.[3] 29

VI. **Public Safety Impacts:**

A. The DEIS does not address, with sufficient data and analysis, public safety impacts as described below. The DEIS does not contain plans to address hurricanes commonly experienced in Florida during the six month hurricane season, as well as potential hazards caused by high winds, squalls, tornadoes, extreme waves, extreme currents, tsunami, extreme heat, high humidity and lightening. To address potential 30

[3] See Attachment, Report of Coastal Planning & Engineering, Inc., Pages 26-27.

- 14 -

29. Socioeconomic impacts, including environmental justice issues, are addressed in Section 4.9 of the EIS.

30. Extreme weather conditions were discussed in Phase I Risk assessment and mitigation measures would be addressed in Phase II Risk Assessment. Operations manual, which would be developed and approved by the USCG if a license is issued, specifies the limiting wave, wind and current conditions under which the operation would take place. There will be continuous weather monitoring. In case of hurricanes, the operation would be stopped and the LNGC would be moved to open sea.

significant public safety impact, the DEIS should be revised to evaluate a potential impact associated with all credible events. The DEIS should identify all feasible mitigation measures. This analysis should include the potential for island flooding and impact upon hurricane emergency evacuation routes due to eroded beaches on the island communities within Anna Maria. 30

B. Any additional expenses that Manatee County could be anticipated to incur in the future regarding additional security necessary for the Port Dolphin Pipeline or LNG vessels serving in the Deep Water Port entering the vicinity of Manatee County should be detailed in the DEIS in light of recent Federal proposed legislation and Congressional reports.[4] It should be expressly stated in the DEIS that any unfunded mandate by Federal or State governments to provide security for the liquefied natural gas facilities shall be the sole financial responsibility of Port Dolphin. 31

VII. On-Shore Pipeline Route:

A. Environmental Impacts: Seagrass mitigation areas impacted must be delineated on an appropriate map and mitigation of any impacts detailed in the mitigation plan. 32

1. Detailed plans need to be submitted to Manatee County regarding the safety aspects and logistics of running the on-shore pipeline route under the existing FP&L tank farm. 33

2. A detailed analysis of the impact of locating the proposed pipeline route in close proximity to the northern terminus of Bean Point, on Anna Maria Island, 34

[4] H.R.2830, Section 721 through Section 723 regarding State and local law enforcement augmentation of Coast Guard resources with respect to security zones in United States ports for proposed waterside liquefied natural gas facilities. Also see Congressional Research Report entitled CRS Report for Congress Liquefied Natural Gas (LNG) Infrastructure Security: Issues for Congress, updated March 25, 2008 prepared by the Congressional Research Service and filed in these proceedings by Representative Kathy Castor.

- 15 -

31. If a License is issued by the Maritime Administration, the USCG would require development and approval of an Operations Manual that would include security provisions (facility security plan). The plan would be coordinated with Federal, state and local officials responsible for enforcement or response.

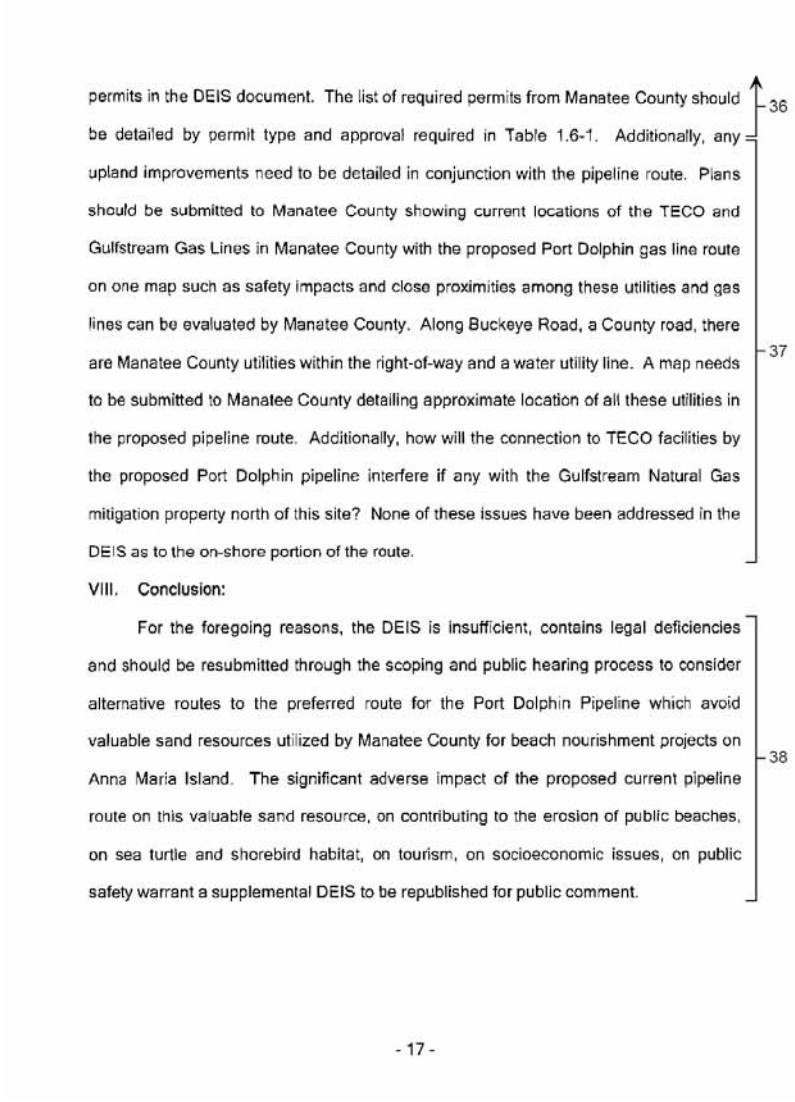
32. Impacts to seagrass are discussed in Section 4.2 of the EIS.

33. As described in the application, the pipeline will not run under the FP&L tank farm. It will run along the edge of the property that contains the tank farm.

34. Impacts to navigation and bird nesting due to construction activities are discussed in Sections 4.10 and 4.2 respectively.

needs to be detailed including impacts on navigation and bird nesting during construction of the pipeline. 34

B. Transportation Impacts within Manatee County:



1. There are potential impacts to roads which have future widening plans both within Port Manatee and outside the boundaries of Port Manatee within Manatee County. Specifically, the future widening of Buckeye Road to a four-lane configuration as a collector road is contained in the Manatee County Comprehensive Plan (see attached Attachment D). As a County road along which the proposed on-shore pipeline route runs, Buckeye Road is planned to be widened under the Manatee County Comprehensive Plan and such widening would be hampered if the on-shore pipeline route proposed by Port Dolphin would need to be relocated at the time of road widening. Within the boundaries of Port Manatee immediately south of South Dock Street, there are potential road improvement plans regarding a new southern road running south of South Dock Street which may be impacted by the location of the proposed pipeline route of Port Dolphin. Details and plans need to be submitted to Manatee County outlining how the new road and the pipeline route can coexist. The legal status of whether South Dock Street is a public or private road is questionable at this time. Port Dolphin should describe how they intend to acquire the right to use South Dock Street. 35

C. Local permits required such as an administrative permit, site plan, right-of-way use permit from FDOT (Florida Department of Transportation) and right-of-way use permit from Manatee County for County roads need to be listed as required permits. Any approvals required from the CSX Railroad to locate the pipeline within their right-of-way need to be detailed as required permits. The above list is not meant to be exhaustive of all local permits required but is illustrative of the omission of any local 36

- 16 -

35. If a license is issued, the applicant will ensure all local ordinances would be complied with.

36. Section 1.6 of the EIS states, "It is the Applicant's responsibility to provide the permitting agency with the information necessary to determine the applicable requirements, in a timely manner." The EIS provides a representative sampling of the significant permits required for the project.

permits in the DEIS document. The list of required permits from Manatee County should be detailed by permit type and approval required in Table 1.6-1. Additionally, any upland improvements need to be detailed in conjunction with the pipeline route. Plans should be submitted to Manatee County showing current locations of the TECO and Gulfstream Gas Lines in Manatee County with the proposed Port Dolphin gas line route on one map such as safety impacts and close proximities among these utilities and gas lines can be evaluated by Manatee County. Along Buckeye Road, a County road, there are Manatee County utilities within the right-of-way and a water utility line. A map needs to be submitted to Manatee County detailing approximate location of all these utilities in the proposed pipeline route. Additionally, how will the connection to TECO facilities by the proposed Port Dolphin pipeline interfere if any with the Gulfstream Natural Gas mitigation property north of this site? None of these issues have been addressed in the DEIS as to the on-shore portion of the route.

VIII. Conclusion:

For the foregoing reasons, the DEIS is insufficient, contains legal deficiencies and should be resubmitted through the scoping and public hearing process to consider alternative routes to the preferred route for the Port Dolphin Pipeline which avoid valuable sand resources utilized by Manatee County for beach nourishment projects on Anna Maria Island. The significant adverse impact of the proposed current pipeline route on this valuable sand resource, on contributing to the erosion of public beaches, on sea turtle and shorebird habitat, on tourism, on socioeconomic issues, on public safety warrant a supplemental DEIS to be republished for public comment.

- 17 -

37. Section 1.6 of the EIS states, "It is the Applicant's responsibility to provide the permitting agency with the information necessary to determine the applicable requirements, in a timely manner." The EIS provides a representative sampling of the significant permits required for the project.

38. Alternatives that avoid/reduce impacts on sand resources are discussed in Sections 2.1.4.5 and 2.1.4.6 of the EIS. Impacts from these alternatives are discussed in Sections 4.2.1.6.1, 4.4.1, 4.4.2, 4.5.1, 4.5.2, and 4.9.1.

Respectfully submitted,

MANATEE COUNTY, FLORIDA

Bradenton, Florida 34206

Dear Sarah,

The following document represents the technical comments prepared by Coastal Planning & Engineering (CPE) on behalf of Manatee County for the Port Dolphin Draft Environmental Impact Statement (DEIS) issued on April 18, 2008. This DEIS was prepared for, and submitted as part of the Department of Transportation docket number USCG-2007-28532 and the Federal Energy Regulatory Commission document numbers CP07-191 and CP07-192. These dockets represent the Federal review process for the Deepwater Port Application submitted by Port Dolphin LLC on March 29, 2007.

The following comments were prepared by CPE at the request of Manatee County. CPE has been the consulting Coastal Engineering firm for Manatee County for the last 20 years, and as such, has assisted the County in the design, administration, and implementation of their shore-protection program. These comments detail direct and cumulative impacts of the proposed Port Dolphin offshore pipeline to nearshore beach-compatible sand resources that Manatee County relies on for ongoing beach-nourishment projects on Anna Maria Island.

These comments were prepared under close coordination with Manatee County, and are submitted to you for inclusion in Manatee County's official June 2nd public comment submittal to the above mentioned Federal dockets. Please feel free to contact me with any questions or comments.

Sincerely,

COASTAL PLANNING & ENGINEERING, INC.,

Richard H. Spadoni
Senior Vice President

POTENTIAL IMPACTS OF THE PORT DOLPHIN PIPELINE ON THE MANATEE COUNTY SHORE-PROTECTION PROGRAM: COUNTY COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STAEMENT ON THE PORT DOLPHIN LLC DEEPWATER PORT LICENSE APPLICATION

EXECUTIVE SUMMARY

On March 29, 2007, Port Dolphin LLC submitted to the United States Coast Guard and the Maritime Administration an application for a Deepwater Port License. The proposed port would be a liquid natural gas re-gasification and offloading facility located approximately 28 miles offshore Anna Maria Island/Manatee County. As proposed, this facility would then be connected to Port Manatee via a subsea pipeline. On April 18, 2008 the United States Coast Guard and the Maritime Administration issued a Draft Environmental Impact Statement on the proposed Port Dolphin Project. The document is currently available for public comment, with comments due by June 2, 2008. The following information presented by Manatee County summarizes both the Manatee County Shore Protection Program and the potential impacts the proposed Port Dolphin Project would have on the viability of those program.

Manatee County manages an active shore-protection program for the entire coast of Anna Maria Island. This program is funded through the Tourist Development Council "Bed Tax" which is supported by the extensive tourism industry of Manatee County. The tourism industry, in turn, is highly dependent on the beaches within Manatee County, including those of Anna Maria Island. However, the beaches of Anna Maria Island are eroding and require maintenance through implementation of a comprehensive beach nourishment program. The shore-protection program relies on a proven, existing, native, white, beach-compatible Gulf of Mexico sand resource located off the northwestern tip of Anna Maria Island as the ideal sand source for beach nourishment. The high similarity of this sand source with the native beach, coupled with its proximity to the project area, makes it an invaluable resource ideally suited for the geologic, biologic, and recreational needs of Anna Maria Island's white sandy beaches. In addition, it is these white sandy beaches that support the tourism driven economy of Anna Maria Island, Manatee County, and the State of Florida.

The Manatee County shore-protection program, and ultimately the beaches of Anna Maria Island, is in jeopardy due to the proposed location of Port Dolphin LLC's preferred and southern alternative routes for the Port Dolphin natural gas pipeline. This pipeline is proposed to be built directly through the ideal sand source that supports the current and future beach nourishment projects of Anna Maria Island. The pipeline, as well as a large buffer zone which must be established along either side of the pipeline route, greatly impact sand available for the Anna Maria Island Shore Protection Program. Extraction of sand by dredging would be prohibited in the buffer zone effectively eliminating the sand for future beach nourishment use. Direct impacts to this sand resource revolve around the fact that a significant volume of these beach-compatible sands will become permanently unavailable for future beach nourishment projects depending on the extent of the required buffer zone which is provided to protect the gas pipeline. This direct impact, while extreme by itself, would lead to significant cumulative impacts to the economy, public safety and the environment of Manatee County and Anna Maria Island.

If the beach-compatible sand source is impacted by the construction of the pipeline and an associated safety buffer of up to 1,000 meters, significant programmatic issues would arise. Specifically, if the nearby beach-compatible sand resource is impacted by removing up to 8,500,000 cy of ideal, beach-compatible material, the County may be forced to explore other as yet unknown sand resources. Assuming such high quality resources can be found, these resources will assuredly occur further away from the project area, causing the County to abandon its current, efficient cutterhead dredge construction model for the less efficient and more costly hopper dredge construction model. If this was to occur, the costs of future beach nourishment projects would increase substantially, up to a potential increase of $53,200,000 over forty years, depending on the final safety buffer imposed around the pipeline. A cost increase of this magnitude will likely not be sustained by the Bed Tax alone, meaning that Manatee County will need an alternative funding source, a very difficult proposition.

A reduced or eliminated shore-protection program would result in the erosion of Anna Maria Island's white sandy beaches. If this were allowed to happen, significant cumulative impacts to biological, recreational, and socioeconomic resources would occur, as well as the introduction of sensitive public safety issues, including:

1. A reduced or eliminated shore protection program could result in the erosion of Anna Maria Island's beaches resulting in the loss of the public beaches (a major public recreation resource) of Anna Maria Island;
2. A reduced or eliminated shore protection program could result in the erosion of Anna Maria Islands beaches resulting in the loss of tourists, affecting the local socioeconomic structure through a reduction in employment and tax revenues;
3. A reduced or eliminated shore protection program could result in the erosion of Anna Maria Island's beaches resulting in the loss of protection the beaches afford the island, resulting in the potential for increased flooding and undermining of vital hurricane and emergency evacuation routes for both Anna Maria Island and Longboat Key.
4. A reduced or eliminated shore protection program could result in the erosion of Anna Maria Island's beaches resulting in the loss of the beach as habitat, and loss of critical habitat needed for threatened and endangered sea turtle nesting;

These issues are vital to the continued well being of Manatee County, yet none of these concerns are addressed in the DEIS issued by the United States Coast Guard and the Maritime Administration or the Deepwater Port License Application issued by Port Dolphin LLC. Manatee County believes that all of these issues need to be included and comprehensively addressed within the Draft Environmental Impact Statement so that the United States Coast Guard and the Maritime Administration, and the Governor of Florida (as a Governor of an adjacent coastal state) can make a fully informed decision on the Application for a Deepwater Port License submitted by Port Dolphin LLC.

The County also feels that it important to state unequivocally that the Port Dolphin LLC Deepwater Port and associated pipeline and the Manatee County shore-protection program are

not mutually exclusive projects. In fact, several seemingly viable pipeline route alternatives exist that can allow the Port Dolphin project to be constructed without affecting the vital and highly limited sand resources required by Manatee County for its shore-protection program.

These alternatives include:

1. Constructing the Port Dolphin pipeline from the deepwater port to an existing y-valve in the Gulfstream natural gas pipeline, where the Port Dolphin facility could then tie-into the existing pipeline. This option also eliminates many of the environmental impacts associated with the preferred route;
2. Follow the preferred pipeline route as it is proposed, from the deepwater port toward Southwest Passage, where the pipeline would then deviate to the proposed northern alternative route as it enters Tampa Bay through Southwest Passage. Once inside of Tampa Bay, the pipeline could then deviate back to the preferred route. The vast majority of the preferred pipeline route could be retained with this minor adjustment.
3. A new alternative that would construct the pipeline route from the proposed deepwater port site straight to a spot approximately 2,000 feet south of where the existing Gulfstream pipeline crosses the Federal/State Boundary, approximately nine miles west of Egmont Key. At this point, the new pipeline could be collocated, or constructed parallel to, the existing Gulfstream pipeline all the way into Port Manatee.
4. A new alternative that would construct the pipeline straight from the offshore deepwater port site, directly to Southwest Passage (not Passage Key Inlet), crossing the Gulfstream Pipeline, and then continuing straight to its planned location in West-Central Lower Tampa Bay (all in one straight line).

Each of these alternatives results in no impacts (direct or cumulative) to the beach-compatible mineral resources off Anna Maria Island that are vital to Manatee County's shore-protection program. With this in mind, the County strongly believes that a more detailed alternatives analysis needs to be presented in the Draft Environmental Impact Statement. This analysis needs to build on the previously described alternatives, while adding the new alternatives

suggested by the County. Each alternative needs to be critically evaluated in terms of direct and cumulative environmental resource impacts, with the greatest weight given to the alternative(s) that have the least impacts to these environmental resources. In addition, the direct and cumulative impacts raised by the County in these detailed comments need to be included and critically evaluated in the Draft Environmental Impact Statement.

In its current form, the County finds the Draft Environmental Impact Statement to be lacking a significant amount of information regarding alternatives and true resource impacts, and as such the County feels another Draft Environmental Impact Statement needs to be issued that addresses these significant issues prior to going to the Final Environmental Impact Statement stage.

While Manatee County has strong objections to the way the project is currently proposed, the County feels that there a seemingly minor changes that can be made by Port Dolphin LLC to the preferred pipeline route that would result in no impacts to vital beach-compatible mineral resources. With this in mind, the County is willing to work directly with Port Dolphin LLC and/or the United States Coast Guard and the Maritime Administration to explore these alternatives in order to design a route that is mutually beneficial to both Manatee County and Port Dolphin LLC.

INTRODUCTION

Manatee County manages the Anna Maria Island Shore Protection Project, consisting of two separate beach nourishment project areas which include more than six miles of the coastline. The goal of these projects is to provide protection for all of Anna Maria Island's approximately seven miles of coastline. The entire length of Anna Maria Island is considered to be "Critically Eroded" by the Florida Department of Environmental Protection (FDEP), and prior to implementation of the program, was eroded substantially, adversely effecting private and public upland properties.

Anna Maria Island's economy is based on tourism. The single feature that draws thousands of tourists to Anna Maria Island is its beautiful white sand beaches. Numerous hotels, motels, rental homes, restaurants, stores and other related businesses depend on the beaches of the Island to survive. However, Anna Maria Island has a serious beach erosion problem that is only addressed through a comprehensive program of periodic beach nourishment. In order to successfully maintain and preserve the beaches of Anna Maria Island, offshore high quality sediment which matches the sediment on the beaches is required as the material to replace beach sand lost to erosion.

The sediment source off of the north end of Anna Maria Island meets a series of stringent requirements which allow its use as beach nourishment material for Anna Maria Island. This sediment source is the only available economical sediment deposit with similar sediment characteristics to that of the Anna Maria Island beach available to Manatee County. It is a source which meets the rigorous requirements of the State of Florida concerning "beach-compatible" sediment. This sediment source also meets a series of environmental constraints for a beach nourishment project. The sediment source is located a sufficient distance from reefs (hard bottom resources) to avoid potential reef impacts from sedimentation during the dredge excavation process. The sediment source meets the state requirement to have 5% or less of the silt and clay sediment component. Silt and clay is of concern because it is the sediment

component which can cause water quality problems. The sediment matches the existing beach sediment very closely, which is an indication that sea turtle nesting will not be effected by sediment quality. The sediment source is clean of debris and is very low in rock content. Sediment deposits considered for beach nourishment use must be free of potential cultural resources. Studies conducted of the sediment deposit off the north end of Anna Maria Island indicate that cultural resources will not prohibit the use of the material for beach nourishment. The sediment source is free of other man made features, such as fiber optic cables or pipelines. The sediment is located in near vicinity to the beaches of Anna Maria Island. This allows for faster, more efficient construction of beach nourishment projects on Anna Maria Island verses distant sediment sources, assuming sediment sources of similar quality and characteristics are available to Manatee County for use on Anna Maria Island. Even the depth of the high quality material is such that it promotes efficient excavation, which in turn translates into lower construction costs for beach nourishment. The quality of the material, the geophysical characteristics of the sediment deposit and proximity of this sediment source allows for much lower cost to Manatee County, the State of Florida and the Federal government to construct the beach nourishment projects on Anna Maria Island.

The sediment source off the north end of Anna Maria Island is a limited resource. Most of the sediment in near vicinity to Anna Maria Island is of marginal quality, or will not meet State requirements. There is one other source of high quality white colored sand within reasonable distance of Anna Maria Island located within Longboat Pass, but this source is limited in volume, and is not eligible for permits from the FDEP BBCS. Sand resources off the west coast of Florida for beach nourishment are a dwindling resource. As the availability of beach-compatible sands becomes less and less, the regional needs of Manatee County and its neighbors, specifically the Town of Longboat Key and Pinellas County, begin to overlap, causing an increase in competition for the dwindling sand resources. As the sands become more sporadic and competition grows, regional sand management issues become more important. The existing sand resources, therefore, must be available if the beaches south of Tampa Bay are to be

maintained. The large sediment deposit off the north end of Anna Maria Island is a major deposit and is vital to Anna Maria Island.

HISTORY

The USACE initially recommended nourishment of the beaches of Anna Maria Island in a General Design Memorandum which was published in 1978. Anna Maria Island was first nourished in 1992/93 as the initial "Central Island" shore protection project. The first Central Island beach nourishment project was constructed ten years later in 2002 and a minor hurricane damage repair fill project was conducted in 2005/06. An initial nourishment project of about one mile in length is planned for construction at the southern end of Anna Maria Island fronting the Coquina Beach Park area. The sediment source will be the beach-compatible sand source off the north end of Anna Maria Island. The County is planning its second Central Island beach nourishment project for 2011-2012, and also intends to use the beach-compatible sand source off the north end of Anna Maria Island to accomplish the nourishment effort.

The 1992/93 Central Island shore protection project consisted of the placement of approximately 2.32 million cubic yards of sand along a 4.6 mile project area between FDEP monuments R-12 and R-36. The project was constructed from December 1992 to February 1993. The design berm width was 75 feet on average with an advanced fill of 85 feet. The 1992 beach nourishment project was constructed under the direct supervision of the USACE.

The 2002 Central Island beach nourishment project was constructed between March and May under the management and supervision of Manatee County. Approximately 1.9 million cubic yards of sand were placed along 5.2 miles of the Anna Maria Island shoreline. Manatee County assumed control of the project under the provisions of the 1992 Water Resources Development Act (WRDA) which provided for local government project control and Federal cost-sharing on a reimbursable basis. As the non-federal sponsor, Manatee County proceeded under the authority of Section 206 of the Water Resources Development Act of 1992, Public Law 102-580,

with the first periodic beach nourishment project. Section 206 allows a local sponsor, Manatee County in this case, to engineer and construct the beach nourishment project and then receive reimbursement for the Federal share of the project costs. For the 2002 project, USACE reviewed the County's engineering products, issued a permit for the project and participated in project cost-sharing.

The 2002 Central Island project limits included the original 4.6 mile federally authorized and federally funded project area located between FDEP monuments R-12 and R-36. The County also nourished an additional 3,000 foot (previously unnourished) of beach within the City of Anna Maria between FDEP monuments R-7 and R-10. The project limits for the newly defined City of Anna Maria segment (R-7 to R-10) had no Federal involvement other than acquisition of the USACE permit for project construction. The nourishment of the City of Anna Maria segment was entirely funded by the State and local governments.

The County defined beach-compatible sand borrow area utilized for the 2002 project was located approximately 2,000 feet offshore of the north end of Anna Maria Island and seaward of FDEP monuments R-7 through R-10, located south of Passage Key Inlet. The same borrow area was utilized for the 2005 Anna Maria Island storm damage repair project. The mean grain size of the borrow area was 0.24 mm (2.07 phi) with a silt content of 2.72%. The 2006 pre-construction survey of the borrow area indicated an available volume of 970,000 cubic yards of material. The contractor dredged approximately 200,000 cubic yards of sand from the borrow area during the 2005 project, leaving approximately 650,000 to 700,000 cubic yards of beach-compatible material within the borrow area.

The County is presently in the permitting process to restore the beach at the southern end of Anna Maria Island, referred to as the Coquina Beach Nourishment Project. The proposed project length is about 0.9 miles, and the proposed volume will be approximately 300,000 cubic yards. The project is slated for construction in late 2008 or early 2009. With the addition of this project area, the total length of Anna Maria Island which will be protected through beach

nourishment will be over six miles. The sand source for maintaining Anna Maria Island's beaches will be the native sediment deposit located west of the north end of Anna Maria Island, which will include the 2002 borrow area.

The County is planning the construction of the second periodic maintenance nourishment project for the Central Island area in late 2011 or early 2012. Again, the beach-compatible sediment source for the project is planned to be the sediment deposit off the north end of Anna Maria Island. A minimum volume of 1.5 million cubic yards of sediment is anticipated for use.

This mineral resource has proven to be an ideal beach-compatible sand source for these projects. As the periodic nourishment of Anna Maria Island beaches continues into the future, Manatee County will rely on this shoal for the optimal beach-compatible sand needed to maintain the beaches of Anna Maria Island..

COUNTY COMMENTS ON THE PORT DOLPHIN DRAFT ENVIRONMENTAL IMPACT STATEMENT

The County has reviewed the DEIS on the Port Dolphin LLC Deepwater Port License Application in order to determine what potential impacts the preferred alternatives may have on Manatee County's Shore-protection program. Potential impacts (both major and minor), as well as areas where information identifying the potential impacts is missing and/or deficient, are outlined below, referenced to the specific DEIS sections.

Section 2: Detailed Description of Project and Alternatives

The County reviewed Section 2 in order to understand how preferred alternative pipeline route was selected. After a detailed review of the Alternatives Analysis, the County found several areas where information was either contradictory to other public comments, lacking information, or missing altogether.

2.1. Alternatives Considered

2.1.1 Alternatives for Analysis

2.1.1.3 Port and Pipeline Location Alternatives

This section lists several criteria for identifying and evaluating the alternative pipeline corridor locations. Of particular interest to the County is Criterion 3. This criterion states that "siting a project in an identified sand resource would be difficult, and likely would not be approved by the Minerals Management Service" (USCG and MARAD, 2008). With this statement, there is a strong acknowledgement that sand resources in Federal waters would be protected for such uses as beach nourishment. However, this statement and alternatives analysis, while true, does not fully describe the situation regarding mapped sand resources, specifically those within State of Florida jurisdictional waters. The MMS does have authority over identifying and permitting sand resources in Federal waters, but the proposed pipeline route also impacts offshore sovereign submerged lands of the State of Florida. The MMS has no jurisdiction or authority for these lands. In regards to State of Florida sand and mineral resources, the FDEP BBCS has full authority for permitting the use of these sands as identified resources for shore protection projects through Florida Administrative Code 62B-41. In the case of this alternatives analysis, it does not appear that the USCG and MARAD, or Port Dolphin LLC in the Application (Port Dolphin, 2007a), coordinated with the FDEP BBCS in order to determine if the proposed alternatives impacted any sand resources.

There is reference to one report in which "Sand Resources" were identified. These resources are mapped on the Figure 2.1-10 (and many other figures) of the DEIS (USCG and MARAD, 2008). Upon further review of this referenced report, the "Sand Resources" as mapped within the DEIS are areas were the potential for sand resources may exist and not actual, beach-compatible mapped resources at all. The reliance of Port Dolphin LLC on this one source of mineral

resource information resulted in the misinterpretation of true sand resources and the resulting location of the proposed pipeline route, which directly impacts a regionally limited, beach-compatible sand resource (Figures 1 and 2).

The exploration, identification, permitting, and use of sand resources are highly regulated actions by the State of Florida. As such, a great detail of time, money, and effort are expended to complete the regulatory process to the satisfaction of FDEP BBCS and the State of Florida. Applicants typically conduct both geophysical and geotechnical studies to identify appropriate, beach-compatible, site-specific sediment sources for beach nourishment use. Geophysical surveys are conducted after extensive research into existing and historical geological data to identify areas of potential beach-compatible sediments, such as the mineral resource off the northern end of Anna Maria Island. These geophysical surveys include seismic sub-bottom investigations of the sub-surface sediment strata, sidescan sonar to map surficial ocean bottom features, bathymetric data to develop overlying water depths, magnetometer surveys to identify any potential cultural resources and/or hazards to borrow area development, and if necessary, diver surveys of the proposed borrow areas. After a borrow area is identified, a more detailed (30 meter spacing) seismic sub-bottom, sidescan sonar, and magnetometer survey is conducted under the supervision of a Marine Archaeologist to map all magnetic and geophysical anomalies for further study into cultural resource significance. Vibracores (sediment cores) are obtained, and the sediment layers within the vibracores are analyzed to determine sediment characteristics and compatibility with the recipient beach sediments. The vibracore and sediment data is then extrapolated to the seismic sub-bottom data in order to verify the geophysical survey data. If all of the surveys, studies, and analysis provide supportive results, a specific borrow area is identified and approved by the FDEP for use in the beach nourishment process. The sediments contained in the larger geologic feature in which the borrow area is located also

may contain beach-compatible sediment resources that are suitable for future use in beach nourishment projects. This is true for the sediment deposit located off the north end of Anna Maria Island.

As part of the process to identify sediments which meet the stringent criteria for beach nourishment, easements and State of Florida "consent to use" decisions are issued for identified resources lying within State of Florida jurisdictional waters. Had Port Dolphin LLC contacted FDEP BBCS to determine if actual identified beach-compatible sand resources were going to be impacted, it would have been apparent that an existing, fully permitted existing borrow area, as well as a very-limited, highly-valuable, native, white sand mineral resource currently used for beach nourishment projects would be directly impacted by the Preferred and Southern alternative pipeline routes (direct impacts to Geologic Resources will be discussed in greater detail in the comments on section 4.4 below). The northern pipeline route, as it approaches Egmont Key and enters Tampa Bay through Southwest Passage, does not impact any identified sand resources, and as such, the northern pipeline route alternative should be considered the preferred alternative in regards to Criterion 3. The decision to route the preferred and the southern routes through Passage Key Inlet has led to the direct impact to identified sand resources, whereas the routing of the pipeline through Southwest Passage results in no impacts to identified sand resources. Therefore, a route through Southwest Passage should be thoroughly reviewed in the alternatives analysis.

In response to the selected pipeline route, the County requests a detailed analysis of the preferred pipeline route, but taking into consideration the actual identified and mapped sediment resources described above (and not the generic "potential sand resource" currently shown in the DEIS), which were not

considered in the DEIS. There appear to be a number of alternatives which require additional analysis (Figure 3).

One option the County requests is that Port Dolphin LLC analyze is the potential use of a small portion of the northern route which deviates north of the sediment resource area. In this manner, the vast majority of the preferred route could be retained for use as the pipeline route. The County believes that revision of the preferred pipeline route to incorporate that portion of the northern pipeline route that enters Tampa Bay through Southwest Passage, fully by-passing the beach-compatible sediment deposit, is a realistic alternative.

Another option is to connect into the existing Gulfstream pipeline. The Gulfstream pipeline apparently has both capacity and an offshore point of connection available to Port Dolphin, assuming a number of technical issues can be addressed. A major advantage to use of the Gulfstream line is avoidance of environmental impacts associated with the proposed Port Dolphin pipeline. Nevertheless, each alternative provides a satisfactory solution to the potential loss of sand resources which have been identified for use as the Anna Maria Island beach nourishment sediment source (addressed by the County later in these comments). This alternative will be addressed in greater detail below.

A pipeline route which continues straight from the offshore Deepwater Port site, directly to Southwest Passage, crossing the Gulfstream Pipeline, and then continuing straight to its planned location in Central Tampa Bay (all in one straight line) is also an option, although not one specifically identified in the DEIS. This route may involve more study, but is a logical stand-alone pipeline route, and may actually result in a reduction of the overall length of pipeline, while maintaining the same number (2) of planned crossings of the Gulfstream Pipeline.

There is another alternative that is not addressed in the DEIS. This alternative would have the preferred pipeline route begin at the proposed Deepwater Port site and then continue to a spot approximately 2,000 feet south of where the existing Gulfstream Pipeline crosses the Federal/State Boundary, approximately nine miles west of Egmont Key. At this point, the new pipeline should be collocated, or constructed parallel to, the existing Gulfstream pipeline. In order to prevent impacts to either pipeline, the construction should occur outside of the easement of either Pipeline, but on a parallel path from offshore to Port Manatee. It would reduce the overall environmental impacts (addressed by the County later in these comments) while maintaining access for the Port Dolphin pipeline. This route would also avoid impacts to all identified sand resources. Without an analysis of an alternative pipeline route based on collocating the Port Dolphin pipeline parallel to the existing Gulfstream pipeline in Florida State waters, the County believes that the DEIS Alternatives Analysis is not complete.

The alternative of greatest viability may be the option of Port Dolphin LLC constructing their pipeline to, and connecting with the existing offshore piggable y-type valve already available as part of Gulfstream's existing pipeline at milepost 392.6. This valve was specifically constructed for this type of situation although as reported in the DEIS, technical issues would need to be addressed. This alternative was discussed in the DEIS, however, it was not addressed in detail and may have been dismissed after Port Dolphin LLC determined to use the preferred route. The DEIS lists several pipeline engineering reasons as to why this is not a feasible alternative, however, in response to the FERC proceeding for the onshore portion of the pipeline (and submitted as public comment to the DEIS proceeding) Gulfstream states that these issues can be successfully addressed. There is a minor discrepancy between the information presented in the DEIS and the information presented by Gulfstream regarding operating

pressures of the Gulfstream pipeline and of the re-vaporized gas at the proposed terminal. However, minor revisions to the pipeline or vessel engineering systems should be considered more seriously if they result in significant reduction in impacts to environmental resources by tapping into an existing pipeline offshore, and avoid the beach-compatible sand resources required for beach nourishment projects.

A reduction in major and minor environmental impacts would be accomplished be eliminating over 20 miles of new pipeline construction. Additionally, the Gulfstream pipeline was constructed with this valve in order to provide access to additional providers (like Port Dolphin). This appears to have been required by FERC in order to be in the public interest by allowing additional providers of natural gas access to the Gulfstream pipeline. The County questions whether it is in the public interest to allow Port Dolphin to refuse this connection and to construct a new pipeline through sensitive and scarce resources that have significant environmental, economic, and public safety value to the County (see later sections for detailed discussion of the impacts).

Based on these facts and observations it is the County's opinion that the Alternatives Analysis presented in the DEIS is not complete, and that at least four potential alternatives need to be further explored, with greater importance given to the reduction in environmental impacts and avoidance of sand resources of each of these alternatives. These suggested alternatives are listed below (in no particular order):

- A more detailed discussion regarding tapping into the Gulfstream pipeline at milepost 392.6, including a detailed analysis of the engineering issues involved and a qualitative and quantitative discussion on the reduction in environmental impacts by not having to construct 20+ miles of new pipeline;

- A discussion of the potential for diverting the pipeline to follow a small portion of the northern route as it enters Tampa Bay via Southwest Passage to avoid the beach-compatible sediment resource areas, while retaining the greater majority of the preferred pipeline route.
- A discussion of a new alternative that would construct the preferred pipeline route beginning at the proposed Deepwater Port site and then continue to a spot approximately 2,000 feet south of where the existing Gulfstream Pipeline crosses the Federal/State Boundary, approximately nine miles west of Egmont Key. At this point, the new pipeline could be collocated, or constructed parallel to, the existing Gulfstream pipeline all the way into Port Manatee.
- A discussion of a new alternative of constructing the pipeline straight from the offshore Deepwater Port site, directly to Southwest Passage (not Passage Key Inlet), crossing the Gulfstream Pipeline, and then continuing straight to its planned location in West-Central Lower Tampa Bay (all in one straight line).

Section 3: Affected Environment

Upon review of Section 3, the County feels that the discussion relating to several resources was deficient in regards to issues specific to the West-Florida Coast. Additionally, information was missing in regards to the regulatory authority of State of Florida agencies on mineral resource management, which resulted in a major oversight of previously defined and active mineral resources directly in the path of the proposed pipeline route. These issues are discussed below.

3.2 Biological Resources

3.2.3 Threatened and Endangered Species

3.2.3.2 Threatened and Endangered Sea Turtles

The beaches of Anna Maria Island and the west coast of Florida provide valuable nesting habitat for sea turtles. Five sea turtle species have been known to nest

on Florida beaches, including the threatened loggerhead sea turtle (*Caretta caretta*), endangered green sea turtle (*Chelonia mydas*), endangered leatherback sea turtle (*Dermochelys coriacea*), endangered hawksbill sea turtle (*Eretmochelys imbricata*), and endangered Kemp's ridley sea turtle (*Lepidochelys kempii*). Loggerhead sea turtles are the nesters within Manatee County, accounting for an average of 136 nests annually on the beaches of Anna Maria Island between the years 2000 and 2006 (S. Fox, personal communication, 2007). Erosion of these beaches reduces available nesting habitat; however, Manatee County's periodic beach nourishment with fill material that replicates the native beach sand increases the area that may be utilized for sea turtle nesting.

Sand source compatibility is a major consideration for the nourishment of a project area (NMFS and USFWS, 1991). Following beach nourishment, the increase in success of sea turtle hatchlings on a nourished beach environment is attributable to the type of sand (fill material) used in the project. Characteristics such as color, grain size, compaction and gas balance in the nest are major determinants in the success of nesting. Beach sand characteristics strongly influence the relative suitability of sea turtle nesting success (a choice to nest or false crawl) and hatchling success (the percentage of eggs that produce hatchlings) (T. Tucker, personal communication, 2008). According to Broadwell (1991), conditions favoring hatchling production may rely heavily on pore spacing and moisture content. The sand composition, color, and grain size can affect the incubation time, sex, and hatching success of turtle hatchlings (Street *et al.*, 2005). The color of the fill material can affect the temperature of the nest; increased nest temperatures have been linked to a strongly female-biased hatchling sex ratio among loggerhead sea turtles, which has serious implications for the reproductive success of the species (Mrosovsky and Provancha, 1992).

It is important that beach fill material be compatible with sea turtle nesting and hatching requirements. Fill material should resemble native grain size distribution and sorting level, color and shape to better maintain native beach habitats. The sediment source off of the north end of Anna Maria Island meets the rigorous requirements of the State of Florida concerning "beach-compatible" sediment, and it is the only available economical sediment deposit with similar sediment characteristics to that of the Anna Maria Island beach currently available to Manatee County. The sediment very closely matches the existing beach sand, therefore utilization of this sand source for Manatee County beach nourishment projects maintains the beaches of Anna Maria Islands as suitable and valuable sea turtle nesting habitat.

While The DEIS has a relatively extensive discussion on threatened and endangered sea turtles, it fails to discuss the importance of beaches and sediment characteristics required by threatened and endangered sea turtles to nest and successfully reproduce. This is a major oversight, and the County considers the DEIS incomplete without a discussion on:

1. A description of the optimal native beach habitat required for threatened and endangered sea turtles to successfully nest and reproduce;
2. A discussion on the importance of quality beach material and access to successful sea turtle reproduction;
3. A discussion on the requirements of beach-compatible borrow sand quality and characteristics required for maintaining suitable beach habitat for threatened and endangered sea turtles to successfully nest and reproduce.

3.4 Geological Resources

3.4.2 Offshore Regional Geology (Mineral Resources)

As described in the County's comments for Section 2.1.1.3, there was limited to no discussion of State of Florida sand and mineral resources. There was only a cursory mention of sand resources within Florida State waters, and that comment was incorrect. In both the application and DEIS, there are repeated assertions that the MMS has final regulatory authority over these resources. While this is true for Federal mineral resources, it is not true for State of Florida mineral resources which extend from the mean high water line out to a distance of nine (9) miles offshore. The FDEP BBCS has full regulatory authority over the identification, permitting, and use of State of Florida sand resources for shore protection activities under Florida Administrative Code 62B-41. It is believed that Port Dolphin LLC failed to address the potential presence of beach-compatible mineral resources required for region beach nourishment projects within the planned pipeline route with the FDEP BBCS, instead relying on one report that shows a large region of potential sand resources offshore of Anna Maria Island and Longboat Key, and not actual identified and mapped beach-compatible sand resources (*i.e.* mapped mineral resources as the NEPA process requires). However, even in considering this larger area of potential sand resources referenced in the DEIS, Port Dolphin LLC ignored that information and selected a pipeline route through the potential resource area even though there were other viable pipeline routes.

As stated earlier, potential sand deposits within the area mapped as potential sand resources in the DEIS are actually undefined, and most of them do not meet the present strict "beach compatibility" standards for use as borrow material in beach nourishment projects. The exploration and identification of beach-compatible sand resources is a highly-regulated process governed by the FDEP BBCS. The goals of these strict regulations are to identify and use only the best and most appropriate sand for beach nourishment activities, primarily seeking sediment which most closely matches the native beach sediment. In order to be deemed suitable, proposed offshore sand sources are reviewed in context with the recipient beach by the FDEP BBCS. The review includes comment by outside agencies (State Fish and Wildlife, State Historic Preservation Office,

etc.) to insure that adverse environmental or cultural impacts will not occur. In addition, sediments must meet specific criteria. The performance of a beach nourishment project is related to the quality and quantity of sand used to nourish or replenish the eroding shoreline. State and federal regulatory agencies require that sand resources for nourishment be "beach-compatible" or similar to the natural sand for any given area. Various qualities like grain size, silt content, color, and mineralogical content are taken into account. The quality of material that can be placed on Florida's beaches is governed by Rule 62B-41.007(2)(j) F.A.C. which states that:

> To protect the environmental functions of Florida's beaches, only beach-compatible fill shall be placed on the beach or in any associated dune system. Beach-compatible fill is material that maintains the general character and functionality of the material occurring on the beach and in the adjacent dune and coastal system. Such material shall be predominately of carbonate, quartz or similar material with a particle size distribution ranging between 0.062 mm (4.0 phi) and 4.76 mm (-2.25 phi) (classified as sand by either the Unified Soils or the Wentworth classification), shall be similar in color and grain size distribution (sand grain frequency, mean and median grain size, and sorting coefficient) to the material in the existing coastal system at the disposal site and shall not contain:
>
> 1. Greater than 5 percent, by weight, silt, clay or colloids passing the #230 sieve (4.0 phi);
> 2. Greater than 5 percent, by weight, fine gravel retained on the #4 sieve (-2.25 phi);
> 3. Coarse gravel, cobbles or material retained on the 3/4 inch sieve in a percentage or size greater than found on the native beach;
> 4. Construction debris, toxic material or other foreign matter; and
> 5. Not result in cementation of the beach.

> If rocks or other non-specified materials appear on the surface of the filled beach in excess of 50% of background in any 10,000 square foot area, then surface rock should be removed from those areas. These areas shall also be tested for subsurface rock percentage and remediated as required. If the natural beach exceeds any of the limiting parameters listed above, then the fill material shall not exceed the naturally occurring level for that parameter.

Once a borrow area is found to be compatible with the recipient beach, a detailed Quality Assurance/Quality Control (QA/QC) plan is developed (in conjunction with, and approved by the FDEP BBCS) which must be followed exactly during construction of the shore protection project. This plan specifies a range of sediment characteristics which are considered acceptable for placement. The characteristics typically include mean grain size, silt content, color and shell content. These plans are site specific and can include other parameters as well. A detailed sampling regimen is provided to determine if material placed meets the QA/QC criteria. The plan also provides guidance on mitigation in the event that material fails to meet the criteria. Mitigation often involves either removal of non-compliant material or mixing with other material in order to meet QA/QC standards.

Based on these strict standards and rules, the area mapped in Figure 2.1-10 of the DEIS (USCG and MARAD, 2008) is not an accurate representation of sand resources. It does show the area of potential resources based on available data, but unfortunately does not highlight high quality, limited beach-compatible sediment resources such as the sediment deposit off the north end of Anna Maria Island. In fact, beach-compatible sand is a severely limited resource, and as such, needs to be conserved whenever possible for future use on shore-protection programs. Nevertheless, Port Dolphin LLC still selected a preferred pipeline route through the potential sediment resources when there were viable pipeline routes that would have preserved the limited beach-compatible sediment resources for shoreline protection.

Due to what appears to be a major oversight in not thoroughly investigating potential beach nourishment sediment resources in the path of the preferred pipeline, the applicant missed the important beach-compatible beach nourishment sediment source for both Manatee County and the Town of Longboat Key. The Port Dolphin LLC may not have been familiar with the strict rules governing the identification of a beach-compatible sand resource, not aware of the various criteria that must be met to receive approval of a beach-compatible, beach nourishment sediment source. Port Dolphin LLC may have not been aware of the fact that such resources are highly limited, and greatly sought after, by communities which need the sediment to maintain their beaches. Communication with FDEP BBCS and local government agencies in charge of local shore-protection programs (Manatee County Department of Conservation Lands Management, the Town of Longboat Key, Pinellas County Department of Environmental Resource Management, etc.) would have provided the applicant with information that would have been important in developing a pipeline route to avoid the beach-compatible sand resource area. The Applicant apparently did consult with the ROSS database for potential sediments, however, the applicant did not follow up on the ROSS information to learn of the specific resources in the direct path of the preferred pipeline route. As a result, the Application and DEIS failed to identify the true beach-compatible sand resources along the preferred pipeline route. In addition to the sediment deposit as a whole, specifically, a fully permitted, active, existing borrow area for Longboat Key is directly bisected by the proposed pipeline route (see comments in section 4.4 for more impact information). This borrow area was permitted for use by the FDEP BBCS under Consolidated Joint Coastal Permit and Sovereign Submerged Lands Authorization Number 0202209-001-JC.

Due to the proposed pipeline route, a significant portion of the sediment deposit offshore the northwestern tip of Anna Maria Island will not be available for use on both Anna Maria Island and Longboat Key after construction. This sediment is the ideal sand

mineral resource for shore protection projects on Anna Maria Island and Longboat Key. The geologic character (as described above in Florida Administrative Code 62B-41.007(2)(j)) is an excellent perfect match for both Anna Maria Island and Longboat Key. In addition to being the sand source for the above mentioned Longboat Key sand source, this sediment deposit has served as a successful sand source for the last three Anna Maria Island beach nourishment projects. Manatee County considers this shoal to be the current and long-term sediment source for its shore-protection program. Impacts to this sediment source will be described in detail under comments for section 4.4 (below).

When defining a potential pipeline route, Port Dolphin LLC should conduct a title determination on the submerged lands to be included on, or near, the proposed pipeline route. It appears that this was not done, or not completed properly, for the Application or the DEIS. If it had been, the existing Longboat Key borrow area and historic Anna Maria Island borrow areas should have been mapped as identified sand resources.

In summary, the County finds this section of the DEIS severely lacking in regard to information on actual geologic mineral resources within the proposed project area. As such, the County considers the DEIS incomplete until a detailed discussion is included on:

1. The detailed and highly-regulated process by which mineral resources are identified in Florida State waters;
2. A detailed description of true identified mineral resources (including sand borrow areas permitted for use by FDEP BBCS) as opposed to a generic mention a large portion of seafloor that has limited potential for sand resources;
3. A detailed discussion on the regional needs for sand resources for shore-protection programs in the vicinity of the project area.

3.6 Recreation and Aesthetics

3.6.1 Definition of the Resource

Although Manatee County has major beach front public parks, inexplicably none of the beach front public parks were identified in the DEIS. In particular, the section titled "Recreation on Local Islands" solely focus on island parks in Hillsborough and Pinellas County, with two of the mentioned parks (Caladesi and Honeymoon Island) occurring over 35 miles from the proposed project location, while Anna Maria Island is immediately south of the preferred pipeline route.

The County believes that there was a significant oversight of the extensive Manatee County and local government park system, and of the beaches themselves, which are in direct proximity to the project area. The beach front public park system on Anna Maria Island includes Cortez Beach Park, Coquina Beach Park (with over 1,000 parking spaces and beach facilities), Manatee Beach Park (with over 400 parking spaces and beach facilities), and Bayfront Park. All of these parks provide access to the public beach, which, in and of itself, serves as a major recreational and economic resource to the local governments, Manatee County, and the Town of Longboat Key, as well as the State of Florida.

Each and every one of the public beach parks is included in the County's beach management program. Manatee County actively maintains the beaches of six of the approximate seven miles of island coastline as part of its shore-protection program. The shore-protection program is partly funded by the United States Army Corps of Engineers, the State of Florida, and Manatee County. In order to qualify for State funds for shore protection, the County and local governments have to maintain beach access and parking facilities for the general public along the entire shoreline of Anna Maria Island. As part of the certification process, the FDEP BBCS identifies all available access points and provides funding based on actual availability. In the case of Anna Maria Island, the termination of all roads near the beach is a public access point, resulting in

over 100 separate public access points (not counting the park system) on Anna Maria Island alone.

In order to qualify for State cost-sharing funds for the Anna Maria Island Shore Protection project, the County and Cities on Anna Maria Island must maintain beach access and parking facilities for the general public along portions of the shoreline of Anna Maria Island (including the parks described above). As part of the certification process, the FDEP BBCS identifies all available access points and provides funding based on actual availability. The process of determining public access and eligibility for State cost-sharing also includes the determination of an Erosion Control Line (ECL). Since the State of Florida cost-shares the construction (and related) costs of Manatee County's beach nourishment projects, the ECL was determined and platted in relation to the existing mean-high water line prior to the construction of the first beach-nourishment project. Once determined, the ECL becomes the legal boundary between upland, private property and public, State of Florida sovereign lands, meaning that anything seaward of the ECL is State of Florida public property. This rule is critical to the Florida shore protection program by ensuring that all constructed beaches that are funded (at least partly) by the State of Florida are owned by the State and considered public property for the enjoyment of the citizens of the State of Florida.

The goal of this process is to ensure, on behalf of the Governor and Board of Trustees for the Internal Improvement Trust Fund of the State of Florida, access to the general public to the sandy beaches of the State of Florida. In essence, this allows for the entire shoreline of Anna Maria Island to be accessed and enjoyed by the general public, and therefore, the entire sandy coastline of Anna Maria Island (and all other local barrier island beaches) is a major public recreation area. Due to this fact, the maintenance of these public recreational resources through shore protection activities like beach nourishment is vital to the protection and continued availability to the general public.

This is a major recreational resource enjoyed by the general public and tourists from all over the United States and abroad.

The DEIS does not identify or otherwise mention the beaches and extensive park system of Anna Maria Island, in particular the beaches in the vicinity of the proposed pipeline project, as a major recreational resource. The County considers the DEIS to be incomplete and misleading without the inclusion of a detailed discussion of the existing park system and public beach access program present on Anna Maria Island and neighboring barrier islands.

3.9 Socioeconomic Resources and Environmental Justice

3.9.1 Definition of the Resource

The DEIS states that "NEPA requires an analysis of socioeconomic issues if socioeconomic effects are interrelated with environmental effects" and continues to define the resource as "the basic attributes and resources associated with the human environment, particularly population and economic activity" (USCG and MARAD, 2008). One of the largest economic sectors of the State of Florida and Manatee County is the tourism industry. The tourism industry in Florida and Manatee County is highly dependent on the environment, in particular, to the access and health of Florida's white sandy beaches. The County was dismayed to see that the DEIS discussion of socioeconomics was limited to fisheries and fisheries management as well as basic statistics as to general onshore economic industries, population, and employment. There is only brief mention of tourism, on DEIS page 3-116, that is inadequate at best. This reference is to recreational fishing as the only tourism related industry in the region is both highly misleading and completely incorrect.

The main economic engine for Anna Maria Island is tourism, which is based on the existence of the beaches of Anna Maria Island. Rental properties, transportation, retail,

food and service industries primarily revolve around the beach–related tourism industry of Manatee County. None of these economic issues are even addressed in the DEIS.

Additionally, the tax base of Manatee County is highly dependent on Tourist Development "Bed Taxes" as well as the retail sales tax. Currently, it is the Bed Taxes that directly fund tourism development activities, including beach nourishment projects. The DEIS fails to discuss any issues related to the extensive tourism industry of Manatee County, or how these issues fund large socioeconomic programs, including environmentally based activities like beach nourishment.

Seeing that these activities are closely linked, the County believes a detailed discussion of the total tourism industry and its direct impact to tax revenues in Manatee County is required. Additionally, the link between the tourism industry, "Bed Taxes", and beach nourishment need to be addressed in the DEIS. It is important for the DEIS to accurately describe the interconnectivity of beach nourishment (including protection of available beach-compatible mineral resources) to tourism, to tax revenue, to the continued funding of the shore-protection program through beach nourishment. Without this discussion the DEIS is incomplete.

Section 4: Environmental Consequences

In Section 4, the County was able to identify a direct, major impact to a sensitive environmental resource that the County relies on for shore-protection. The impact to this geologic resource is described below, and several major cumulative impacts due to this direct environmental impact are described later in the County's comments to Section 6 of the DEIS.

Section 4.4: Geological Resources

The DEIS states that "Protection of unique geological features, minimization of soil erosion, and the siting of facilities in relation to mineral resources and potential geologic hazards are considered when evaluating potential impacts of the Port Dolphin project on geological

resources. Generally, impacts on geological resources or caused by geologic hazards can be avoided or minimized through proper siting" (USCG and MARAD, 2008). Both the DEIS and the Application plainly state, in an effort to properly site the preferred pipeline route, that "the route avoids mapped mineral resources" with the DEIS stating the following...."geological resources generally would not be impacted by the project. Some localized, short-term changes in sedimentation would be expected. It is not expected that the project would cause destruction of any unique geologic feature, increase erosion potential, prevent recovery of mineral resources..." These statements are inaccurate, rendering this portion of the DEIS completely unacceptable.

As discussed earlier in the comments for Section 3.4.2, the DEIS maps a much larger area of potential sand resources instead of referencing actual permitted and identified sand resources (*i.e.* mapped mineral resources as the NEPA process requires). However, even in considering this larger area of potential sand resources referenced in the DEIS, Port Dolphin LLC ignored that information and selected a pipeline route through the potential resource area even though there were other viable pipeline routes. Yet, even with this clearly mapped on figures in the DEIS, the document still states that "It is not expected that the project would cause destruction of any unique geologic feature, increase erosion potential, prevent recovery of mineral resources..." This is clearly contradictory to figure 2.1-10 (among others) presented in the DEIS which shows the preferred pipeline route going through the northern section of the potential sand resources. Also, as discussed earlier in the County's comments on section 3.4.2, had Port Dolphin LLC considered the State of Florida's regulatory authority regarding mineral resources in State of Florida jurisdictional waters, it would have discovered the FDEP BBCS has full regulatory authority over the identification and permitting of mineral resources in Florida State jurisdictional waters. This, together with a properly performed title determination, may have led to the discovery that, as proposed, the preferred pipeline route completely bisects an existing, fully permitted borrow area used by Longboat Key, as well as bisecting a much larger beach-compatible sand resource, containing an estimated 18,245,000 cy of beach-compatible

sand resources, that is the historic and future source for beach-compatible sands for the Manatee County shore-protection program.

The Manatee County beach-compatible sand resource mentioned above is directly impacted by the proposed pipeline route, which bisects this oblong feature as the route travels from the offshore Port facility into Passage Key Inlet. This mineral resource has served as the source of beach-compatible sand for the Manatee County shore-protection program for the last three beach nourishment events. This sand source has repeatedly proven to meet the strict beach-compatibility guidelines, including optimal compatibility for nesting threatened and endangered sea turtles, as set by the FDEP BBCS (described in the County comments on Section 3.4.2 above). Due to the limited availability of similar beach-compatible sand resources, and to the fact that this resource has been used successfully on at least four occasions (three for Anna Maria Island and once for Longboat Key), this mineral resource qualifies as a unique geologic feature. Referring back to the DEIS contention that "it is not expected that the project would cause destruction of any unique geologic feature, increase erosion potential, prevent recovery of mineral resources...", the County disagrees, as the proposed pipeline route directly impacts a unique geologic feature while also preventing recovery of a substantial volume of beach-compatible mineral resources vital to the Manatee County shore-protection program.

In addition to being the ideal sand source in regards to geologic and biologic native beach compatibility, this sand source is in close proximity to the recipient beaches of Anna Maria Island. This allows Manatee County to employ a construction model that revolves around the use of a "cutterhead" dredge to excavate and place the beach-compatible sand resources. Cutterhead dredges are able to access shallower water, where they can then excavate the mineral resources directly into a pipeline system that carries the sand from the seafloor straight to the recipient beach. This technology is the most efficient technology for excavating borrow sands and transporting them to the recipient beach, resulting in significant cost and time savings to Manatee County. This is one of only two sand resources known to Manatee County that have the unique, beach specific qualities and proximity to the project area required for the

County's shore-protection program. Unfortunately the other source, the Longboat Pass ebb shoal presently does not qualify for the State of Florida permits required for excavation of those beach-compatible sands. This means that the beach-compatible sand source off the northern end of Anna Maria Island is the only sand resource that contains the only readily available ideal beach-compatible sand required by the State of Florida available to the County for its current and future beach nourishment programs. Therefore, quantifying the impact of the proposed construction of the Port Dolphin natural gas pipeline directly through this sand resource is vital to Manatee County as such an analysis will lead to the conclusion that a non-impactive pipeline route is absolutely necessary .

In order to determine the true impact that the proposed pipeline route would have on these geologic resources, the County must consider not just the actual footprint of the pipeline itself, but a "safety buffer", restricting dredging or other bottom impacts, that would be employed around the constructed pipeline in order to avoid future impacts to the natural gas pipeline. In the State of Florida, this is a common occurrence when defining boundaries for mineral resources (such as beach-compatible sand borrow areas) when they occur in proximity to cable routes, storm water, and waste water outfalls, and other buried obstructions. Unfortunately, there is no clear precedent for how wide a safety buffer around a natural gas pipeline must be in the State of Florida. Its size would be determined through the State permitting process. Nevertheless, natural gas pipelines which are located in other areas of the country require buffer zones of 300 to 600 meters (or potentially more) to either side of the pipeline. In Louisiana, these pipelines are quite distant from highly-populated areas in many cases, yet the 300 – 600 meter buffer zones are the common. The preferred Port Dolphin pipeline route, as it passes through the sediment resource of concern, is close to highly populated areas, and to areas of relatively high recreational boat traffic. Considering the proximity of the proposed pipeline to the populace, it is anticipated that the State of Florida could require at least a 300 meter buffer zone, if not more. In the case of defining and permitting a beach-compatible borrow area, the safety buffer would be negotiated during the permitting process between the beach nourishment project applicant (typically a County or municipality) and the FDEP BBCS,

the State regulatory agency in charge of permitting beach-compatible mineral resources and the related beach nourishment projects. Due to the sensitive nature of a natural gas pipeline, it is assumed that the State would err on the side of caution and design a larger "no dredge" safety buffer.

Realistic assumptions must be made to try and determine what this safety buffer will be, prior to allowing construction of any pipeline. Louisiana and Texas have extensive oil and gas infrastructure, including widespread oil and gas pipelines throughout their State and Federal submerged lands. Borrow areas have been defined in proximity to these pipelines in the past, and recently, the safety buffer proposed by the MMS (the regulatory agency in charge of Federal oil, gas, and mineral resources) was 1,000 meters to either side of the pipeline, resulting in a 2,000 meter no-dredge corridor centered on the pipeline. This is a significant buffer and probably the worst case scenario regarding a safety buffer for the Port Dolphin pipeline. In order to determine how a safety buffer may impact the mineral resources along the proposed pipeline route, the worst case scenario of 1,000 meters was considered along with a less restrictive, but still highly significant, 1,000 foot buffer (Figures 1 and 2).

When a 1,000 meter buffer is placed around the proposed pipeline route, the currently available 18,245,000 cy yards of beach-compatible sand is reduced to an estimated 9,654,800 cy, resulting in the loss of 8,590,200 cy of beach-compatible sand for future beach nourishment projects. If the buffer is reduced to the less restrictive 1,000 ft, the currently available 18,245,000 cy yards of beach-compatible sand is reduced to an estimated 16,211,200 cy, resulting in the loss of 2,033,800 cy of sand for future beach nourishment projects.

Manatee County's current sand resource needs for its shore-protection program are substantial. The Central Project area requires approximately 1,900,000 cy of beach-compatible offshore sand every ten years. The next nourishment of the Central Project is currently scheduled for sometime between 2011 and 2013. The Coquina Beach Project area requires 420,000 cy of beach-compatible offshore sand. The next nourishment of the Coquina Beach

Project is currently scheduled for early 2009. When you weigh the loss of beach-compatible sands due to the pipeline construction and associated safety buffer with the project needs, approximately four full Anna Maria Island nourishment projects alone (not counting any other regional sand needs) becomes unavailable for future beach nourishment projects when a 1,000 meter safety buffer is placed around the pipeline route. In other words, the current proposed pipeline location, together with a 1,000 meter buffer, would result in the loss of 40 years worth of highly-limited, beach-compatible sands for the Manatee County shore-protection program. If the buffer was reduced to 1,000 feet, well over the minimum volume needed for one full Anna Maria Island beach nourishment project becomes unavailable for future beach nourishment projects. These represent significant volumes of regionally-limited, beach-compatible material that would become permanently unavailable for future beach nourishment activities. Not only does this directly impact the Manatee County shore-protection program, but it impacts regional sand management, further limiting and already limited mineral resource.

If the pipeline construction occurred as currently proposed, and the volumes of sand discussed above became unavailable for future Manatee County beach nourishment projects, the County would be forced to try and locate a new source of beach-compatible sand. First, there is no guarantee that the County would be successful in locating a new beach-compatible sand source, however, if it was, it is assured that the beach-compatible sand resources would be further from the project area. This would result in Manatee County having to change from its efficient, cutterhead dredge construction model to a hopper dredge construction model. Hopper dredges operate in deeper water and instead of pumping the material directly from the mineral resource area, they dredge the material into large holds within the ship. Once the ship has filled to capacity, the ship steams to a location directly offshore the project area, hooks into a pipeline, and offloads the sand to the beach. The hopper dredge continues back and forth, between the project area and the sand source until the beach project is fully constructed. This is a much less efficient and much more costly construction method than the cutterhead model currently employed by Manatee County.

In order to quantify the loss of this unique geologic resource, the County calculated the potential economic impact of replacing the mineral resources lost due to the construction of the pipeline and its associated safety buffer. Based on accepted dredging industry costs, the County can assume an increased cost of $5 to $7 per cubic yard to explore, define, permit, and excavate and construct a more distant beach-compatible sand resource using a hopper dredge instead of a cutterhead dredge. This cost may rise as the cost of fuel continues to escalate. For the standard Anna Maria Island beach nourishment project this results in an additional cost of $9,500,000 to $13,300,000 for one 1,900,000 cy project. If Manatee County lost over four projects worth of sand (up to 8,590,200 cy of material) from the nearby beach-compatible sand resource due to a 1,000 m buffer around the pipeline, and had to switch to a new, as yet unknown beach-compatible sand source and hopper dredge technology, the County would be looking at a cumulative project cost increase as high as $38,000,000 to $53,200,000 over the next forty years. This calculation does not include changes in economic conditions such as inflation, the cost of fuel, and availability of dredging contractors for future projects. A cost increase this large could effectively paralyze Manatee County's shore protection efforts.

It is important to point out that these figures are based on an assumed 1,000 meter safety buffer (recently proposed by the MMS in Louisiana) to either side of the pipeline. It is possible that the buffer could be smaller, reducing (but not eliminating) the impact, but there is no State of Florida precedent for defining a safety buffer for dredging near a natural gas pipeline, and unfortunately, there is no way to set the buffer until a pipeline has been constructed and a mineral resource identified in proximity to the pipeline. Once that happens, it is already too late to try and minimize the impact the pipeline route would have on mineral resources.

The impacts described above are direct impacts to a unique geologic mineral resource of limited existence both locally and regionally. This type of resource is of great value not only to Manatee County, but to neighboring regional communities for their shore-protection programs, including Pinellas County, Sarasota County, and the Town of Longboat Key. By allowing the construction of the Port Dolphin pipeline in its current proposed configuration, not only would

it further limit this specific beach-compatible mineral resource, but would result in the increased completion for similar, already scarce resources for regional shore-protection programs. In addition to the direct impacts, a series of cumulative impacts would occur for the foreseeable future. These cumulative impacts, described below in the County's comments for Section 6, not only impact this geologic resource, but impact biological, recreational, and socioeconomic resources as well as create issues of public safety.

The DEIS entirely overlooks the impacts to the unique mineral resources listed above. The DEIS describes the destruction of unique geological features as a major impact, and impacts due to siting of facilities to prevent recovery of mineral resources can have varying degrees of importance. With that knowledge, the DEIS then goes on to say that "Geological resources generally would not be impacted by the project. Some localized, short-term changes in sedimentation would be expected. It is not expected that the project would cause destruction of any unique geologic feature, increase erosion potential, prevent recovery of mineral resources, increase the potential for geologic hazards (e.g., seismicity), or alter soil composition or structure." This is inaccurate and misrepresents the true impacts to geologic resources due to the construction of the pipeline (as it is currently proposed) and the implementation of a "no-dredge" safety buffer around the pipeline. Without a discussion of the issues listed in the above comments, with specific details on existing, permitted, State of Florida borrow areas and unique, regionally-limited, beach-compatible sand resources, and how the proposed pipeline route directly impacts these mineral resources, the DEIS is incomplete and insufficient, as well as misleading to the layperson.

4.11 Mitigation and Minimization Measures and Monitoring

As described above, there are major impacts to Geologic Resources due to the siting of the preferred pipeline route. This route has significant impacts on scarce beach-compatible sands, both those currently identified and permitted as existing beach-compatible sand resources and those resources identified as the sole beach-compatible source for future Anna Maria Island beach nourishment needs. As such, the County believes "avoidance" should be addressed in the

DEIS since there are no plausible options for mitigation, and minimization can be accomplished through avoiding the limited beach-compatible sediment resources. However, no discussion exists in the current DEIS to address the presence of the sediment resource off the north end of Anna Maria Island.

While no mitigation measures exist for the impacts on sand resources, there are specific minimization efforts that can be employed. These efforts are described in detail in the comments provided above for section 2.1.1.3. Impacts to Geologic Resources can be minimized, or actually completely avoided, by rerouting that portion of the pipeline route which impacts the sediment resource. Viable options exist which can achieve avoidance. For example, one potential option would be to utilize the northern pipeline route in the area of the sediment resources, retaining the majority of the preferred pipeline route. Another option would be to connect via an offshore subsea interconnection to the Gulfstream Pipeline. The subsea interconnection valve already exists. This is also an alternative deemed viable by Gulfstream. By rerouting the pipeline to connect to the Gulfstream pipeline offshore, all impacts to mineral resources will be removed. The County would have no further objection to the project (in regards to mineral resource impacts) as the one major impact that greatly affects the future of its shore-protection program will be eliminated with the rerouting of the pipeline through the northern route, or selecting the subsea interconnection of the Port Dolphin pipeline to the existing Gulfstream pipeline.

If this is not deemed possible, following an extensive alternatives analysis, then perhaps the second minimization effort involves rerouting the pipeline to be collocated with the existing Gulfstream Pipeline in Florida State waters. The existence of the Gulfstream pipeline already creates a corridor where sand resources are no longer available. As an alternative to the subsea Gulfstream connection, a parallel, collocated pipeline along the existing Gulfstream Pipeline route would reduce and/or eliminate the impacts the current proposed route has to mineral resources.

The final potential minimization measure involves rerouting the pipeline entirely. This route could take the pipeline on a direct route from the offshore deepwater port, into the central portion of Southwest Passage, and onto its planned route in West-Central Lower Tampa Bay, where it would continue along its currently proposed route to Port Manatee. Another option within this alternative could be routing the pipeline from the deepwater port to a location near the subsea interconnection valve on the Gulfstream Pipeline, at which point the route would follow the proposed northern pipeline alternative through Southwest Passage to Port Manatee.

All four of these potential minimization measures would result in the elimination of impacts to geologic resources. Avoidance is the only measure that would result in a minimization to the impacts on geologic resources the proposed pipeline route would have. As stated before, once the resources are removed as a sand source due to the construction of the proposed pipeline, there are no realistic mitigation options available. Beach-compatible sands on the west-coast of Florida are a very scarce resource. There are no mitigation measures that provide relief from the destruction of these valuable and limited resources. Without seriously addressing potential measures to completely avoid the beach-compatible sediment resource, and considering the lack of realistic mitigation available for these impacts, the County will consider the DEIS to be incomplete.

Section 6: Cumulative and Other Impacts

The major impacts to the existing Geologic Resources described in our comments for section 4.4 above would lead to a series of reasonably foreseeable cumulative impacts to other resources. These major and minor impacts, described in the sections below, are not presented in the DEIS and are vital for evaluating the overall impact the proposed project would have on environmental resources.

6.2 Past, Present, and Reasonable Foreseeable Cumulative Actions

6.2.4 Oil and Gas Leasing/Mineral Leasing

The County was able to identify major impacts to the future mineral leasing activities in Florida State waters due to the previously described direct impacts to the beach-compatible geologic resource off the northwestern tip of Anna Maria Island if the Port Dolphin natural gas pipeline were constructed along the preferred route (described under our comments for section 4.4).

The geologic resource off Anna Maria Island has been used multiple times for beach nourishment and has proven time and time again to be an optimal source of beach-compatible sand for shore-protection programs. Sands of this high-quality are difficult to find due to their limited existence on the west coast of Florida. By removing access to these mineral resources by constructing a pipeline and safety buffer directly though them, Port Dolphin LLC would be further restricting the available beach-compatible mineral resources on the west-coast of Florida. This is not in the public interest of Manatee County or Florida citizens.

Several large, local communities rely on regional beach-compatible sand resources to support their shore-protection programs. These include Pinellas County, Manatee County, Sarasota County, and the Town of Longboat Key. By eliminating access to this one large, beach-compatible mineral resource, a significant increase in competition will result for the remaining limited beach-compatible mineral resources. The impact to regional mineral resources is further described below in our comments on section 6.3.4: Cumulative Impacts to Geologic Resources.

After reviewing section 6.2.4 in the DEIS, the County was surprised to see that there was no discussion of the impacts to State or Federal mineral resources. The discussion in this section focused solely on Oil and Gas leasing. There are no active Oil and Gas leases on Florida's west coast in the vicinity of the proposed project. In fact, there is currently a Congressional moratorium on Oil and Gas exploration within the immediate project area. Alternatively, there is a very long history of, and numerous active, mineral mining

projects. All of the mineral mining projects focus on identifying and utilizing beach-compatible minerals sources for beach nourishment.

The fact that Oil and Gas issues are exclusively discussed within this section, and no discussion if offered on potential cumulative impacts to mineral resources, is a major oversight in the DEIS. The DEIS is incomplete without a discussion of the following items within section 6.2.4:

1. The extensive need for beach-compatible mineral resources for shore-protection programs along the west coast of Florida;
2. A discussion of the different regional shore-protection programs (Pinellas County, Manatee County, the Town of Longboat Kay, and Sarasota County) and the specific mineral resource/leasing activities (present and future needs) of each program;
3. A discussion of the regulatory authority of the MMS and FDEP BBCS to explore, define, and permit beach-compatible mineral resources for beach nourishment activities, including a detailed discussion on the effort required to explore and define these resources;
4. A discussion on the cumulative impacts to regional sand management issues caused by the removal of a large volume of beach-compatible mineral resources due to the construction of the proposed pipeline route and associated safety buffer.

6.3 Overview of Cumulative Impacts

6.3.2 Biological Resources (Threatened and Endangered Species)

As described in the County's comments to Section 4.4, construction of the proposed pipeline in its current configuration would result in the loss of much of an optimal, proven, state-approved beach-compatible sand resource. This resource is highly limited, and primarily found only in relative close proximity to the barrier island, in shallower waters. The loss of this sediment resource due to establishment of the Port Dolphin

pipeline will result in the County having to attempt to locate a distant, less-compatible sand source elsewhere, assuming such a source would be permittable, or result in the reduction or total elimination of the shore-protection program all together.

Threatened and endangered sea turtle species, specifically the threatened Loggerhead sea turtles, rely on the beaches of Anna Maria Island to reproduce. If the County is forced to use a less-compatible sand source (i.e. darker and coarser), there could be cumulative impacts to endangered sea turtles. The less compatible beach material could impact the ability of nesting sea turtles to successfully lay eggs on the beaches of Anna Maria Island. The increase in success of sea turtle hatchlings on a nourished beach environment is partially attributable to the type of sand fill used in the project. Characteristics such as color, grain size, compaction, and gas exchange in the nest are determinants in the success of nesting.

According to Mortimer (1990), conditions favoring hatchling production may rely heavily on moisture content. The idea that moisture content may play a role in the success of hatchlings is shown in evidence that suggests turtles may experience difficulties in constructing nests in coarse, dry sands. A positive correlation between mortality of clutches and the mean particle size of the sand has been found in studies conducted on nests of the green sea turtle. Typically, the coarser the sand is, the harder it is for the nesting female to dig the nest. The sand located in the beach-compatible sediment resource located off the north end of Anna Maria Island, where the pipeline is proposed to be constructed, has been proven to be an ideal sand source for beach nourishment in terms of turtle nesting compatibility. If this sand becomes unavailable to future beach nourishment projects, then lesser-compatible material may have to be substituted for future projects, resulting in a potential cumulative impact to endangered sea turtles by reducing the quality of beach material (by having to use coarser, darker sand from a more distant source).

If the Anna Maria Island shore-protection program is eventually reduced or eliminated due to the cumulative impacts associated with the construction of the proposed pipeline through the beach-compatible sand source, then the shoreline will continue to erode until it begins to impact upland structures and infrastructure. This erosion will result in the direct loss of critical nesting habitat for endangered and threatened sea turtles. Without periodic beach nourishment, the beaches of Anna Maria Island and Longboat Key will disappear, leaving nowhere for engendered and threatened sea turtle species to nest.

The DEIS lists biological resource impact evaluation criteria as follows:

1. Violate a legal standard for protection of a species or its critical habitat (major impact);
2. Degrade the commercial, recreational, ecological, or scientific importance of a biological resource or its critical habitat (minor to major impact depending on extent of degradation);
3. Measurably change the population size (density) or change the distribution of an important species in the region (minor to major depending on extent of change).

The cumulative impacts listed within the County's comments above have the potential to satisfy all of these criteria overtime. Without a discussion of the major cumulative impacts lesser-compatible beach sand and/or the lack of sands or funds to support a beach nourishment project on the ability of endangered and threatened sea turtles to successfully nest, the DEIS is incomplete.

6.3.4 Geological Resources

Locating the proposed pipeline in the local native, white, beach-compatible sand resource available to Anna Maria Island and Manatee County, and thereby removing it from the inventory of optimal sand resources, will increase local competition for limited

sand resources, even assuming such resources can be located at a distant location and would be available to Manatee County or the Town of Longboat Key. In addition to increased local competition, regional sand management issues would arise, as the local communities are forced to look for beach-compatible sand further away from their project areas.

In the case of West-Central Florida, the removal of the beach-compatible sediment source near Anna Maria Island from the inventory of beach-compatible sand resources will result in Manatee County and Longboat Key having to explore further north and south to look for beach-compatible sand resources, which may not even be available for a variety of reasons. This takes both entities into the local territories of Pinellas and Sarasota Counties, both of which have their own active shore-protection programs requiring large amounts of beach-compatible sand. With the removal of up to 8,500,000 cy of beach-compatible material due to the construction and safety buffer associated with the proposed pipeline, competition for regional sand resources will be greatly increased among Pinellas County, Manatee County, Sarasota County, and the Town of Longboat Key, with each government trying to locate and develop beach-compatible sand resources from an ever shrinking pool of available material.

Without a discussion of how the removal of this sand source results in a cumulative effect to geologic resources by effecting regional sand management plans and multiple shore-protection programs, the DEIS is incomplete and insufficient.

6.3.6 Recreation and Aesthetics

The discussion in this section focuses on recreational issues related almost exclusively to the marine environment, *i.e.* fishing, boating, etc. There is no mention of potential impacts to upland recreational facilities, in particular beaches. As explained in the County's comments on Section 3.6.1 of the DEIS, little to no discussion exists in the DEIS on beaches and parks immediately adjacent to the pipeline route. The beaches of Anna

Maria Island are a major recreational resource, and are not mentioned as such in the DEIS. As explained in the comments on the sections above, significant cumulative impacts may arise due to the construction of the Port Dolphin pipeline in its proposed configuration. As far as recreational resources are concerned, there is the potential of long-term, cumulative impacts on the health and accessibility of Anna Maria Island beaches (of which the entire length is considered public beach), including Cortez Beach Park, Coquina Beach Park, and Manatee Beach Park, due to the proposed pipeline route. Specifically, if major impacts to the beach-compatible sand resource are realized by the construction of the pipeline and associated safety buffer, there could be significant impacts to the funding structure and availability of beach-compatible mineral resources for the foreseeable future. If this were to happen, the viability of Manatee County's shore-protection program would be in question. The beach-compatible sediments contained in the sediment deposit off the north end of Anna Maria Island may not exist elsewhere in the needed volumes, or be permittable for use by the County. Even if a sediment deposit of similar quality were discovered, a significant increase in cost, coupled with a significant decrease in available beach-compatible materials would conspire to reduce and/or eliminate the County's ability to construct beach nourishment projects. If these projects are not constructed, then the beaches of Anna Marine Island will continue to erode, eating away at the public recreational beach along the entire coastline of Anna Maria Island. Without maintenance through beach nourishment, Anna Maria Island's public beach will eventually disappear, resulting in the loss of a major recreational resource for the general public.

The DEIS lists the following criteria for evaluating impacts to recreational resources:

1. Interference with access to coastal recreational shorelines or waterways (minor to moderate depending on extent of alteration);
2. Loss or displacement of an important recreational resource, such as impairment of recreational fishing activities and other water-dependent uses (minor to major depending on extent of alteration);

3. Degradation of recreational value (moderate);
4. Alter or impair a viewshed, scenic quality, or aesthetic value not consistent with applicable laws or regulations (minor to major depending on extent of alteration).

The construction of the Port Dolphin pipeline though existing beach-compatible sand resources, as currently proposed, could foreseeably result in cumulative adverse impacts to the Anna Maria Island shoreline as a recreational resource. These impacts, as described above, would satisfy all four of the decision criteria for evaluating impacts listed in the DEIS. Without a discussion of the cumulative impacts caused by the construction of the pipeline within beach-compatible mineral resources, and how these impacts relate to the decision criteria listed in the DEIS, the DEIS is incomplete.

6.3.9 Socioeconomics and Environmental Justice

Section 6.3.9 not only neglects to discuss potential major cumulative socioeconomic impacts, but misleads the reader by indicating that the impacts are mostly positive, with only some minor and isolated negative impacts. There is absolutely no discussion as to how cumulative impacts to the funding structure of Manatee County's shore-protection program, the potential degradation of future beach-nourishment projects, the potential implications to the tax structure, and potential long-term impacts to the tourism industry are related to the cumulative effects of construction of the pipeline (as it is currently proposed) directly though a beach-compatible, nearby, sand resource.

As described in the County's comments on Section 3.9.1 above, a significant portion of the economy and tax base for Manatee County revolves around the extensive tourism industry. This industry relies on healthy and accessible beaches as the main recreational draw for the tourism industry, and for the public in general (as described in the County's comments on Section 3.6.1). The cumulative socioeconomic impact as a result of the

direct geologic impacts to the beach-compatible sand resource offshore Anna Maria is not addressed in the DEIS.

This is a significant oversight, in that the direct impact to the geologic resource as described in the County's comments on section 4.4 above has a dramatic impact to the cost of maintaining, or the future viability of, Manatee County's shore-protection program via beach nourishment projects. The direct and cumulative impacts to geologic beach-compatible sand resources (described in our comments on Section 4.4) due to the construction of the pipeline as currently proposed would result in an economic impact to Manatee County's shore-protection projects in the amount of $38,000,000 to $53,200,000 over the next 40 years (at today's financial rates). This significant cost increase to the Manatee County shore-protection program is not sustainable.

The funding for the Manatee County shore-protection program is generated through the Tourist Development Council's "Bed Tax", which is generated from the large tourism industry within Manatee County. The current bed tax provides enough funding to maintain the Manatee County shore-protection program at its current funding level, allowing for the continued support of beach nourishment programs for Anna Maria Island. The bed tax is currently able to barely keep up with the cost of construction using the current, nearby sand source/cutterhead dredge model employed by Manatee County. If the County loses access to the nearby sand resource historically used for beach nourishment, resulting in the $38,000,000 to $53,200,000 impact of exploring, defining, permitting, and excavating an as yet unknown distant sand source, and constructing future projects using a hopper dredge, the current bed tax funding structure will not be able to cover the cost increase.

This leaves the County with two alternatives, both of which are not realistic. The first alternative is that the County explores alternate funding sources. At an increase of $38,000,000 to $53,200,000, the only alternate funding source is through the County's

ad valorem property tax. This is not a realistic alternative in that the ad valorem property taxes of Manatee County are already stretched beyond capacity, and cannot sustain an increase as large as the one caused by the loss of the current and future beach-compatible sand source due to the construction of the Port Dolphin pipeline as it is currently proposed.

In addition, the County is operating under increased restrictions as to how property taxes can be raised and spent in a direct reaction to the public view that property taxes are too high and cause excessive hardship to property owners. With these new rules, and the already burdensome level of property taxes, the County will be left to decide on two options regarding property tax funding for the increase in the cost of the shore-protection program due to cumulative impacts from the construction of the pipeline in its currently proposed location. First, the County must decide if the burden of property taxes needs to be increased to cover the added cost of beach nourishment construction due to the pipeline impacts. The second option is for the County to cut funding for other existing County programs in order to fund the increase in cost due to the pipeline impacts. Based on the current restrictions the County has regarding funding of existing projects, together with the State of Florida mandate to reduce property tax burdens on property owners, the County believes these two specific options, or any other option, requiring additional funding for the shore-protection program from ad valorem property taxes is not realistic and cannot be implemented. Either one of these ad valorem property tax options would produce significant socioeconomic impacts to the general public of Manatee County, by either increasing their already burdensome property taxes, or by reducing or eliminating other County programs that benefit and support the general public of Manatee County.

This leaves only one other option. Since the bed tax cannot keep up with the cost increases due to the pipeline impacts described above, and the ad valorem tax cannot be realistically implemented without increasing the burden to tax payers or at the

expense of existing County programs, the only option left is to greatly reduce or completely abandon the shore-protection program for Manatee County. In addition to the obvious public safety issues this option would create (see County comments for Section 6.3.11 below), significant cumulative socioeconomic impacts will occur. Specifically, by not maintaining the beaches, the shoreline will continue to erode over time. As described above in our comments on sections 3.6.1. and 3.9.1, the beaches of Anna Maria Island serve as the main draw to tourist from around the United State and the world, as well as being the main recreational resource for the general public. As this resource erodes away, the tourism industry would begin to decline, effecting employment, tax revenue, and the tourism industry in general. Overtime, the beaches would be gone, and with them, the tourism industry that Manatee County and Anna Maria rely on as a major economic engine. The cumulative socioeconomic impacts of this happening are significant, yet not even mentioned in the DEIS.

One of the evaluation criteria listed for determining potential impacts on socioeconomic resources states that "substantial change to the local or regional economy, population, housing, infrastructure (schools, police, and fire services), social conditions, or employment" would be considered a major impact. As described in the County's comments on this section, the potential cumulative impacts to tourism and the tax system of Manatee County as a result of the pipeline construction, as it is currently proposed, would satisfy this evaluation criterion as a major impact. The DEIS must include a detailed discussion of the potential socioeconomic impacts due to the cost increases associated with the removal of the beach-compatible sands offshore of Anna Maria Island from the inventory of available beach-compatible sands for future beach nourishment projects. Without this discussion, the DIES is incomplete and insufficient. The following specific items should be addressed in the DIES in terms of cumulative socioeconomic impacts:

1. The impacts to the socioeconomics of Manatee County if ad valorem property taxes will be required to cover the cost increases in future beach nourishment construction projects due to the removal of the beach-compatible sands in question, and exploration for, and use of, an as yet unknown more distant sand resource due to the construction of the Port Dolphin pipeline as currently proposed. This discussion should include both the option of increasing future ad valorem taxes to cover the cost increase and the option of not increasing taxes, but cutting funding for existing programs in order to fund future beach nourishment projects.
2. The impacts to the socioeconomics of Manatee County if the shore-protection program needs to be reduced and/or abandoned due to cost increases in future beach nourishment construction projects due to the removal of the beach-compatible sands in question, and exploration for, and use of, an as yet unknown more distant sand resource due to the construction of the Port Dolphin pipeline as currently proposed. This discussion should include a detailed analysis of the impacts this would have on the Tourism Industry, employment, and tax system (including the bed tax).

6.3.11 Public Safety

As described in the comments for Section 4.4, 6.3.2, 6.3.4, and 6.3.9, the direct and cumulative impacts on the proposed pipeline route on geologic resources available for beach nourishment could cause irreparable harm to the Manatee County shore-protection program. These impacts would stress the current tax-based funding structure for the program while significantly limiting the available mineral resources required to construct future beach nourishment projects. The cumulative effect of these impacts can lead to the foreseeable reduction or elimination of the shore-protection program in the near future. Without periodic beach nourishment, Anna Maria Island will continue to erode. As the erosion continues, the shoreline will retreat and begin to threaten upland structures and infrastructure, potentially including portions of the major hurricane evacuation route for Anna Maria Island, Gulf Drive. Public and private facilities will face destruction due to the forces of the retreating shoreline.

As a result of the unchecked erosion, Gulf Drive, which serves as the hurricane and emergency evacuation route, could become compromised in the event of a major storm. Of even greater concern is the fact that Anna Maria Island has many sections which are low in elevation. These areas are subject to flooding in the event of a major storm. Studies indicate that some of the population is likely to wait until the storm is fairly close before deciding to evacuate the island. For the general public living on and visiting the barrier islands of Manatee and Sarasota Counties, there are only two evacuation routes, with both of them running parallel to the beach along Longboat Key and Anna Maria Island. The northern Longboat Key evacuation route crosses over Longboat Pass and runs along Coquina Beach on Anna Maria Island. This evacuation route is relatively close to the shoreline (less than 250 feet in some places), and without maintenance of the shoreline though beach nourishment, can quickly become undermined, resulting in the stranding of a significant number of residents and visitors on Longboat Key and Southern Anna Maria Island. One area is of particular concern. Cortez beach includes three long groin structures which were constructed in an attempt to maintain the beach in an area where Gulf Drive is particularly vulnerable to storm damage. This area is also within the limits of a beach nourishment project. There are also areas within the central part of Anna Maria Island that have experienced water overwash in storm events. The water has been pushed over Gulf Drive and the entire barrier island, eventually draining back into the bay on the back side of the island. Without a beach, this phenomenon may increase, especially in a major storm event. The public on the northern end of Anna Maria Island must also rely on a beach-parallel evacuation route that runs south to one of two bridges connecting Anna Maria Island to the mainland.

Without the shore protection benefits provided by periodic beach nourishment with available, nearby, beach-compatible sand resources, the existing hurricane and evacuation routes for both Anna Maria Island and Longboat Key face the very real

possibility of being flooded or undermined due to a reduced or eliminated shore-protection program. This results in a major cumulative impact to Public Safety due to the construction of the proposed pipeline in its current configuration. Without a discussion of the cumulative impact to Public Safety described above, the DEIS is incomplete.

In light of the information above, the County feels that Table 6.3-1 of the DEIS (presented on pages 6-9 to 6-11) needs some major revisions. This table lists the different resources, past actions, background activities, the proposed action and alternatives, known future actions, and cumulative impacts. The past actions, known future actions, and cumulative impacts columns all need to be revised to include the shore-protection activities described above and the cumulative impacts to these resources (specifically the geologic, biologic, recreational, and socioeconomic resources) describes in the County comments for section 6.3. Without a detailed discussion of these major cumulative impacts and how they affect these resources, the DEIS is incomplete and inaccurate.

6.4 Unavoidable Impacts

6.4.4 Geological Resources

The DEIS describes unavoidable impacts as "those impacts that would result from the Proposed Action or any alternatives that cannot be mitigated." The complete DEIS entry for section 6.4.4 identifies "Unavoidable disturbance of surficial sediment or soils would occur during installation of the proposed Port and pipeline" (USCG and MARAD, 2008) as the only unavoidable geologic resource impact due to the proposed project or any presented alternatives. This statement is only true for one alternative proposed in the DEIS. The DEIS alternative of tapping into the Gulfstream subsea interconnection would result in only minor additional impacts to the surficial sediments and soils along the route of the proposed pipeline from the deepwater port to the interconnection site.

As proposed, the DEIS preferred pipeline route and associated buffer zone will cause direct and irreparable harm to the availability of already limited, beach-compatible mineral resources available for beach nourishment programs such as the County's shore-protection program. These impacts cannot be mitigated or avoided once the pipeline has been constructed through the beach-compatible sediment resource off the north end of Anna Maria Island.

In order to assess "unavoidable impacts" the DEIS must comprehensively consider the impact to sediment resources for beach nourishment, and seriously address the County's proposed alternatives (utilizing a portion of the northern route, rerouting the State portion of the pipeline to be collocated alongside the Gulfstream pipeline, or to reroute the entire pipeline to go straight through the Southwest Passage, possibly along the northern route alternative as it enters Tampa Bay). Without a more detailed discussion of all three alternatives proposed by the County in the comments for section 2.1.1.3, the County feels that section 6.4.4 needs to reflect that fact that, under the preferred alternative, unavoidable and unacceptable impacts will occur to geologic resources needed to support the shore-protection program of Manatee County. These impacts will be major and could result in the expected reduction or elimination of the shore-protection program, leading to a series of cumulative impacts to geologic, biologic, and socioeconomic resources as well as public safety issues.

SUMMARY

Manatee County manages an active shore-protection program for the entire coast of Anna Maria Island. This program is funded through the Tourist Development Council "Bed Tax" which is supported by the extensive tourism industry of Manatee County. The tourism industry, in turn, is highly dependent on the beaches within Manatee County, including those of Anna Maria Island. However, the beaches of Anna Maria Island are eroding and require maintenance through implementation of a comprehensive beach nourishment program. The shore-

protection program relies on a proven, existing, native, white, beach-compatible Gulf of Mexico sand resource located off the northwestern tip of Anna Maria Island as the ideal sand source for beach nourishment. The high similarity of this sand source with the native beach, coupled with its proximity to the project area, make it an invaluable resource ideally suited for the geologic, biologic, and recreational needs of Anna Maria Island's white sandy beaches. In addition, it is these white sandy beaches that support the tourism driven economy of Anna Maria Island, Manatee County, and the State of Florida.

The Manatee County shore-protection program, and ultimately the beaches of Anna Maria Island, is in jeopardy due to the proposed location of Port Dolphin LLC's preferred and southern alternative routes for the Port Dolphin natural gas pipeline. This pipeline is proposed to be built directly through the ideal sand source that supports the current and future beach nourishment projects of Anna Maria Island. The pipeline, as well as a large buffer zone which must be established along either side of the pipeline route, greatly impact sand available for the Anna Maria Island Shore Protection Program (Figures 1 and 2). Extraction of sand by dredging would be prohibited in the buffer zone effectively eliminating the sand for future beach nourishment use. Direct impacts to this sand resource revolve around the fact that a significant volume of these beach-compatible sands will become permanently unavailable for future beach nourishment projects depending on the extent of the required buffer zone which is provided to protect the gas pipeline. This direct impact, while extreme by itself, would lead to significant cumulative impacts to the economy, public safety and the environment of Manatee County and Anna Maria Island.

If the beach-compatible sand source is impacted by the construction of the pipeline and an associated safety buffer of up to 1,000 meters, significant programmatic issues would arise. Specifically, if the nearby beach-compatible sand resource is impacted by removing up to 8,500,000 cy of ideal, beach-compatible material, the County may be forced to explore other as yet unknown sand resources. Assuming such high quality resources can be found, these resources will assuredly occur further away from the project area, causing the County to

abandon its current, efficient cutterhead dredge construction model for the less efficient and more costly hopper dredge construction model. If this was to occur, the costs of future beach nourishment projects would increase substantially, up to a potential increase of $53,200,000 over forty years, depending on the final safety buffer imposed around the pipeline. A cost increase of this magnitude will likely not be sustained by the Bed Tax alone, meaning that Manatee County will need an alternative funding source, a very difficult proposition.

A reduced or eliminated shore-protection program would result in the erosion of Anna Maria Island's white sandy beaches. If this were allowed to happen, significant cumulative impacts to biological, recreational, and socioeconomic resources would occur, as well as the introduction of sensitive public safety issues, including:

1. A reduced or eliminated shore protection program could result in the erosion of Anna Maria Island's beaches resulting in the loss of the public beaches (a major public recreation resource) of Anna Maria Island;
2. A reduced or eliminated shore protection program could result in the erosion of Anna Maria Islands beaches resulting in the loss of tourists, effecting the local socioeconomic structure through a reduction in employment and tax revenues;
3. A reduced or eliminated shore protection program could result in the erosion of Anna Maria Island's beaches resulting in the loss of protection the beaches afford the island, resulting in the potential for increased flooding and undermining of vital hurricane and emergency evacuation routes for both Anna Maria Island and Longboat Key.
4. A reduced or eliminated shore protection program could result in the erosion of Anna Maria Island's beaches resulting in the loss of the beach as habitat, and loss of critical habitat needed for threatened sea turtle nesting;

These issues are vital to the continued well being of Manatee County, yet none of these concerns are addressed in the DEIS issued by the USCG and MARAD or the Deepwater Port License Application issued by Port Dolphin LLC. Manatee County believes that all of these issues need to be included and comprehensively addressed within the DEIS so that the USCG and

MARAD, and the Governor of Florida (as a Governor of an adjacent coastal state) can make a fully informed decision on the Application for a Deepwater Port License submitted by Port Dolphin LLC.

The County also feels that it important to state unequivocally that the Port Dolphin LLC Deepwater Port and associated pipeline and the Manatee County shore-protection program are not mutually exclusive projects. In fact, several seemingly viable pipeline route alternatives exist that can allow the Port Dolphin project to be constructed without affecting the vital and highly limited sand resources required by Manatee County for its shore-protection program (Figure 3).

These alternatives include:

- Constructing the Port Dolphin pipeline from the deepwater port to an existing y-valve in the Gulfstream natural gas pipeline, where the Port Dolphin facility could then tie-into the existing pipeline. This option also eliminates many of the environmental impacts associated with the preferred route;
- Follow the preferred pipeline route as it is proposed, from the deepwater port toward Southwest Passage, where the pipeline would then deviate to the proposed northern alternative route as it enters Tampa Bay through Southwest Passage. Once inside of Tampa Bay, the pipeline could then deviate back to the preferred route. The vast majority of the preferred pipeline route could be retained with this minor adjustment.
- A new alternative that would construct the pipeline route from the proposed deepwater port site straight to a spot approximately 2,000 feet south of where the existing Gulfstream pipeline crosses the Federal/State Boundary, approximately nine miles west of Egmont Key. At this point, the new pipeline could be collocated, or constructed parallel to, the existing Gulfstream pipeline all the way into Port Manatee.
- A new alternative that would construct the pipeline straight from the offshore deepwater port site, directly to Southwest Passage (not Passage Key Inlet), crossing the

Gulfstream Pipeline, and then continuing straight to its planned location in West-Central Lower Tampa Bay (all in one straight line).

Each of these alternatives results in no impacts (direct or cumulative) to the beach-compatible mineral resources off Anna Maria Island that are vital to Manatee County's shore-protection program. With this in mind, the County strongly believes that a more detailed alternatives analysis needs to be presented in the DEIS. This analysis needs to build on the previously described alternatives, while adding the new alternatives suggested by the County. Each alternative needs to be critically evaluated in terms of direct and cumulative environmental resource impacts, with the greatest weight given to the alternative(s) that have the least impacts to these environmental resources. In addition, the direct and cumulative impacts raised by the County in these detailed comments need to be included and critically evaluated in the DEIS.

In its current form, the DEIS lacks a significant amount of essential information regarding alternatives and true resource impacts, and a revised DEIS needs to be issued that addresses these significant issues prior to going to the Final EIS stage.

While Manatee County has strong objections to the way the project is currently proposed, the County feels that there a seemingly minor changes that can be made by Port Dolphin LLC to the preferred pipeline route that would result in no impacts to vital beach-compatible mineral resources. With this in mind, the County is willing to work directly with Port Dolphin LLC and/or the USCG and MARAD to explore these alternatives in order to design a route that is mutually beneficial to both Manatee County and Port Dolphin LLC.

NOAA National Marine Fisheries Service

Researchers to develop ocean sanctuary 'noise budget' to evaluate potential impact on marine mammals

3-D blueprint could serve as national and international model

Like sentinels at their posts, an array of buoys equipped with underwater microphones and other sensors will be on duty in the Stellwagen Bank National Marine Sanctuary off the coast of Massachusetts for the next 30 months, recording sounds from whales, fish, ships and other sources around the clock. NOAA marine mammal scientists will analyze the biological sounds to help develop a global monitoring network for ocean noise, an important step in effectively managing marine sanctuary resources and protecting endangered species like the North Atlantic right whale.

"The ocean is a noisy place," said Sofie Van Parijs, marine mammal acoustician at NOAA's Northeast Fisheries Science Center (NEFSC) and a project scientist. "It's full of natural sounds and those from human activities, and there is substantial evidence that the level of man-made noise is rising. Marine mammals and many fishes are highly dependent on sound for communication, navigation, foraging and predator avoidance. We need to understand how these animals, especially endangered and protected species, are impacted by sounds from many sources to be able to better manage and protect these living resources."

An ocean-observing system consisting of ten autonomous recording units will be deployed for periods of three months, each in different parts of the Sanctuary at different times of the year, to monitor low frequency sounds. The passive-acoustic buoys, moored to the ocean floor and fully submerged, continually record ocean sounds around the clock before they pop to the surface on command so the data can be retrieved and batteries refreshed.

The three-year project began in late December with funding from the National Oceanographic Partnership Program and a team of scientists and engineers from NOAA Fisheries, NOAA Sanctuaries, the Bioacoustic Research Program at Cornell University and Marine Acoustics, Inc. Van Parijs and NEFSC colleague Denise Risch, also a marine mammal bioacoustician, will analyze the biological sounds collected during the study, while Sanctuary scientists Leila Hatch, Michael Thompson and Dave Wiley will focus on the anthropogenic or human-produced sounds. Project leader Chris Clark of Cornell University and colleagues provide scientific guidance, hardware and software, and are working with Bill Ellison of Marine Acoustics, Inc. on modeling ocean noise propagation within the sanctuary.

The Gerry E. Studds Stellwagen Bank National Marine Sanctuary is an urban marine sanctuary located in close proximity to Boston and a densely populated coastal zone. The area has commercial fishing fleets, heavy vessel traffic, is frequented by marine mammals like endangered Northern right whales, and forms a critical feeding ground for endangered fin and humpback whales. It is also home to acoustically-sensitive marine animals like commercially important haddock and other fishes, sharks and sea turtles.

Van Parijs says the Sanctuary is a perfect place to build a case study that can provide a benchmark to scientifically evaluate the impacts and interactions between various human-produced sounds and acoustically-sensitive marine animals.

ATTACHMENT C

The abundance of endangered whales and human activities in the Sanctuary will help the team address many of the recommendations made by the National Research Council's

committee on the potential impacts of ambient noise in the ocean on marine mammals. The committee has cited the importance of sound in the lives of marine mammals, the potential for harm from excessive noise, and the lack of scientific data as to the amounts of noise introduced into the oceans by human activities and its potential impact on marine mammals.

"We need to ground-truth current sampling and analysis techniques and identify gaps that must be addressed prior to implementing a large-scale domestic or international monitoring program," Van Parijs said. "The products of this project will be a suite of tools designed to be transferable for use in other ecological regions or sanctuaries along with an extensive database of sounds. This project is a first step toward a much larger goal of establishing a global passive acoustic monitoring network to measure ambient noise levels in a variety of locations."

The first set of project buoys deployed in December were recently recovered from the northeast corner of the Sanctuary and were redeployed March 7 in the southwest corner, where endangered Northern right whales are congregating. The area is a primary nursing and feeding ground for the whales in the spring.

Ten similar buoys were used successfully in the Sanctuary in 2006 during a one-year pilot project in preparation for this study. This is the first project to record all types of sounds over a long time period in a relatively large area in an effort to characterize the marine acoustic environment and the health of an urbanized, highly productive ecosystem. One potential use of the information: scientists could track whale migration patterns and ship movements to help prevent collisions, a leading cause of whale mortality.

"Our goals are to map the low-frequency noise budget throughout the Sanctuary, identify and quantify the contributing sources of sounds, and determine whether or not these noises have the potential to impact endangered marine mammals and fishes," said David Wiley, the Sanctuary's research coordinator. "The results from this project will have local, national and international implications."

Washington, DC 20590

RE: Port Dolphin LNG Deepwater Port Facility
Environmental Impact Statement

To Whom It May Concern:

Pinellas County has concerns with the pipeline route presented as the Preferred Alternative in the April 18, 2008, United States Coast Guard and the United States Department of Transportation, Maritime Administration's Draft Environmental Impact Statement (DEIS) for the Port Dolphin LNG Deepwater Port facility. As proposed, the port would be a liquid natural gas re-gasification and offloading facility located 28 miles offshore Anna Maria Island in Manatee County. The facility would be connected to Port Manatee via a submerged pipeline. While Pinellas County is not opposed to the deepwater port, we are concerned with the location of the pipeline route as it traverses an important sand "borrow area". This borrow area is the primary source of beach renourishment sand for Manatee County and Longboat Key. Unfortunately, it would be rendered unusable if the Preferred Alternative pipeline route were constructed due to required buffer zones during dredging to protect the gas pipeline. This borrow area contains beach-compatible white sand, which is difficult and costly to locate. This type of sand is in high demand along the west coast of Florida due to its similarity with our native beaches. For example, Pinellas County is presently conducting a $1 million offshore sand search for a similar borrow area for future beach renourishment.

1

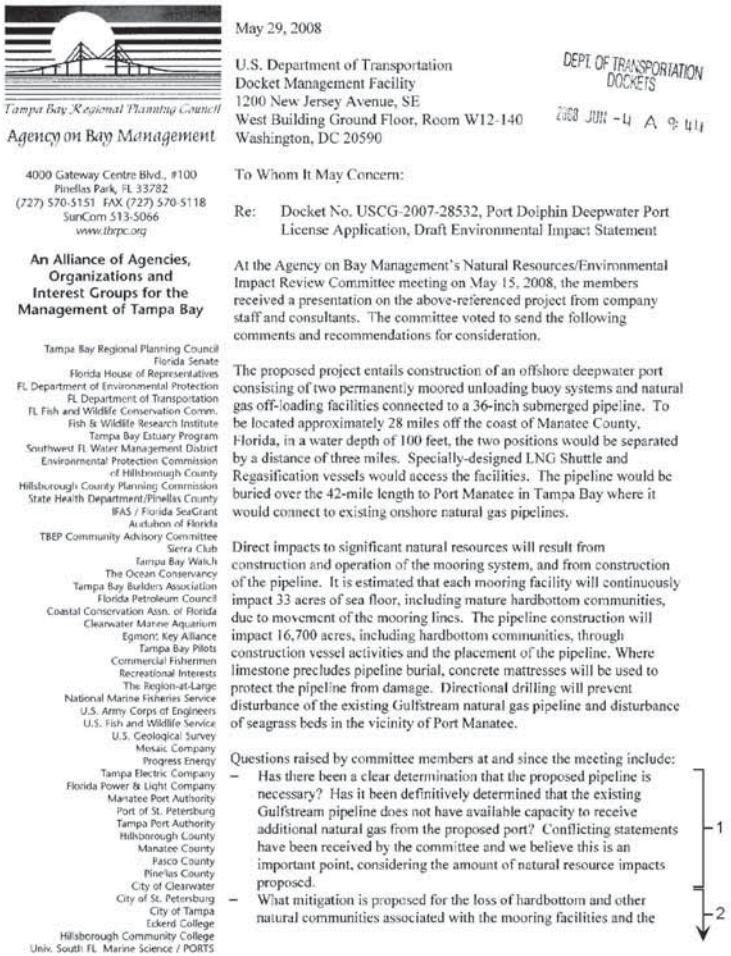
In addition to the Manatee County/Longboat Key borrow area described above, the Preferred Alternative pipeline route crosses four potential future borrow areas identified in a new offshore sand search. Longboat Key initiated this new offshore sand search earlier this year to locate additional beach-compatible sand sources before learning about the subject DEIS. The initial search area extended into southern Pinellas County and included our largest and most important borrow area, the sand shoal on the north side of Egmont Channel. In other words, competition for limited sand resources already exists without the elimination of the large Manatee County/Longboat Key borrow area. Construction of the Preferred Alternative pipeline route will eliminate one of the viable sand sources in the region leading to increased competition for already-limited white sand resources on the west coast of Florida.

2

3

1. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. Alternatives that avoid/reduce impacts on sand resources are discussed in Sections 2.1.4.5 and 2.1.4.6 of the Final EIS. Impacts from these alternatives are discussed in Sections 4.2.1.6.1, 4.4.1, 4.4.2, 4.5.1, 4.5.2, and 4.9.1.

2. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. Alternatives that avoid/reduce impacts on sand resources are discussed in Sections 2.1.4.5 and 2.1.4.6 of the Final EIS. Impacts from these alternatives are discussed in Sections 4.2.1.6.1, 4.4.1, 4.4.2, 4.5.1, 4.5.2, and 4.9.1.



3. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. Alternatives that avoid/reduce impacts on sand resources are discussed in Sections 2.1.4.5 and 2.1.4.6 of the Final EIS. Impacts from these alternatives are discussed in Sections 4.2.1.6.1, 4.4.1, 4.4.2, 4.5.1, 4.5.2, and 4.9.1.

Four potential pipeline route alternatives were proposed for the Port Dolphin project that would not impact the limited sand resources on the west coast of Florida. These alternatives were presented in a report compiled for the Town of Longboat Key by their consultant, Coastal Planning and Engineering, Inc. We strongly urge you to give higher priority to these other proposed routes. -4

Sincerely,

Fred E. Marquis
Interim County Administrator
ewJ

4. The alternatives proposed by CPE, Inc. have been considered in preparation of the Final EIS.

To Whom It May Concern:

Re: Docket No. USCG-2007-28532, Port Dolphin Deepwater Port License Application, Draft Environmental Impact Statement

At the Agency on Bay Management's Natural Resources/Environmental Impact Review Committee meeting on May 15, 2008, the members received a presentation on the above-referenced project from company staff and consultants. The committee voted to send the following comments and recommendations for consideration.

The proposed project entails construction of an offshore deepwater port consisting of two permanently moored unloading buoy systems and natural gas off-loading facilities connected to a 36-inch submerged pipeline. To be located approximately 28 miles off the coast of Manatee County, Florida, in a water depth of 100 feet, the two positions would be separated by a distance of three miles. Specially-designed LNG Shuttle and Regasification vessels would access the facilities. The pipeline would be buried over the 42-mile length to Port Manatee in Tampa Bay where it would connect to existing onshore natural gas pipelines.

Direct impacts to significant natural resources will result from construction and operation of the mooring system, and from construction of the pipeline. It is estimated that each mooring facility will continuously impact 33 acres of sea floor, including mature hardbottom communities, due to movement of the mooring lines. The pipeline construction will impact 16,700 acres, including hardbottom communities, through construction vessel activities and the placement of the pipeline. Where limestone precludes pipeline burial, concrete mattresses will be used to protect the pipeline from damage. Directional drilling will prevent disturbance of the existing Gulfstream natural gas pipeline and disturbance of seagrass beds in the vicinity of Port Manatee.

Questions raised by committee members at and since the meeting include:

- Has there been a clear determination that the proposed pipeline is necessary? Has it been definitively determined that the existing Gulfstream pipeline does not have available capacity to receive additional natural gas from the proposed port? Conflicting statements have been received by the committee and we believe this is an important point, considering the amount of natural resource impacts proposed. — 1
- What mitigation is proposed for the loss of hardbottom and other natural communities associated with the mooring facilities and the — 2

1. The purpose and need are discussed in Section 1.2 of the EIS. Section 2.1.4 discusses an alternative to connect to the Gulfstream pipeline offshore.

2. The Maritime Administration and USCG would require the Applicant to mitigate impacts to hardbottom communities. The Applicant has proposed to bury the pipeline with concrete mattresses over hardbottom areas resulting in a net increase of hard bottom area. Section 4 discussions include potential construction, operation, and decommissioning impacts by resource area. Section 4.11.1 (subsection Benthic Habitat Impact Mitigation), discusses the mitigation measures for hard-bottom communities. Section 6 relates project impacts to other past and known future actions in the area.

pipeline? Have the secondary impacts of construction and operation been taken into account in the assessment of impact and mitigation? 2

- Concerns have been raised by the Florida Fish and Wildlife Conservation Commission and the National Oceanic and Atmospheric Administration over the database used to model fisheries impacts from the regasification operation. How will the analysis of impacts be modified to address these concerns? 3

The Agency on Bay Management wishes to review the Final Environ-mental Impact Statement and any permit applications associated with this project, including the port, offshore pipeline, onshore pipeline, and facility operation. Please provide all material to Ms. Suzanne Cooper, ABM staff, via "ftp" access or e-mail to *suzanne@tbrpc.org* or U.S. Postal Service to the address on the letterhead. She will distribute it to the Agency members.

We deeply appreciate the opportunity to provide comments on this project, and look forward to reviewing the additional information outlined above.

And please do not hesitate to call on us, at 727-570-5151 x 32, if we can assist in any other way.

Sincerely,

Suzanne J. Cooper for

Robert Kersteen

Potential Impacts of the Port Dolphin Pipeline on Beach Nourishment Sand Resources on Florida's West Coast

INTRODUCTION

Both Manatee County and the Town of Longboat Key (together with other Florida west coast communities) have active shore protection programs requiring large amounts of beach compatible offshore sand resources for beach nourishment activities. Sand resources undergo extensive and costly mapping and analysis in order to define and permit the most suitable sand for these projects. Unfortunately, these sand resources are limited and will eventually be depleted. Loss of beach compatible sand due to the impact of the proposed Port Dolphin pipeline route through beach quality sand resources will irreparably harm beach preservation and maintenance efforts in Manatee and Sarasota counties, as well as other neighboring communities. Alternatives exist that can minimize impacts to these communities. 1

MANATEE COUNTY SHORE PROTECTION PROGRAM

Manatee County manages the Anna Maria Island Shore Protection Project, consisting of two separate beach nourishment project areas. The goal of these projects is to provide protection for all of Anna Maria Island's approximately seven miles of coastline. The entire length of Anna Maria Island is considered to be "Critically Eroded" by the Florida Department of Environmental Protection (FDEP), and prior to implementation of the program, was eroded substantially, adversely effecting private and public upland properties (Figure 1).

Anna Maria Island's economy is based on tourism. The single feature that draws thousands of tourists to Anna Maria 2

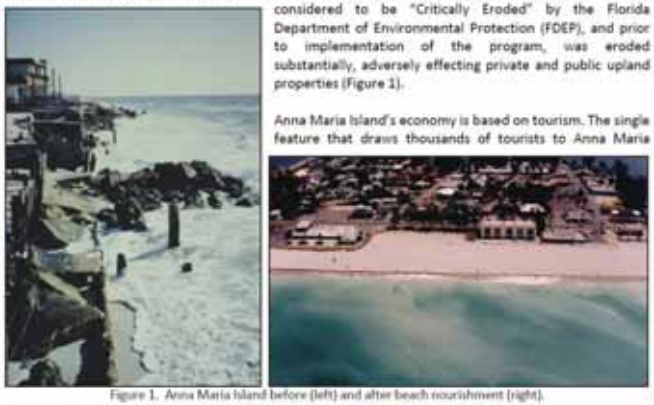

Figure 1. Anna Maria Island before (left) and after beach nourishment (right).

1. In response to comments the Applicant revised the proposed pipeline route to avoid permitted sand resources. See Section 2.1.4 of the Final EIS for a description of the alternatives. Sand resources are described in Section 3.4 and impacts from these alternatives are discussed in Sections 4.2.1.6.1, 4.4.1, 4.4.2, 4.5.1, 4.5.2, and 4.9.1.

2. A pipeline route paralleling Gulfstream would involve impacts to other benthic resources and raise objections from Gulfstream similar to objections already raised in filings on the FERC docket.

Island is its beautiful white sand beaches. Numerous hotels, motels, rental homes, restaurants, stores and other related businesses depend on the beaches of the Island to survive. However, Anna Maria Island has a serious beach erosion problem that is only addressed through a comprehensive program of periodic beach renourishment. In order to successfully maintain and preserve the beaches of Anna Maria Island, offshore high quality sediment is needed as the material to replace beach sand lost to erosion.

The sediment source off of the north end of Anna Maria Island is the only available economical sediment deposit with similar sediment characteristics to that of the Anna Maria Island beach available to Manatee County. It is a source which meets the rigorous requirements of the State of Florida concerning "beach compatible" sediment. Most of the sediment in near vicinity to Anna Maria Island is of marginal quality, or will not meet State requirements. There is one other source of high quality white colored sand located within Longboat Pass, but this source is limited in volume, and is not eligible for permits from the FDEP. Sand resources off the west coast of Florida for beach nourishment are a dwindling resource. As the availability of beach-compatible sands becomes less and less, the regional needs of Manatee County and its neighbors, specifically the Town of Longboat Key and Pinellas County, begin to overlap, causing an increase in competition for the dwindling sand resources. As the sands become more sporadic and competition grows, regional sand management issues become more important. The existing sand resources, therefore, must be available if the beaches south of Tampa Bay are to be maintained. The ebb tidal shoal complex off the north end of Anna Maria Island is a major deposit and is vital to Anna Maria Island.

Figure 2. Anna Maria Island Shore Protection Project limits.

Manatee County's current sand resource needs for these projects are substantial. The Central Project area requires 1,900,000 cubic yards (cy) of beach compatible offshore sand every ten years (Figure 2). The next nourishment of the Central Project is currently scheduled for sometime between 2011 and 2013. The Coquina Beach Project area requires 420,000 cy of beach compatible offshore sand. The next nourishment of the Coquina Beach Project is currently scheduled for early 2009.

Identification of sand resources for both of these projects is currently underway and is focusing on the ebb tidal shoal complex off the north end of Anna Maria Island (described above), which was utilized for the last two beach nourishment events (Figure 6). This historic Anna Maria Island borrow areas lie immediately south of the proposed pipeline route, within a large shoal offshore the northern tip of Anna

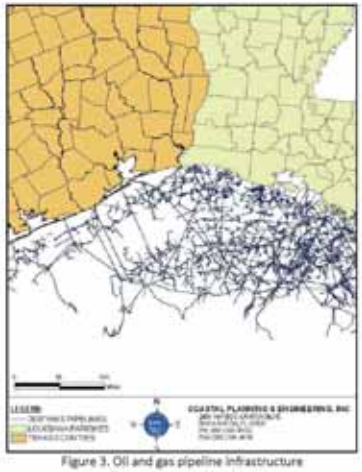

Figure 3. Oil and gas pipeline infrastructure offshore Texas and Louisiana

Maria Island. The sand quality of this shoal has repeatedly proven to be optimal for the beach nourishment needs of Manatee County and is considered to be the long term source of beach nourishment sands for the County. An estimated 18,245,000 cy of beach-compatible material is located within this shoal (Figure 7). The pipeline route is currently proposed to bisect this shoal.

If the pipeline follows the proposed route, any future dredging activities will have to be buffered to prevent impacts to the pipeline. These buffers (as yet undefined by the FDEP) can be quite large. The closest example of oil and gas pipelines impacting proposed sediment resource areas occurs offshore Texas and Louisiana, where substantial (and historically uncoordinated) pipeline construction present extreme difficulties to sediment resource delineation (Figure 3). Recently, the United States Minerals Management Service (MMS) was requesting buffers as large as 1,000 meters (m) around pipeline routes. Therefore, any buffer will greatly impact the volume of available material from this shoal for future use in beach nourishment projects. 2

As an example, we have calculated an estimate of the impact the proposed pipeline route, in the form of both a 1,000 m and 1,000 foot (ft) buffer, would have on the existing beach-compatible sands available in the shoal offshore the northern tip of Anna Maria Island (Figure 7). When a 1,000 m buffer is placed around the proposed pipeline route, the currently available 18,245,000 cy yards of beach compatible sand is reduced to an estimated 9,654,800 cy, resulting in the loss of 8,590,200 cy of sand for future beach nourishment projects. This figure is the equivalent of approximately four full Anna Maria Island renourishment projects alone (not counting any other regional sand needs). In other words, the current proposed pipeline location, together with a 1,000 m buffer, would result in the loss of 40 years worth of project-compatible sands for the Anna Maria Island Shoreline Protection Project.

If this buffer was reduced to 1,000 ft (a potentially optimistic buffer), the currently available 18,245,000 cy yards of beach compatible sand is reduced to an estimated 16,211,200 cy, resulting in the loss of 2,033,800 cy of sand for future beach nourishment projects, well over the minimum needed for one full Anna Maria Island beach nourishment project. These represent significant volumes of beach compatible material that would become permanently unavailable for future beach nourishment activities. Not only does this impact regional sand management, but it will cause irreparable harm for Manatee County's Shore Protection Program.

The sediment within this area can be excavated by a hydraulic cutterhead dredge because the distance from the sediment deposit to the beach is relatively short. This area has previously been used on two occasions to restore the beaches of Anna Maria Island. In each case, a cutterhead dredge was used to excavate the sediment and pump it to the beach. The use of a cutterhead type dredge resulted in a substantial reduction in construction cost verses the use of other types of dredging technology because cutterhead technology is more efficient. The unit cost to place the sand on the beach is estimated to be half of the cost compared to the use of other types of dredging technology, such as hopper dredges. Cost savings are estimated to be $5 to $7 per cubic yard of placed beach sediment using a cutterhead dredge from the existing sand source verses a hopper dredge mining a slightly more distant sand source. For the Anna Maria Island Beach Renourishment Project, this results in a cost savings of $9,500,000 to $13,300,000 for one 1,900,000 cy project. If Manatee County lost four projects worth of sand from the nearby sand resource (due to a 1,000 m buffer around the pipeline), and had to switch to a different sand source and dredge technology, the County would be looking at a cumulative project cost increase in the neighborhood of $38,000,000 to $53,200,000. This calculation does not include changes in economic conditions such as inflation, the cost of fuel, and availability of dredging contractors for future projects. A cost increase this large could effectively paralyze Manatee County's shore protection efforts.

LONGBOAT KEY SHORE PROTECTION PROGRAM

The Town of Longboat Key administers an extensive shore protection program that actively manages the entire twelve-mile coastline of the Town (Figure 5). This program revolves around an eight year cycle of

Figure 4. Longboat Key Reach 2 before (top left) and after (bottom left) 2005/2006 beach nourishment; and Reach 4 before (top right) and after (bottom right) 2005/2006 beach nourishment.

2

renourishment for the entire coastline of Longboat Key, all of which is designated "Critically Eroded" by the Florida Department of Environmental Protection (Figure 4).

During the most recent nourishment in 2005/2006, 1,789,332 cy of beach-compatible sand was pumped along 52,000 ft of Longboat Key shoreline. Approximately 1,000,000 cy of this material was dredged from a permitted borrow area within the beach-compatible shoal described above. This borrow area was not fully depleted, and currently has approximately 1,500,000 cy of beach-compatible material available for future beach nourishment events. Unfortunately, as currently proposed, the Port Dolphin pipeline bisects this borrow area (Figure 6). Once buffered, the pipeline will likely prevent use of the remaining sands of the active borrow area in the future. Considerable expense has already been spent to locate, design, and permit this borrow area, and the loss of this borrow area would represent a significant financial, timing, and resource loss to the Longboat Key Comprehensive Beach Management Plan.

Figure 5. Longboat Key Shore Protection Project Limits.

If the Town of Longboat Key loses access to the borrow area, it will be required to search for an alternate sand source. Considering the potential loss of a large portion of the nearshore shoal off Anna Maria Island due to the pipeline construction, the likelihood of locating a similar quality borrow area at the same distance or closer to the project area is low. The location of a borrow area further away will result in a substantial increase in cost to the Town in order to construct the next beach nourishment. -2

For purposes of discussion, the economic impact to the Town can be summarized as follows:

1. Loss of investment of previous sand investigations and analyses for current borrow area ($500,000).
2. Investment cost to locate a new sand resource of similar quality ($500,000).
3. Incremental increase in cost (estimated at $2.00/cy) of transporting sand the additional distance ($3,000,000).
4. Total economic impact to the Town of Longboat Key is $4,000,000.

In addition to bisecting an existing Longboat Key borrow area, the proposed pipeline route impacts several offshore sand hills that are currently being investigated as potential future Longboat Key sand sources. These hills occur along the proposed pipeline route from three to ten nautical miles (nm) offshore of Anna Maria Island (Figure 8). In April, 2008, the Town of Longboat Key initiated a

reconnaissance-level geophysical and geotechnical investigation of those potential resources. The proposed pipeline route, if constructed, would impact large portions of these potential sediment resources, and together with the impact to the nearshore shoal off the northern tip of Anna Maria Island, would constitute a substantial economic impact to all future Longboat Key beach nourishment events.

POTENTIAL ALTERNATIVES

Both Manatee County and the Town of Longboat Key desire to work with Port Dolphin LLC in order to define an alternate pipeline route that satisfies the goals of all interested parties. We feel that there are multiple options that revolve around the existing Gulfstream pipeline that could both preserve a pipeline route for Port Dolphin LLC while avoiding beach-compatible sand resources. The fact that the Gulfstream pipeline has already been constructed automatically creates a pipeline corridor that local communities must avoid while developing and dredging regional sand source areas. It would seem logical to build within this corridor to reduce impacts to sand resources while preserving a pipeline route from the proposed deep-water port facility to Port Manatee. A second alternative would consist of tapping into the Gulfstream pipeline well offshore, thus eliminating the need to traverse potential State of Florida sand resources with a new pipeline.

2

3

SUMMARY

Both Manatee County and Longboat Key have major concerns with the proposed Port Dolphin pipeline route. The route, as currently designed, will have major economic and performance impacts on the existing shore protection programs of both communities, resulting in increased project costs (greater than $50,000,000 in direct impacts), most of which is funded by tax-payer dollars. These cost increases may inevitably result in a decrease in project scope, which ultimately decreases shore protection to private and public infrastructure and public safety within these communities. In addition, Pinellas County has expressed concern over the pipeline route and its impact on regional sand management. While the current proposed route does not have direct impacts on Pinellas County, a reduction of regional sand resources can have a potential long-term impact on all regional Shore Protection Programs by creating increased competition for already limited regional sand resources.

RE: Port Dolphin LLC Liquefied Natural Gas Deepwater Port License Application, Public Docket USCG-2007-28532.

Dear Mr. Martin:

My name is Jon Thaxton and I am the Chair of the Sarasota Board of County Commissioners. I am writing on behalf of the Board to express our support of the Town of Longboat Key's efforts to have the Port Dolphin LNG pipeline route changed to eliminate or minimize impacts to critical current and future beach compatible sand resources. 1

While Sarasota County supports construction of the Port Dolphin project, Sarasota County does not concur in the proposed near-shore modified pipeline route because the pipeline still will intercept sand deposits farther offshore that may contain extremely valuable beach-quality sand. It would be hard to overstate the importance of the area's beaches to Sarasota County, its neighboring jurisdictions, and the millions of people who live in the immediate area. Replenishing the area's beaches is necessary to prevent erosion and flooding, protect the public safety, sustain the region's economy, preserve the habitat of threatened and endangered sea turtles and provide for the well being of residents and visitors alike. The sand resources nearest shore will eventually be depleted, requiring Sarasota County and its neighboring jurisdictions to use the other resources off shore of Tampa Bay, major portions of which the Port Dolphin pipeline would put off limits to us. 2 3

Local jurisdictions, including Sarasota County, have invested millions of dollars in recent years to develop information about known and potential sand sources that could support our absolutely essential beach nourishment and habitat protection programs. As shown by these studies, and as confirmed by the extensive data that we understand Port Dolphin has developed, the proposed pipeline will pass through at least four areas that contain beach-quality sand. Sarasota County, and its neighbors, will need this sand within a few years. 4

Addendum II does propose a slightly revised route that avoids most of the closest near-shore known beach-compatible sand deposits. However, Addendum II does not consider the alternative route that the Town of Longboat Key proposed that would co-locate the pipeline with the Gulfstream Pipeline, or the possibility of other alternative routes that could be 5

1. Comment noted.

2. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

3. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

4. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

5. Section 2.1 addresses several possible alternatives for the project including three pipeline alternatives, an offshore interconnection to the Gulfstream Interstate Pipeline, and the route proposed by Longboat Key during the public comment period. Furthermore, the Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

Raymond M. Martin
February 13, 2009
Page two

located in large offshore areas that appear to have little or no sand resources. We do not understand how the Coast Guard or the Maritime Administration could prepare an adequate Environmental Impact Statement or ultimately issue a license for the project without thorough study of these fundamentally different routes, and not just the minor adjustments Port Dolphin has proposed. 5

Sarasota County understands that Port Dolphin has extensive geophysical and geotechnical data from which Port Dolphin could readily construct a complete scientific picture of where beach-quality sand exists in most if not all of the off-shore area west of Tampa Bay along any of the pipeline routes that have been discussed. This kind of study by Port Dolphin would supplement the information that Sarasota County and the other shoreline jurisdictions have developed and are developing through ongoing studies. We urge the Coast Guard and the Maritime Administration to require Port Dolphin to conduct such an analysis before any evaluation of the environmental impacts of any of the alternatives occurs. 6

Beach-quality sand resources in the offshore area, whether in state or close-in federal waters, are essential to Sarasota County's and other beachfront jurisdictions' beach restoration and protection programs. Yet the impact of the pipeline on this essential resource received only superficial attention in the draft EIS. Accordingly, we respectfully request that the Coast Guard and MARAD issue a revised or supplemental draft EIS that fully addresses the sand issue and circulate that draft for public comment before preparing a final EIS. 7

Sincerely,

JON THAXTON
Chair

6. The Applicant revised the proposed pipeline route to avoid sand resource areas. See the revised pipeline description in Section 2.1.4 of the Final EIS. Sand resources are discussed in Sections 3.4 and 4.4.

7. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

COMMENTS OF GULFSTREAM NATURAL GAS S YSTEM, L.L.C. ON PORT DOLPHIN SUBMISSI ON AND DRAFT ENVIRONMENTAL IMPACT STATEMENT

Gulfstream Natural Gas System, L.L.C. ("Gulfstream") submits these comments on the April 2008 Draft Environmental Impact Statement ("DEIS") issued by the United States Coast Guard ("USCG") and the Maritime Administration ("MARAD") in response to Port Dolphin LLC's ("Port Dolphin") March 2007 deepwater port application, as amended in December 2007, and its January 2008 amended application under Section 7(c) of the Natural Gas Act ("NGA"), 15 U.S.C. § 717f(c), and Part 157 of the Federal Energy Regulatory Commission's ("Commission") regulations, 18 C.F.R. Part 157, for a certificate of public convenience and necessity to construct, install, own, operate, and maintain a new non-open access natural gas pipeline and related facilities to transport Port Dolphin's regasified LNG from the proposed Port Dolphin Project, a deepwater port offshore of Tampa Bay, Florida, from the shoreline to proposed interconnections with Gulfstream and Peoples Gas System/TECO Energy, Inc. ("Peoples/TECO"). Because of its relationship with and reference to the DEIS, these

comments also respond to the May 6, 2008 submission of Port Dolphin in FERC Docket Nos. CP07-191-000, *et al.*[1]

I. EXECUTIVE SUMMARY

The DEIS is deficient in two material respects: (1) it ignores the safety and operational issues associated with the proposed onshore route of the Port Dolphin pipeline through Port Manatee; and (2) it incorrectly concludes that the offshore interconnection of the proposed Port Dolphin pipeline with Gulfstream "is not technically feasible".[2] Gulfstream's comments address these and related matters.

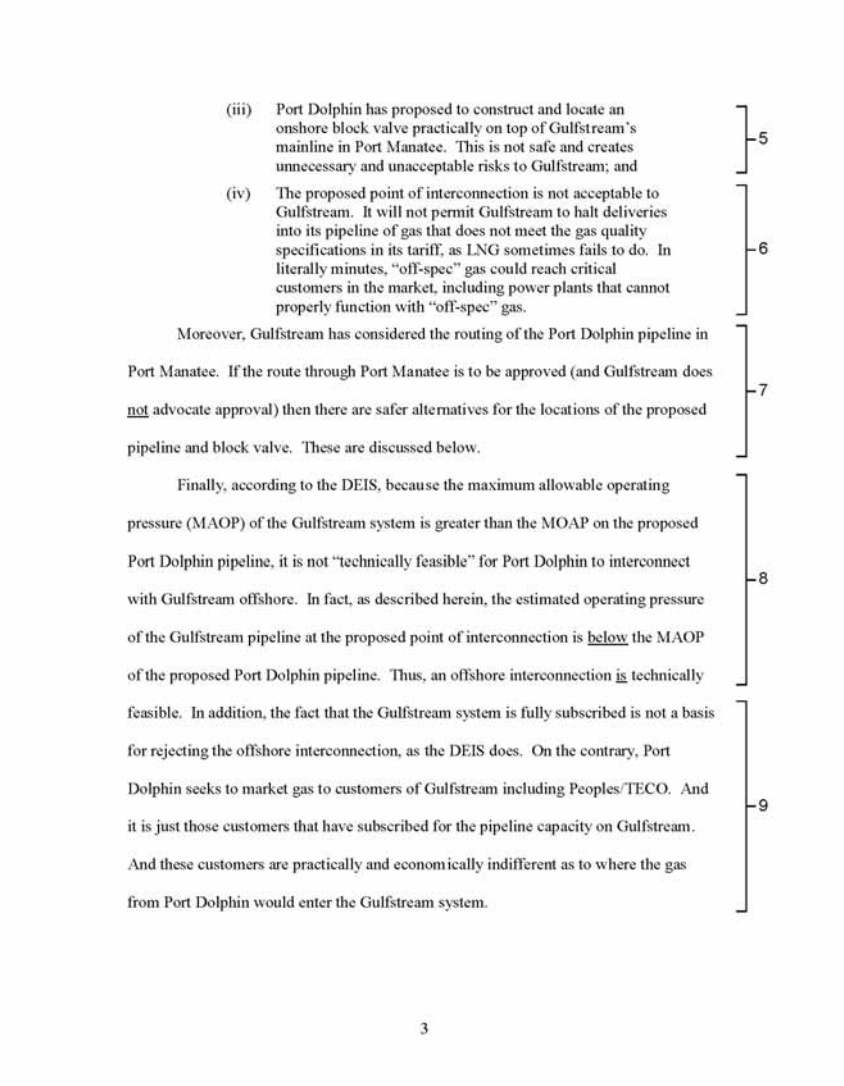
As discussed below, the DEIS is almost void of any analysis of the onshore portion of the proposed Port Dolphin pipeline. In its prior protest and comments to the FERC (which also were served on MARAD/USCG), Gulfstream raised several serious safety and operational concerns. These can be summarized as follows:

(i) Port Dolphin's proposed horizontal direction drill ("HDD") and the proposed route are not safe. Port Dolphin proposes to initiate its HDD less than 25 feet from Gulfstream's mainline in Port Manatee, within a right-of-way held by Gulfstream and to utilize Gulfstream's pipeline right-of-way for the construction and operation of its facilities;

(ii) Rather than following industry established best practices requiring pipelines to cross at or near a 90-degree angle, Port Dolphin proposes to parallel Gulfstream mainline within a very tight corridor in Port Manatee and to cross under Gulfstream's mainline at an extremely shallow angle;

[1] To the extent deemed necessary by the Commission, Gulfstream respectfully seeks waiver of the Commission's regulations and leave to respond to Port Dolphin's May 6, 2008 submission to provide material information and to assist the Commission in its decision-making process. *Kinder Morgan Interstate Gas Transmission LLC*, 123 FERC ¶ 61,018, at n.6 (2008); *Gulf South Pipe Line Co.*, 118 FERC ¶ 61,262, at P 7 (2007); *Dominion Cove Point LNG, LP*, 106 FERC ¶ 61,339, at P 9 (2004); Portland Natural Gas Transmission Sys., 106 FERC ¶ 61,298, at P 15 & n.4 (2004).

[2] DEIS at 2-19.



2

1. Proposed engineering plans for the project submitted to the Maritime Administration and USCG are not meant to serve as the final designs for the project. Final designs are forth coming and will depend in part on the environmental constraints provided by the Final EIS and ROD. In addition to the USCG, the Federal agencies (i.e., FERC and PHSMA) that review the construction and operational safety of the project will review the project plans submitted on the Federal Docket as part of their review of final construction plans. The Applicant would be required to build the project in a way that upholds industry safety standards.

2. Due to public comments on the Draft EIS, the Final EIS discusses an offshore interconnection with the existing Gulfstream pipeline. The description is discussed in Section 2.1.4 and impacts are discussed in Section 4.

3. Proposed engineering plans for the project submitted to the Maritime Administration and USCG are not meant to serve as the final designs for the project. Final designs are forth coming and will depend in part on the environmental constraints provided by the Final EIS and ROD. In addition to the USCG, the Federal agencies (i.e., FERC and PHSMA) that review the construction and operational safety of the project will review the project plans submitted on the Federal Docket as part of their review of final construction plans. The Applicant would be required to build the project in a way that upholds industry safety standards.

4. Proposed engineering plans for the project submitted to the Maritime Administration and USCG are not meant to serve as the final designs for the project. Final designs are forth coming and will depend in part on the environmental constraints provided by the Final EIS and ROD. In addition to the USCG, the Federal agencies (i.e., FERC and PHSMA) that review the construction and operational safety of the project will review the project plans submitted on the Federal Docket as part of their review of final construction plans. The Applicant would be required to build the project in a way that upholds industry safety standards.

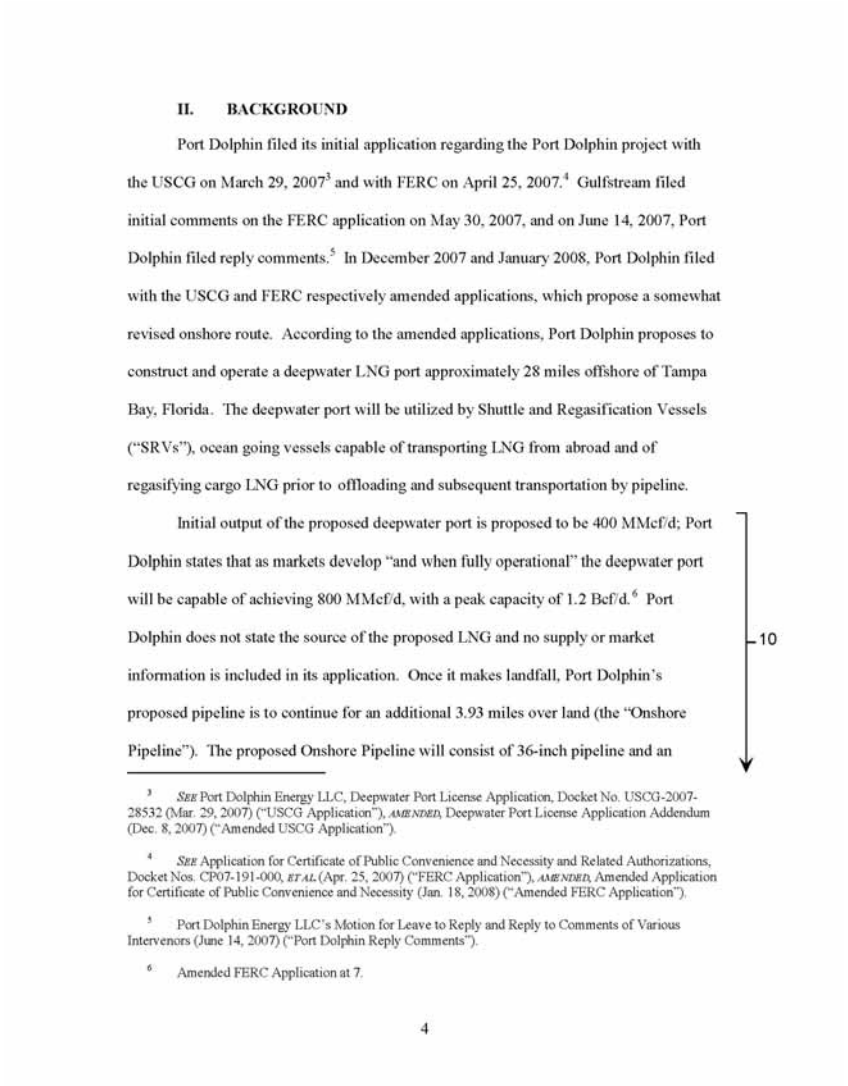
(iii) Port Dolphin has proposed to construct and locate an onshore block valve practically on top of Gulfstream's mainline in Port Manatee. This is not safe and creates unnecessary and unacceptable risks to Gulfstream; and

(iv) The proposed point of interconnection is not acceptable to Gulfstream. It will not permit Gulfstream to halt deliveries into its pipeline of gas that does not meet the gas quality specifications in its tariff, as LNG sometimes fails to do. In literally minutes, "off-spec" gas could reach critical customers in the market, including power plants that cannot properly function with "off-spec" gas.

Moreover, Gulfstream has considered the routing of the Port Dolphin pipeline in Port Manatee. If the route through Port Manatee is to be approved (and Gulfstream does not advocate approval) then there are safer alternatives for the locations of the proposed pipeline and block valve. These are discussed below.

Finally, according to the DEIS, because the maximum allowable operating pressure (MAOP) of the Gulfstream system is greater than the MOAP on the proposed Port Dolphin pipeline, it is not "technically feasible" for Port Dolphin to interconnect with Gulfstream offshore. In fact, as described herein, the estimated operating pressure of the Gulfstream pipeline at the proposed point of interconnection is below the MAOP of the proposed Port Dolphin pipeline. Thus, an offshore interconnection is technically feasible. In addition, the fact that the Gulfstream system is fully subscribed is not a basis for rejecting the offshore interconnection, as the DEIS does. On the contrary, Port Dolphin seeks to market gas to customers of Gulfstream including Peoples/TECO. And it is just those customers that have subscribed for the pipeline capacity on Gulfstream. And these customers are practically and economically indifferent as to where the gas from Port Dolphin would enter the Gulfstream system.

3



5. Comment noted. Proposed engineering plans for the project submitted to the Maritime Administration and USCG are not meant to serve as the final designs for the project. Final designs are forth coming and will depend in part on the environmental constraints provided by the Final EIS and ROD. In addition to the USCG, the Federal agencies (i.e., FERC and PHSMA) that review the construction and operational safety of the project will review the project plans submitted on the Federal Docket as part of their review of final construction plans. The Applicant would be required to build the project in a way that upholds industry safety standards.

6. Comment noted. FERC will consider this and make recommendations in their certificate.

7. Comment noted.

8. Comment noted. FERC will consider this and make recommendations in their certificate.

9. The offshore interconnection with Gulfstream is analyzed in the EIS, Section 2.1.4.6.

II. BACKGROUND

Port Dolphin filed its initial application regarding the Port Dolphin project with the USCG on March 29, 2007[3] and with FERC on April 25, 2007.[4] Gulfstream filed initial comments on the FERC application on May 30, 2007, and on June 14, 2007, Port Dolphin filed reply comments.[5] In December 2007 and January 2008, Port Dolphin filed with the USCG and FERC respectively amended applications, which propose a somewhat revised onshore route. According to the amended applications, Port Dolphin proposes to construct and operate a deepwater LNG port approximately 28 miles offshore of Tampa Bay, Florida. The deepwater port will be utilized by Shuttle and Regasification Vessels ("SRVs"), ocean going vessels capable of transporting LNG from abroad and of regasifying cargo LNG prior to offloading and subsequent transportation by pipeline.

Initial output of the proposed deepwater port is proposed to be 400 MMcf/d; Port Dolphin states that as markets develop "and when fully operational" the deepwater port will be capable of achieving 800 MMcf/d, with a peak capacity of 1.2 Bcf/d.[6] Port Dolphin does not state the source of the proposed LNG and no supply or market information is included in its application. Once it makes landfall, Port Dolphin's proposed pipeline is to continue for an additional 3.93 miles over land (the "Onshore Pipeline"). The proposed Onshore Pipeline will consist of 36-inch pipeline and an

10. Section 1.2 describes the need for the project and Section 1.3 describes the intended market for LNG distribution.

interconnection station connecting Port Dolphin's facilities to Gulfstream and Peoples/TECO just downstream of Gulfstream's Station 420.

Gulfstream filed an initial protest to the amended FERC application on February 19, 2008, to which Port Dolphin filed a response on March 5, 2008. At the request of Gulfstream, representatives of Port Dolphin met with representatives of Gulfstream to discuss various concerns that Gulfstream has with safety, construction, and other matters associated with the Port Dolphin proposal. The meeting occurred in Tampa, Florida on April 1, 2008. At the outset, Port Dolphin declared that it would not discuss or provide any information to Gulfstream that was non-public. It continues to be the case that Port Dolphin will not release any non-public information to Gulfstream without Gulfstream signing a confidentiality agreement that would prevent Gulfstream from using such information in these proceedings.

The USCG and MARAD issued its DEIS on Friday, April 18, 2008. On Monday, April 21, 2008, Gulfstream filed additional comments on the Port Dolphin Project with both USCG/MARAD and FERC.[7] Those additional comments should be considered along with this submission in preparation of the final environmental impact statement ("FEIS"). Port Dolphin filed a reply with the Commission on May 6, 2008.[8]

As noted in previous comments, Gulfstream is not opposed to an interconnection with Port Dolphin. However, the interconnection point that Port Dolphin proposes is problematic for myriad reasons. FERC policy requires Gulfstream to permit an

11. Comment noted.

interconnection upon request so long as it creates no operational or safety problems.[9] The proposed interconnection appears to raise significant safety concerns. These must be considered not only by the FERC as part of its responsibilities under the NGA, but also by USCG/MARAD in fulfilling the obligations under the National Environmental Policy Act.

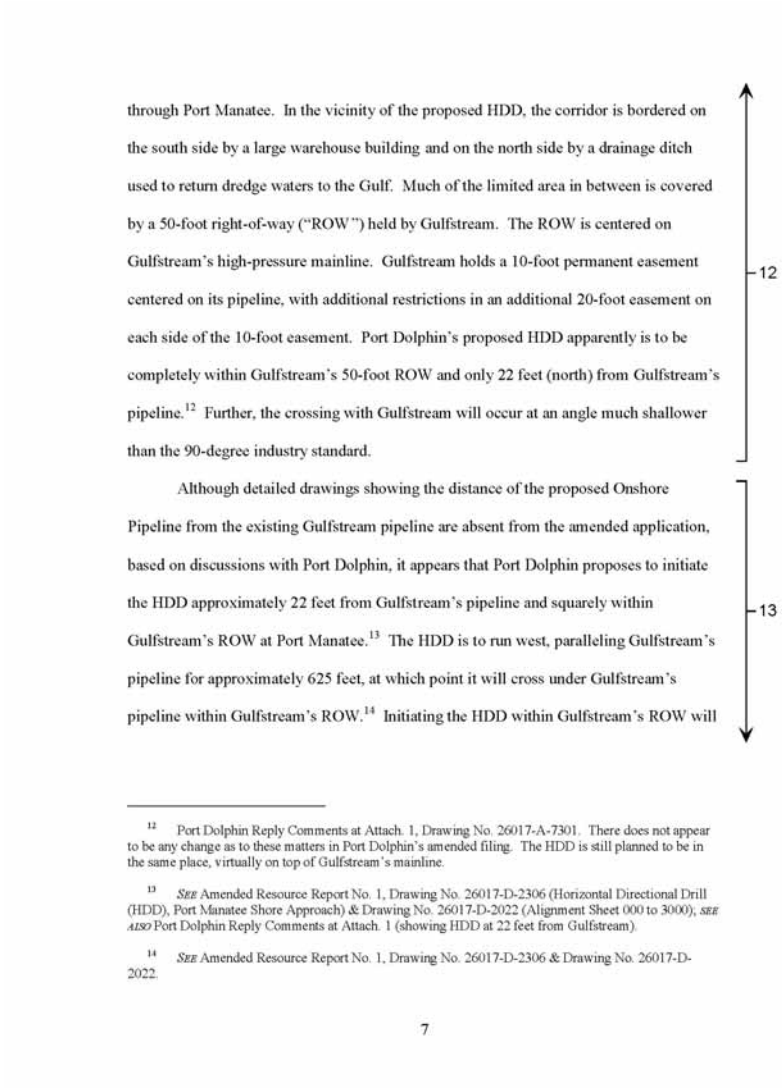
11

III. COMMENTS ON PORT DOLPHIN'S MAY 6, 2008 SUBMISSION

A. NOTHING IN THE DEIS OR PORT DOLPHIN'S MAY 6, 2008 ANSWER ADDRESSES GULFSTREAM'S SAFETY CONCERNS.

Nothing in the DEIS or Port Dolphin's Reply addresses Gulfstream's safety concerns. As explained previously, to make landfall, Port Dolphin proposes a horizontal direction drill ("HDD") that would begin at FM 1327.18 as shown on Drawing No. 26017-D-2022[10] and travel west (seaward) for 4,900 feet, coming up in the waters close to the Terra Ceia Aquatic Preserve.[11] The available space at Port Manatee that Port Dolphin seeks to utilize presents significant construction and safety concerns that are not acceptable to Gulfstream and have not been satisfactorily addressed by Port Dolphin. The proposed route for the Onshore Pipeline lies within a narrow corridor running

12



[9] *See Panhandle E. Pipe Line Co.*, 91 FERC ¶ 61,037, at 61,141 (2000) ("The policy announced here enables a party desiring access to a pipeline to obtain an interconnection if it satisfies five conditions. First, the party seeking the interconnection must be willing to bear the costs of the construction if the pipeline performs that task. In the alternative, the party seeking the interconnection could construct the facilities itself in compliance with the pipeline's technical requirements. Second, the proposed interconnection must not adversely affect the pipeline's operations. Third, the proposed interconnection and any resulting transportation must not diminish service to the pipeline's existing customers. Fourth, the proposed interconnection must not cause the pipeline to be in violation of any applicable environmental or safety laws or regulations with respect to the facilities required to establish an interconnection with the pipeline's existing facilities. Finally, the proposed interconnection must not cause the pipeline to be in violation of its right-of-way agreements or any other contractual obligations with respect to the interconnection facilities.").

12. Proposed engineering plans for the project submitted to the Maritime Administration and USCG are not meant to serve as the final designs for the project. Final designs are forth coming and will depend in part on the environmental constraints provided by the Final EIS and ROD. In addition to the USCG, the Federal agencies (i.e., FERC and PHSMA) that review the construction and operational safety of the project will review the project plans submitted on the Federal Docket as part of their review of final construction plans. The Applicant would be required to build the project in a way that upholds industry safety standards..

through Port Manatee. In the vicinity of the proposed HDD, the corridor is bordered on the south side by a large warehouse building and on the north side by a drainage ditch used to return dredge waters to the Gulf. Much of the limited area in between is covered by a 50-foot right-of-way ("ROW") held by Gulfstream. The ROW is centered on Gulfstream's high-pressure mainline. Gulfstream holds a 10-foot permanent easement centered on its pipeline, with additional restrictions in an additional 20-foot easement on each side of the 10-foot easement. Port Dolphin's proposed HDD apparently is to be completely within Gulfstream's 50-foot ROW and only 22 feet (north) from Gulfstream's pipeline.[12] Further, the crossing with Gulfstream will occur at an angle much shallower than the 90-degree industry standard.

Although detailed drawings showing the distance of the proposed Onshore Pipeline from the existing Gulfstream pipeline are absent from the amended application, based on discussions with Port Dolphin, it appears that Port Dolphin proposes to initiate the HDD approximately 22 feet from Gulfstream's pipeline and squarely within Gulfstream's ROW at Port Manatee.[13] The HDD is to run west, paralleling Gulfstream's pipeline for approximately 625 feet, at which point it will cross under Gulfstream's pipeline within Gulfstream's ROW.[14] Initiating the HDD within Gulfstream's ROW will

12

13

[12] Port Dolphin Reply Comments at Attach. 1, Drawing No. 26017-A-7301. There does not appear to be any change as to these matters in Port Dolphin's amended filing. The HDD is still planned to be in the same place, virtually on top of Gulfstream's mainline.

13. Proposed engineering plans for the project submitted to the Maritime Administration and USCG are not meant to serve as the final designs for the project. Final designs are forth coming and will depend in part on the environmental constraints provided by the Final EIS and ROD. In addition to the USCG, the Federal agencies (i.e., FERC and PHSMA) that review the construction and operational safety of the project will review the project plans submitted on the Federal Docket as part of their review of final construction plans. The Applicant would be required to build the project in a way that upholds industry safety standards..

require Port Dolphin to excavate a sump pit,[15] again within 25 feet of Gulfstream's pipeline. This exposes Gulfstream to unacceptable risks of potential damage to the Gulfstream mainline.

Despite Gulfstream's repeated efforts to have Port Dolphin explain how it will safely perform an HDD so close to Gulfstream's pipe, Port Dolphin continues to ignore this concern. Even in its May 6, 2008 filing, Port Dolphin does not meaningfully address Gulfstream's safety concerns. Gulfstream has responsibilities under its FERC certificate authority to assure the safe and reliable operation of its own jurisdictional pipeline system, a system that provides 35% of the natural gas pipeline capacity into Florida. The potential disruption of service of this magnitude and the resulting hardships it would cause just cannot be taken lightly, particularly in this situation where Port Dolphin is attempting to squeeze its proposed pipeline into Gulfstream's narrow right-of-way. 13

As an initial matter, the Department of Transportation's regulations at 49 C.F.R. Part 192 do not address the methods and safety precautions for horizontal directional drills. Therefore, Port Dolphin's stated intent to comply with such regulations does nothing to address Gulfstream's concerns. Gulfstream attached to its Additional Comments published industry best practices and demonstrated that such best practices would be ignored by Port Dolphin under the current proposal. Port Dolphin does not address this evidence or Gulfstream's concerns.

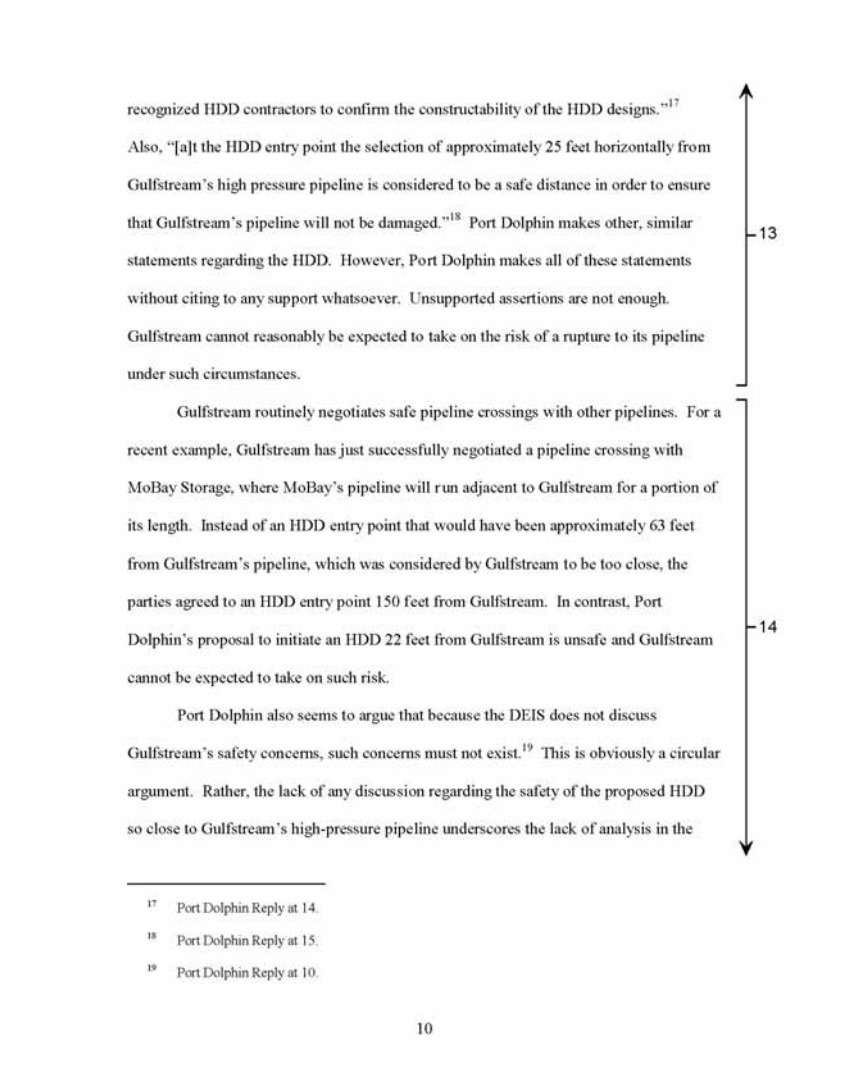
Port Dolphin also argues that the Commission has in the past recommended co-location in rights-of-way.[16] While this may be true in the abstract, general policies

---

[15] *See* Amended Resource Report No. 1 at Fig. 1-11.

[16] Port Dolphin Reply at 8-10.

regarding co-location also do not address Gulfstream's concerns with an HDD entry within 22 feet of it pipeline. Further, the cases cited by Port Dolphin are not on point.



In *Freeport-McMoRan ENergy LLC*, 115 FERC ¶ 61,201 (2006), although the proposed pipeline's right-of-way was *ADJACENT* to Gulfstream's and Transco's existing easement, *ID.* at P 5, it was not within those easements, and the Commission did not discuss how close the HDD exit point was to Gulfstream's pipeline. In fact, that HDD exit point was 75 feet from Gulfstream. In that instance, based on all of the factors involved, Gulfstream and Freeport-McMoRan were able to reach agreement on a safe construction plan in proximity to Gulfstream's pipe.

Equitrans, L.P., 117 FERC ¶ 61,184 (2006), and *Transwestern Pipeline Co.*, 121 FERC ¶ 61,175 (2007), also cited by Port Dolphin, also are not on point. In *Equitrans*, the Commission held that a pipeline application will not be denied simply because the proposed pipeline will cross an existing pipeline. *Equitrans* at P 32. Gulfstream does not argue that Port Dolphin should not be permitted to cross Gulfstream's pipeline. Rather, Gulfstream objects to the risk involved with initiating an HDD almost on top of Gulfstream's existing pipeline. In *TRANSWESTERN*, the Commission held that the proposed pipeline could parallel an existing pipeline at a distance of 35 feet, not the 22.5 feet that Port Dolphin claims. *Id.* at P 136. In any event, Gulfstream does not object to co-location, but rather to an HDD being staged less than 25 feet from its pipe.

In response, Port Dolphin continues to do nothing more than make conclusory statements regarding the safety of the proposed HDD. For example, Port Dolphin blandly states that it "has consulted with several of the most experienced and industry

13

9

recognized HDD contractors to confirm the constructability of the HDD designs."[17] Also, "[a]t the HDD entry point the selection of approximately 25 feet horizontally from Gulfstream's high pressure pipeline is considered to be a safe distance in order to ensure that Gulfstream's pipeline will not be damaged."[18] Port Dolphin makes other, similar statements regarding the HDD. However, Port Dolphin makes all of these statements without citing to any support whatsoever. Unsupported assertions are not enough. Gulfstream cannot reasonably be expected to take on the risk of a rupture to its pipeline under such circumstances.

Gulfstream routinely negotiates safe pipeline crossings with other pipelines. For a recent example, Gulfstream has just successfully negotiated a pipeline crossing with MoBay Storage, where MoBay's pipeline will run adjacent to Gulfstream for a portion of its length. Instead of an HDD entry point that would have been approximately 63 feet from Gulfstream's pipeline, which was considered by Gulfstream to be too close, the parties agreed to an HDD entry point 150 feet from Gulfstream. In contrast, Port Dolphin's proposal to initiate an HDD 22 feet from Gulfstream is unsafe and Gulfstream cannot be expected to take on such risk.

Port Dolphin also seems to argue that because the DEIS does not discuss Gulfstream's safety concerns, such concerns must not exist.[19] This is obviously a circular argument. Rather, the lack of any discussion regarding the safety of the proposed HDD so close to Gulfstream's high-pressure pipeline underscores the lack of analysis in the

[18] Port Dolphin Reply at 15.

[19] Port Dolphin Reply at 10.

10

13

14

14. Proposed engineering plans for the project submitted to the Maritime Administration and USCG are not meant to serve as the final designs for the project. Final designs are forth coming and will depend in part on the environmental constraints provided by the Final EIS and ROD. In addition to the USCG, the Federal agencies (i.e., FERC and PHSMA) that review the construction and operational safety of the project will review the project plans submitted on the Federal Docket as part of their review of final construction plans. The Applicant would be required to build the project in a way that upholds industry safety standards.

DEIS. This critical safety issue cannot be ignored, and a NEPA analysis that does not do so will not withstand judicial review. 14

B. Gulfstream offers the following alternatives regarding the placement of Port Dolphin's Facilities.

Gulfstream has legitimate concerns about the close proximity of the proposed Port Dolphin pipeline to Gulfstream's existing pipeline in the narrow corridor selected by Port Dolphin in Port Manatee. The pictures in Attachment 1 (Drawing No. 69-14-37/42405 and inset pictures) demonstrate how tight the space is in this corridor of Port Manatee and highlight the safety concerns. Gulfstream believes that the proposed pipeline route should not be approved. However, if the route through Port Manatee is to be approved, there are alternative points of entry for the HDD and valve sites that should be considered. These alternative sites at least reduce the safety concerns. Gulfstream believes that Port Dolphin's valve could be located at several locations at or downstream of FM 6600, as shown at Attachment 2 (Drawing No. 69-14-37/42405). The current valve site overlaps Gulfstream's pipeline centerline and right of way. The alternate sites are not as close to Gulfstream's pipe and still allow very good emergency access by Port Dolphin. In particular, Proposed Valve Site 1 has good access from South Dock Street. 15, 16

Port Dolphin also could relocate the HDD entry point 93 feet to the north to the center of the drainage ditch in which its pipeline will run.[20] *See* Attachment 1. This would locate the HDD entry point approximately 115 feet from Gulfstream's pipeline, which is clearly much safer than Port Dolphin's proposal. In fact, the entirety of Port Dolphin's pipeline could be moved from Gulfstream's ROW to the drainage ditch as 17

[20] As proposed, the Port Dolphin pipeline is 51' 2" from the edge of the drainage ditch, and the distance from the edge to the center of the drainage ditch is 41' 7". *See* Drawing No. 26017-D-4106.

11

15. Comment noted.

16. Comment noted.

17. Comment noted.

shown in Attachment 1. In its May 6, 2008 filing, Port Dolphin indicated that it will "take appropriate action to reshape the drainage ditch cross-section for properly handling future runoff and discharge, and eliminate any future need for additional excavation work."[21] If this is true, there appears to no longer be any reason for Port Dolphin to intrude on Gulfstream's ROW. It can simply move its pipeline 93 feet to the north of the proposed route in Port Manatee. 17

IV. COMMENTS ON DEIS

On Gulfstream's existing offshore system at Gulfstream's MP 392.6, approximately 26 miles off of the Florida shoreline, there is a valve site, which includes a piggable Y-type configuration that Gulfstream refers to as the East Subsea Tie-In. This existing tie-in location was designed for just the type of interconnection needed by Port Dolphin. Gulfstream believes that Port Dolphin readily can interconnect with Gulfstream at that point. 18

The DEIS dismisses out-of-hand the alternative of an off-shore interconnection with Gulfstream.[22] It does so the on grounds that an off-shore interconnection with Gulfstream does not appear to be technically feasible and because Gulfstream is currently operating at capacity. Neither of these reasons is persuasive, and the USCG must thoroughly address an off-shore interconnection alternative, and the environmental consequences that would be avoided thereby, in the FEIS. 19

[21] Port Dolphin Answer at 16.

[22] DEIS at 2-17–2-29.

12

18. Due to public comments on the Draft EIS, the Final EIS discusses an offshore interconnection with the existing Gulfstream pipeline. The description is discussed in Section 2.1.4 and impacts are discussed in Section 4.

19. Due to public comments on the Draft EIS, the Final EIS discusses an offshore interconnection with the existing Gulfstream pipeline. The description is discussed in Section 2.1.4 and impacts are discussed in Section 4.

A. The DEIS is incorrect when it concludes that Port Dolphin cannot interconnect because of pressure differentials.

The DEIS states that the operating pressure of the Gulfstream pipeline is 2,180 psig, that the maximum operating pressure for the vaporization and send out systems proposed by Port Dolphin is 1,643 psig, and that its Station 420 Gulfstream regulates its pressure down to 1,470 psig. From these assertions, the DEIS concludes that "[o]nly on shore, after this pressure drop, would it be possible for Port Dolphin to interconnect with Gulfstream."[23] 20

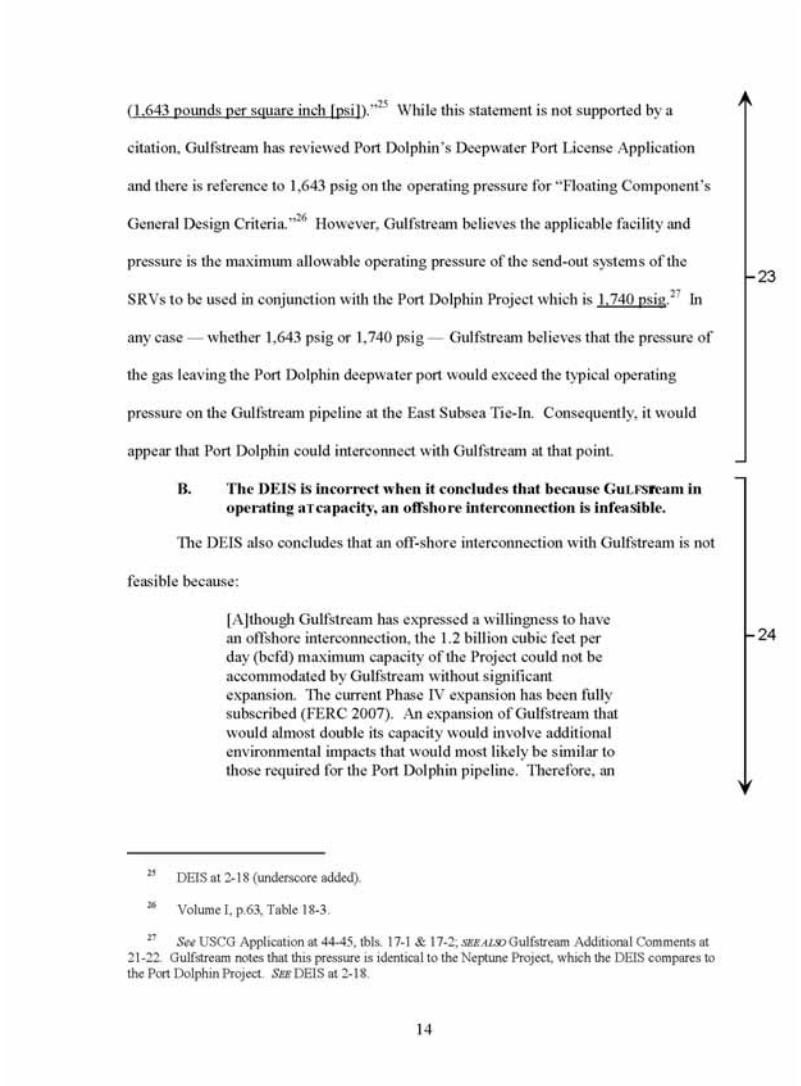
The facts as set forth in the DEIS are not wholly accurate. It is correct that the natural gas on Gulfstream's pipeline can be compressed at Station 410, which is located onshore near Coden, Alabama, up to Gulfstream's MAOP of 2,180 psig. However, as explained in Gulfstream's Additional Comments,[24] the pressure on the Gulfstream pipeline decreases as the gas travels from Station 410 in Alabama to Station 420 in Florida, a distance of 428 miles across the Gulf of Mexico. 21

Under typical operating conditions based on Gulfstream's existing design, the pressure at the proposed offshore interconnection point at the East Subsea Tie-In is estimated by Gulfstream to be 1,595 psig, which is below the maximum operating pressure of the proposed Port Dolphin pipeline. Gulfstream believes this will accommodate receipts from Port Dolphin without the need for additional compression. 22

Also, the DEIS states that "the maximum allowable operating pressure for the vaporization and send-out systems proposed by the Applicant is 11,328 kiloPascal (kPa) 23

[23] DEIS at 2-18.

[24] Gulfstream Additional Comments at 21.



13

20. Comment noted. Due to public comments on the Draft EIS, the Final EIS discusses an offshore interconnection with the existing Gulfstream pipeline. The description is discussed in Section 2.1.4 and impacts are discussed in Section 4.

21. Comment noted.

22. Comment noted.

23. Comment noted.

(1,643 pounds per square inch [psi]).[25] While this statement is not supported by a citation, Gulfstream has reviewed Port Dolphin's Deepwater Port License Application and there is reference to 1,643 psig on the operating pressure for "Floating Component's General Design Criteria."[26] However, Gulfstream believes the applicable facility and pressure is the maximum allowable operating pressure of the send-out systems of the SRVs to be used in conjunction with the Port Dolphin Project which is 1,740 psig.[27] In any case — whether 1,643 psig or 1,740 psig — Gulfstream believes that the pressure of the gas leaving the Port Dolphin deepwater port would exceed the typical operating pressure on the Gulfstream pipeline at the East Subsea Tie-In. Consequently, it would appear that Port Dolphin could interconnect with Gulfstream at that point.

B. The DEIS is incorrect when it concludes that because GULFSTREAM in operating AT capacity, an offshore interconnection is infeasible.

The DEIS also concludes that an off-shore interconnection with Gulfstream is not feasible because:

> [A]though Gulfstream has expressed a willingness to have an offshore interconnection, the 1.2 billion cubic feet per day (bcfd) maximum capacity of the Project could not be accommodated by Gulfstream without significant expansion. The current Phase IV expansion has been fully subscribed (FERC 2007). An expansion of Gulfstream that would almost double its capacity would involve additional environmental impacts that would most likely be similar to those required for the Port Dolphin pipeline. Therefore, an

[25] DEIS at 2-18 (underscore added).

[26] Volume I, p.63, Table 18-3.

[27] *See* USCG Application at 44-45, tbls. 17-1 & 17-2; *SEE ALSO* Gulfstream Additional Comments at 21-22. Gulfstream notes that this pressure is identical to the Neptune Project, which the DEIS compares to the Port Dolphin Project. *SEE* DEIS at 2-18.

14

24. Comment noted. Proposed engineering plans for the project submitted to the Maritime Administration and USCG are not meant to serve as the final designs for the project. Final designs are forth coming and will depend in part on the environmental constraints provided by the Final EIS and ROD. In addition to the USCG, the Federal agencies (i.e., FERC and PHSMA) that review the construction and operational safety of the project will review the project plans submitted on the Federal Docket as part of their review of final construction plans. The Applicant would be required to build the project in a way that upholds industry safety standards.

alternative that interconnects offshore is not technically feasible and will not be evaluated in detail.[28]

There are several assumptions in this statement that need to be addressed. First, based on the project description as set forth in Port Dolphin's application, at least 70% of the gas deliveries by Port Dolphin are to go into Gulfstream's pipeline and therefore serve Gulfstream's customers. Consequently, Port Dolphin must have taken into account the need for those shippers to have transportation capacity on Gulfstream. 24

Second, each of those shippers already holds a certain amount of capacity on the entire Gulfstream system. That also will not change or increase as a result of an interconnection with Port Dolphin onshore. So it should not matter if the new receipt point is onshore or offshore. To the extent a shipper decides to purchase its gas from Port Dolphin, as opposed to some other seller at or upstream of Station 410, the gas that Port Dolphin sells to such a shipper will simply displace gas coming from Alabama. New interconnections among pipelines are routine, and such interconnections are not thwarted because a connecting pipeline is operating at capacity. The new supply source simply increases the availability and diversity of gas supplies that markets like Florida desire. 25

C. The FEIS must thoroughly review an offshore interconnection with Gulfstream as the environmentally superior alternative to Port Dolphin's proposed interconnection.

As demonstrated above, an offshore interconnection with Gulfstream is feasible. The negative environmental effects that would be avoided with an offshore interconnection are very likely significant. For example, under this alternative proposal, the amount of new subsea pipeline would be significantly reduced. Under the current proposal, Port Dolphin will require approximately 50 miles of subsea pipeline to reach 26

[28] DEIS at 2-19.

15

25. Comment noted.

26. Due to public comments on the Draft EIS, the Final EIS discusses an offshore interconnection with the existing Gulfstream pipeline. The description is discussed in Section 2.1.4 and impacts are discussed in Section 4.

the Florida shoreline. In addition, Port Dolphin will require approximately 3.93 miles of pipe landward of the mean high water mark and a regulator or regulators to regulate Port Dolphin's gas pressure down to 1480 psig for an interconnection with Gulfstream and 1250 psig for Peoples/TECO.[29] Under Gulfstream's alternative, and based on a description of the proposed deepwater port as being 28 miles offshore of Tampa Bay, Florida, Gulfstream roughly estimates that Port Dolphin would need only approximately 15 miles of subsea pipeline and no onshore pipeline and regulators. Therefore, under the requirements of the National Environmental Policy Act, an offshore interconnection with Gulfstream must be thoroughly reviewed as an alternative in the FEIS. *See, e.g.*, *City and State of N.Y. v. DOT*, 715 F.2d 732, 740-43 (2d Cir. 1983), *cert. denied*, 465 U.S. 1055 (1984). Gulfstream stands ready to assist the USCG and MARAD in this regard. 26

V. CONCLUSION

Regardless of the technical ability of Port Dolphin to interconnect with Gulfstream at the East Subsea Tie-In, the safety concerns raised by Gulfstream are of paramount importance. Gulfstream is an existing, operating natural gas pipeline system, while Port Dolphin is a greenfield project. Therefore, it is appropriate to require Port Dolphin to substantively address and meet Gulfstream's safety concerns. Port Dolphin can do this by changing the design of the vessels associated with the project to connect at the East Subsea Tie-In or by connecting to Gulfstream at a point resulting in the least amount of risk to Gulfstream's system.

As stated by Gulfstream before, the fact that the offshore portion of the overall Port Dolphin project is not subject to the Commission's NGA jurisdiction does not mean,

[29] Amended Resource Report 1 at 1-16.

16

and should not be interpreted to mean, that the Commission's analysis of Port Dolphin's onshore pipeline facilities may not consider the alternative of the East Subsea Tie-In as described above. On the contrary, the Commission's responsibilities under the National Environmental Policy Act (NEPA) require that it consider all reasonable alternatives that would mitigate (in this case eliminate) adverse environmental and safety issues.[30] Similarly, MARAD/USCG also must consider the East Subsea Tie-In as part of its own analysis of the Port Dolphin project flowing from the Deepwater Port Act jurisdiction and the similar NEPA demands on MARAD/USCG.

[30] *See, e.g., Florida Gas Transmission Co.*, 100 FERC ¶ 61,282, at P 20 (recognizing that NEPA requires the FERC "to analyze the environmental consequences of alternatives that are feasible, practical, and effective." (*CITING ALL INDIAN PUEBLO COUNCIL V. UNITED STATES*, 975 F.2d 1437, 1444 (10th Cir. 1992)).

17

For the foregoing reasons, and the reasons set forth in Gulfstream's previous comments, the Commission should deny Port Dolphin's request for certificate authorization. If the Commission approves Port Dolphin's application, the Commission should require Port Dolphin to interconnect with Gulfstream offshore, or, in the alternative, at the alternate onshore locations described herein.

Re: Port Dolphin Energy LLC Docket No. USGS-2007-28532

ManaSota-88, Inc. (hereinafter, "ManaSota-88"), is a public interest conservation and environmental protection organization which is a Florida not-for-profit corporation and a citizen of the State of Florida. The corporate purposes of ManaSota-88 include the protection and preservation of water quality and wildlife habitat in Manatee and Sarasota Counties and, therefore, commenting on the proposed Port Dolphin Energy project falls within ManaSota-88's general scope of interest and activity. Disapproval of the preferred pipeline route is the type of relief appropriate for ManaSota-88 to request on behalf of its members.

A large number of ManaSota-88's members own real property and reside in Manatee County and will be substantially adversely affected if the proposed Deepwater Port License Application is accepted by U.S.C.S.

Port Dolphin's Draft Environmental Impact Study (DEIS) is lacking significant information regarding alternatives having less environmental impact than the current alternatives being reviewed. Additional alternative routes need to be considered in the DEIS prior to the Final EIS. Alternatives having the least environmental impact are currently not a part of this DEIS review. -1

ManaSota-88 recommends the DEIS include a review of an alternative which utilizes a portion of the existing Gulfstream pipeline. It is our understanding that the Gulfstream pipeline was constructed with a value in order to provide access to other users such as Port Dolphin. Utilizing a portion of the existing Gulfstream pipeline would significantly reduce proposed impacts to the environment by eliminating over 20 miles of new pipeline construction. -2

A detailed alternative analysis needs to be presented in the DEIS which considers the use of the Gulfstream pipeline. -3

1. The EIS has been expanded to discuss three Port site alternatives and three pipeline route alternatives. Alternatives were also considered for regasification technology and propulsion types. See Section 2.1 for discussions.

2. This alternative is included in the Final EIS. Please refer to Section 2.1.4.

3. This alternative is included in the Final EIS. Please refer to Section 2.1.4.

As proposed, the preferred route will likely reduce or eliminate shore-protection programs, this could result in an increase in the erosion of Anna Maria Island's coast. The entire length of Anna Maria Island is considered to be "Critically Eroded" by the Florida Department of Environmental Protection (FDEP). 4

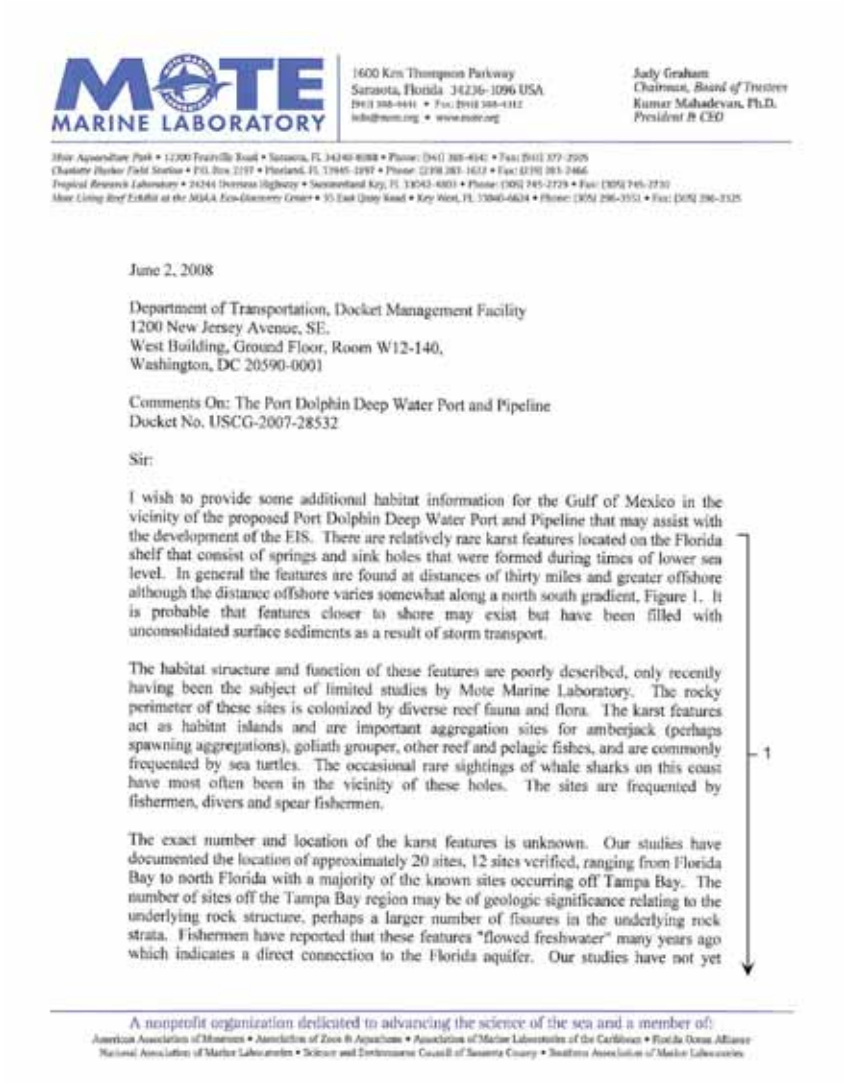
Increased beach erosion will result in an increased risk from significant storm events and an increase in coastal flooding. Hurricane and emergency evacuation routes for both Anna Maria Island and Longboat Key will be affected by increased erosion of the coastline. 5

The loss of the beach habitat will result in loss of critical habitat needed for sea turtle nesting. Five sea turtle species have been known to nest on Florida beaches, including the threatened loggerhead sea turtle (Caretta caretta), endangered green sea turtle (Chelonia mydas), endangered leatherback sea turtle (Dermochelys coriacea), endangered hawksbill sea turtle (Eretmochelys imbricata), and endangered Kemp's ridley sea turtle (Lepidochelys kempii). 6

Unless additional alternatives are considered, ManaSota-88 recommends a "No Build Alternative" for Port Dolphin's proposed pipeline.

Additional comments on the DEIS will be made at a future date.

Sincerely,



Chairman, ManaSota-88

2

4. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

5. The Proposed Action is not anticipated to cause erosion of the coastline, or increase the risk of natural disasters.

6. Please see Section 4.2.1.3 of the Final EIS for potential impacts to sea turtles.

Comments On: The Port Dolphin Deep Water Port and Pipeline
Docket No. USCG-2007-28532

Sir:

I wish to provide some additional habitat information for the Gulf of Mexico in the vicinity of the proposed Port Dolphin Deep Water Port and Pipeline that may assist with the development of the EIS. There are relatively rare karst features located on the Florida shelf that consist of springs and sink holes that were formed during times of lower sea level. In general the features are found at distances of thirty miles and greater offshore although the distance offshore varies somewhat along a north south gradient, Figure 1. It is probable that features closer to shore may exist but have been filled with unconsolidated surface sediments as a result of storm transport.

The habitat structure and function of these features are poorly described, only recently having been the subject of limited studies by Mote Marine Laboratory. The rocky perimeter of these sites is colonized by diverse reef fauna and flora. The karst features act as habitat islands and are important aggregation sites for amberjack (perhaps spawning aggregations), goliath grouper, other reef and pelagic fishes, and are commonly frequented by sea turtles. The occasional rare sightings of whale sharks on this coast have most often been in the vicinity of these holes. The sites are frequented by fishermen, divers and spear fishermen. 1

The exact number and location of the karst features is unknown. Our studies have documented the location of approximately 20 sites, 12 sites verified, ranging from Florida Bay to north Florida with a majority of the known sites occurring off Tampa Bay. The number of sites off the Tampa Bay region may be of geologic significance relating to the underlying rock structure, perhaps a larger number of fissures in the underlying rock strata. Fishermen have reported that these features "flowed freshwater" many years ago which indicates a direct connection to the Florida aquifer. Our studies have not yet

1. A discussion of karst features is discussed in Section 3.4 and 4.4.

verified definitive freshwater flows. However, we have documented that a number of the sites exhibit tidal pumping of water in and out of the hole, which verifies water flow into and out of the underlying rock strata. A site off the mouth of Tampa Bay contains a verified saltwater spring.

These features are also of significant archaeological interest. Former sea level stands left these areas exposed 8,000 - 12,000 years before present, representing the period of colonization of the Florida peninsula by man. Human skeletons and artifacts have been recovered from two sink hole archaeological sites in Sarasota County that have been dated to 10,000 YBP. Sources of freshwater were important aggregation sites for humans and the offshore sites may contain similar human artifacts from that time period. 1

The primary proposed offshore terminal site lies closest to several of the known karst features, approximately 8 miles from the AJ hole and MD, Figure 2. While this is not particularly close it should be noted that based on the distribution of known features, all three sites lie within a zone that could possibly have unreported or unknown underlying karst features. The proposed south alternative lies approximately 11 miles from the closest known karst feature and the north alternative is 13 miles from the closest known karst feature. Most of these features have a relatively small surface expression, less than 70 ft in diameter, although they open into much larger caverns or caves. Because of this the features can be difficult to locate by coarse bottom surveys which may simply show a fish aggregation. I would suggest that each of the proposed sites be examined with high resolution side scan sonar coupled with sub-bottom profiling and diver verification of suspect depressions or areas of fish aggregations. 2

I hope this information is useful. If you need additional information I can be reached at the above listed address and phone numbers.

Sincerely,

James K. Culter
Senior Scientist
Benthic Ecology Program

2. Comment noted. Site specific hazard surveys would be conducted prior to construction.

3.

and Offshore Activities
U.S. Maritime Administration

Re: Port Dolphin Energy LLC, Deepwater Port License Application
Docket No. USCG-2007-28532

Dear Messrs Prescott and Lesnick:

There is a need for a LNG terminal to provide natural gas to the West coast of Florida. We support the construction of a properly designed West coast of Florida LNG terminal. We do not support the impact the proposed Port Dolphin terminal vaporizer would have on the environment. 1

The best available technology for vaporizing LNG is not presented in this application.

The LNG shuttle and regasification vessel (SRV) serving the proposed terminal utilizes fired burners as the heat source for vaporizing LNG. The huge burners emit vast quantities of greenhouse gases and other pollutants. Fired burners do not present the best available technology for vaporizing LNG when a best available technology with environmental benefits exists. 2

A fish friendly seawater heat source vaporizer with environmental benefits is available.

Seawater heat source LNG vaporization results in cooler seawater, thereby reducing global warming. Using seawater as a heat source conserves energy that would have otherwise been used for fired burners. As a result, greenhouse gases, which increase global warming, are not produced and a large potential source of greenhouse gases is eliminated.

The cooler seawater from vaporization carries more oxygen for increased oxygen supplies for fish species and generally more food for marine life. 3

The system conserves energy and reduces atmospheric pollution.

The vaporizer system is not detrimental to fish species. The physical arrangement of the vaporizer does not entrain fish species in the seawater. The physical stress on fish species from impingement

1

1. Comment noted.

2. Based on information provided by the commenter and on publicly available documents describing the system, it was determined that there has been no commercial application or demonstration project for the technology. Since the heat exchanger proposed must be exposed to ocean currents, it would not appear to be feasible for a shipboard system for inclusion in the shuttle and regassification vessel design proposed for the project. Therefore, the proposed alternative was not included in the evaluation.

3. The system proposed by Wheaton Process Systems is discussed in in Section 2.1.7.

and impact is in effect absent with the fish friendly vaporizer. The thermal effect on fish species is essentially nonexistent. The system is designed to eliminate toxic chemical use. Fish species have no chemical stress.

The fish friendly seawater heat source vaporizer technology is the most environmentally responsive LNG vaporizer presently available. We would be pleased to provide information on this new fish friendly and environmentally beneficial vaporizer. 3

Best regards,

Gerald Engdahl

June 1, 2007

INTRODUCTION

The comments expressed here reflect the views of a single, but informed resident of Anna Maria Island, Florida. Dr. LeGore is a consulting marine scientist with >30 years extensive project experience, much of it related both to EIS development and EIS review. His professional credentials are provided as the final component of this submission.

Dr. LeGore regrets that due to project travel he was unaware of this DEIS until May 27, 2008, and was unable to obtain a copy until the evening of May 28. This review is therefore hurried due to the comment deadline of June 2, and would have benefited significantly from an extension of the comment and review period.

It is also important to note that the function of an EIS is not to value impacts, but to describe them in sufficient detail that socio-economic judgments may be made by resource managers, the interested public, and the elected representatives of regional stakeholders. The authors of an EIS are not called upon to render judgments of impacts as "minor" or "insignificant." Anticipated impacts must be clearly described and quantified to enable stakeholder judgment of whether impacts are minor or important, insignificant or significant. Local values apply to such judgments, and they must not be usurped by inappropriate representations in an EIS.

Jun 02 08 01:57a Steve LeGore (941) 778-4650 p.4

GENERAL COMMENTS

The DEIS with respect to forecasting and describing impacts on marine biota is deficient. There are almost no quantitative discussions or assessments of species important to recreational fisheries and the regional economy, such as tarpon, snook, grouper, snapper, and several other important species. The single exception relates to ichthyoplankton data, which is immediately followed by a discussion of the unreliability of these data, and which are deemed by the Florida Fish and Wildlife Commission to be inappropriate to impingement analyses for this proposed development (Appendix B, p. 20). Because there is no quantitative discussion of the occurrence of benthic community species in the proposed development area, or consideration of the life cycle patterns and needs of benthic species, the description of the "affected environment" as required by NEPA is fundamentally deficient. It follows that if the affected environment is inadequately described, then accurate forecasts of anticipated impacts and their effects are at least unlikely, and probably impossible. 1 2

Examination of benthic habitats is restricted to side-scan sonar tracks, some undefined number and character of diver surveys, and video imaging. Methods are not described, rendering our ability to evaluate their appropriateness moot. It appears that no samples were taken of benthic infauna or accompanying particle size samples. Similarly, there seem to be no records of motile invertebrate or vertebrate species utilizing habitats through which pipelines are proposed to be installed and unloading facilities are proposed to be constructed. Benthic habitats are merely described as hard and soft bottom, with a few subcategories. We are not informed of what species of recreational, commercial, or ecological importance are utilizing these habitats, let alone the densities of their populations. Site-specific quantitative baseline data are not provided. Without such quantitative information, estimates of numbers of acres impacted are almost meaningless. 3 4

The important components of the EIS should be resolution of impacts on the local ecosystem components, i.e. the species occurring and utilizing these habitats. No information is provided in this regard. Local tarpon fishers, for example, want to know whether this proposed development will affect the tarpon fishery, but no information is provided in the DEIS to indicate that the Applicant is aware of the great seasonal importance of the local coastal fishery for tarpon, or of the use this species makes of nearshore habitats for spawning and nursery development. In the end, it may be that this proposed development poses little threat to tarpon, but the potential must be thoroughly considered in the DEIS if the DEIS is to achieve its purpose. Similar arguments may be made for many other species, including snappers, groupers, red drum, albacore, tunas, mackerels, stone crabs, and so on. All are components of the "affected environment," and must be evaluated. 5

Comments on Port Dolphin EIS
Docket Number USCG-2007-28532

1. Comment noted. Detailed benthic surveys were conducted as part of the Deepwater Port Application. These studies were incorporated into the Draft EIS analysis in appropriate detail for a Draft EIS. Additional studies have been conducted and additional detail has been added to the Final EIS, as appropriate. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements would be developed after a license is issued. All available data would be used to specify mitigation type, extent, duration, and schedule.

2. Comment noted. Detailed benthic surveys were conducted as part of the Deepwater Port Application. These studies were incorporated into the Draft EIS analysis in appropriate detail for a Draft EIS. Additional studies have been conducted and additional detail has been added to the Final EIS, as appropriate. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements would be developed after a license is issued. All available data would be used to specify mitigation type, extent, duration, and schedule.

3. Comment noted. Detailed benthic surveys were conducted as part of the Deepwater Port Application. These studies were incorporated into the Draft EIS analysis in appropriate detail for a Draft EIS. Additional studies have been conducted and additional detail has been added to the Final EIS, as appropriate. Specific monitoring requirements would be developed after a license is issued. All available data would be used to specify mitigation type, extent, duration, and schedule.

4. This discussion has been expanded. Please see Section 3.2.8 of the EIS.

Jun 02 08 01:57a Steve LeGore (941) 778-4650 p.5

SPECIFIC COMMENTS

Executive Summary

Page ES-7, lines 6-7: "Minor to moderate short-term adverse impacts and minor long-term adverse impacts on biological resources could occur as a result of the Project."

(a) Change "could occur" to "will occur." (b) The terms "minor" and "moderate" are subject to debate as quantitative data are not made available to scale these impacts. 6

Page ES-7, line 17: "Minor to moderate . . . impacts . . ."

Same comment as above 7

Page ES-7, line 17: ". . . impacts on benthic communities . . ."

Impacts on benthic communities are left unclear by this document, because no quantitative baseline survey was conducted to estimate populations of benthic community components. It is therefore not possible to scale the extent of impacts or their secondary effects on species living in or dependent upon the benthic community. 8

Page ES-7, lines 20-22: "The area off Tampa Bay is highly dynamic with constantly shifting sediments. Benthic communities would be expected to recover quickly by recolonization from surrounding communities of similar organisms."

No citations are provided to support these contentions. In cases of lost hard bottom habitat, it is not at all clear that recovery would occur quickly, or that all species would quickly recover in soft sedimentary habitats. 9

Page ES-7, lines 36-44: ". . . two additional species were identified for analysis . . . gag grouper . . . [and] sheepshead . . . It is assumed that impacts on other species in the Project area would be similar to impacts on these representative species."

Unfortunately, these analyses extended only to the ichthyoplanktonic life stages of these species, and not to other stages involving use of nursery and benthic habitat. 10

5. Commercial and recreational fishing are described in Section 3.9 and 4.9.

6. Comment noted.

7. Comment noted.

8. Comment noted. Detailed benthic surveys were conducted as part of the Deepwater Port Application. These studies were incorporated into the Draft EIS analysis in appropriate detail for a Draft EIS. Additional studies have been conducted and additional detail has been added to the Final EIS, as appropriate. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements would be developed after a license is issued. All available data would be used to specify mitigation type, extent, duration, and schedule.

9. Text in the Final EIS has been revised to add quantitative measurements when information is available. Otherwise, a qualitative assessment has been given. The Applicant is in consultation with USCG and the Maritime Administration to develop appropriate mitigation plans. Additionally, video mapping results from the Gulfstream Pipeline Project EIS (2001) are being compiled to augment the predicted benthic impacts, as appropriate. All available data will be used to specify mitigation type, extent, duration and schedule.

10. Comment noted.

Chapter 2: Detailed Description of the Project and Alternatives

Page 2-15, lines 4-5: "[A good development program] avoids dredging in areas where sediments contain high levels of heavy metals, biocides, oil, or other pollutants or hazardous materials . . ."

Were any samples collected in the proposed development areas to verify absence of such materials? 11

---

*Page 2-17, lines 9-10: "**Criterion 3, Avoidance of Mapped Sand Resources**. Siting a project in an identified sand resource would be difficult, and likely would not be approved by Minerals Management Service."*

See comments from Longboat Key, Manatee County, and others concerning sand resources through which the pipeline is proposed to be placed. 12

Pages 2-23 to 2-25, Discussion on Vaporization Alternatives.

This discussion is somewhat difficult to follow and would benefit greatly by the addition of schematic representations of the several alternatives, as well as of the alternative actually proposed by the Applicant. 13

Page 2-25, lines 28-30: "The proposed design provides for a through slot intake of 0.25 inches with a velocity of less than the USEPA-recommended velocity of 0.15 meters per second (m/s) . . . It provides for exclusion of most juvenile fish."

Please provide the citation to these USEPA recommendations. 14

Page 2-26, lines 18-19: "Plowing involves laying the pipeline on the bottom and then dragging a plow along the sea bottom using the pipeline to guide the plow."

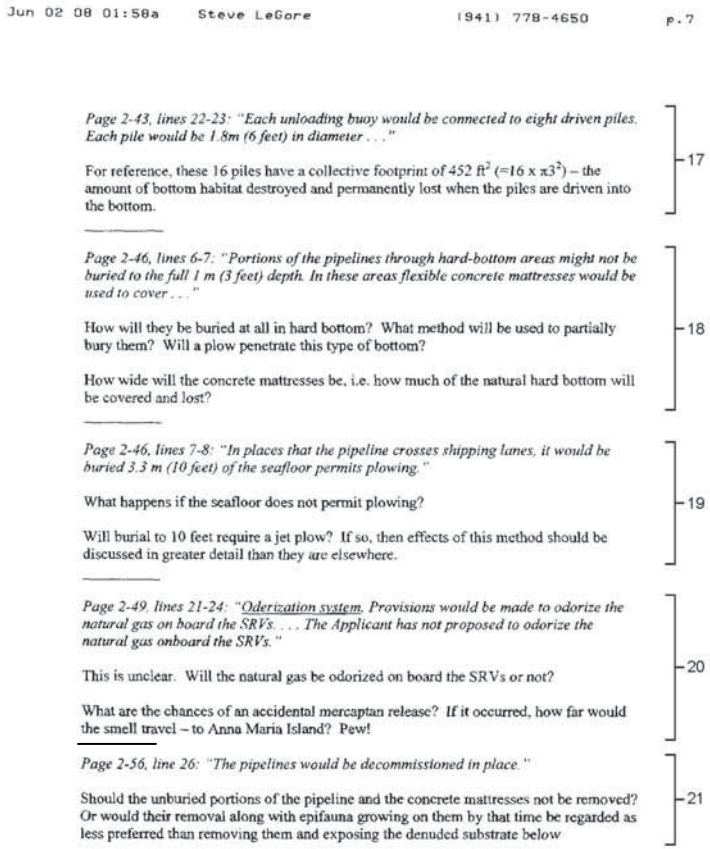
Does plowing as proposed by the Applicant involve the use of anchors? If so, what kind, how large, how many, and how often will they be deployed to the bottom. How large and how deep will the resulting holes be, and what will be the resulting impacts? 15

Page 2-39, line 39: ". . . the maximum flow rate of 1,520 m^3 per hour (6,692 gallons per minute . . ."

For reference, this = 112 gallons per second 16

---

11. Available data and samples collected by the Applicant are described in Section 4.1 of the EIS.



12. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

13. Schematic representations have been added.

14. Citation added.

15. An anchoring plan has been submitted by the Applicant and impacts from those activities on benthic habitats are discussed in Section 4.2.1.6.

16. Comment noted.

Jun 02 08 01:58a Steve LeGore (941) 778-4650 p.7

Page 2-43, lines 22-23: "Each unloading buoy would be connected to eight driven piles. Each pile would be 1.8m (6 feet) in diameter . . ."

For reference, these 16 piles have a collective footprint of 452 ft^2 ($\approx 16 \times \pi 3^2$) – the amount of bottom habitat destroyed and permanently lost when the piles are driven into the bottom. 17

Page 2-46, lines 6-7: "Portions of the pipelines through hard-bottom areas might not be buried to the full 1 m (3 feet) depth. In these areas flexible concrete mattresses would be used to cover . . ."

How will they be buried at all in hard bottom? What method will be used to partially bury them? Will a plow penetrate this type of bottom?

How wide will the concrete mattresses be, i.e. how much of the natural hard bottom will be covered and lost? 18

Page 2-46, lines 7-8: "In places that the pipeline crosses shipping lanes, it would be buried 3.3 m (10 feet) of the seafloor permits plowing."

What happens if the seafloor does not permit plowing?

Will burial to 10 feet require a jet plow? If so, then effects of this method should be discussed in greater detail than they are elsewhere. 19

Page 2-49, lines 21-24: "Oderization system. Provisions would be made to odorize the natural gas on board the SRVs. . . . The Applicant has not proposed to odorize the natural gas onboard the SRVs."

This is unclear. Will the natural gas be odorized on board the SRVs or not?

What are the chances of an accidental mercaptan release? If it occurred, how far would the smell travel – to Anna Maria Island? Pew! 20

Page 2-56, line 26: "The pipelines would be decommissioned in place."

Should the unburied portions of the pipeline and the concrete mattresses not be removed? Or would their removal along with epifauna growing on them by that time be regarded as less preferred than removing them and exposing the denuded substrate below 21

LeGore Environmental Associates, Inc.
Page 6 of 21

Comments on Port Dolphin EIS
Docket Number USCG-2007-28532

17. Comment noted.

18. In some areas along the pipeline route, there is a sandy cover over shallow hardbottom areas. Therefore part of the pipeline may be buried in that shallow sandy cover. Mattresses would cover the rest of the pipeline over the hard bottom areas (see Sections 2.3.8 4.2.1.3.1, 4.2.1.5, 4.2.1.6, 4.4, and 4.5).

19. Shipping lanes are continually dredged to stay deep enough for the large vessels so plowing in this area is not expected to be cause a major impact. The bounding case of impacts is discussed in the EIS, and other impacts would be expected to be lower in magnitude (see Sections 2.1.10 and 2.3.8).

20. As proposed by the Applicant, natural gas will not be odorized on board the SRVs.

21. Text has been added to clarify that decommissioning would be governed by the the appropriate Federal agencies' requirements at the time and the Operator would be required to submit a decommissioning plan to the Secretary for approval. The general decommissioning process is outlined in 2.3.12 of the EIS.

Chapter 3: Affected Environment

Page 3-6, lines 22-23: "No turbidity or TSS data specific to the Gulf portion of the Project Site are available."

Why not? Did the Applicant not collect any data? — 22

Page 3-6, lines 27-29: "Sediments within both the continental shelf and Tampa Bay portions of the project area consist of a mixture of quartz sands eroded from older deposits and biogenic carbonates. The mean grain size of the sediment ranges from 0.18 to 0.5 mm, and is classified as fine- to medium-grained sand."

What is the source of these statements? The ASA citation provided is a modeling study. How much of the primary data, if any were collected to verify literature-based data?

Did the Applicant collect any sediment samples for particle size analysis to correlate with benthic habitat discussions? This reviewer was unable to find any. — 23

Page 3-26, lines 35-36; "Benthic habitats are characterized by physical and structural features, such as topography, substrate type, sediment grain size, and water depth, and by . . .

How many grain-size distribution samples were collected? Where were they collected and how were they analyzed. This reviewer was unable to find such data in the DEIS. — 24

Page 3-27, lines 8-9 ff: "The Inner and Middle Shelf Live Bottom Assemblage II consists of algae, sea squirts, bryozoans, hard corals, small sea fans, hydrozoans and several sponges."

Note that this assemblage description includes only sessile organisms, which are appropriately used to characterize this kind of live bottom. However, as noted on the previous page (3-26, lines 34-35) benthic *communities* consist of both substrate (habitat) and organisms that occupy that substrate. The named sessile organisms in effect define the substrate of this assemblage. Unfortunately, this description does not include mention of any motile species (fish, invertebrates) or benthic infauna (animals living in the sediment) living in or using this hard bottom assemblage. Thus, this is not a description of a benthic *community* despite inferences to the contrary throughout this DEIS. This reviewer was unable to find any information in this document providing quantitative estimates of benthic infauna populations or motile species associated with these assemblages. This is a basis for difficulty in scaling environmental impacts of this proposed development. — 25

22. Turbidity data is now available and is included in Section 3.1.3.4 of the Final EIS.

23. References have been added to the discussion.

24. Geophysical and geotechnical surveys have been conducted by the Applicant. The reports from these surveys are available electronically via the Federal Docket Management System (*www.regulations.gov*), Docket No. USCG-2007-28532.. The surveys have not been included in already lengthy EIS due to size.

25. Comment noted.

Page 3-27, lines 16-17: "Rocky bottom is colonized by sponges, soft corals, true corals, and anemones. These provide commercially important fish and shellfish habitat."

True, but which fish and shellfish species utilize these habitats in the proposed project area? How many (density) occur in the affected environment, and where are they? Without these data, how is it possible to anticipate environmental impacts of the project? 26

Such generalities occur throughout this chapter, but quantitative data are not provided. It appears that the Applicant conducted no benthos baseline survey beyond the side-scan sonar, diver and photographic surveys that seem to have been conducted more for construction and design purposes than for analysis of benthic communities.

Page 3-27, lines 22-34: Paragraph discussing hard-bottom habitats in Tampa Bay. 27

This is all very general information, and its relevance to the proposed project is unclear.

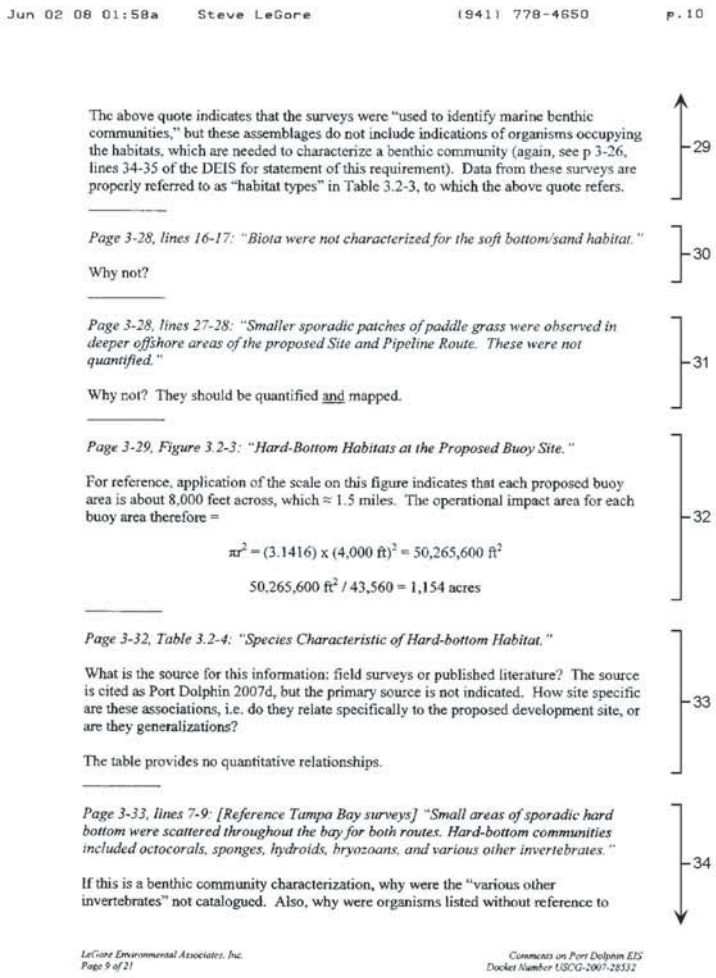
Page 3-27, lines 37-38: "Five species of seagrass are common to the GOM."

This is merely another example of a generality without project-site specificity. GOM = the entire Gulf of Mexico. The statement above is fair enough if it serves as an introduction to site-specific information, but this appears to not be the case. 28

Page 3-28, lines 1-11: "The Applicant performed a benthic survey . . . Side-scan sonar, photodocumentation (video and still photographic data), and diver surveys were used to identify marine benthic communities within the Project Area. Surveyed habitats were classified into six different habitat types, presented in Table 3.2-3."

Descriptions of specific survey methods would enable appreciation of their applicability, benefits, and limitations.

It seems to this reviewer that the habitat types identified were more relevant to construction planning than benthic community characterization. They included Type A – with relief of ≥0.25 m, Type B - with relief < 0.25 m, Type C – Breakwater Spoil Area or Habitat of Special Concern, Type D – Sand near hard bottom or sandy veneer over hard substrate, Soft Substrate/Sand, and Seagrass. 29



No mention is made in the DEIS of sampling infauna, of samples for establishing grain size distributions, or of characterizing fish and macroinvertebrate assemblages utilizing these habitats. Even qualitative species relationships are left uncharacterized. Quantitative data are absent, rendering scaled environmental impact assessments impossible.

26. Comment noted. Detailed benthic surveys were conducted as part of the Deepwater Port Application. See Section 4.2.1.6 for benthic resources analysis.

27. Comment noted.

28. Seagrass studies have been completed since the development of the Draft EIS and have been quantified in the Final EIS.

29. Comment noted. Detailed benthic surveys were conducted as part of the Deepwater Port Application. See Section 4.2.1.6 for benthic resources analysis.

Jun 02 08 01:58a Steve LeGore (941) 778-4650 p.10

The above quote indicates that the surveys were "used to identify marine benthic communities," but these assemblages do not include indications of organisms occupying the habitats, which are needed to characterize a benthic community (again, see p 3-26, lines 34-35 of the DEIS for statement of this requirement). Data from these surveys are properly referred to as "habitat types" in Table 3.2-3, to which the above quote refers. 29

Page 3-28, lines 16-17: "Biota were not characterized for the soft bottom/sand habitat." 30

Why not?

Page 3-28, lines 27-28: "Smaller sporadic patches of paddle grass were observed in deeper offshore areas of the proposed Site and Pipeline Route. These were not quantified." 31

Why not? They should be quantified and mapped.

Page 3-29, Figure 3.2-3: "Hard-Bottom Habitats at the Proposed Buoy Site." 32

For reference, application of the scale on this figure indicates that each proposed buoy area is about 8,000 feet across, which ≈ 1.5 miles. The operational impact area for each buoy area therefore =

$$\pi r^2 = (3.1416) \times (4{,}000 \text{ ft})^2 = 50{,}265{,}600 \text{ ft}^2$$

$$50{,}265{,}600 \text{ ft}^2 / 43{,}560 = 1{,}154 \text{ acres}$$

Page 3-32, Table 3.2-4: "Species Characteristic of Hard-bottom Habitat." 33

What is the source for this information: field surveys or published literature? The source is cited as Port Dolphin 2007d, but the primary source is not indicated. How site specific are these associations, i.e. do they relate specifically to the proposed development site, or are they generalizations?

The table provides no quantitative relationships.

Page 3-33, lines 7-9: [Reference Tampa Bay surveys] "Small areas of sporadic hard bottom were scattered throughout the bay for both routes. Hard-bottom communities included octocorals, sponges, hydroids, bryozoans, and various other invertebrates." 34

If this is a benthic community characterization, why were the "various other invertebrates" not catalogued. Also, why were organisms listed without reference to

LeGore Environmental Associates, Inc. Page 9 of 21

Comments on Port Dolphin EIS Docket Number USCG-2007-28532

30. Soft-bottom species were not quantified because survey protocols from both MMS and FDEP required that quantitative photos only be taken of live-bottom areas, not soft bottom. Many of the organisms observed in the soft-bottom areas are motile species that move along the seafloor (see Section 3.2.5).

31. Seagrass studies have been completed since the development of the Draft EIS and have been quantified in the Final EIS.

32. Comment noted.

33. The data are site-specific. The wrong source is cited and has been corrected. The citation should be: *Port Dolphin Energy LLC (Port Dolphin). 2007. Port Dolphin Energy LLC Deepwater Port License Application. Volume II, Appendix E, Field Survey Report, Survey of Marine Benthic Habitats within the Port Dolphin Deepwater Port and Pipeline Corridor, Offshore, and within Tampa Bay. Port Dolphin Project, Tampa Bay, FL. Prepared by CSA International, Inc. January 2007.* The citation has been changed in several places.

useful identifying taxa? These questions reinforce the impression that the benthic surveys were conducted more for construction planning reasons than for environmental impact assessment purposes. 34

Page 3-33, lines 9-10: "Fields of one species of tunicate was observed in Tampa Bay, but not offshore. It is not known whether this species is native or nonnative."

The designation of native vs. non-native is fairly important as baseline information for an EIS, particularly if the Applicant wishes to protect himself against future accusations of importing or enabling establishment of exotic species. 35

Page 3-49, line 33 ff: "Fish and Fisheries Resources" Section, extending to page 3-50, line 31.

The DEIS attempts to characterize fishery resources of the project area by citing literature describing generalized fishery assemblages. This is useful for basic understanding and introduction, but it does not provide the quantitative data one generally expects in an EIS. This discussion is far too general to provide a basis for estimating or characterizing impacts of the proposed project. For example is a km^2 of a particular hard-bottom type is destroyed by the project, there is no quantitative basis for relating that loss to an effect on any fishery resource. If the DEIS provided some measure of fish density in various habitat types, then a relationship would be readily computed. It appears, however, that no quantitative surveys of fishery or benthic communities were made in support of this DEIS. 36

Page 3-91, Table 3.6-2: "Annual Landing Statistics for . . . Counties, Florida in 2006."

Does this table assert that only 1,690 Finfish Trips were made in Manatee County for all of 2006? This seems like a very low number considering the popularity of recreational fin fishing in the area. What is the source of these data? 37

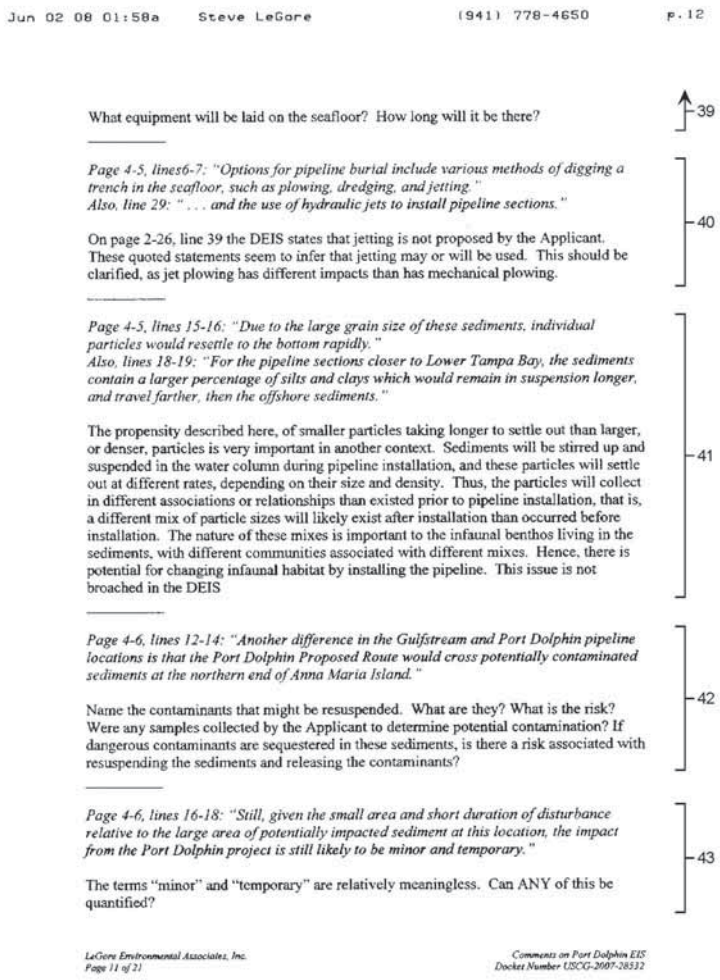
Page 3-123, Table 3.9-13: "Income and Poverty, 1999."

In first column, change Per Capital Income to read: Per Capita Income. 38

Chapter 4: Environmental Consequences

Page 4-4, lines 30-31: "These actions are expected to result in increases in turbidity from sediment disturbance during placement of the anchors and laying of equipment on the seafloor." 39

34. Comment noted. This has been further analyzed in Section 3.2.5 of the Final EIS.



35. Comment noted. Quantitative data is included where available.

36. Table sources were added for Tables 3.6-1 and 3.6-2.

37. Text changed to reflect comment.

38. This information is provided in the first three sentences of the paragraph.

39. Text revised per comment.

Jun 02 08 01:58a Steve LeGore (941) 778-4650 p.12

What equipment will be laid on the seafloor? How long will it be there? 39

Page 4-5, lines6-7: "Options for pipeline burial include various methods of digging a trench in the seafloor, such as plowing, dredging, and jetting."
Also, line 29: ". . . and the use of hydraulic jets to install pipeline sections."

On page 2-26, line 39 the DEIS states that jetting is not proposed by the Applicant. These quoted statements seem to infer that jetting may or will be used. This should be clarified, as jet plowing has different impacts than has mechanical plowing. 40

Page 4-5, lines 15-16: "Due to the large grain size of these sediments, individual particles would resettle to the bottom rapidly."
Also, lines 18-19: "For the pipeline sections closer to Lower Tampa Bay, the sediments contain a larger percentage of silts and clays which would remain in suspension longer, and travel farther, then the offshore sediments."

The propensity described here, of smaller particles taking longer to settle out than larger, or denser, particles is very important in another context. Sediments will be stirred up and suspended in the water column during pipeline installation, and these particles will settle out at different rates, depending on their size and density. Thus, the particles will collect in different associations or relationships than existed prior to pipeline installation, that is, a different mix of particle sizes will likely exist after installation than occurred before installation. The nature of these mixes is important to the infaunal benthos living in the sediments, with different communities associated with different mixes. Hence, there is potential for changing infaunal habitat by installing the pipeline. This issue is not broached in the DEIS 41

Page 4-6, lines 12-14: "Another difference in the Gulfstream and Port Dolphin pipeline locations is that the Port Dolphin Proposed Route would cross potentially contaminated sediments at the northern end of Anna Maria Island."

Name the contaminants that might be resuspended. What are they? What is the risk? Were any samples collected by the Applicant to determine potential contamination? If dangerous contaminants are sequestered in these sediments, is there a risk associated with resuspending the sediments and releasing the contaminants? 42

Page 4-6, lines 16-18: "Still, given the small area and short duration of disturbance relative to the large area of potentially impacted sediment at this location, the impact from the Port Dolphin project is still likely to be minor and temporary."

The terms "minor" and "temporary" are relatively meaningless. Can ANY of this be quantified? 43

LeGore Environmental Associates, Inc.
Page 11 of 21

Comments on Port Dolphin EIS
Docket Number USCG-2007-28532

40. This issue has been further analyzed in Section 4.1.1 of the Final EIS.

41. After reviewing revised data, the original map was incorrect and there are no "hot spots" near Anna Maria Island. Text revised clarify.

42. After reviewing revised data, the original map was incorrect, and there are no "hot spots" near Anna Maria Island. Text revised to clarify.

43. Impacts of chain sweep on biota have been updated and are addressed in Section 4.2 and are accounted in Table 4.1-2.

Page 4-10, lines 40-44: "While the SRVs are moored at the Port, raising and lowering of the buoy and weathervaning of the SRVs would cause dragging of the mooring chains and risers on the seafloor. This would result in localized and temporary disturbances to the sediment, potentially causing short-term sediment resuspension and increases in turbidity near the bottom of the water column. These disturbances would occur periodically during the entire duration of the project (25 years)."

More significantly, the mooring chains are very heavy, and dragging them across the sediment will surely kill and benthic flora and fauna present. Since this will occur repeatedly over the duration of the project, this area will presumably be taken out of production for 25 years. As per comments above concerning page 3-29, this seems to mean that two times 1,154 acres, or 2,308 acres, will be effectively denuded for 25 years. 44

Page 4-13, lines 16-18: "Approximately 8,787 acres of soft-bottom and hard-bottom benthic habitat would be impacted from pipeline installation, buoy anchor installation, and anchoring impacts of construction vessels along the construction pathway."

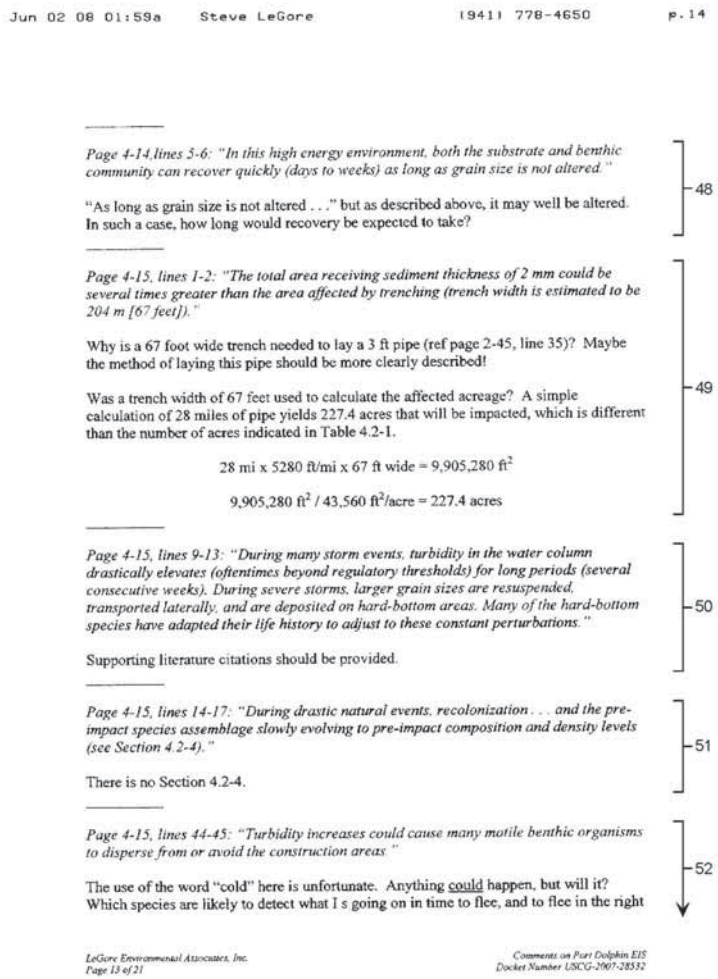
The term "impacted" should be clarified. Does it here mean "destroyed?"

What effects will this habitat destruction have on animals that live in and utilize this habitat? What species use it, e.g. for protective habitat or for food? What impacts will this have on the populations of these habitat users? How much actual biomass is lost by destroying, even temporarily, these habitats? Answers to these questions require some measure of quantitative information, which does not appear to be provided by this DEIS. 45

Page 4-14, Table 4.2-1, 2nd row, Pipeline installation – plowing, total of 176.1 acres.

Referring to the comment above for page 4-5, lines 15-16, this entry means that 176.1 acres will potentially be filled with redistributed sediments particle sizes, i.e. altered habitat. Neither this potential nor its implications are mentioned by the DEIS. 46

Page 4-14, Table 4.2-1, 4th row, Concrete mattresses along pipeline route – 16.32 acres of soft bottom . . .



Why are concrete mattresses being applied to so much soft bottom? The previous description indicated that these mattresses will only be used when hard bottom prevents burial of the pipeline to 3 feet.

Also, is mooring line chain drag, as discussed above re: page 4-10, lines 40-44, included in this table? IF Anchor sweep (STL buoy) is the same thing, then our estimates of acreage affected differ greatly. Can this be clarified? 47

44. The amount of hard bottom habitat that will be impacted is quantified as discussed in Section 4.2.1.3.1 and Table 4.2-13.

45. The impact of resettled sediments is addressed in Section 4.1 (water quality), and impacts on habitat are discussed Section 4.2.

46. Mattresses will be applied in areas where the pipeline cannot be buried with three feet of cover. There are areas along the pipeline that have some sand cover over hard bottom areas, but are not deep enough to completely cover the pipeline to the depth required. Anchor sweep is quantified in Table 4.2-1.

Jun 02 08 01:59a Steve LeGore (941) 778-4650 p.14

Page 4-14,lines 5-6: "In this high energy environment, both the substrate and benthic community can recover quickly (days to weeks) as long as grain size is not altered."

"As long as grain size is not altered . . ." but as described above, it may well be altered. In such a case, how long would recovery be expected to take? 48

Page 4-15, lines 1-2: "The total area receiving sediment thickness of 2 mm could be several times greater than the area affected by trenching (trench width is estimated to be 204 m [67 feet])."

Why is a 67 foot wide trench needed to lay a 3 ft pipe (ref page 2-45, line 35)? Maybe the method of laying this pipe should be more clearly described!

Was a trench width of 67 feet used to calculate the affected acreage? A simple calculation of 28 miles of pipe yields 227.4 acres that will be impacted, which is different than the number of acres indicated in Table 4.2-1. 49

$$28 \text{ mi} \times 5280 \text{ ft/mi} \times 67 \text{ ft wide} = 9{,}905{,}280 \text{ ft}^2$$

$$9{,}905{,}280 \text{ ft}^2 / 43{,}560 \text{ ft}^2/\text{acre} = 227.4 \text{ acres}$$

Page 4-15, lines 9-13: "During many storm events, turbidity in the water column drastically elevates (oftentimes beyond regulatory thresholds) for long periods (several consecutive weeks). During severe storms, larger grain sizes are resuspended, transported laterally, and are deposited on hard-bottom areas. Many of the hard-bottom species have adapted their life history to adjust to these constant perturbations."

Supporting literature citations should be provided. 50

Page 4-15, lines 14-17: "During drastic natural events, recolonization . . . and the pre-impact species assemblage slowly evolving to pre-impact composition and density levels (see Section 4.2-4)."

There is no Section 4.2-4. 51

Page 4-15, lines 44-45: "Turbidity increases could cause many motile benthic organisms to disperse from or avoid the construction areas."

The use of the word "cold" here is unfortunate. Anything could happen, but will it? Which species are likely to detect what I s going on in time to flee, and to flee in the right 52

LeGore Environmental Associates, Inc.
Page 13 of 21

Comments on Port Dolphin EIS
Docket Number USCG-2007-28532

47. Information has been added to the EIS regarding recovery.

48. Construction methods are described in Section 2.1.1.9, and shown in Figures 2.2-8 and 2.2-9.

49. Citations added per comment.

50. Section reference deleted.

51. Additional detail provided in Sections 4.2.1.7 and 4.2.1.13.

direction? Which species are not? To a small crab or sea cucumber, the plow will certainly seem very big and fast moving. The contention that motile benthic organisms will be able to detect and avoid harm should be seriously substantiated. 52

Page 4-18, lines 6-7: "The mid-line buoy would be a single buoy and line used to suspend the anchor line to prevent it from dragging and scouring the seafloor."

Will there be NO dragging when the anchors are retrieved as the vessel moves forward? The forward anchors would seem to be controllable by the buoys, but retrieving the trailing anchors ad the vessel moves forward, is probably likely to drag and scour the seafloor to some extent. Is the Applicant willing to guarantee that all scour from this cause will be prevented? 53

Page 4-18, lines 8-10: "Anchor lines on the derrick/lay barge would be set and raised once during the installation of each loading buoy, but they would be set and raised repeatedly during pipeline installation."

How many anchor placements will there be per mile of pipeline installation – and in total? How big are these anchors, and what kind of anchors are they? How large and deep a hole will they leave behind in the sediments, and what impact will these holes have, e.g. on commercial fishing operations such as trawling? How much benthic biomass of what species will be destroyed with each anchor placement? 54

Page 4-18, Line 10: "Other construction vessels could also employ anchors and anchor lines."

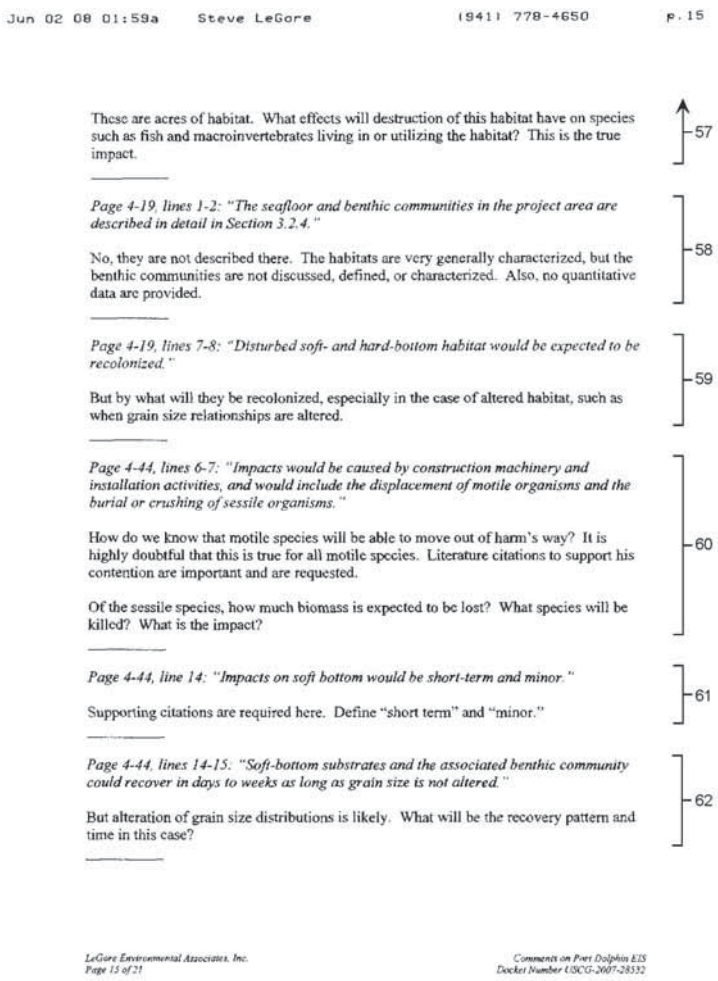
Which ones? How many? What will be the impacts from thee anchors? 55

Page 4-18, line 33: ". . . and beneficial impacts . . ."

Please itemize and clearly identify the beneficial impacts of project operations. 56

Page 4-18, lines 35-38: "The placement of buoy system parts and concrete mattresses along the pipeline route, as well as anchor sweep would result in 16.32 acres of long-term disturbance on soft-bottom habitat and 19.42 acres of long-term disturbance on hard-bottom habitat. An additional 18.98 acres of soft substrate/sand habitat would be disturbed due to anchor sweep."

The term "disturbed" should be more clearly defined here. Does this mean "destroyed?" 57



52. If a License is issued by the Maritime Administration, the license would include a condition that would require a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements would be developed after a license is issued.

53. Total anchor line impacts are estimated in Table 4.2-1.

54. Information on construction and operation vessels is included in Section 4.10 and impacts have been estimated in Table 4.2-1.

55. Text revised to clarify.

56. Text revised to clarify.

Jun 02 08 01:59a Steve LeGore (941) 778-4650 p.15

These are acres of habitat. What effects will destruction of this habitat have on species such as fish and macroinvertebrates living in or utilizing the habitat? This is the true impact. 57

Page 4-19, lines 1-2: "The seafloor and benthic communities in the project area are described in detail in Section 3.2.4."

No, they are not described there. The habitats are very generally characterized, but the benthic communities are not discussed, defined, or characterized. Also, no quantitative data are provided. 58

Page 4-19, lines 7-8: "Disturbed soft- and hard-bottom habitat would be expected to be recolonized."

But by what will they be recolonized, especially in the case of altered habitat, such as when grain size relationships are altered. 59

Page 4-44, lines 6-7: "Impacts would be caused by construction machinery and installation activities, and would include the displacement of motile organisms and the burial or crushing of sessile organisms."

How do we know that motile species will be able to move out of harm's way? It is highly doubtful that this is true for all motile species. Literature citations to support his contention are important and are requested.

Of the sessile species, how much biomass is expected to be lost? What species will be killed? What is the impact? 60

Page 4-44, line 14: "Impacts on soft bottom would be short-term and minor."

Supporting citations are required here. Define "short term" and "minor." 61

Page 4-44, lines 14-15: "Soft-bottom substrates and the associated benthic community could recover in days to weeks as long as grain size is not altered."

But alteration of grain size distributions is likely. What will be the recovery pattern and time in this case? 62

LeGore Environmental Associates, Inc.
Page 15 of 21

Comments on Port Dolphin EIS
Docket Number USCG-2007-28532

57. Comment noted. Description and analysis incorporate a level of detail that is appropriate for an EIS. The amount of hard bottom habitat that will be impacted is quantified. From an ecosystem perspective, this is enough detail to determine the nature, context, and intensity of the impact.

58. Additional detail provided in Section 4.2.1.7.

59. This issue has been further analyzed in Sectuib 4.2.1.6.1 of the Final EIS.

60. Nature and intensity of the impact is supported by the remainder of the paragraph. The paragraph is cited appropriately.

61. Text revised to reflect comment.

62. Text revised to clarify.

Page 4-44, lines 16-18: "Impacts such as pile driving into hard bottom or the laying of pipelines and concrete mattresses on limestone outcroppings and other hard-bottom relief features would be permanent."

How much of what species will be lost? To what effect? 63

Page 4-44,line 18: "The substrates that replace the limestone outcropping would be recolonized."

By what? 64

Page 4-44, lines 18-19: "If soft substrates replace hard bottom the new habitat would be replaced with opportunistic organisms."

Which are what species? Also, these recruits would not "replace" the habitat. Rather, they would colonize and inhabit the habitat. 65

Page 4-44, lines 22-24: ". . . the structural component of the habitat would be reduced because the biota such as corals, sponges, and algae provide structure for juvenile and adult fish and shellfish species in this low relief habitat . . ."

What species of fish and shellfish utilize this habitat and in what numbers or densities? What is the impact on these species? Can these impacts be quantified? 66

Page 4-44, lines 26-28: "In the offshore areas, patches of paddlegrass would be affected by trenching of the pipeline. These impacts could be long-term as patches are completely disturbed or uprooted, or permanent if bathymetry is changed."

What species utilizing paddlegrass habitat would be affected by these changes? In what numbers? These areas were not quantified or mapped, so analysis of these impacts will probably be difficult, but they should be done. 67

Page 4-44, lines 31-37: "Seafloor disturbance could also occur as a result . . .possible mortality to these species as well."

This paragraph is very general. Can specifics be provided? This IS an EIS. What are the expected impacts? 68

---

63. Text revised to clarify.

64. Text revised to clarify.

65. Text revised to clarify.

66. Text revised to clarify.

67. Specific impacts have been included in the Final EIS.

68. This issue has been further analyzed in the Final EIS.

Page 4-44, lines 38-39: "Effects of burial are dependent on sediment type, depth of sediment, and the size and behavior of infaunal or epifaunal organisms (including the species' ability to burrow and species' mobility) . . ."

Because no infaunal baseline survey was conducted, we do not know what species occur in the project area, hence we do not know which will survive and which will not. 69

Page 4-44, line 44 ff: "In areas where burrowing species compose the benthic community, it is possible that the fauna would burrow up through a 10-cm (3.9-inch) thick layer of material, which is well within the burrowing depth of most benthic organisms."

How can this be stated if we do not even know what infaunal species inhabit the area? Indeed, what is the point of the statement if we do not know the species involved?

This discussion is not relevant to the species likely to be buried 3-10 feet deep in the 67 ft-wide pipeline trenches. Few species can burrow out of a layer that thick. 70

Page 4-45, lines 35-37: "Predicting recovery times of benthic communities following disturbance is complex and depends on (1) the timing, severity, and frequency of the impact; (2) the complexity of the habitat and the organisms that are being disturbed; and (3) the energy of the environment . . ."

It also requires knowledge of what is living in these communities, which we do not have because no baseline surveys were conducted.

As it stands, this paragraph predicts nothing other than that the recovery times are complex and unknown. 71

Page 4-46, lines 1-2: "While recolonization usually begins soon after dredging ends, the process may range in duration from a few months for shallow dredging to years or decades . . ."

Can citations be provided? 72

Page 4-46, lines 4-5: "Unlike typical dredging sites, the trench itself would be only a few m wide."

According to page 4-5, line 2, the trench will be 20.4 m wide – hardly a "few." 73

---

69. This issue has been further analyzed in the Final EIS.

70. This issue has been further analyzed in the Final EIS.

71. Citation added to reflect comment.

72. Comment noted. This issue has been further analyzed in the Final EIS.

73. Please see Section 4.2.1.7, page 4-46, lines 7-8.

Page 4-46, lines 8-9: "Epifaunal species associated with hard bottom would be buried and infaunal species would recruit the soft bottom habitat."

With what impact to species utilizing the respective habitats? 74

Page 4-46, line 40: "The extent of hard/live bottom exposed to turbidity from plowing/jetting can be roughly estimated. . ."

Is it really the same for mechanical plowing and jet plowing? Doubtful, I think. 75

Page 4-47, line 14: "long-term . . . beneficial impacts . . ."

These beneficial impacts should be enumerated. 76

Page 4-47, lines 22-23: ". . . a shift in associated benthic assemblages could occur."

"Could" or "would?" The EIS should amplify its expectations, not catalogue possibilities. 77

Page 4-47, lines 27-32: "Additional long-term disturbance . . . would be caused by the sweeping and scouring of benthic substrate by anchor chains/cables. In soft-bottom areas . . . anchor rise/sweep could cut through the top few inches of the sediment layer, adversely impacting fauna such as tube-dwelling polychaetes, anemones, and other large infauna. In hard-bottom areas . . . anchors/risers would scrape the surface of limestone outcropping, impacting various epifaunal species."

"Adversely impacting" seems like a serious understatement for a massive chain plowing three inches deep through the soft sediment. More likely, this sweep will denude the affected area of virtually all life for the life of the project. 78

Page 4-47, lines 37-38: "The importance of this habitat to commercial and recreational fish and shellfish species is presented in Section 3.2.9."

No, it is not. Section 3.2.9 is titled "Terrestrial Resources." 79

Page 4-47,lines 38-40: "A characterization of the commercial and recreational fish and shellfish species, and commercial and recreational fisheries in the area is presented in Section 3.2.8."

Characterizations are not presented quantitatively, so degrees of impact remain unclear. 80

74. This issue has been further analyzed in the Final EIS.

75. Comment noted.

76. Comment noted.

77. Comment noted.

78. Correct section callout is 3.2.8. Text revised to clarify.

79. Comment noted.

80. Benthic communities are evaluated in 4.2.1.1 of the EIS.

Page 4-58, line 23: "The need for quantitative assessment off impacts on Ichthyoplankton was recognized . . .

Why was it recognized for Ichthyoplankton, but not for benthic community evaluation? 81

Page 4-64, lines3-5: "These impacts would include the displacement of demersal fish . . . and the displacement crushing of benthic shellfish such as shrimp, stone crabs, and spiny lobsters."

The meaning of "displacement crushing" is unclear. Also, quantitative impacts are not provided. 82

Page 4-64, lines11-13: "The redeposition of sediment would cause additional short-term minor direct adverse impacts on benthic fish and shellfish . . . through burial. The effects of burial of benthic invertebrates depends on the species mobility and burrowing ability"

Yes, it would. Can the species present be enumerated and predictions made concerning their ability to burrow through covering sediments? As it stands, the DEIS provides no estimates of impacts, but only lists of what could happen. This is not helpful to resource managers who must decide the fate of this proposed project. 83

Also, the individuals buried in the actual trenches to 3-10 ft depths would be lost.

Page 4-64, lines 17-18: "As stated above, these species [shrimp, spiny lobster, stone crabs] are expected to avoid the installation construction/installation [sic.] area due to the noise."

Literature citations supporting this contention would be appreciated. 84

Page 4-68, lines 21-23: "The crushing of benthic epifauna such as bryozoans, sponges, and corals in hard/live bottom habitat would result in long-term, minor adverse impacts on EFH for juvenile and adult fish and shellfish that utilize these benthic invertebrates as structure."

For EIS purposes, we should be told what fish and shellfish species are being discussed. Once again, we ask that the EIS be more specific and quantitative to enable evaluation of impacts and decision-making. 85

81. Text changed to clarify comment.

82. Comment noted.

83. Citation added.

84. This issue has been further analyzed in the Final EIS.

85. This issue has been further analyzed in the Final EIS.

Page 4-139, line 15-17 ref mitigation: "Geohazards and benthic video survey that were conducted during the summer and fall of 2006 provided a fine-scale delineation of seafloor structure, substrate, and habitat within the proposed Port Dolphin project area."

However, no information on benthic infauna or other species utilizing these habitats was provided. 86

Page 4-139, line 23 ref mitigation: "Identify avoidance zones of critical habitat for placement of installation barge anchors."

The value of this contribution is difficult to judge, however, because impacts of these anchors is not described in the DEIS. 87

Page 4-139, lines 24-25 ref mitigation: "Midline buoys would be utilized to the extent practicable on anchor chains to reduce the amount of anchor chain sweep."

This says to "reduce" effects of sweep. On page 4-18, line 7, the document uses the word "prevent." These statements should be rendered consistent. 88

Page 4-139, lines 28-29 ref mitigation: "During detailed design, an anchoring plan would be developed that would provide procedures for anchor deployment to minimize impacts on hard/live bottom habitat."

Why wait, Can this not be committed to in the EIS? 89

Page 4-139, lines 30-31 ref mitigation: "A Mitigation Plan to compensate for unavoidable impacts on hard bottom would be developed during the permitting process."

The Mitigation Plan would seem to be related to net project impacts, and should perhaps appear in the EIS rather than waiting to develop some undescribed plan at some undetermined time in the future. 90

Appendix F:

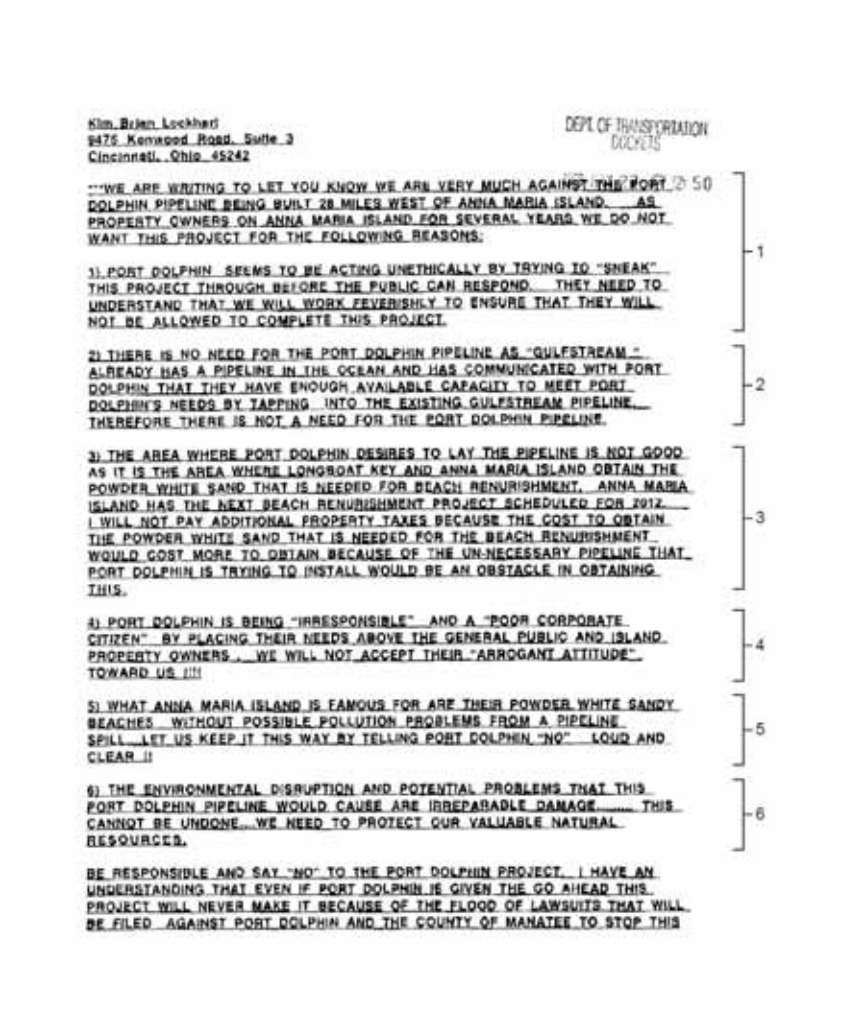
Page 1-1, final two lines on the page: "However, based on the proposed monitoring and mitigation plan, no long-term effects on [fishery] stock size are expected.

This statement must be substantiated, and its basis clearly and thoroughly described. 91

86. An anchor placement plan has been developed to avoid critical habitat to the extent applicable. The Applicant has developed a mitigation plan for unavoidable impacts to hard bottom that will be finalized by USCG and the Maritime Administration and appropriate resource agencies if a license is issued.

87. Text changed to reflect comment.

88. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.



89. If a License is issued by the Maritime Administration, the license would include a condition that would require development of a Monitoring and Mitigation Plan with input from applicable Federal and state resource agencies. Specific monitoring requirements not listed in Section 4.11 would be developed after a license is issued.

90. Comment noted.

REVIEWER CREDENTIALS

Dr. Steve LeGore earned his M.S. and Ph.D. Degrees from the University of Washington's College of Fisheries. He has more than 30 years of project experience relating to environmental impact assessment. Dr. LeGore has successfully completed projects throughout the United States and in more than 30 other nations; his project sponsors have included The World Bank, USAID, The UN's International Maritime Organization, several foreign governments and multinational companies. He has worked on offshore issues for several petroleum companies and he served for 5 years on the API's Fate & Effects of Oil Spills Committee. "WE ARE WRITING TO LET YOU KNOW WE ARE VERY MUCH AGAINST THE PORT DOLPHIN PIPELINE BEING BUILT 28 MILES WEST OF ANNA MARIA ISLAND. AS PROPERTY OWNERS ON ANNA MARIA ISLAND FOR SEVERAL YEARS WE DO NOT WANT THIS PROJECT FOR THE FOLLOWING REASONS:

1) PORT DOLPHIN SEEMS TO BE ACTING UNETHICALLY BY TRYING TO "SNEAK" THIS PROJECT THROUGH BEFORE THE PUBLIC CAN RESPOND. THEY NEED TO UNDERSTAND THAT WE WILL WORK FEVERISHLY TO ENSURE THAT THEY WILL NOT BE ALLOWED TO COMPLETE THIS PROJECT. 1

2) THERE IS NO NEED FOR THE PORT DOLPHIN PIPELINE AS "GULFSTREAM" ALREADY HAS A PIPELINE IN THE OCEAN AND HAS COMMUNICATED WITH PORT DOLPHIN THAT THEY HAVE ENOUGH AVAILABLE CAPACITY TO MEET PORT DOLPHIN'S NEEDS BY TAPPING INTO THE EXISTING GULFSTREAM PIPELINE. THEREFORE THERE IS NOT A NEED FOR THE PORT DOLPHIN PIPELINE. 2

3) THE AREA WHERE PORT DOLPHIN DESIRES TO LAY THE PIPELINE IS NOT GOOD AS IT IS THE AREA WHERE LONGBOAT KEY AND ANNA MARIA ISLAND OBTAIN THE POWDER WHITE SAND THAT IS NEEDED FOR BEACH RENURISHMENT. ANNA MARIA ISLAND HAS THE NEXT BEACH RENURISHMENT PROJECT SCHEDULED FOR 2012. I WILL NOT PAY ADDITIONAL PROPERTY TAXES BECAUSE THE COST TO OBTAIN THE POWDER WHITE SAND THAT IS NEEDED FOR THE BEACH RENURISHMENT WOULD COST MORE TO OBTAIN BECAUSE OF THE UN-NECESSARY PIPELINE THAT PORT DOLPHIN IS TRYING TO INSTALL WOULD BE AN OBSTACLE IN OBTAINING THIS. 3

4) PORT DOLPHIN IS BEING "IRRESPONSIBLE" AND A "POOR CORPORATE CITIZEN" BY PLACING THEIR NEEDS ABOVE THE GENERAL PUBLIC AND ISLAND PROPERTY OWNERS. WE WILL NOT ACCEPT THEIR "ARROGANT ATTITUDE" TOWARD US !!!! 4

5) WHAT ANNA MARIA ISLAND IS FAMOUS FOR ARE THEIR POWDER WHITE SANDY BEACHES WITHOUT POSSIBLE POLLUTION PROBLEMS FROM A PIPELINE SPILL. LET US KEEP IT THIS WAY BY TELLING PORT DOLPHIN "NO" LOUD AND CLEAR !! 5

6) THE ENVIRONMENTAL DISRUPTION AND POTENTIAL PROBLEMS THAT THIS PORT DOLPHIN PIPELINE WOULD CAUSE ARE IRREPARABLE DAMAGE..... THIS CANNOT BE UNDONE... WE NEED TO PROTECT OUR VALUABLE NATURAL RESOURCES. 6

BE RESPONSIBLE AND SAY "NO" TO THE PORT DOLPHIN PROJECT. I HAVE AN UNDERSTANDING THAT EVEN IF PORT DOLPHIN IS GIVEN THE GO AHEAD THIS PROJECT WILL NEVER MAKE IT BECAUSE OF THE FLOOD OF LAWSUITS THAT WILL BE FILED AGAINST PORT DOLPHIN AND THE COUNTY OF MANATEE TO STOP THIS

1. Thank you for your comment.

2. The need for the project is discussed in Sections 1.2 and 1.3 of the EIS. An offshore interconnection with the Gulfstream Pipeline has been added as an alternative in Section 2.1.4 and its impacts discussed in Section 4.

3. Due to public comments on the sand resources, Port Dolphin has moved their preferred route to avoid mapped sand resources currently used by Longboat Key and Anna Maria Island. The pipeline route is discussed in Section 2.1.4. Sand resources are discussed in Sections 3.4 and 4.4.

4. Thank you for your comment.

5. Thank you for your comment.

6. For Environmental Consequences see Section 4 of the Final EIS.

General Comment

Comment: I'm devastated at the thought/idea of placing yet another pipeline in the gulf of Florida.

I also share the concerns of the Coast Guard re: all the hazards/ (spills/ explosions/fire/gas release at processing equipment/severe weather/ just to name a few !)

I'm strongly concerned of the death caused to the gulf waters/ including all the wild life/sea life/that would eventually result in the death of the gulf waters/ turning the current pristine color of waters/ into dark/murky HORROR! I find it so hard to fathom that we'd allow this kind of natural occurring events to take place since the inevitable is obvious. Just look at other ocean/sea waters where pipelines have now been in exisistance. I know we are stewards of this land/ocean/air....could we please NOT do this to the last pristine beaches left on the gulf of Florida

1

2

1. As discussed in the *Maritime, Safety, and Related Matters* (Section 2.3.10), shipboard systems such as the metering system and cargo system, would help identify risk and potential issues that may result in spills, such as fire and gas release before such events occur. The Coast Guard would also approve the Operations Manual to ensure that the Applicant only operates in weather conditions that are safe for unloading and processing the liquefied natural gas. Since the terminal would be located 28 miles offshore, if there were a spill/fire, the thermal impact radius would not reach the shore to risk human life.

   As discussed in Section 4, natural gas in its liquid or gaseous form does not mix with seawater. Therefore, impacts to aquatic systems from an LNG spill would not be significant.

I am against the Port Dolphin natural gas project which will impact our environment, imperil Florida sea life, and also impact our beach renourishment programs.

In Manatee County there are less than five residential communities that utilize natural gas. Additionally, Manatee County proudly bears its name because we have numerous manatees here which are already fairly heavily impacted by the boats upon the water.

This area relies for a substantial part of its income upon tourist and eco-tourist visitors. We have all varieties of sea turtles nesting in the areas that would be impacted by this project.

Many articles have been written about concerns for this project and it is generally believed by long term residents in our island and adjacent mainland communities that this would not be a beneficial project for this area.

RE: USCG-2007-28532

We oppose the Port Dolphin, a subsidiary of an Italo, Norway, company pipeline for 3 (three) reasons.

I. PORT DOLPHIN'S PROPOSAL TO BUILD IT'S OWN PRIVATE PIPELINE WHEN THERE IS AN APPROVED PUBLIC PIPELINE AVAILABLE FOR THEM TO TAP INTO AND WHICH PORT DOLPHIN PLANS TO AT LANDFALL. 1

II. ENVIORMENTAL CONCERNS.
A. Liquid natural gas might be released in an accident or severe storm. 2
B. The placement of a 42mile pipeline through hard bottom habitat and seagrass can cause damage and is hard to mitigate. 3
C. The tanker engine cooling system intake would disrupt the biological resources and is hard to mitigate. 4

III. ECONOMIC CONCERNS
The extra expense the beach preservation and maintenance of Manatee and Sarasota Counties, would be carried by LOCAL, STATE, FEDERAL TAX PAYERS AND NOT THE NORWEGIAN, PORT DOLPHIN. 5

Sincerely,

Carl W. Van Cleave
Carl W. Van Cleave

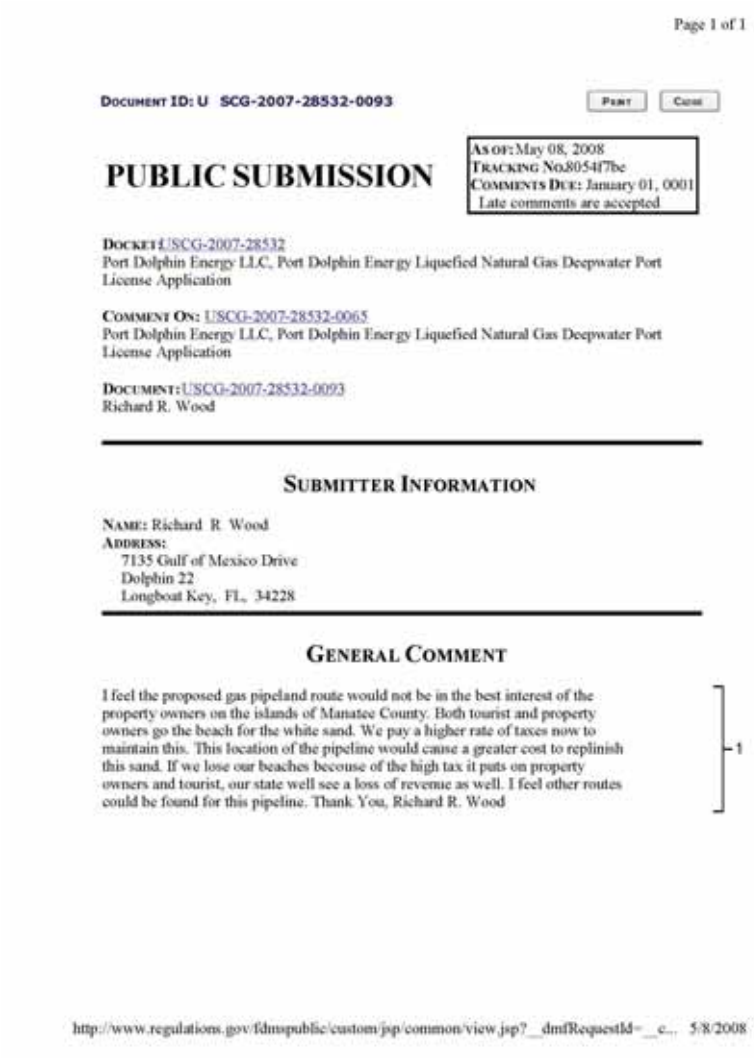
Senator Nelson
Rep. Buchanan



1. The potential for offshore interconnection with the Gulfstream Pipeline is discussed in Section 2.1.4 of the EIS. An offshore interconnection to the Gulfstream Pipeline has been added as an alternative and its impacts are discussed in Section 4.

2. The Coast Guard would require the Applicant to develop an approved operating plan for the Port to ensure that it is not operated in severe weather that may cause an accident or spill. Furthermore, Section 2.3.10 *Maritime, Safety, and Related Matters* outlines specific onboard control and safety systems such as a pipeline metering system, and a cargo system to ensure monitoring of all operations.

3. Comment noted. Impacts to biological resources such as hard bottom areas and sea grass are discussed in Section 4.2 of the EIS. Mitigation for those impacts is discussed in Section 4.11.

4. Impacts to fish and fisheries from the engine cooling system are discussed in Section 4.2.1.14 of the EIS. Conservative estimates suggest that no more than 0.05 percent of the average Florida landings would be lost during an entire year.

5. In response to comments on the Draft EIS, the Applicant has revised the pipeline route to minimize impacts on sand resource areas. The pipeline route is described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

GENERAL COMMENT

I feel the proposed gas pipeland route would not be in the best interest of the property owners on the islands of Manatee County. Both tourist and property owners go the beach for the white sand. We pay a higher rate of taxes now to maintain this. This location of the pipeline would cause a greater cost to replinish this sand. If we lose our beaches becouse of the high tax it puts on property owners and tourist, our state well see a loss of revenue as well. I feel other routes could be found for this pipeline. Thank You, Richard R. Wood

RE: USCG-2007-28532 -- PROPOSED DOLPHIN PROJECT

I oppose this project for most of the reasons put forth by other individuals and organizations and especially because

* it seems that running a pipe line through the channel subject to the most forceful tidal currents (that occur at the tip of the island) is asking for trouble from the most severe stress on the pipe itself. -1

* the exploitation of public space for private profit with the major risk for damage and disaster accruing to the public -- and especially when there is already a means of transporting the material available (but, of course, the profit would not be as great to the company). -2

1. Pipeline safety is discussed in Section 5 of the EIS. Any pipeline constructed and operated in the US would be constructed to withstand normal tidal currents.

2. Comment noted.

PORT DOLPHIN LNG DEEPWATER PORT

PUBLIC MEETING TO RECEIVE COMMENTS ON THE DRAFT EIS

DATE TAKEN: Tuesday, May 6, 2008

TIME: 4:30 p.m.

PLACE: Manatee Convention Center

* * *

MR. MARTIN: Good afternoon. Welcome, Ladies and Gentlemen. My name is Ray Martin of the Deepwater Port Standards Division of the Coast Guard Headquarters. Also, here are Mr. Chris Hanan of the Maritime Administration, Dave Swearingen of the Federal Energy Regulatory Commission, and Mark Sramek of the National Geographic Atmospheric Administration and Don Beckham of Engineering Environmental Management, or E²M.

In a few minutes they will provide a short overview of their responsibilities regarding the Port Dolphin deepwater port license application. But first I would like to give a brief background of the process.

In November of 2002 Coast Guard -- Congress passed the Maritime Transportation Security Act, which amended the Deepwater Port Act by including the importation of natural gas. Prior to that, it only included oil.

Since the passage of the Act, the Coast Guard and the Maritime Administration have received 16 applications for natural gas deepwater ports. One of those applications was submitted on March 29,

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

2007, by Port Dolphin Energy, LLC. They proposed to own, construct and operate a natural gas deepwater port located, approximately, 28 miles off the western coast of Florida. This project is referred to as Port Dolphin.

Since the project is closest to Florida it has been identified as an adjacent coastal state. This gives the governor specific authority in the approval process under the Deepwater Port Act. The governor of an adjacent coastal state may approve, disapprove or notify Maritime of inconsistencies with state programs relating to environmental protection, land and water use, and coastal zone management for which Maritime condition the license to make consistent.

To issue a deepwater port license, there are a number of elements that must be considered by the Maritime Administration. Chris Hanan will describe those in a minute.

With that as some background, I would now like to provide a brief overview of the Coast Guard's responsibility regarding the license application process. The Coast Guard and the Maritime Administration work together in processing deepwater port license applications. Although, the

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

administrator of the Maritime Administration will ultimately decide whether to approve, disapprove or approve with conditions a license for the proposed deepwater port. The Coast Guard is the lead federal agency for developing the environmental impact statement as one important input for that decision.

In fulfilling this role the Coast Guard must seek input from the public as well as from other state and federal agencies.

The Coast Guard is also responsible for the evaluation of the proposed deepwater port engineering design standards; the development of operations, water waste management, Maritime safety and security requirements and risk management; environmental protection and monitoring requirements; and compliance with various domestic and international laws for LNG carriers that might call on the Port Dolphin deepwater port.

Should the application be approved the Coast Guard will also coordinate with other agencies in overlapping areas or responsibility of design and operational conditions to be included in the record of decision and license and in developing post licensing requirements.

I want to make it clear that the Coast Guard

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

is neither a proponent nor an opponent for any deepwater port project. I also want to emphasize that only after the environmental review process have been completed can there be any activity on the proposed project.

As required by the Deepwater Port Act, the environmental analysis, in this case the environmental impact statement or EIS must be prepared in accordance with the National Environmental Policy Act or NEPA.

On April 17, 2008, we published a draft EIS. The intent of this public meeting is to receive your comments on the draft EIS or DEIS. In addition, written comments on the DEIS can be submitted until June 2, 2008, to the docket management facility. Instructions for filing written comments are available at the registration table.

The DEIS describes the nature and extent of the environmental impacts of the proposed action, which is the construction and operation of Port Dolphin deepwater port and associated pipelines. The DEIS includes, among other topics, the purpose and need for the proposed action, a description of the alternatives, a description of the affected environment, and an evaluation of impacts and

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

cumulative impacts on the natural and human environment by the proposed action and alternatives.

Comments received on the DEIS will become public record and will be considered in preparation of the final EIS. Following publication of the final EIS there will be another comment period and public hearing on the EIS and overall application.

Don Beckham of E²M will explain more on this in a few minutes.

At this time I would like to introduce Chris Hanan of the Maritime Administration who will describe the responsibilities of his agency.

MR. HANAN: Good afternoon. As Ray said, my name is Chris Hanan, and I am a member of the Maritime Administration of deepwater port management team, together with the U.S. Coast Guard.

The secretary of transportation has charged the Maritime Administration with processing all deepwater port applications for the Federal Government. In addition, the secretary has placed the responsibility for issuing or denying a deepwater port license with the Maritime Administration. The environmental impact statement is a major and important step in the deepwater port application process.

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

Early on in this process a public meeting was held here in Palmetto, where you and other individuals expressed concerns and provided areas of interests to be addressed in the environmental impact statement. The staff at E²M, along with many other staff members from various other government agencies, worked hard to produce this comprehensive document that specifically addressed your concerns.

I want to thank everyone who helped put this draft document together. However, we have more work to do. We have returned here today to see how we can make the environmental impact statement better. Your comments will help us do just that and will be greatly appreciated.

The next step in the EIS process requires us to take your comments made here today and those written, which we will accept until June 2, 2008, and try and make an improved and more comprehensive environmental document.

After the final environmental document is completed and published the Maritime Administration and the U.S. Coast Guard will host the third and final public hearing later this year.

At that time we will accept comments from all concerned parties for up to 45 days after the final

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

public hearing. After the comment period the Maritime Administration will make a decision within 45 days of the close of comments. The decision will be either: approve the application and issue a license, approve the application and issue a license subject to conditions, or disapprove the application.

The agency's decision to approve or disapprove the application will be reflected in the record of decision document issued by the Maritime Administrator. Issuance of the official license will follow should the application be accepted.

Any stated terms and/or conditions for the license will be reflected in the record of decision as well as in the official license document.

We emphasize these license requirements are stringent and completely enforceable. If a licensee violates the conditions of its license the Maritime Administration will suspend the license and/or operation of the facility until the conditions are sufficiently met.

Finally, we can assure you that the environmental review will have a substantial bearing on the final licensing decision. We appreciate your interest and encourage you to express your views and

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

concerns to help shape an adequate environmental document for the Port Dolphin Energy, LLC deepwater port project.

Now I will turn this over to Dave Swearingen and he can elaborate on his roles.

MR. SWEARINGEN: Thank you, Chris.

Good evening. My name is Dave Swearingen and I am an environmental project manager of the Federal Energy Regulatory Commission.

As Ray mentioned earlier, the FERC is a cooperating agency for the production of the EIS because of the onshore pipeline, which is under FERC jurisdiction. NEPA requires that the FERC Commission take into consideration environmental impacts associated with new natural gas facilities under its jurisdiction. So the FERC will use this cooperation process to fulfill its NEPA obligations.

The FERC Commission is responsible for making a determination on whether to issue a certificate of public convenience and necessity to Port Dolphin. The EIS prepared by the various agencies does not make that decision for the FERC.

The purpose of the EIS will be used to advise the FERC Commission and to disclose to the public the environmental impact of constructing and

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

operating the proposed project. The commission will consider the environmental information in the EIS, public comments, as well as a host of nonenvironmental issues, such as engineering, markets, rates, finances, tariffs and design and costs in making an informed decision on whether or not to approve the part of the project under FERC jurisdiction, that is the onshore pipeline.

Only after taking the environmental and nonenvironmental factors into consideration will the commission make its final decision on whether or not to approve Port Dolphin's proposed onshore pipeline.

As Ray mentioned, we are in the comment period phase of the environmental analysis. The FERC invites you to submit either oral or written comments on the draft EIS this evening or either by mailing them in or using the FERC Web site to submit them electronically. Only comments directly related to environmental impacts on the onshore pipeline should be submitted directly to the FERC. All others should be submitted via the Coast Guard process.

Okay. With that, I will turn things over to Mark Sramek with NOAA, National Marine Fisheries Service.

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

MR. SRAMEK: Thank you, Dave.

Good evening. My name is Mark Sramek. I work with the National Oceanic and Atmospheric Administration, National Marine Fisheries Service, Habitat Conservation Division. I work in St. Petersburg, Florida.

My principal role on the project is the environmental role -- excuse me -- environmental review and assessment of potential impacts on living and the marine resources, particularly essential fish habitat, icthyoplankton and hard bottom habitats in the project area.

My area of responsibility stands from Dixie County near the Suwannee River, south down to Naples, Florida, Ten Thousand Islands estuary.

Next I would like to turn this over to Mr. Beckham with the E²M. Thank you.

MR. BECKHAM: Thank you, Mark.

Good afternoon. I am Don Beckham. I am the project manager for this -- development of this EIS for engineering and environmental management, or E²M as Ray mentioned.

E²M is an environmental contractor that help the Coast Guard and Maritime Administration to prepare the draft of the environmental impact

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

statement.

I want to provide an overview of the public participation process that is involved in preparing the EIS.

E2M is a science-based environmental consulting firm experienced in preparing EISs and related studies. The EIS is being conducted in accordance with the National Environmental Policy Act or NEPA. We conducted an independent evaluation of the anticipated environmental impacts of the proposed project.

Public involvement is a fundamental aspect of NEPA and of the Coast Guard and Maritime Administration's NEPA policies.

The public involvement process started several months ago when the Coast Guard and Maritime Administration published a notice of intent to prepare the EIS in the federal register on July 12th of 2007. The notice was also published in the Tampa Tribune and the Bradenton Herald.

The notice -- we also mailed a notice to about 190 state and federal agencies, individuals and groups that might have some interest in the project.

During the 30-day public comment period in July and August an open house and public meeting was

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

held here at the Manatee County Convention Center. Information was provided on how to submit written comments. A number of comments were received and these were taken into account in the preparation of the draft EIS.

Since that time the draft EIS has been published. A notice of availability of the DEIS was published in the federal register on April 17th and that notice announced this public meeting that the DEIS was available and how you could get copies of it.

The notice was also published in the Tampa Tribune and the Bradenton Herald and included information about how to make comments on the federal government's electronic docket system.

We also mailed, approximately, 200 copies of the draft EIS to people or agencies that had requested a copy or that we knew were interested in the project. We also have copies here tonight. You saw them on the table in the other room and we'll make those available at the registration table if you would like to take a copy with you. We have both paper copies and CDs of the draft EIS.

The comment period for the draft EIS is 45 days, starting on April 17th and closing on June

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

2nd. At the close of the comment period the Coast Guard Maritime Administration will start work on the final EIS. A notice of availability of the final EIS is expected somewhere in mid-July. A notice will also be published and distributed when the final EIS is available and there will also be a 30-day public comment period specifically on the FEIS.

On a similar track, but not directly connected to the NEPA process, the Coast Guard and Maritime Administration will hold a formal hearing on the deepwater port license application following the distribution of the FEIS. At that meeting the public will be given additional opportunity to provide comments on all aspects of the proposed project.

We would like to thank you for taking your time to come out tonight and provide your comments on the draft EIS. Thanks very much.

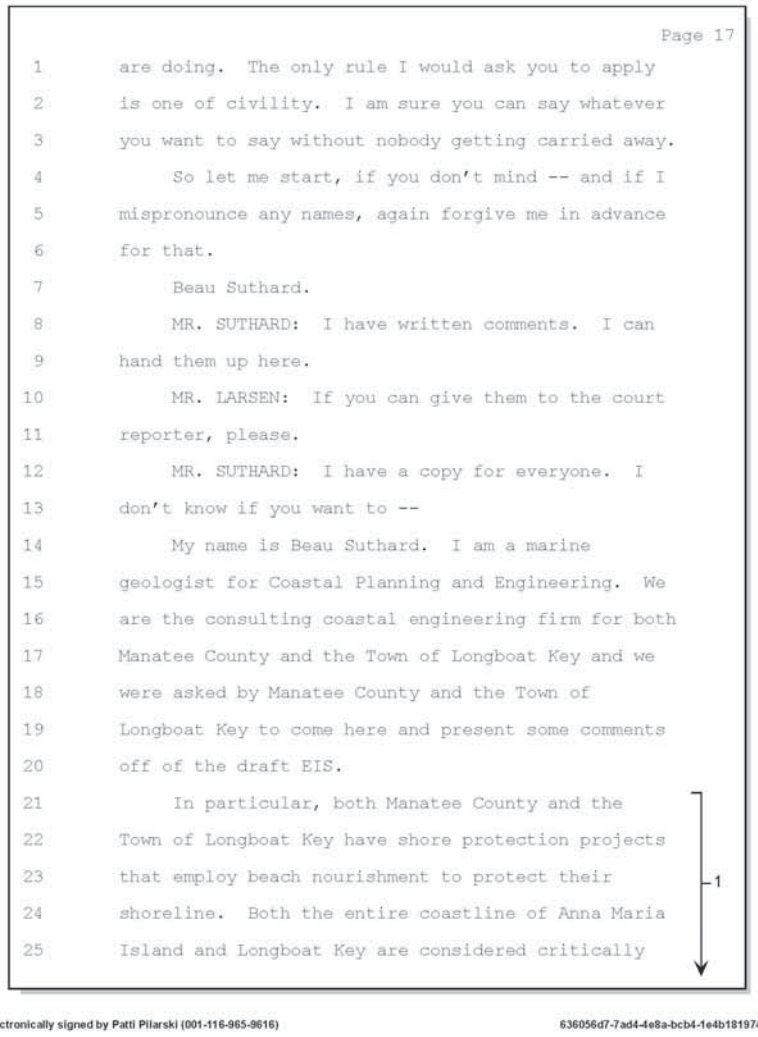
MR. MARTIN: Thanks, Don.

Now I would like to introduce Mr. Gary Larsen who will explain how the remainder of this meeting will go.

MR. LARSEN: Thank you.

Good afternoon, everyone. My name is Gary

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa



Larsen. I am a local mediator. I have been asked to do one thing, and that is to help moderate and facilitate these public comments. I am sure you have all heard by now that we are here to talk about and receive the public comments for the draft EIS, a similar format to what we use at the initial public scope meeting.

We have a wonderful court reporter here, who I assure you will take down everything that you say, and accurately as well.

And what I am going to do is, I have got a sheet of people that signed up. I will go down that sheet. I will ask you to come up. And initially your comments should be three minutes. That is to make sure that everyone gets to speak. I assure you if you don't have a chance to complete what you want to say in that three minutes, when we are done with everyone who signed up and they've had their opportunity, I will look back to this audience and anyone who has got something more to say is certainly free to do it.

I would clarify that the purpose of this is not a question-and-answer session, but rather to receive the public comments as you have heard for consideration by the various agencies and what they

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

Page 17

are doing. The only rule I would ask you to apply is one of civility. I am sure you can say whatever you want to say without nobody getting carried away.

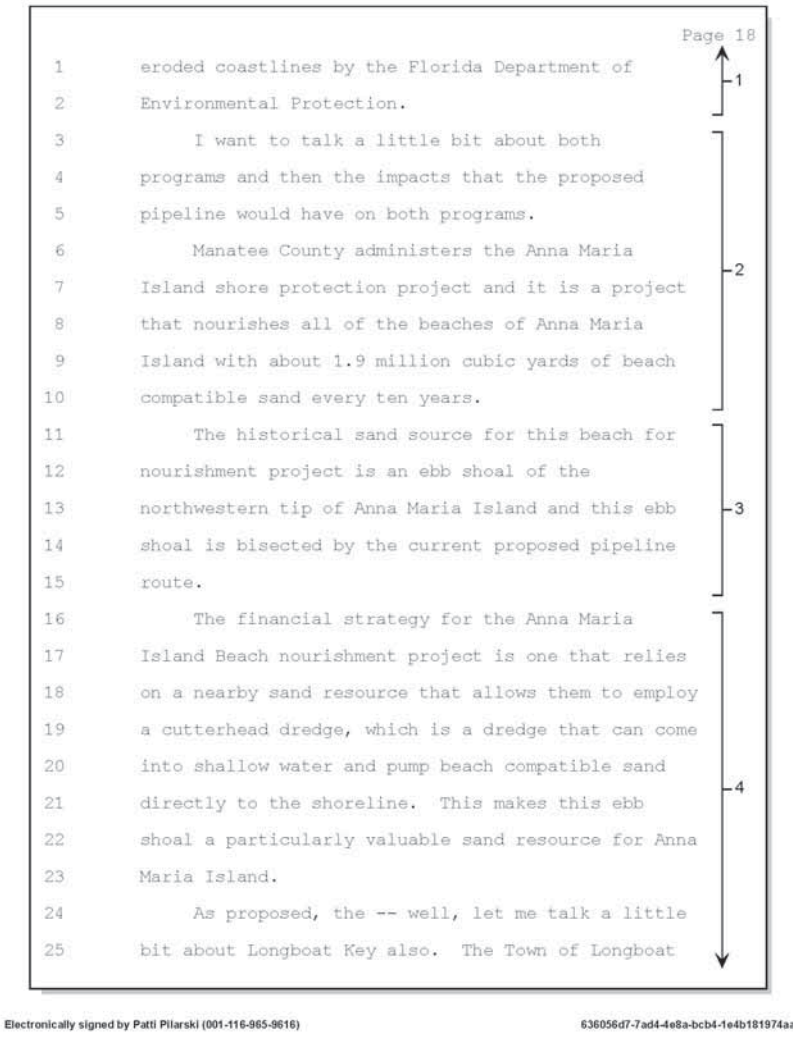
So let me start, if you don't mind -- and if I mispronounce any names, again forgive me in advance for that.

Beau Suthard.

MR. SUTHARD: I have written comments. I can hand them up here.

MR. LARSEN: If you can give them to the court reporter, please.

MR. SUTHARD: I have a copy for everyone. I don't know if you want to --



My name is Beau Suthard. I am a marine geologist for Coastal Planning and Engineering. We are the consulting coastal engineering firm for both Manatee County and the Town of Longboat Key and we were asked by Manatee County and the Town of Longboat Key to come here and present some comments off of the draft EIS.

In particular, both Manatee County and the Town of Longboat Key have shore protection projects that employ beach nourishment to protect their shoreline. Both the entire coastline of Anna Maria Island and Longboat Key are considered critically

1

1. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

Page 18

eroded coastlines by the Florida Department of Environmental Protection.

I want to talk a little bit about both programs and then the impacts that the proposed pipeline would have on both programs.

Manatee County administers the Anna Maria Island shore protection project and it is a project that nourishes all of the beaches of Anna Maria Island with about 1.9 million cubic yards of beach compatible sand every ten years.

The historical sand source for this beach for nourishment project is an ebb shoal of the northwestern tip of Anna Maria Island and this ebb shoal is bisected by the current proposed pipeline route.

The financial strategy for the Anna Maria Island Beach nourishment project is one that relies on a nearby sand resource that allows them to employ a cutterhead dredge, which is a dredge that can come into shallow water and pump beach compatible sand directly to the shoreline. This makes this ebb shoal a particularly valuable sand resource for Anna Maria Island.

As proposed, the -- well, let me talk a little bit about Longboat Key also. The Town of Longboat

2. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

3. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

4. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

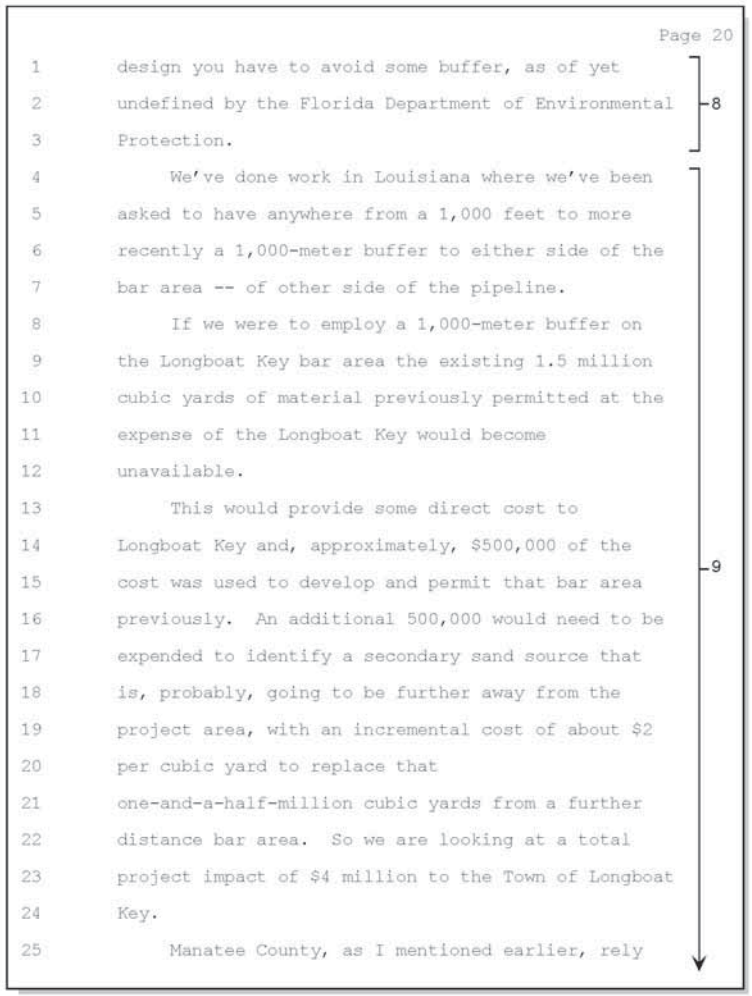
Page 19

Key also has a beach nourishment project that nourishes the entire coastline of Longboat Key and it relies on about 1.8 million cubic yards of beach compatible sand for every eight years of a renourishment cycle for Longboat Key. 4

The sand resources off the west coast of Florida are limited to begin with and have to undergo a detailed and costly mapping exercise in order to define, permit and use bar areas.

In the case of Longboat Key, they have an existing bar area on that same northwestern ebb shoal. I have maps in the prepared comments that show the locations of all of these areas. 5

This particular bar area was used by Longboat Key in their 2005/2006 beach renourishment project. About 1 million cubic yards of beach compatible sand permitted by the Florida Department of Environmental Protection was used for that beach renourishment project.



1.5 million cubic yards of material remain in that permitted bar area. As proposed, the current pipeline completely bisects that bar area into two separate bar areas. 6 The greater impact of the pipeline construction is in a buffer, avoidance zone, around the pipeline. 7 So for future bar area

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

5. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

6. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

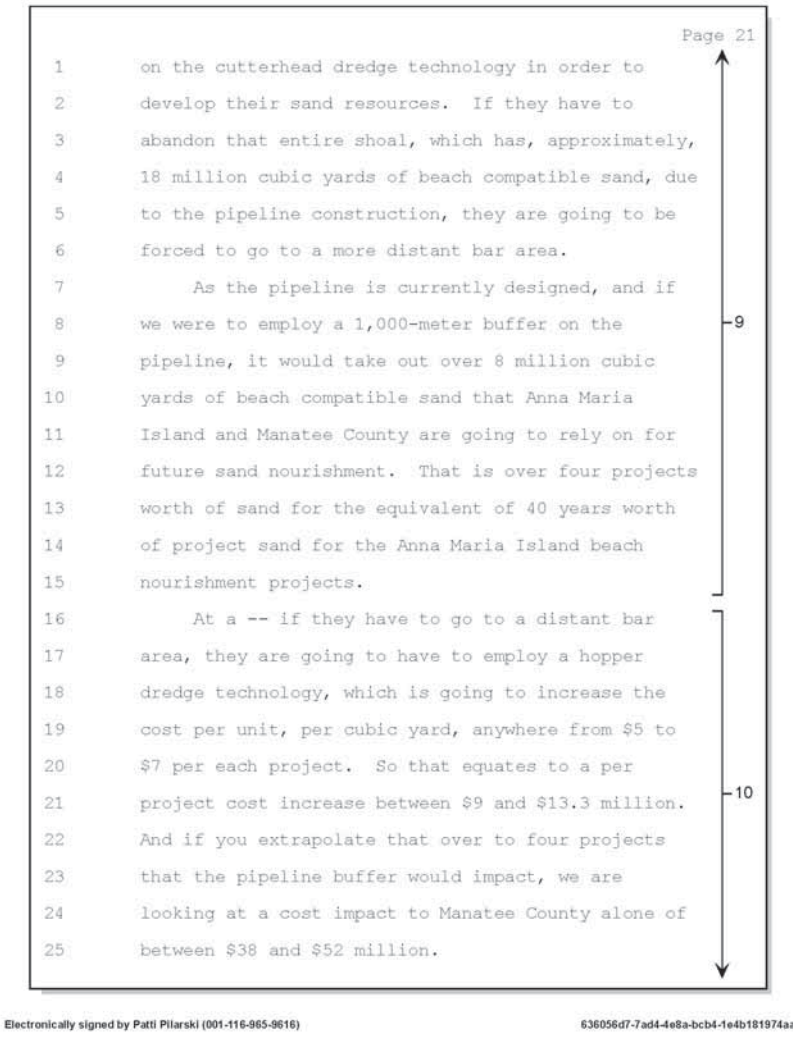
7. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4. Also, the Applicant has proposed a 400 foot buffer through potential sand resource areas based on the best available information from discussions from the state.

Page 20

design you have to avoid some buffer, as of yet undefined by the Florida Department of Environmental Protection. 8

We've done work in Louisiana where we've been asked to have anywhere from a 1,000 feet to more recently a 1,000-meter buffer to either side of the bar area -- of other side of the pipeline.

If we were to employ a 1,000-meter buffer on the Longboat Key bar area the existing 1.5 million cubic yards of material previously permitted at the expense of the Longboat Key would become unavailable.



This would provide some direct cost to Longboat Key and, approximately, $500,000 of the cost was used to develop and permit that bar area previously. An additional 500,000 would need to be expended to identify a secondary sand source that is, probably, going to be further away from the project area, with an incremental cost of about $2 per cubic yard to replace that one-and-a-half-million cubic yards from a further distance bar area. So we are looking at a total project impact of $4 million to the Town of Longboat Key. 9

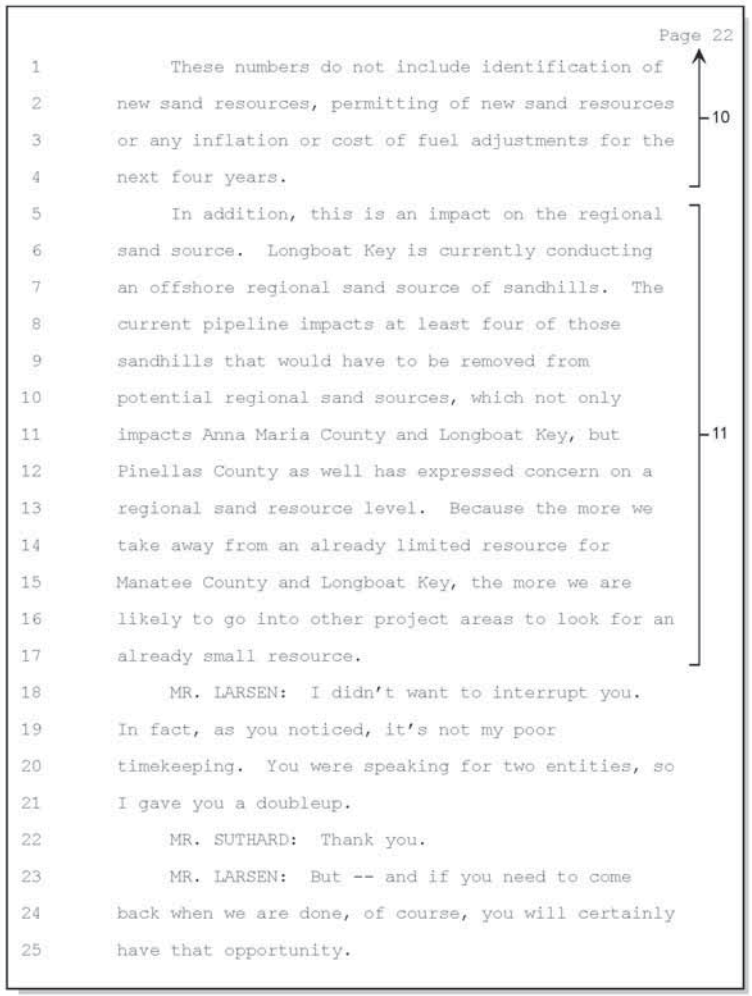
Manatee County, as I mentioned earlier, rely

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

8. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4. Also, the Applicant has proposed a 400 foot buffer through potential sand resource areas based on the best available information from discussions from the state.

9. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4. Also, the Applicant has proposed a 400 foot buffer through potential sand resource areas based on the best available information from discussions from the state.

Page 21



on the cutterhead dredge technology in order to develop their sand resources. If they have to abandon that entire shoal, which has, approximately, 18 million cubic yards of beach compatible sand, due to the pipeline construction, they are going to be forced to go to a more distant bar area.

As the pipeline is currently designed, and if we were to employ a 1,000-meter buffer on the pipeline, it would take out over 8 million cubic yards of beach compatible sand that Anna Maria Island and Manatee County are going to rely on for future sand nourishment. That is over four projects worth of sand for the equivalent of 40 years worth of project sand for the Anna Maria Island beach nourishment projects. 9

At a -- if they have to go to a distant bar area, they are going to have to employ a hopper dredge technology, which is going to increase the cost per unit, per cubic yard, anywhere from $5 to $7 per each project. So that equates to a per project cost increase between $9 and $13.3 million. And if you extrapolate that over to four projects that the pipeline buffer would impact, we are looking at a cost impact to Manatee County alone of between $38 and $52 million. 10

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

10. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4. Also, the Applicant has proposed a 400 foot buffer through potential sand resource areas based on the best available information from discussions from the state. Furthermore, sand resource estimates have been calculated and are discussed in Section 4.4.

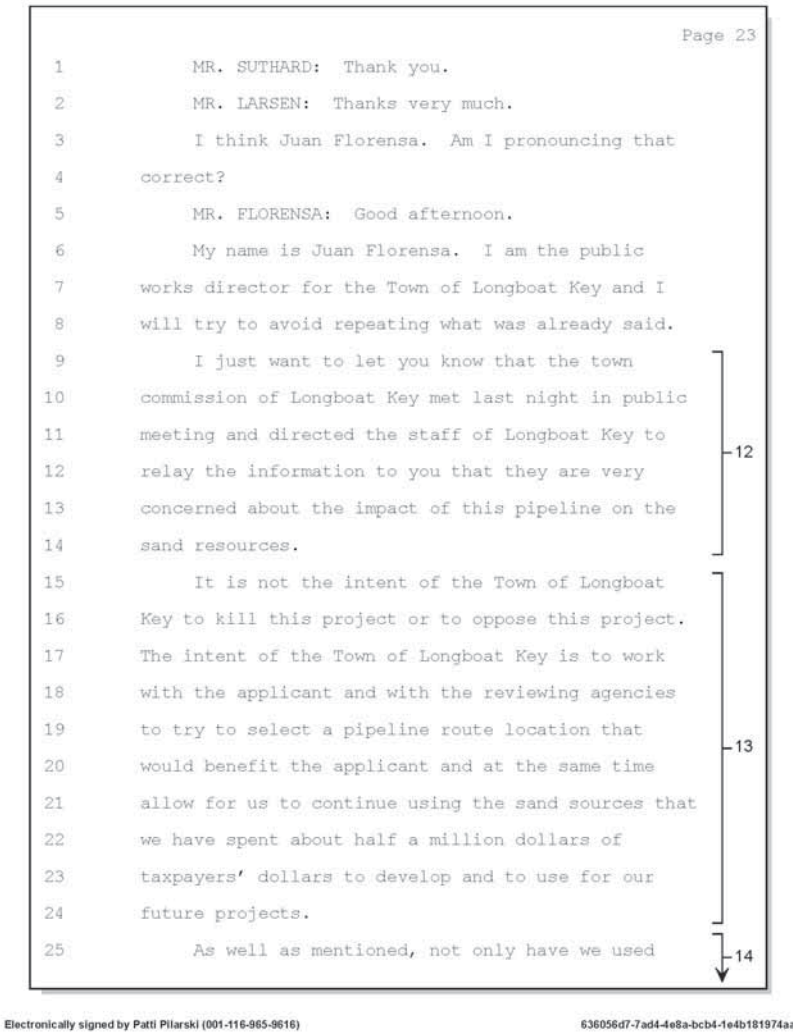
Page 22

These numbers do not include identification of new sand resources, permitting of new sand resources or any inflation or cost of fuel adjustments for the next four years.

In addition, this is an impact on the regional sand source. Longboat Key is currently conducting an offshore regional sand source of sandhills. The current pipeline impacts at least four of those sandhills that would have to be removed from potential regional sand sources, which not only impacts Anna Maria County and Longboat Key, but Pinellas County as well has expressed concern on a regional sand resource level. Because the more we take away from an already limited resource for Manatee County and Longboat Key, the more we are likely to go into other project areas to look for an already small resource.

MR. LARSEN: I didn't want to interrupt you. In fact, as you noticed, it's not my poor timekeeping. You were speaking for two entities, so I gave you a doubleup.

MR. SUTHARD: Thank you.



MR. LARSEN: But -- and if you need to come back when we are done, of course, you will certainly have that opportunity.

10

Page 23

MR. SUTHARD: Thank you.

MR. LARSEN: Thanks very much.

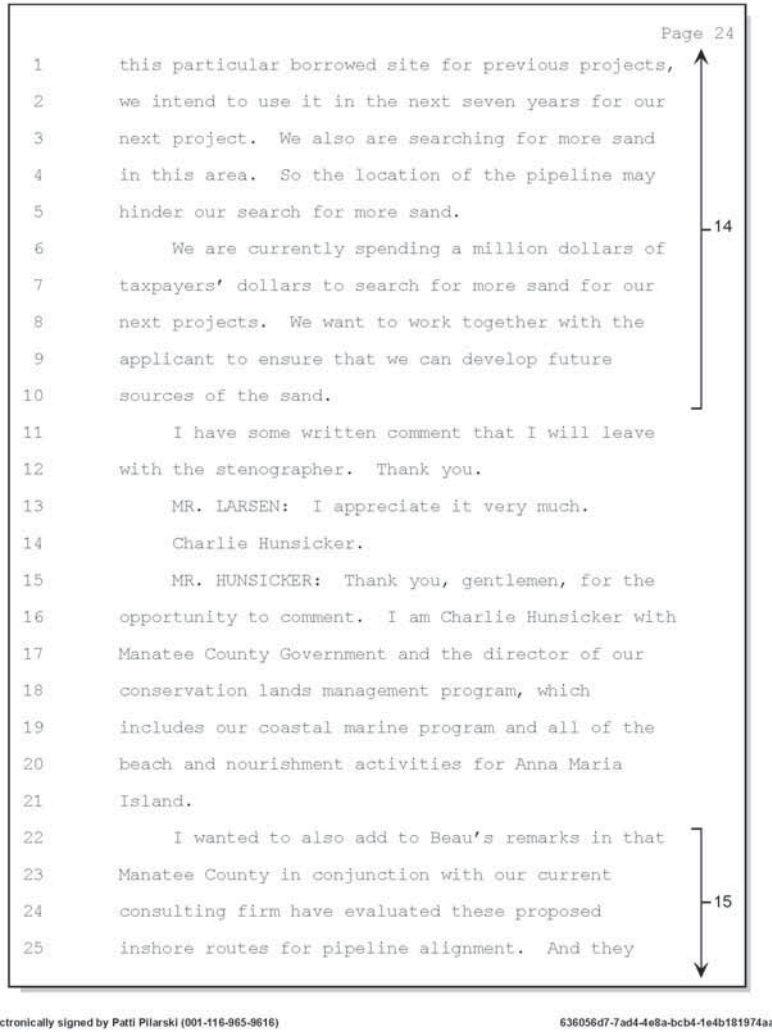
I think Juan Florensa. Am I pronouncing that correct?

MR. FLORENSA: Good afternoon.

My name is Juan Florensa. I am the public works director for the Town of Longboat Key and I will try to avoid repeating what was already said.

I just want to let you know that the town commission of Longboat Key met last night in public meeting and directed the staff of Longboat Key to relay the information to you that they are very concerned about the impact of this pipeline on the sand resources. 12

It is not the intent of the Town of Longboat Key to kill this project or to oppose this project. The intent of the Town of Longboat Key is to work with the applicant and with the reviewing agencies to try to select a pipeline route location that would benefit the applicant and at the same time allow for us to continue using the sand sources that we have spent about half a million dollars of taxpayers' dollars to develop and to use for our future projects. 13



As well as mentioned, not only have we used 14

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

12. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

13. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

14. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

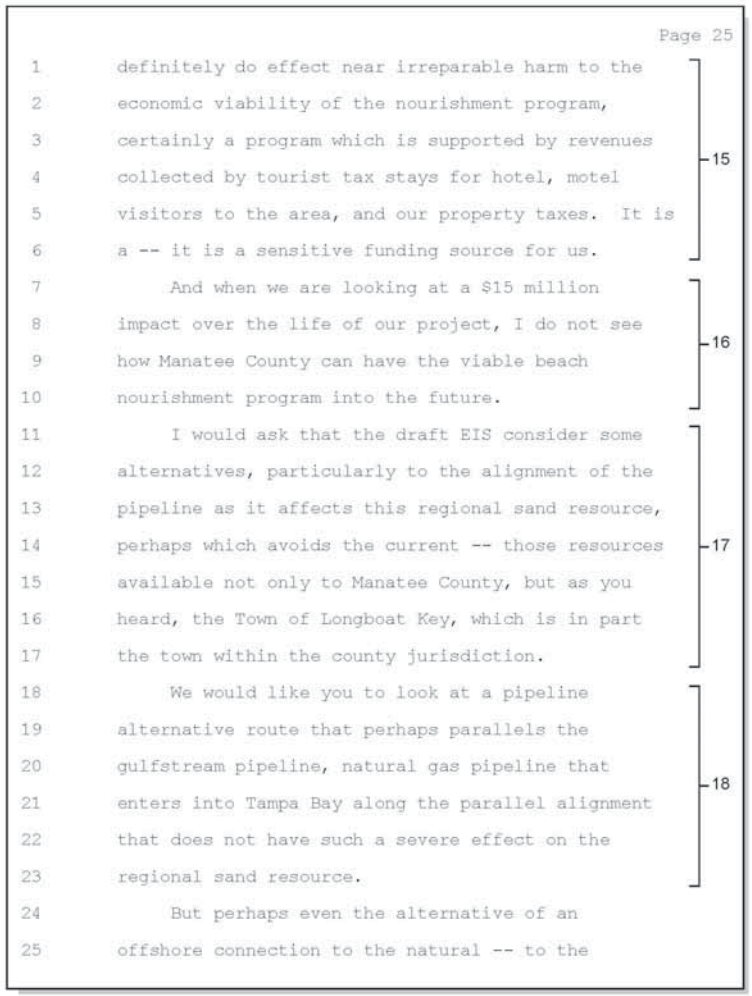
Page 24

this particular borrowed site for previous projects, we intend to use it in the next seven years for our next project. We also are searching for more sand in this area. So the location of the pipeline may hinder our search for more sand.

We are currently spending a million dollars of taxpayers' dollars to search for more sand for our next projects. We want to work together with the applicant to ensure that we can develop future sources of the sand. 14

I have some written comment that I will leave with the stenographer. Thank you.

MR. LARSEN: I appreciate it very much.



Charlie Hunsicker.

MR. HUNSICKER: Thank you, gentlemen, for the opportunity to comment. I am Charlie Hunsicker with Manatee County Government and the director of our conservation lands management program, which includes our coastal marine program and all of the beach and nourishment activities for Anna Maria Island.

I wanted to also add to Beau's remarks in that Manatee County in conjunction with our current consulting firm have evaluated these proposed inshore routes for pipeline alignment. And they 15

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

15. Comment noted.

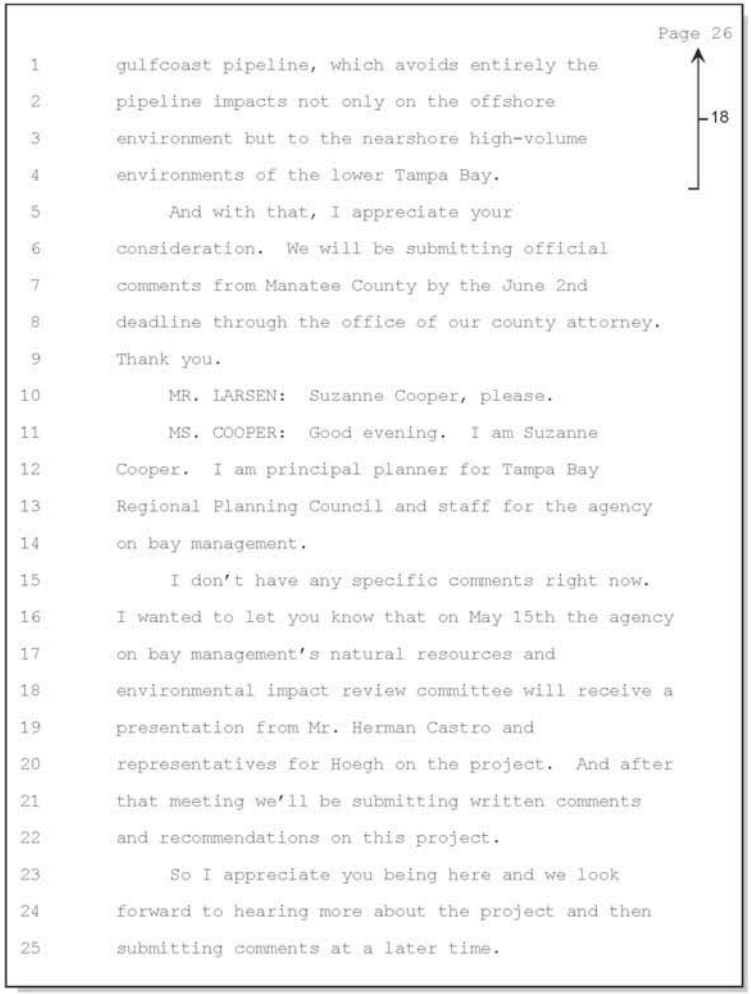
Page 25

definitely do effect near irreparable harm to the economic viability of the nourishment program, certainly a program which is supported by revenues collected by tourist tax stays for hotel, motel visitors to the area, and our property taxes. It is a -- it is a sensitive funding source for us. 15

And when we are looking at a $15 million impact over the life of our project, I do not see how Manatee County can have the viable beach nourishment program into the future. 16

I would ask that the draft EIS consider some alternatives, particularly to the alignment of the pipeline as it affects this regional sand resource, perhaps which avoids the current -- those resources available not only to Manatee County, but as you heard, the Town of Longboat Key, which is in part the town within the county jurisdiction. 17

We would like you to look at a pipeline alternative route that perhaps parallels the gulfstream pipeline, natural gas pipeline that enters into Tampa Bay along the parallel alignment that does not have such a severe effect on the regional sand resource. 18



But perhaps even the alternative of an offshore connection to the natural -- to the

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

16. Comment noted.

17. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

18. Three pipeline alternatives are outlined in Section 2.1.4 and impacts of each are discussed in Section 4.

Page 26

gulfcoast pipeline, which avoids entirely the pipeline impacts not only on the offshore environment but to the nearshore high-volume environments of the lower Tampa Bay.

18

And with that, I appreciate your consideration. We will be submitting official comments from Manatee County by the June 2nd deadline through the office of our county attorney. Thank you.

MR. LARSEN: Suzanne Cooper, please.

MS. COOPER: Good evening. I am Suzanne Cooper. I am principal planner for Tampa Bay Regional Planning Council and staff for the agency on bay management.

I don't have any specific comments right now. I wanted to let you know that on May 15th the agency on bay management's natural resources and environmental impact review committee will receive a presentation from Mr. Herman Castro and representatives for Hoegh on the project. And after that meeting we'll be submitting written comments and recommendations on this project.

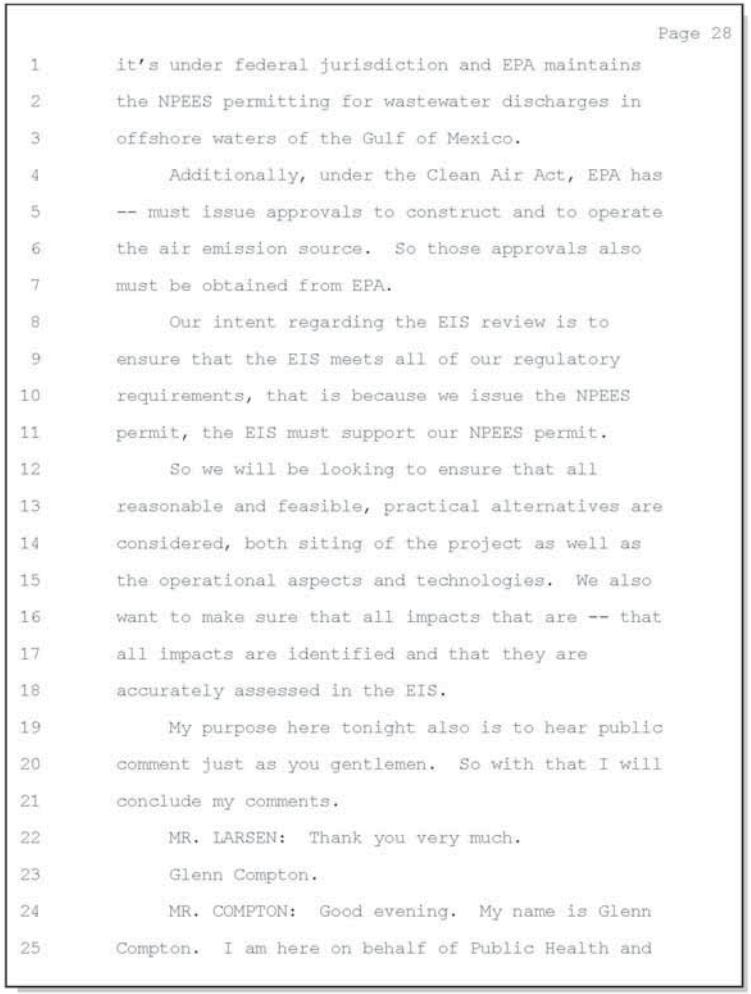
So I appreciate you being here and we look forward to hearing more about the project and then submitting comments at a later time.

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

MR. LARSEN: Mr. Bisterfeld.

MR. BISTERFELD: Thank you, Mr. Martin and gentlemen. Good afternoon.

I am Ted Bisterfeld. I am a biologist on the staff of the NEPA program office, U.S. Environmental Protection Agency Region IV in Atlanta. Here with me tonight is Kelly Fortan representing our air programs branch.



I don't have a prepared statement but I would just like to run over a few -- make a few brief remarks about EPA's role in the review of this project.

First of all, it's important to realize that EPA places a high priority in the review of all national -- nationally significant energy projects, including the Port Dolphin LNG import project.

Specifically, EPA has mete the requirements that we must fulfill. One of them is that we have a statutory obligation to review all environmental impact statements, to comment on them and make our comments known to the public. EPA is now reviewing the draft EIS along with the other agencies.

I would also like to mention that EPA has its regulatory actions for Port Dolphin. First of all, the port would be in federal waters, and as such,

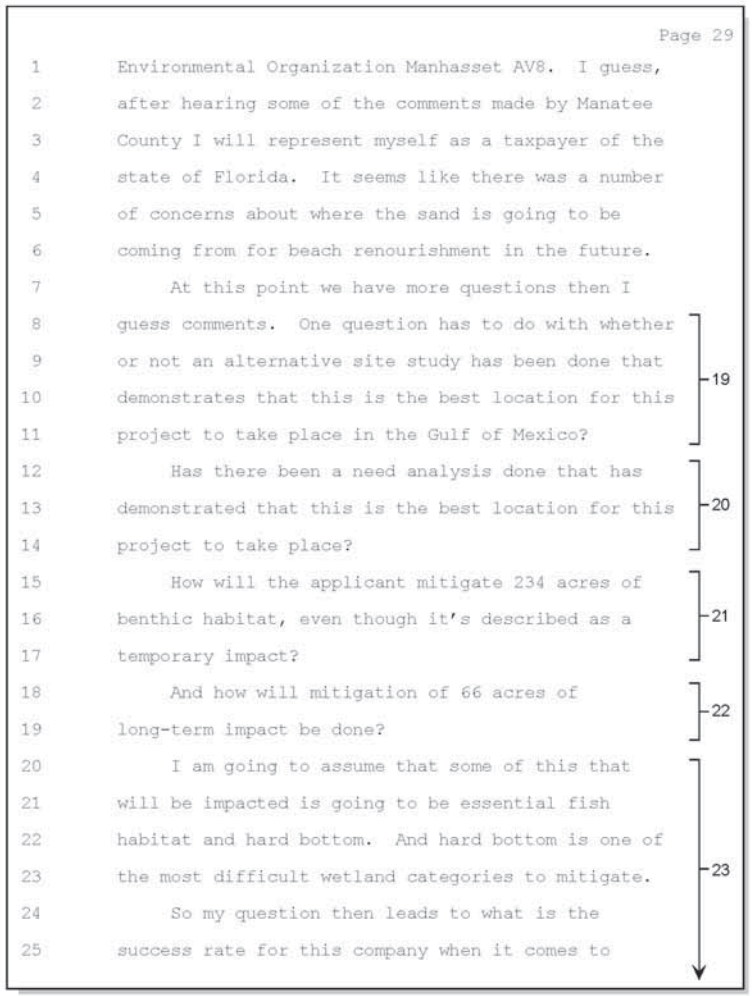
Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

it's under federal jurisdiction and EPA maintains the NPEES permitting for wastewater discharges in offshore waters of the Gulf of Mexico.

Additionally, under the Clean Air Act, EPA has -- must issue approvals to construct and to operate the air emission source. So those approvals also must be obtained from EPA.

Our intent regarding the EIS review is to ensure that the EIS meets all of our regulatory requirements, that is because we issue the NPEES permit, the EIS must support our NPEES permit.

So we will be looking to ensure that all reasonable and feasible, practical alternatives are considered, both siting of the project as well as the operational aspects and technologies. We also want to make sure that all impacts that are -- that all impacts are identified and that they are accurately assessed in the EIS.



My purpose here tonight also is to hear public comment just as you gentlemen. So with that I will conclude my comments.

MR. LARSEN: Thank you very much.

Glenn Compton.

MR. COMPTON: Good evening. My name is Glenn Compton. I am here on behalf of Public Health and

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

Page 29

Environmental Organization Manhasset AV8. I guess, after hearing some of the comments made by Manatee County I will represent myself as a taxpayer of the state of Florida. It seems like there was a number of concerns about where the sand is going to be coming from for beach renourishment in the future.

At this point we have more questions then I guess comments. One question has to do with whether or not an alternative site study has been done that demonstrates that this is the best location for this project to take place in the Gulf of Mexico? 19

Has there been a need analysis done that has demonstrated that this is the best location for this project to take place? 20

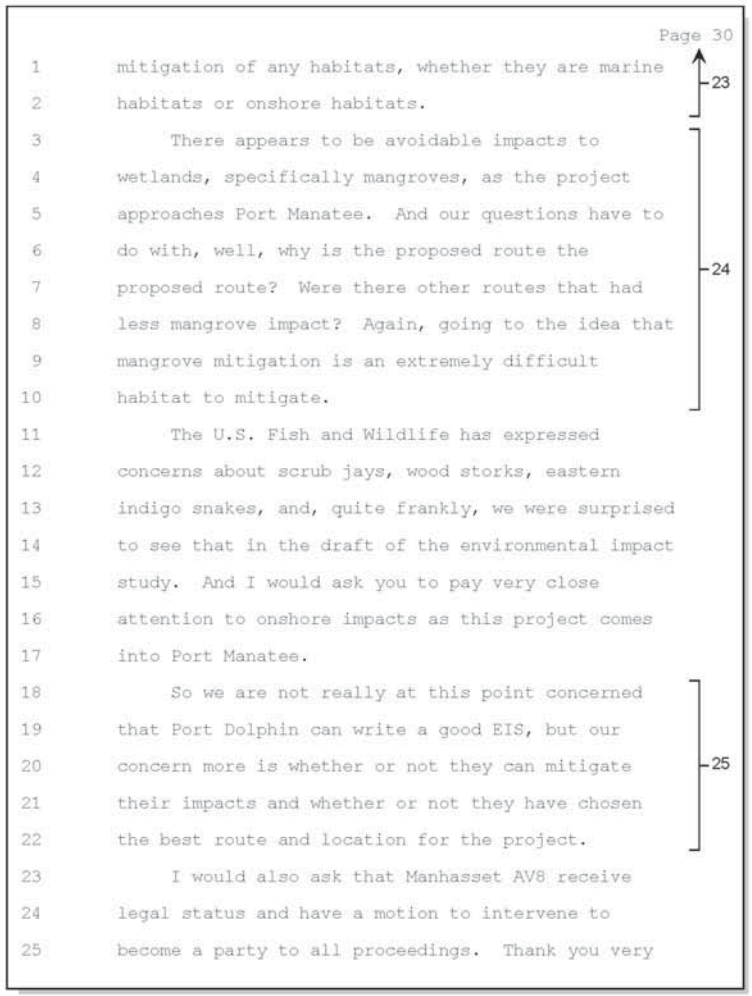
How will the applicant mitigate 234 acres of benthic habitat, even though it's described as a temporary impact? 21

And how will mitigation of 66 acres of long-term impact be done? 22

I am going to assume that some of this that will be impacted is going to be essential fish habitat and hard bottom. And hard bottom is one of the most difficult wetland categories to mitigate. 23

So my question then leads to what is the success rate for this company when it comes to

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa



19. Section 2.1.4 of the EIS discusses the phases and criteria for choosing the port location.

20. The purpose and need for the project are discussed in detail in Section 1.2 of the EIS.

21. Impacts to benthic habitat are quantified and discussed in Section 4.2.1.6. Information has been revised to include geotechnical data provided by the applicant since the Draft EIS was published.

22. Impacts to benthic habitat are quantified and discussed in Section 4.2.1.6. Information has been revised to include geotechnical data provided by the applicant since the Draft EIS was published. Section 4.11 provides information on mitigation, including compensatory, that are recommended regarding impacts to benthic habitat.

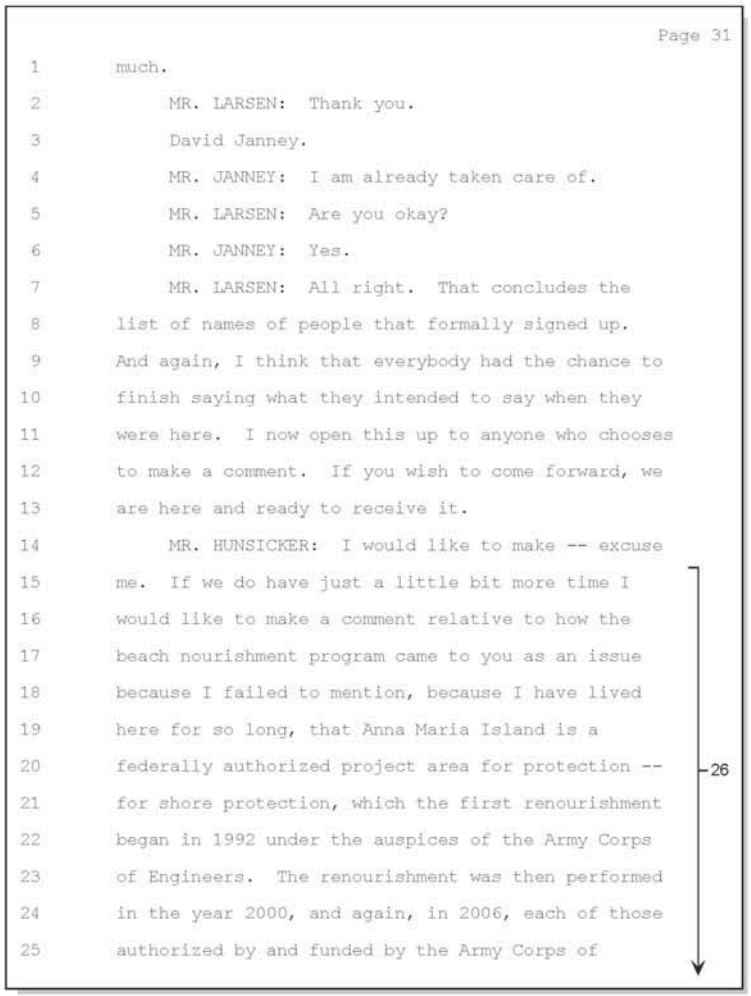
23. If granted a license, the Maritime Administration and USCG would require a mitigation and monitoring plan to ensure success.

Page 30

mitigation of any habitats, whether they are marine habitats or onshore habitats. 23

There appears to be avoidable impacts to wetlands, specifically mangroves, as the project approaches Port Manatee. And our questions have to do with, well, why is the proposed route the proposed route? Were there other routes that had less mangrove impact? Again, going to the idea that mangrove mitigation is an extremely difficult habitat to mitigate. 24

The U.S. Fish and Wildlife has expressed concerns about scrub jays, wood storks, eastern indigo snakes, and, quite frankly, we were surprised to see that in the draft of the environmental impact study. And I would ask you to pay very close attention to onshore impacts as this project comes into Port Manatee.



So we are not really at this point concerned that Port Dolphin can write a good EIS, but our concern more is whether or not they can mitigate their impacts and whether or not they have chosen the best route and location for the project. 25

I would also ask that Manhasset AV8 receive legal status and have a motion to intervene to become a party to all proceedings. Thank you very

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

24. Impacts to wetlands and mitigation are discussed in Section 4.2 and 4.11. The Applicant would be required to follow FERC Procedures for wetland crossings, and mitigate any wetland loss with in-kind wetlands from an established wetland bank in Florida as approved by FERC.

25. Comment noted.

Page 31

much.

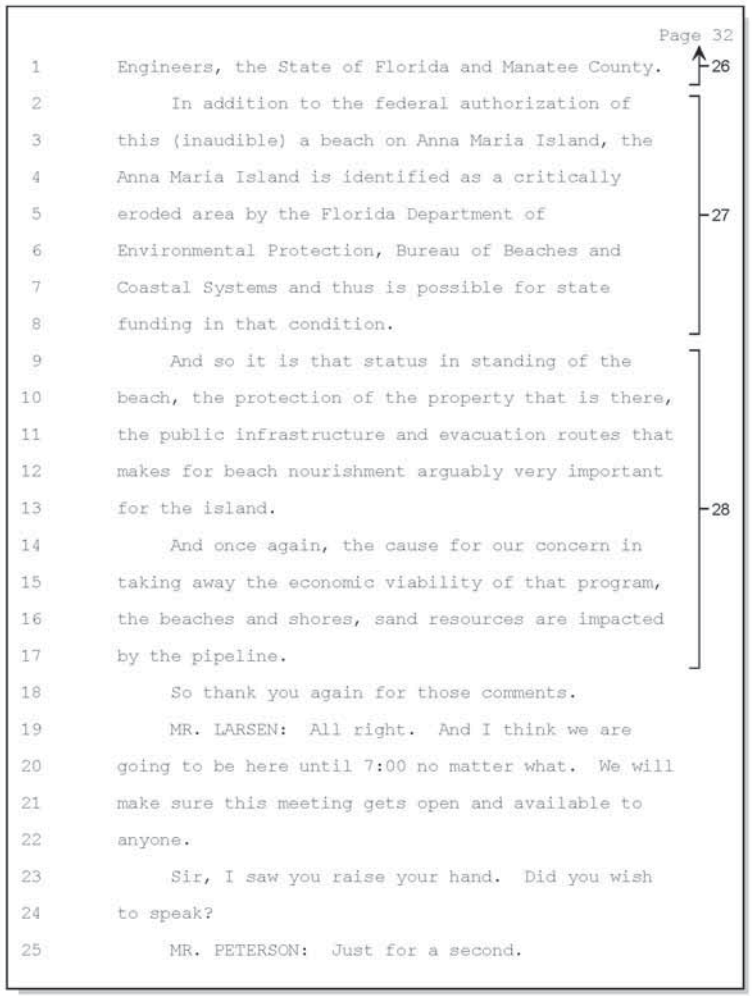
MR. LARSEN: Thank you.

David Janney.

MR. JANNEY: I am already taken care of.

MR. LARSEN: Are you okay?

MR. JANNEY: Yes.



MR. LARSEN: All right. That concludes the list of names of people that formally signed up. And again, I think that everybody had the chance to finish saying what they intended to say when they were here. I now open this up to anyone who chooses to make a comment. If you wish to come forward, we are here and ready to receive it.

MR. HUNSICKER: I would like to make -- excuse me. If we do have just a little bit more time I would like to make a comment relative to how the beach nourishment program came to you as an issue because I failed to mention, because I have lived here for so long, that Anna Maria Island is a federally authorized project area for protection -- for shore protection, which the first renourishment began in 1992 under the auspices of the Army Corps of Engineers. The renourishment was then performed in the year 2000, and again, in 2006, each of those authorized by and funded by the Army Corps of

26. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

Page 32

Engineers, the State of Florida and Manatee County. 26

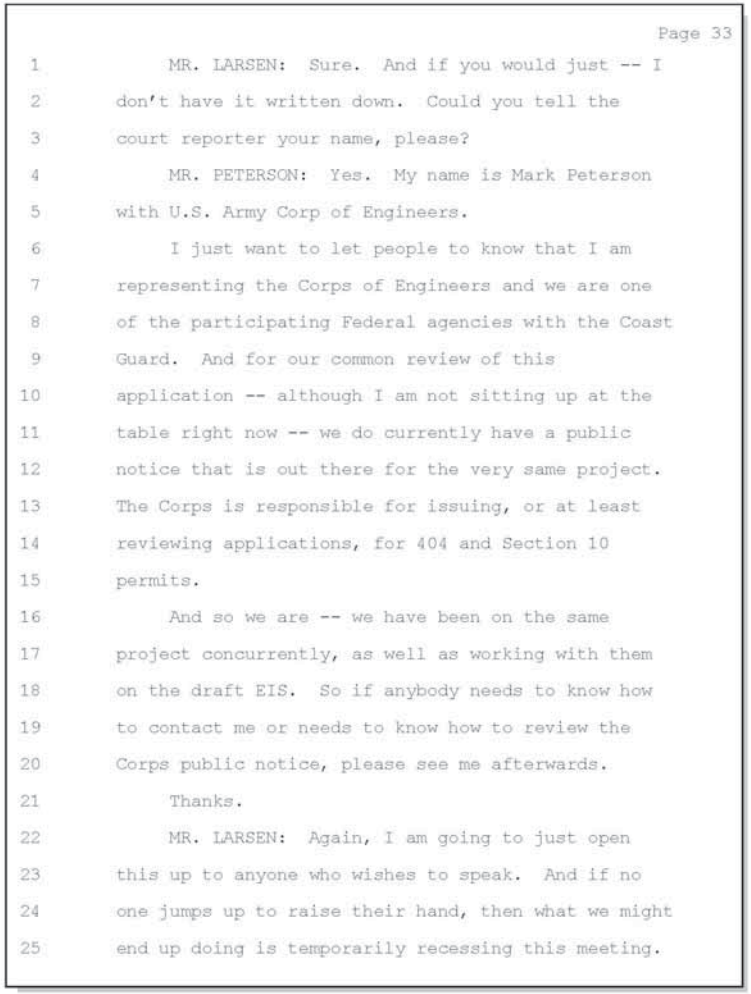
In addition to the federal authorization of this (inaudible) a beach on Anna Maria Island, the Anna Maria Island is identified as a critically eroded area by the Florida Department of Environmental Protection, Bureau of Beaches and Coastal Systems and thus is possible for state funding in that condition. 27

And so it is that status in standing of the beach, the protection of the property that is there, the public infrastructure and evacuation routes that makes for beach nourishment arguably very important for the island. 28

And once again, the cause for our concern in taking away the economic viability of that program, the beaches and shores, sand resources are impacted by the pipeline.

So thank you again for those comments.

MR. LARSEN: All right. And I think we are going to be here until 7:00 no matter what. We will make sure this meeting gets open and available to anyone.



Sir, I saw you raise your hand. Did you wish to speak?

MR. PETERSON: Just for a second.

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

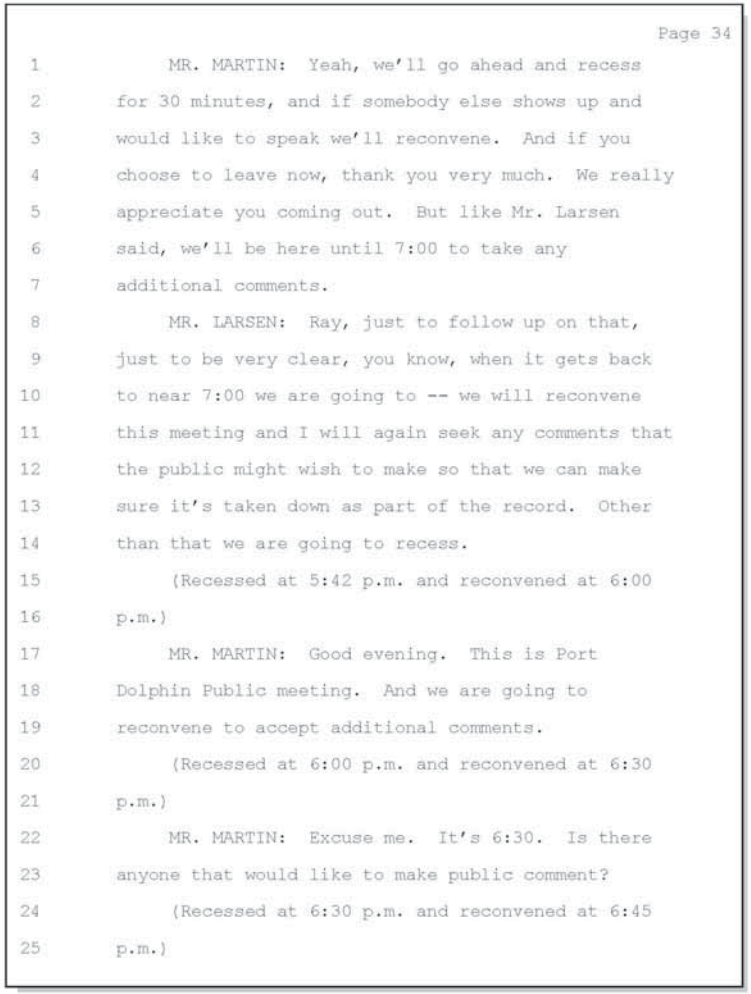
27. In response to comments the Applicant has revised the pipeline route to minimize impacts on permitted sand resource areas. The pipeline route alternatives are described in Section 2.1.4 and sand resources are discussed in Sections 3.4 and 4.4.

28. Comment noted.

Page 33

MR. LARSEN: Sure. And if you would just -- I don't have it written down. Could you tell the court reporter your name, please?

MR. PETERSON: Yes. My name is Mark Peterson with U.S. Army Corp of Engineers.



I just want to let people to know that I am representing the Corps of Engineers and we are one of the participating Federal agencies with the Coast Guard. And for our common review of this application -- although I am not sitting up at the table right now -- we do currently have a public notice that is out there for the very same project. The Corps is responsible for issuing, or at least reviewing applications, for 404 and Section 10 permits.

And so we are -- we have been on the same project concurrently, as well as working with them on the draft EIS. So if anybody needs to know how to contact me or needs to know how to review the Corps public notice, please see me afterwards.

Thanks.

MR. LARSEN: Again, I am going to just open this up to anyone who wishes to speak. And if no one jumps up to raise their hand, then what we might end up doing is temporarily recessing this meeting.

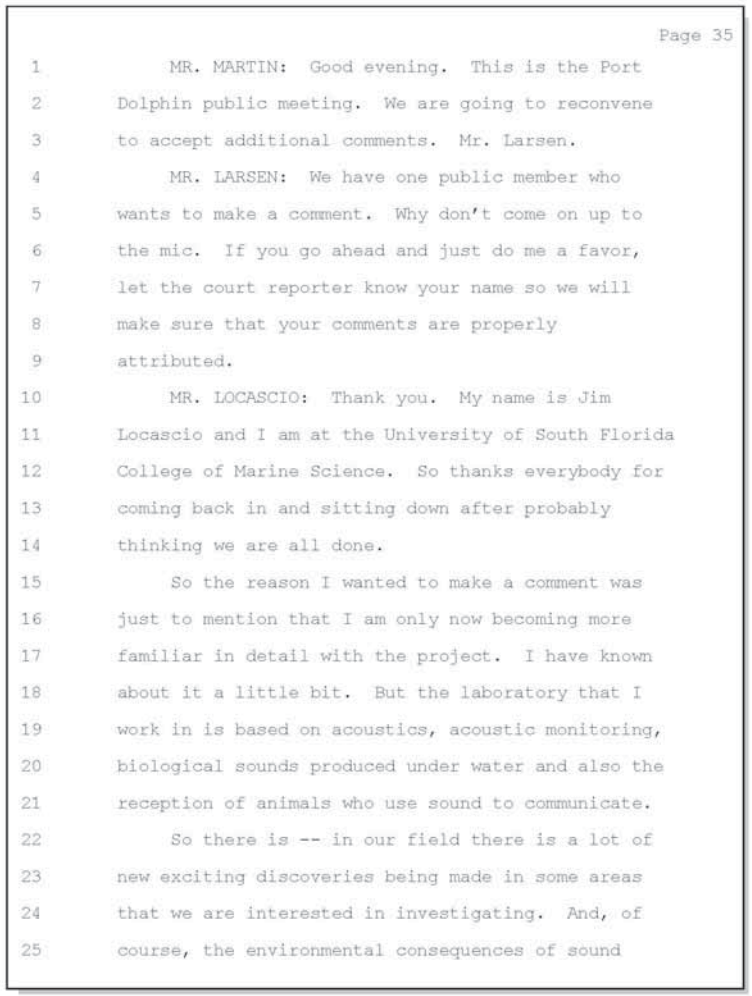
Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

Page 34

MR. MARTIN: Yeah, we'll go ahead and recess for 30 minutes, and if somebody else shows up and would like to speak we'll reconvene. And if you choose to leave now, thank you very much. We really appreciate you coming out. But like Mr. Larsen said, we'll be here until 7:00 to take any additional comments.

MR. LARSEN: Ray, just to follow up on that, just to be very clear, you know, when it gets back to near 7:00 we are going to -- we will reconvene this meeting and I will again seek any comments that the public might wish to make so that we can make sure it's taken down as part of the record. Other than that we are going to recess.

(Recessed at 5:42 p.m. and reconvened at 6:00 p.m.)



MR. MARTIN: Good evening. This is Port Dolphin Public meeting. And we are going to reconvene to accept additional comments.

(Recessed at 6:00 p.m. and reconvened at 6:30 p.m.)

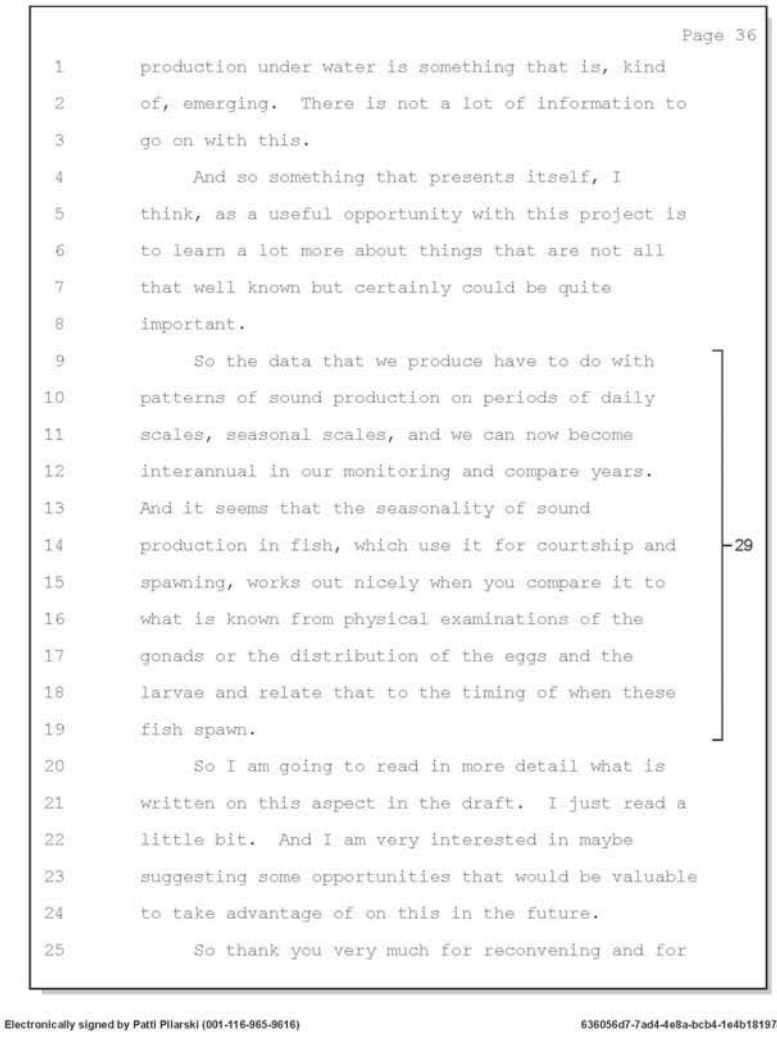
MR. MARTIN: Excuse me. It's 6:30. Is there anyone that would like to make public comment?

(Recessed at 6:30 p.m. and reconvened at 6:45 p.m.)

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

Page 35

MR. MARTIN: Good evening. This is the Port Dolphin public meeting. We are going to reconvene to accept additional comments. Mr. Larsen.



MR. LARSEN: We have one public member who wants to make a comment. Why don't come on up to the mic. If you go ahead and just do me a favor, let the court reporter know your name so we will make sure that your comments are properly attributed.

MR. LOCASCIO: Thank you. My name is Jim Locascio and I am at the University of South Florida College of Marine Science. So thanks everybody for coming back in and sitting down after probably thinking we are all done.

So the reason I wanted to make a comment was just to mention that I am only now becoming more familiar in detail with the project. I have known about it a little bit. But the laboratory that I work in is based on acoustics, acoustic monitoring, biological sounds produced under water and also the reception of animals who use sound to communicate.

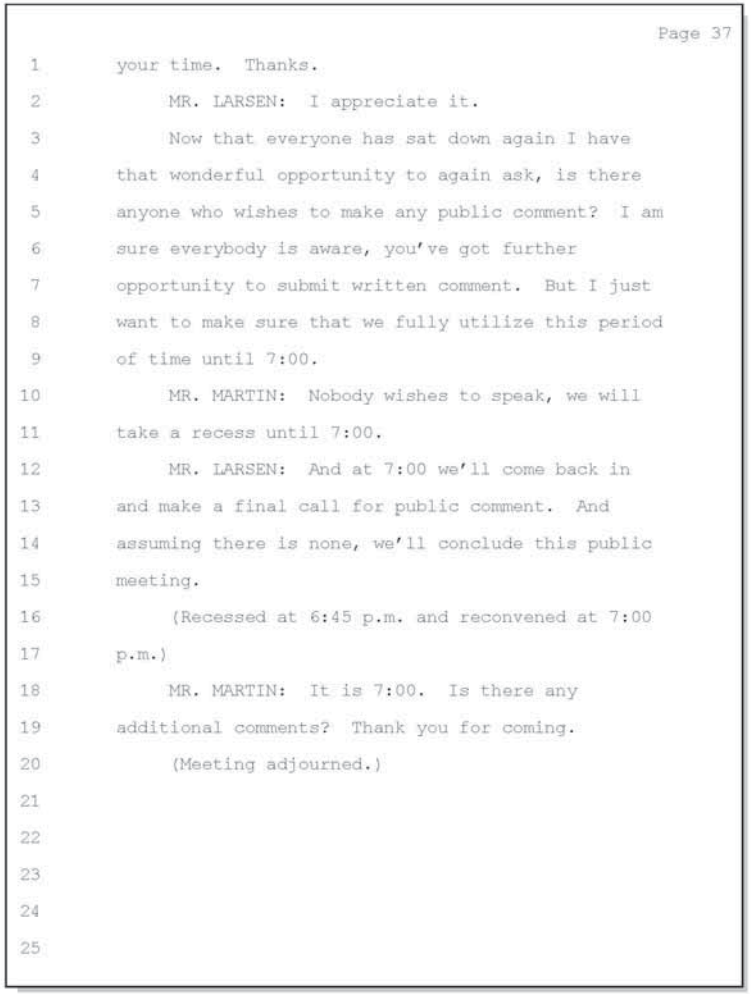
So there is -- in our field there is a lot of new exciting discoveries being made in some areas that we are interested in investigating. And, of course, the environmental consequences of sound

Electronically signed by Patti Pilarski (001-116-965-9616) 636056d7-7ad4-4e8a-bcb4-1e4b181974aa

Page 36

production under water is something that is, kind of, emerging. There is not a lot of information to go on with this.

And so something that presents itself, I think, as a useful opportunity with this project is to learn a lot more about things that are not all that well known but certainly could be quite important.



So the data that we produce have to do with patterns of sound production on periods of daily scales, seasonal scales, and we can now become interannual in our monitoring and compare years. And it seems that the seasonality of sound production in fish, which use it for courtship and spawning, works out nicely when you compare it to what is known from physical examinations of the gonads or the distribution of the eggs and the larvae and relate that to the timing of when these fish spawn. 29

So I am going to read in more detail what is written on this aspect in the draft. I just read a little bit. And I am very interested in maybe suggesting some opportunities that would be valuable to take advantage of on this in the future.

So thank you very much for reconvening and for

29. Comment noted. If granted a license, the Maritime Administration and USCG would require a mitigation and monitoring plan. This plan would include mitigation and monitoring for noise impacts. Details would be determined after the license with input from resource agencies as necessary.

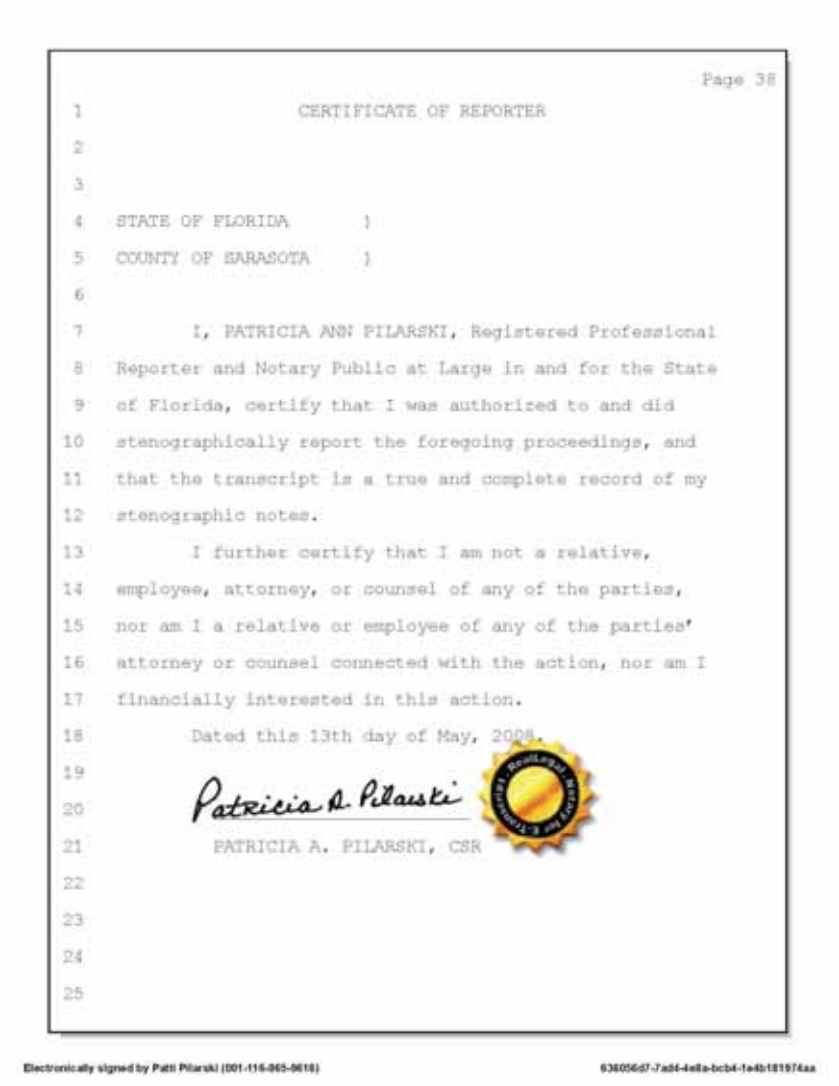
Page 37

your time. Thanks.

MR. LARSEN: I appreciate it.

Now that everyone has sat down again I have that wonderful opportunity to again ask, is there anyone who wishes to make any public comment? I am sure everybody is aware, you've got further opportunity to submit written comment. But I just want to make sure that we fully utilize this period of time until 7:00.

MR. MARTIN: Nobody wishes to speak, we will take a recess until 7:00.



MR. LARSEN: And at 7:00 we'll come back in and make a final call for public comment. And assuming there is none, we'll conclude this public meeting.

(Recessed at 6:45 p.m. and reconvened at 7:00 p.m.)

MR. MARTIN: It is 7:00. Is there any additional comments? Thank you for coming.

(Meeting adjourned.)

Mr. Mark A. Prescott, Chief
CG-3PSO-5
Deepwater Ports Standards Division
2100 Second Street, S.W.
Washington, D. C. 20593-0001

Dear Mr. Prescott:

The National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS), has received the July 12, 2007, Notice of Intent (NOI) and your agency's July 16, 2007, letter and accompanying Proposed Action Fact Sheet to prepare an environmental impact statement (EIS) and request public comment for the proposed Port Dolphin Energy LLC liquefied natural gas (LNG) Terminal Deepwater Port (Port Dolphin) license application (72 FR 133 USCG-2007-28532). The NOI indicates that the U.S. Coast Guard (USCG) and the Maritime Administration (MARAD) intend to prepare an EIS for the construction and operation of an LNG deepwater port facility that would be located in water depth of 100 feet, approximately 28 miles southwest of Tampa Bay, off Manatee County, Florida. Port Dolphin would consist of two permanent unloading buoys for the mooring of up to two LNG shuttle and regasification vessels (SRV). Each unloading buoy would connect to a 36-inch diameter, 41.4-mile long gas transport pipeline that would be constructed from the offshore port to landward portions of existing pipelines in Manatee County, Florida.

In response to the USCG and MARAD's request for comments on resources and issues to be addressed in the EIS for this proposed action, NMFS offers the following recommendations in the context of essential fish habitat (EFH) and fish populations in the Gulf of Mexico:

EFH

Based on our review of the Port Dolphin license application, knowledge of the project area, and participation in the public meetings, the deepwater port and associated pipeline would operate in and be constructed through marine and estuarine EFH in the project area. Summaries of occurrences for life history stages and habitat utilization of federally managed fish and invertebrate species in the project area may be found in Volume 1 the of March 2004 Final EIS for the Generic Essential Fish Habitat Amendment of the Gulf of Mexico. Detailed information on EFH for federally managed shrimp, red drum, reef fish, and coastal migratory pelagic species is provided in the 2005 generic amendment of

the Fishery Management Plans (FMPs) for the Gulf of Mexico prepared by the Gulf of Mexico Fishery Management Council (GMFMC). Information on EFH for highly migratory species (HMS) is contained in the Atlantic Billfish and Atlantic Tunas, Swordfish, and Sharks FMPs prepared by the Secretary of Commerce. The generic amendment and HMS FMPs were prepared as required by the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act).

To fully address EFH and associated fisheries in the project area, we recommend the EIS include sections titled "Essential Fish Habitat" and "Marine Fishery Resources" that describe the potential project impacts on each category of EFH (including, but not limited to: marine non-vegetated water bottoms, continental shelf features, and water column; estuarine submerged aquatic vegetation, mangrove wetlands, estuarine water column) and marine and estuarine fishery species within the project area. These sections should analyze the potential impacts of the proposed project on EFH and dependent federally managed species and life stages, and should fully evaluate alternative measures to avoid, minimize, and offset adverse impacts. EFH regulations at 50 CFR Section 600.810(a) define an adverse effect to EFH as any impact that reduces the quality and/or quantity of EFH, including the loss of, or injury to, benthic organisms, prey species and their habitat, and other ecosystem components. The EIS should analyze impacts to benthic and prey species in the discussion of impacts to EFH. This descriptive and analytical information, coupled with a statement of the agency's conclusions regarding the effects of the action on EFH and marine fishery species, would provide the basic details necessary for an EFH assessment pursuant to the requirements of 50 CFR 600.920(e). The GMFMC also should be provided an opportunity for comment on EFH-related issues under provisions of the Magnuson-Stevens Act.

Individual and Cumulative Operational Impacts to Marine Fishery Resources
In our April 13, 2007, correspondence to your office following our review of the Port Dolphin license application, we identified the need for additional data and further analyses necessary for evaluation of project impacts on NMFS' marine and estuarine trust resources. In this regard, the EIS should evaluate the impacts to marine and estuarine fisheries associated with construction, operation, and decommissioning of the proposed Port Dolphin LNG deepwater port and associated pipeline. As proposed, the facility would utilize up to approximately 9.5 million gallons of seawater per day (MGD) for regasification of LNG aboard each SRV under normal conditions, with an additional 2.3 MGD of ballast water required during SRV off-loading, for a total water use of nearly 24 MGD for regasification operations aboard two SRVs.

NMFS has concerns with the entrainment of marine organisms at facilities utilizing seawater, and calculations of ichthyoplankton impacts resulting from these operations should be addressed in the EIS. Natural mortality of fish eggs and larvae is high, and a fishery's stock success can significantly be affected by the survival and transport of relatively few remaining recruits to their nursery habitats. NMFS considers mortality caused by the proposed deepwater port as a potentially significant additional mortality factor to the natural conditions that affect the sustainability of marine and estuarine fisheries. If it is found that the proposed LNG facility results in the loss of a significant

number of the few recruits otherwise destined for survival, the facility could have a substantial negative effect on economically important fisheries in the Gulf of Mexico. Information necessary to complete an assessment to determine impacts from impingement and entrainment includes:

a) Numbers of eggs, larvae, and juveniles expected to be entrained or impinged (and killed) by species;
b) Daily natural mortality estimates by life stage during the first year of life by species, including hatching success. This allows an estimation of survival from viable egg to age of entrainment; and
c) Age-structured population model estimates of recruits to age-1 and population fecundity. This allows stock-level estimates of egg production (viable eggs) and overall survival from viable egg to recruitment at age-1.

Based on ichthyoplankton impact calculations provided in the Port Dolphin license application utilizing data from the four Southeast Area Monitoring and Assessment Program (SEAMAP) stations closest to the project area, NMFS does not find that the data have been analyzed to a level necessary to determine the significance of entrainment impacts. NMFS recommends that more detailed modeling of entrainment losses, utilizing additional ichthyoplankton data which may be available from the State of Florida, private or public marine science institutions, or inclusion of additional SEAMAP stations in the eastern Gulf of Mexico, be performed and results provided in the EIS. The more detailed analysis should identify impacts to commercially, recreationally, and ecologically important fish species of a size that might be entrained in the SRV water intake systems. NMFS also notes that ichthyoplankton surveys performed in the Port Dolphin project vicinity identified families of fish which contain species under formal rebuilding programs through the reef fish, coastal migratory pelagics, and red drum FMPs. Consequently, species with rebuilding programs can be greatly impacted by relatively small increases in harvest or other sources of mortality. NMFS recommends that the impacts of fish mortality resulting from the proposed offshore port operations on fishery stocks, particularly those under a fishing moratorium (e.g., red drum) or undergoing rebuilding efforts, be analyzed thoroughly in the EIS.

Alternatively, and in consideration of further minimizing potential project entrainment impacts on fishery resources, NMFS recommends that the evaluation and utilization of entirely closed loop SRV regasification systems should also be included in the EIS. Specifically, a discussion of the utilization of SRVs similar in design as were modified for and will be used in shipboard regasification operations at the Neptune LNG LLC project (USCG Docket Number SACG-2005-22611), should be evaluated in the EIS. In that project, Neptune LNG SRVs would have originally required the consumption of 7 MGD for ballasting, regasification operations, engine cooling, and ship services. However, design modifications to these SRVs significantly reduced seawater consumption to approximately 2 MGD. Further, ballast water would be recirculated through a freshwater heat exchanger to supply cooling water needs for the vessel.

Once a thorough analysis of entrainment impacts has been completed, NMFS recommends that mitigative measures be developed and proposed to ensure that unavoidable entrainment impacts are fully offset. The mitigation plan should be linked to a plan for adaptive management of the deepwater port to identify and require operational or mechanical modifications to minimize adverse fishery impacts. NMFS looks forward to coordinating with the USCG/MARAD and the applicant in the development of such a plan.

Mooring Area and Pipeline Impacts to EFH

The Port Dolphin license application provided information on anticipated marine and estuarine habitat impacts from the proposed construction of a 41.4-mile long gas transport pipeline and two offshore SRV mooring areas. From our previous review of the license application, construction of the southern mooring array in the proposed location would affect approximately 11 acres of hard bottom habitat (EFH). NMFS recommends that a more rigorous alternatives analysis be undertaken and included in the EIS, to determine impact minimization and avoidance opportunities. The additional evaluation is necessary to determine whether a realignment of the southern array's anchor placement/mooring cable corridors can be made, thereby reducing or eliminating potential hard bottom impacts. Furthermore, extensive, high-relief hard bottom features exist in the proposed pipeline route and are especially prominent in an area approximately 19 miles east-northeast of the center of the proposed port location. In this area, zones of low-relief hard bottom and sand habitat may provide an opportunity to reduce high-relief hardbottom impacts from pipeline installation. NMFS recommends that the EIS include results from additional and more detailed bottom surveys to determine where modifications of the pipeline route could be made to avoid or further reduce impacts to higher-relief hard/live bottom habitats.

To address unavoidable benthic impacts, the basic components of a compensatory mitigation plan to offset unavoidable adverse impacts to hard/live bottom habitats as a result of the project should be developed and incorporated in the EIS. The compensatory mitigation plan for impacts to hard bottom marine habitats should include a description of the overall mitigation plan; quantification of anticipated hard/live bottom impact acreage and proposed mitigation acreage; scientific criteria for determining mitigation success; a project and mitigation implementation schedule; targeted hard/live bottom climax communities expected in mitigation area(s), including their acreage and configurations; comprehensive 5-year monitoring and reporting schedules; and contingency plans by which equivalent mitigation would be completed if the proposed mitigation fails.

Additional non-quantified impacts to hardbottom areas may also occur from pipeline installation vessels' anchor cables that may contact hard/live bottom areas. NMFS recommends that appropriate mitigative measures be identified and that details outlining anchoring plans be described in the EIS. Also, to potentially eliminate project impacts on estuarine fishery resources and significantly reduce impacts on marine live/hardbottom habitats resulting from installation of the 41.4-mile long pipeline component of the project, NMFS recommends that the EIS include an analysis and discussion of the

practicability of connecting the proposed LNG delivery pipeline to the existing Gulfstream Natural Gas LLC north of the project area.

Alternatives Analysis
The Port Dolphin EIS should evaluate a full range of deepwater port design alternatives, with emphasis on the utilization of an entirely closed loop shipboard regasification system and modified offshore pipeline route. NMFS recommends that evaluation of these project modifications be included in the project's EIS and believes their implementation would further minimize ichthyoplankton entrainment and hardbottom habitat impacts in the Gulf of Mexico. Other alternative designs for the SRV seawater intakes (e.g., the use of variable depth or dynamically positioned water intakes) should be evaluated in relation to the vertical distribution of eggs, larvae, and juveniles of marine fishery species in the water column. The analysis of the design alternatives should include quantification of impacts to marine fishery populations as compared to other potential impacts (e.g., economic, safety, and air quality impacts).

Endangered Species Act Consultation
The Port Dolphin project area is within the known distribution limits of a federally listed threatened species under purview of NMFS. In accordance with the Endangered Species Act of 1973, as amended, it is your responsibility to review this proposal and identify actions that may affect endangered or threatened species. Determinations involving listed species should be reported to our Protected Resources Division at the letterhead address. If it is determined that the activities may adversely affect any species listed as endangered or threatened under Protected Resources Division purview, formal consultation must be initiated.

Thank you for the opportunity to provide comments on environmental issues concerning the proposed permitting of the Port Dolphin LNG Project. If we may be of further assistance, please contact Mr. Mark Sramek at the letterhead address above, by telephone at (727) 824-5311, or e-mail at Mark.Sramek@noaa.gov.

Sincerely,

Miles M. Croom

Subject: Port Dolphin Energy LLC Deepwater Port Environmental Impact Statement

Dear Mr. Sramek:

As stated in our notice of intent dated July 12, 2007, the U.S. Coast Guard (USCG) and Maritime Administration are preparing a Draft Environmental Impact Statement (EIS) to assist in the review of the Port Dolphin Energy LLC (Port Dolphin) application for a deepwater port license to own, construct and operate a natural gas deepwater port in the Gulf of Mexico. The proposed deepwater port would be located in the Federal waters of the Outer Continental Shelf (OCS) in the St. Petersburg (PB) blocks: PB545, PB589, and PB590, approximately 28 miles offshore off the west coast of Florida to the southwest of Tampa Bay, in a water depth of approximately 100 feet. The EIS will be prepared in accordance with the National Environmental Policy Act (NEPA) of 1969, as amended (42 [U.S.C.] 4321, *et seq.*), and pursuant to the requirements of the Deepwater Port Act (33 [U.S.C.] 1501, *et seq.*). The Port Dolphin application is available for viewing and downloading from the DOT Docket Management System Web Page <http://dms.dot.gov>, Docket Number "USCG-2007-28532."

In accordance with Section 305(d)(2) of the Magnuson-Stevens Fishery Conservation and Management Act, as amended, we seek to consult with National Marine Fisheries Service (NMFS) Habitat Conservation Division regarding the presence of essential fish habitat (EFH) that may be affected by the Proposed Action. We will also consult with the NMFS Protected Resources Division and U.S Fish and Wildlife Service regarding the presence of threatened and endangered species under their respective jurisdictions.

In order to fully assess the potential impacts associated with the Proposed Action on EFH we are requesting a list of species of concern that have EFH designated within the region of influence (ROI) and a list of any additional concerns that NMFS may have regarding the potential impacts of the Proposed Action.

Subject: Port Dolphin Energy LLC Deepwater Port Environmental Impact Statement

Dear Mr. Bernhart:

As stated in our notice of intent dated July 12, 2007, the U.S. Coast Guard (USCG) and Maritime Administration are preparing a Draft Environmental Impact Statement (EIS) to assist in the review of the Port Dolphin Energy LLC (Port Dolphin) application for a deepwater port license to construct and operate a natural gas deepwater port in the Gulf of Mexico. The proposed deepwater port would be located in the Federal waters of the Outer Continental Shelf (OCS) in the St. Petersburg (PB) blocks: PB545, PB589, and PB590, approximately 28 miles offshore off the west coast of Florida to the southwest of Tampa Bay, in a water depth of approximately 100 feet. The EIS will be prepared in accordance with the National Environmental Policy Act (NEPA) of 1969, as amended (42 [U.S.C.] 4321, *et seq.*), and pursuant to the requirements of the Deepwater Port Act (33 [U.S.C.] 1501, *et seq.*). The Port Dolphin application is available for viewing and downloading from the DOT Docket Management System Web Page <http://dms.dot.gov>, Docket Number "USCG-2007-28532."

In accordance with Section 7 of the Endangered Species Act (ESA), as amended, we seek to informally consult with National Marine Fisheries Service (NMFS), Protected Resources Division, regarding the presence of marine mammals and federally-listed threatened and endangered species that may be affected by the Proposed Action. We will also consult with the U.S. Fish and Wildlife Service regarding the presence of threatened and endangered species and migratory bird species under their jurisdiction and NMFS Habitat Conservation Division regarding essential fish habitat (EFH).

Pursuant to the ESA, we will include the Biological Assessment (BA) as an appendix to the EIS for this proposed project. In order to fully assess the potential impacts associated with the Proposed Action on threatened and endangered species, we are requesting a list of species of concern that occur within the region of influence (ROI) and a list of any additional concerns that NMFS may have regarding the potential impacts of the Proposed Action.

RE: Maritime Administration and U.S. Coast Guard - Notice of Intent to Prepare a Draft Environmental Impact Statement for Port Dolphin Energy LLC, Port Dolphin Liquefied Natural Gas Deepwater Port License Application – USCG – 2007 – 28532

Dear Mr. Prescott:

Pursuant to Section 403.061(40), *Florida Statutes*, the Florida Department of Environmental Protection (Department) has reviewed and coordinated a state review of the above referenced Notice of Intent (NOI) to prepare an Environmental Impact Statement (EIS) pursuant to the National Environmental Policy Act (NEPA), 42 U.S.C. §§ 4321, 4331-4335, 4341-4347, as amended. The NOI was issued in the July 12, 2007 Federal Register in response to an environmental review of the Deepwater Port (DWP) license application submitted by Port Dolphin Energy LLC (Port Dolphin).

The State of Florida received the Deepwater Port License Application submitted by Port Dolphin Energy LLC on July 9, 2007. In conjunction with the receipt of the application, Governor Crist received notification that Florida has been designated as an adjacent coastal state pursuant to the Deepwater Port Act (33 U.S.C. 1501 et seq.). As an adjacent state, the Florida Governor will have 45 days from the last public hearing in which to transmit approval or disapproval of the proposed deepwater port to the Secretary of the Department of Transportation. Issuance of the license is dependent on Florida's approval of the project.

Project Overview

Port Dolphin proposes to own, construct, and operate a deepwater port in federal waters of the Outer Continental Shelf approximately 28 miles southwest of Tampa Bay, off Manatee County, FL in about 100 feet of water depth. The DWP would consist of a permanently moored unloading system with two submersed buoys separated by approximately three miles. Each buoy would be secured to the bottom using eight mooring lines attached to anchor points on the seabed. The buoys will be designed to moor and unload specialized Liquified Natural Gas (LNG) shuttle and regasification vessels (SRV). Each buoy is proposed to connect via a flexible riser and flowline to a Y intersection and then a 36 inch pipeline approximately 42 miles in length that would connect onshore in Port Manatee, Manatee County, Florida with Gulfstream Natural Gas System, LLC and Tampa Electric Company (TECO) System.

Compliance with State Permitting

The proposed project will require an Environmental Resource Permit under Chapter 373, *Florida Statutes*, and an easement from the State of Florida Board of Trustees of the Internal Improvement Trust Fund in accordance with Chapter 253, *Florida Statutes*, for the use of a corridor for construction, installation and maintenance of the pipeline within state territorial waters. The applicant must provide reasonable assurance that the project is not contrary to the public interest and will not violate state water quality standards. The applicant must also comply with the requirements and conditions considered during the state's review of the environmental resource permit application.

Compliance with the Coastal Zone Management Act

Pursuant to the Coastal Zone Management Act (CZMA), 16 U.S.C. §§1451-1464, as amended, and its implementing regulation,15 C.F.R. 930, Subpart D, applicants for federal licenses and permits for activities that affect land or water uses or natural resources of Florida's coastal zone must include in their applications the consistency certification required by 15 C.F.R. 930.57. Applicants are also required by the CZMA and 15 C.F.R. 930.58 to provide the state with the information needed to support the statements of consistency. The data and information should include a detailed description of the project including its associated facilities, as discussed below, and its effects on the relevant enforceable policies included in the Florida Coastal Management Program (FCMP).

For the state-regulated portion of the project, the Environmental Resource Permit (ERP) will serve as the Coastal Zone Management Act federal consistency review. The state's evaluation of the consistency of the federal waters portion of the proposed project with the FCMP will be conducted in conjunction with the state's review of the draft and final EIS documents. Because the state's consistency evaluation and final consistency decisions will depend upon the information and data provided during the EIS and ERP processes, it is essential for the state and federal reviews to be well-coordinated and based on the same information.

The detailed data and information necessary to support a consistency certification with the enforceable policies of the Florida Coastal Management Program in state and federal waters and uplands include (1) complete descriptions and evaluations of all aspects of the proposed activities including location, duration, alignment alternatives and construction; (2) complete characterizations and descriptions of the environmental resources and physical conditions in the area, including benthic and water column habitats; (3) a thorough assessment of the potential direct and indirect effects to the environmental, cultural, social and economic resources, including essential fish habitats, fisheries, and protected species; (4) a discussion of plans to avoid and minimize impact to important resources; (5) a discussion of mitigation for unavoidable impacts to resources; (6) an assessment of the cumulative impacts of the proposed project in combination with other activities in the vicinity; and (7) a final evaluation of the proposed project's consistency with the FCMP accompanied by a signed consistency certification.

More detailed discussion of specific information needed for the state to complete its review of the proposed DWP is included below.

Need for the Deepwater Port

A complete and thorough needs analysis for the DWP and accompanying natural gas pipeline should be evaluated in the Draft Environmental Impact Statement (DEIS). The needs

analysis should include a discussion of the capacity of existing pipelines as well as pipelines/DWP proposed for the foreseeable future.

Construction Techniques

The preferred pipeline route includes two horizontal directional drill (HDD) installations in the nearshore and landfall portions of the proposed route. The DEIS should include documentation supporting the technical feasibility of successfully completing HDD installations and contingency plans addressing possible problems with the installations and how they will be resolved.

Frac-outs occurring during construction and the potential ecological effects are of concern to Florida. The DEIS should thoroughly discuss measures to assure that frac-outs will not occur during the HDD and pipeline installations. Measures to correct impacts to water quality and habitats should an event occur should also be discussed. The DEIS should also include a description of how the spoils excavated at the HDD entrance and exit sites will be handled and disposed of, methodologies and results from sedimentation models, and estimates of impacts calculated from these modeling efforts.

Pipeline Safety

The draft EIS should describe how the pipeline will be designed to withstand stresses during installation, testing, and operations; including thickness, protection systems, and conformity with the safety requirements of the Department of Transportation, Office of Pipeline Safety.

Resource Impacts

The State of Florida is concerned that the project could result in significant direct and indirect long-term impacts to soft and hard bottom marine communities. The draft EIS should provide location of the DWP and all preferred alternatives with respect to bottom habitats and evaluate direct and indirect impacts that could occur from the installation and/or operation of the DWP.

Detailed maps should be included that will depict where the benthic resources are located in relation to both temporary and permanent structures associated with the DWP. All permanent, temporary and secondary impacts to habitats, especally live and hardbottom, from the installation and operation of the DWP should be examined and quantified. The DEIS should describe how these impacts will be avoided or minimized. Avoiding impacts to resources is preferred. However, for those impacts that cannot be avoided, minimization to the greatest degree possible is paramount. The State will require copies of videos and photographs showing the preferred and all alternative routes, as well as maps detailing the location of videos and photographs taken.

The DEIS should clearly explain the justification for the preferred route and how it best avoids and minimizes encroachments and impact to benthic habitats. The license application only analyzed the preferred route and DWP location. No benthic habitat data was provided regarding the other proposed north and south routes. The presumption that the preferred route would provide the least impacts because it is the shortest route can not be verified without properly surveying the alternative routes. The DEIS should include a discussion of benthic habitats along the alternate routes and a comparison with the preferred route. In addition, discussions of the

preferred route, as described in the license application should include documentation why the route south of Passage Key is preferred and not north of Passage Key.

The biological survey protocol should adequately identify affected resources and ecosystems, especially those that may be unique to the area, in order that they may be more properly mitigated for where necessary. In the license application data from surveys were qualified and quantified using the *Regulatory Basis of Review Mitigation Protocol Offshore Southeast Florida.* This document was developed for projects occurring on the Southeast coast of Florida, where coral reefs were a resource of concern, thus the habitat classifications reflect those habitats in and around coral reefs. The State is currently working with Port Dolphin consultants to adapt these mitigation protocols to better reflect important live and hardbottom habitats in the Gulf of Mexico off Southwest Florida.

The DEIS should also provide a discussion of the air quality impacts that would likely to occur as a result of the DWP including possible nutrient loading via the air/water interface.

The DEIS should provide a detailed description of the water intake of the DWP. This should include the overall need, how much intake will be needed for each vessel and the frequency of each vessel at the DWP. Descriptions of the intake pipes, operations including impingement and entrainment should be included as well. Effects and/or impacts of any biocides, if applicable, used in ballast or intake water systems should also be evaluated in the DEIS.

The potential for impacts to fishery resources of the area through impacts to icthyoplankton resulting from ship water intake activities should also be addressed in the DEIS. Because information regarding ichthyoplankton resources in the vicinity of the DWP is very limited, the state remains concerned that increased water intake from the SRV ships could significantly affect icthyoplankton communities. Please see the attached letter and memo from the Florida Fish and Wildlife Conservation Commission (FWC) for more detailed discussion of concerns and issues.

The DWP will likely increase the number of foreign ships to offshore waters near the Florida coast and therefore increase the potential for the introduction of non-indigenous species in the area through ship ballast discharge. The introduction of non-indigenous species should be thoroughly investigated in the DEIS and measures to limit their introduction should be evaluated.

Fishing activities

The FWC suggests that impacts to fishing activities occurring in the offshore area affected by the DWP should be addressed and include discussions of mitigation alternatives for the loss of fishing grounds.

Accident Management

The DEIS should provide an accident management plan that outlines procedures for notification and actions that are required in the event of an incident at the DWP. This plan should detail the role the state will be expected to play in response to an incident; including identifying port and state responders; identifying training needed; as well as timing for training and who will provide the training.

Discharges, including sanitation waste, fuel spills, hydraulic leaks, LNG leaks and other material from lay barges, supply vessels and other watercraft may affect water or air quality. The

DEIS should describe potential discharges and measures proposed to protect water and air quality in the event of such discharges.

A hydrocarbon spill contingency plan should be included for offshore activities. Within in the DEIS, a worst-case, offshore spill should be evaluated which is based on the maximum quantities and types of hydrocarbons stored or used onboard the lay vessel(s) or the SRVs. Trajectories of a maximum quantity accidental spill should be modeled using worst cast local currents and winds. Model results presented in the DEIS should include estimate of time for the spill to contact natural resources. Procedures and times to respond to a spill, including the protection and clean-up of affected resources, should be described in the DEIS. In the case of a LNG spill or accident air quality impacts should also be considered.

Storm Handling Plan

A Storm Handling Plan (SHP) should be developed that includes measures to ensure that resources are not damaged by the movement of construction equipment and staged pipeline segments during storms or other weather related events. The SHP should include contingencies for securing templates, marine risers, the lateral guidance system and the pullstring on the seafloor. The SHP should also include measures to ensure resources are not damaged when the DWP is operational.

Conflicting Uses and Cumulative Impacts

The DEIS should also examine the cumulative impacts to hardbottom, live-bottom, seagrasses, and sand/soft bottom habitats. These impacts should consider all impact producing uses of the seafloor including but not limited to Manatee Harbor dredging, offshore disposal site, fisheries impacts, artificial reefs and any other foreseeable project that could occur in conjunction with the DWP.

There are many possible conflicting uses occurring on the continental shelf in the area of the proposed project. The DEIS should include a discussion on how the proposed pipeline will affect and be affected by uses, such as military activities, artificial reefs, sand borrow areas, fisheries activities and ocean dredged material disposal sites.

Alternatives

The DEIS should thoroughly evaluate a range of alternatives for the proposed project including alternative routes and alternative construction techniques. Information regarding alternatives provided in the application often contains only cursory analyses. The DEIS should also include discussion on the feasibility of an offshore interconnect with the Gulfstream Natural Gas System LLC pipeline, which would eliminate the need for another onshore pipeline significantly reducing resource impacts.

Mitigation

The DEIS should also address mitigation and mitigation alternatives for unavoidable impacts to important habitats both onshore and offshore including hardbottom, live-bottom, seagrasses, coral and soft coral/sponge communities. The DEIS should also discuss long-term monitoring of the project area and any mitigation sites.

We appreciate the opportunity to provide comments on the NOI. Comments received from the FWC and Tampa Bay Regional Planning Council are enclosed for your consideration. Comments from the Florida Department of State were sent directly to the Coast Guard, but are also included here for convenience. As more detailed additional information becomes available regarding the proposed project, Florida will notify you of any further concerns or issues that should be addressed at that time. Should you have any questions, please contact Ms. Shana Kinsey or Ms. Debby Tucker at (850) 245-2163.

Cordially,

Lynn Griffin

Re: Notice of Intent to prepare Environmental Impact Statement in Evaluation of a Deepwater Port License Application Submitted by Port Dolphin Energy LLC (Port Dolphin), SAI #FL200707093612C

Dear Ms. Tucker:

The Division of Marine Fisheries Management of the Florida Fish and Wildlife Conservation Commission (FWC) has coordinated agency review of the proposed Port Dolphin Liquefied Natural Gas (LNG) Deepwater Port and associated pipeline project, and provide the following comments and recommendations with regards to the preparation of an Environmental Impact Statement (EIS) by the United States Coast Guard and the Maritime Administration.

Our informational needs relate to the following issues: potential reduction in fishing areas, the potential to introduce new species, law enforcement, impacts to fish habitat, impacts to marine fisheries due to entrainment of plankton, and alternatives to be considered.

Background

The Notice of Intent indicates that the U.S. Coast Guard and the Maritime Administration intend to prepare an EIS for the construction and operation of an LNG deepwater port facility that would be located in water depth of 100 feet, approximately 28 miles southwest of Tampa Bay, off Manatee County, Florida. Port Dolphin would consist of two permanent unloading buoys for the mooring of up to two LNG shuttle and regasification vessels. Each unloading buoy would connect to a 36-inch diameter, 41.4-mile long gas transport pipeline that would be constructed from the offshore port to landward portions of existing pipelines in Manatee County, Florida.

Fishing Activities

We recommend that the EIS provide mitigation alternatives for loss of fishing grounds to the fishing community due preclusion of these areas as they become designated security and safety zones.

Introduction of Non-Indigenous Species

We recommend that the EIS address the potential for the introduction of non-indigenous species through the discharge of ballast water. The proposed LNG deepwater port would increase the number of ships that come from foreign areas, and we would like to know what practices will be employed to prevent the introduction of non-indigenous species into the waters offshore of Florida.

Law Enforcement

We recommend that the EIS provide information that outlines the extent of obligation on FWC Law Enforcement resources to provide support for routine security or incident response and management for Port Dolphin. The information should include projected personnel needs, training needs for such personnel, and equipment necessary to meet such obligations.

We would also like to take this opportunity to stress the importance of continued participation by FWC Division of Law Enforcement representatives in all future project meetings concerning (but not limited to) domestic security issues, risk assessments, and development of any incident response or management plans.

Habitat

The primary benthic communities expected to be affected by this project are hard bottom with both hard and soft corals, shallow and deep-water seagrasses, and live-bottom communities. Adverse effects to these benthic resources include impacts due to plowing and burial of the pipeline or covering the pipeline with concrete mats. Additional benthic impacts may occur from the construction of the shuttle and regasification vessel anchoring system, as well as the Standard Triangulation Language buoy landing pad.

The application materials are substantial, but almost all of the information is directed at the proposed route, with little or no marine resource information provided for the alternate northern and southern routes. Although it may be presumed that the proposed pipeline route would result in fewer adverse effects because it is the shortest route, without some level of reconnaissance information of the resources present in the other two pipeline routes, this presumption cannot be confirmed. In order to determine if adverse effects would be greater or less to the resources of Florida, additional information verifying that the northern and southern routes are less desirable is necessary.

We recommend that the applicant investigate alternate routes around significant hardbottom communities or that the applicant reconsider other avoidance methodologies such as directional drilling to preserve these natural communities and lessen the damage and eventual mitigation that will be required to replace these resources and their functions. Additionally, we would like to see evidence that the proposed concrete mats have functioned as suggested in previous pipeline projects. There is evidence in coral restoration projects that concrete mats have moved during storm events resulting in damage to nearby hardbottom resources.

Lastly, the application materials note that deepwater seagrass (*Halophila decipiens*) is found in the waters associated with the proposed pipeline; however, we found no quantification in the document of how much, if any, was located during the surveys performed for the proposed route. We recommend that applicant provide information regarding presence or absence of this resource, or the applicant's inability to adequately detect it due to the diminutive nature of this seagrass species.

Plankton

We recommend that the EIS include additional data regarding potential impacts to plankton resources, and analysis of such data. The information that is presently available is not sufficient to be able to appropriately evaluate potential project impacts. Please see the enclosed memo containing an analysis of current plankton data and identification of plankton data collection needs for this project.

Alternatives

We recommend that the EIS include an offshore interconnect with the Gulfstream pipeline as an alternative and also provides an analysis of this alternative.

We appreciate the opportunity to provide input on the development of an EIS for the Port Dolphin LNG deepwater port and pipeline project. Should you require additional assistance regarding our comments, please contact Lisa Gregg at (850) 487-0554 or at lisa.gregg@myfwc.com.

Sincerely,

Mary Ann Poole

From: **Mark Leiby**
Fish and Wildlife Research Institute
Florida Fish and Wildlife Conservation Commission

Date: **August 27, 2007**

Subject: **Plankton data issues for Port Dolphin LNG DWP**

The larvae of virtually all the recreationally and commercially important species of bony fishes and crustaceans in the Gulf of Mexico and the South Atlantic Bight are part of the planktonic community (Richards, 2006 and references therein, Boltovskoy, D. 1999 and references therein) The eggs and larvae stages of a majority of these species occur over the continental shelf (Richards, 2006 and references therein)

A scientifically valid, *a priori* assessment of impacts to the plankton community which might be a result of the construction and operation of Port Dolphin's proposed LNG facility cannot be made using currently available data

The Port Dolphin deep water port license application (Section 4.2.3.4, pp. 4-35 to 4-37), and the "Analysis of SEAMAP data for Port Dolphin (Draft)" reference qualitative data from the ichthyoplankton survey conducted in the eastern Gulf of Mexico from 1971-1974 by Houde et al., but these data are not included in the analyses. The analyses rely solely on ichthyoplankton data from four SEAMAP stations (Stas. B110, B111, B119 and B120) for quantitative data

The FWC is of the opinion that the SEAMAP ichthyoplankton data from these four stations is not a sufficient basis for assessing Port Dolphin's potential impact on the plankton community near the proposed project, and offers the following discussions for your consideration

SEAMAP DATA

A. **Areal Coverage:** The distance between SEAMAP plankton stations, and the distance of each station from the proposed Port Dolphin project precludes using SEAMAP data to assess potential, localized impacts.

SEAMAP stations are laid out in a rectangular grid. The grid lines, which run North/South and East/West, are located at 0.5° (30 minute) intervals of latitude and longitude. The stations are located at the intersection of the grid lines, and are slightly more than 30 statute miles apart (Figure 1). Consequently, each SEAMAP station lies in the center of a rectangle that encompasses a little more than 1,000 square miles of surface area (Figure 1).

A fine-scale sampling grid centered on all of the proposed Port Dolphin deep water port site alternatives will be necessary to obtain sufficient plankton data for analysis.

B. **Temporal Coverage:** Interannual variation in the abundance of eggs and larvae is frequently quite pronounced (Table 1 this document and Rose, 2000). Distinguishing natural variation from the possible environmental impact of a LNG facility will require multiple years of sampling and data analysis. An estimate of the number of years of pre-EIS sampling that will be necessary to obtain enough base-line data to assess possible environmental impacts from the proposed LNG facility will have to be determined by careful statistical analysis of the only available data, which is the SEAMAP ichthyoplankton data from the SEAMAP stations located on the west Florida shelf between 26° and 29°N (Figure 2).

Species of interest spawn at different times of the year. Some species, e.g. tarpon (*Megalops atlanticus*) and bluefin tuna (*Thunnus thynnus*) have relatively restricted spawning seasons (one to three months). Consequently, year-round, monthly sampling is necessary for preparing a minimally acceptable impact assessment

None of the four SEAMAP stations, which are closest to the proposed Port Dolphin site, have even one year of year-round sampling (Table 2).

C. **Discrete Depth Samples:** Current patterns near the proposed Port Dolphin facility are complex. The speed and direction of long-shore, on-shore and offshore water currents vary with annual variations in wind direction, wind speed, and wind duration. The Loop Current and its effects on the West Florida shelf vary on a fairly regular basis. Local water currents are affected by regular and semi-regular upwelling events. These and other factors result in vertical stratification of the water column as well as variability in Ekman and deep-water Ekman transport. Consequently, discrete depth sampling is necessary to assess potential, localized impacts.

SEAMAP plankton samples, which are oblique tows from near the bottom to the surface, cannot elucidate vertical stratification of the water column.

D. **Faunal Coverage:** An initial impact assessment needs to include data on the planktonic species of economically important crustaceans as well as data on ichthyoplankton.

Generally, only the ichthyoplankton are identified and enumerated from SEAMAP plankton samples.

DATA COLLECTION NEEDS

Plankton Sampling Time Frame: To be determined by careful statistical analysis of the SEAMAP ichthyoplankton data from the SEAMAP stations which are located on the west Florida shelf between 26° and 29°N (Figure 2).

Plankton Sampling Design: The following plankton-sampling program closely follows the program designed by Dr. Monty Graham and his colleagues at the Dauphin Island Sea lab for the Compass Port project. It has been slightly modified to reflect the differences between the Port Dolphin and the Compass Port locations.

Plankton sampling gear should be a multiple opening and closing net system, such as the Mininess, equipped with 0.333-millimeter mesh. The net system should include the electronics necessary to provide real-time displays of conductivity, temperature and depth. The net system should include two real-time flowmeter displays. One of the flowmeters should be inside the mouth of the net and one should be outside of the net. This flowmeter arrangement makes it possible to assess filtration efficiency and net clogging in real-time, as well as to quantify the volume of water filtered. The volume of water filtered by each net is necessary for zooplankton quantification.

Plankton sampling should be conducted in a six mile square area (36 square miles) centered on the proposed Port Dolphin site (Figure 3). The sampling area should be divided into four quadrants, each quadrant being 3 miles square (9 square miles). Each quadrant should be sub-divided into 25 equal sized plats measuring 0.6 x 0.6 miles (0.36 square miles) (Figure 3)

Two of the 25 plats in each quadrant should be randomly selected for plankton sampling each month (i.e., eight plankton stations each month). Eight samples should be taken at each station (i.e. 64 samples each month). Seven of the samples should be discrete-depth plankton samples taken at depth intervals of approximately 15 feet, and one sample should be an oblique tow from near bottom to the surface (i.e., seven stratified layers plus one oblique integrated sample),

Diel variations of plankton should be measured every three months. Seven discrete depth samples and one oblique sample should be taken at one randomly selected station within one mile of the center of the proposed Port Dolphin facility site. These samples should be taken at approximately six-hour intervals over a three-day period (i.e. 96 samples).

Tow speed should be maintained at 1.5 – 2 knots. Tow duration for each sample should be ten minutes unless a comparison of the two, real-time, flowmeter readings indicates that net filtration efficiency has below 75%.

Figure 1

Yellow square outlines 36 square mile sampling area. See Figure 3 for more detailed view

Subject: Port Dolphin

Jessica – The only comments I have on the clearinghouse request is:

The potential for environmental impacts exist in association with the pipeline planned to enter and cross the shallow areas of Tampa Bay. The EIS should thoroughly investigate the potential impacts to hard bottom communities, fisheries, and other organisms, as well as identify sufficient minimization and mitigation measures to prevent primary and secondary impacts to the resources of Tampa Bay.

FLORIDA DEPARTMENT OF STATE
Kurt S. Browning
Secretary of State
DIVISION OF HISTORICAL RESOURCES

Mr. Raymond. W. Martin
Port Dolphin Project Manager
Deepwater Ports Standards Division
U. S. Coast Guard
2100 Second Street, S.W.
Washington, DC 20593-0001

September 12, 2007

Re: Port Dolphin Energy LLC Application for Deepwater Port
Outer Continental Shelf off of Florida's West Coast
Archaeological Assessment
DHR Project File No. 2007-6248B

Dear Mr. Martin:

Our office received and reviewed the above referenced survey in accordance with Section 106 of the *National Historic Preservation Act of 1966*, as amended and *36 CFR Part 800: Protection of Historic Properties*, and with this agency's responsibilities under Section 267.061, *Florida Statutes*. The State Historic Preservation Officer is to advise Federal and State agencies as they identify historic properties (listed or eligible for listing, in the *National Register of Historic Places*), assess effects upon them, and consider alternatives to avoid or minimize adverse effects.

We reviewed the archaeological assessment entitled *Höegh LNG Project Proposed LNG Facility and Proposed 36-Inch Gas Pipeline, Block 545, St Petersburg Area, Gulf of Mexico, to Tampa Bay, Florida*. Staff from the Bureau of Archaeological Research, Underwater Archaeology, assisted in the review of this report. However, we cannot complete our review of this project as the report does not meet our report standards and there is missing information.

As a portion of this archaeological investigation took place within Florida State Waters, a Chapter 1A-32, *Florida Administrative Code (FAC)* permit should have been obtained prior to the commencement of fieldwork. This authorization will need to be obtained from this agency as an after-the-fact permit. The contact person for obtaining a 1A-32 permit is Andrea White, who can be reached at (850) 245-6325. One of the requirements of a 1A-32 permit and Chapter 267, *Florida Statutes*, is that the resultant survey meets the reporting requirements of Chapter 1A-46, *FAC*. This would include copies of project maps, survey log sheet, etc. Once the required permit has been obtained and the missing information forwarded for our review, we shall attempt to expedite our assessment of this report.

☐ Central Florida Regional Office (813) 272-3843 • FAX: 272-2340

Lastly, should the boundaries of the proposed project be modified to include areas which were not subjected to underwater archaeological investigations, additional archaeological work will be necessary.

If you have any questions concerning our comments, please do not hesitate to contact Susan Harp at (850) 245-6333. Thank you for your interest in protecting Florida's historic resources.

Sincerely,

Frederick P. Gaske

Ms. Patience Whitten
U. S. Coast Guard, Commandant (CG-3PSO-5)
Deepwater Ports Standards Division
2100 Second Street, SW
Washington, D. C. 20593-0001

Dear Ms. Whitten:

The National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS), has received your agency's August 24, 2007, letter concerning the preparation of an environmental impact statement (EIS) for the proposed Port Dolphin Energy LLC liquefied natural gas Terminal Deepwater Port (Port Dolphin) license application (72 FR 133 USCG-2007-28532). Port Dolphin would be located in water depth of 100 feet, approximately 28 miles southwest of Tampa Bay, off Manatee County, Florida.

Your letter indicates your agency seeks to consult with NMFS regarding the presence of essential fish habitat (EFH) in the project area potentially affected by the proposed action. To assist your agency in determining impacts associated with Port Dolphin, we are providing a list identifying fish/invertebrate species, life stages, and EFH categories of the project area (see enclosure).

To fully address EFH and associated fisheries in the project area, we recommend the EIS include sections titled "Essential Fish Habitat" and "Marine Fishery Resources" that describe the potential project impacts on each category of EFH (e.g., marine non-vegetated water bottoms, continental shelf features, water column, and estuarine submerged aquatic vegetation, mangrove wetlands, estuarine water column) and marine and estuarine fishery species within the project area. These sections should analyze the potential impacts of the proposed project on EFH and dependent federally managed species and life stages and should fully evaluate alternative measures to avoid, minimize, and offset adverse impacts. Section 600.810(a) of the EFH regulations defines an adverse effect to EFH as any impact that reduces the quality and/or quantity of EFH, including the loss of, or injury to, benthic organisms, prey species and their habitat, and other ecosystem components. The EIS should analyze impacts to benthic and prey species in the discussion of impacts to EFH. This descriptive and analytical information, coupled with a statement of your agency's conclusions regarding the effects of the action on EFH and marine fishery species, would provide the basic details necessary for an EFH assessment pursuant to the requirements of 50 CFR 600.920(e). The Gulf of Mexico

Fishery Management Council should also be provided an opportunity for comment on EFH issues under provisions of the Magnuson-Stevens Fishery Conservation and Management Act.

Further, the project area is within the known distribution limits of a federally listed threatened species under purview of NMFS. In accordance with the Endangered Species Act of 1973, as amended, it is your responsibility to review this proposal and identify actions that may affect endangered or threatened species. Determinations involving listed species should be reported to our Protected Resources Division at the letterhead address. If it is determined that the activities may adversely affect any species listed as endangered or threatened under Protected Resources Division purview, formal consultation must be initiated.

Thank you for the opportunity to provide these comments on environmental issues concerning the proposed permitting of the Port Dolphin LNG Project. If we may be of further assistance, please contact Mr. Mark Sramek at the letterhead address above, by telephone at (727) 824-5311, or e-mail at Mark.Sramek@noaa.gov.

Sincerely,

W. Mark Thompson

Patience Whitten
United States Coast Guard, Commandant (CG-3PSO-5)
Deepwater Ports Standards Division
2100 Second Street, S.W.
Washington, DC 20593-0001

Dear Ms. Whitten:

The National Marine Fisheries Service (NMFS) has received your August 21, 2007, letter, regarding the Port Dolphin Energy LLC (Port Dolphin) application for a deepwater port license to construct and operate a liquefied natural gas (LNG) terminal in the Gulf of Mexico (GOM). You have indicated that a biological assessment (BA) will be prepared as an appendix to the environmental impact statement that will be conducted for the project. You have requested a list of threatened and endangered species under the purview of NMFS and any comments we may have regarding the project that should be addressed in the BA.

Section 7 of the ESA requires that federal agencies consult on the effects of their actions that may affect endangered and threatened species. NMFS may coordinate and provide assistance to applicants and federal agencies prior to initiation of consultation by means of a conference, technical assistance, or informal consultation under the Endangered Species Act (ESA). Based on similar LNG proposals, we believe that there is a potential for some aspects of the Port Dolphin project to affect listed species. Although a BA has yet to be prepared and any conclusions regarding the likelihood of effects occurring cannot be determined at this time, we can provide you with a species list and potential impacts based on our preliminary review of the project. In an April 13, 2007, letter, we provided the following recommendations:

- the inclusion of the endangered smalltooth sawfish (*Pristis pectinata*), including potential effects of the action on the species;
- additional information on potential trenching impacts to protected sea turtle species and smalltooth sawfish;
- additional information on potential effects to sea turtles via entanglement from vertical buoy lines, loss of foraging habitat resulting from anchor sweep and pipeline burial, and acoustic impacts resulting from pile driving of the anchoring system;

- all vessels used during installation/commissioning, routine operations, and decommissioning should follow the enclosed *Vessel Strike Avoidance Measures and Injured or Dead Protected Species Reporting* (attached);

- Construction conditions to be followed during construction activities (please note our previous recommendation was only for sea turtles and smalltooth sawfish, but the conditions may require modification to include additional measures from specific activities (e.g., pile driving and pipeline construction) and dolphin species if necessary); and

- additional information to evaluate potential affects on listed species from various aspects of installation/commissioning and decommissioning.

Please consider the following comments in supplement to those previously provided.

Listed Species and Action Area

Species listed under the ESA and protected under the Marine Mammal Protection Act (MMPA) under the purview of NMFS should be considered in the potential effects of the proposed LNG expansion. Primarily sea turtles and smalltooth sawfish are found in the terminal and pipeline areas (Table 1), and only non-listed species of marine mammal including bottlenose dolphins (*Tursiops truncatus*) and Atlantic spotted dolphins (*Stenella frontalis*). However, LNG tankers (LNGTs) traffic may affect many other species of marine mammals while in transit to and from the terminal.

The action area of the project includes all areas to be affected directly or indirectly by the action, and not merely the immediate area involved in the action (50 CFR 402.02). The action area is considered to be all terrestrial and aquatic environments affected by the construction and operation of the LNG terminal and pipelines. The estuarine and marine portion of the project area is considered to be all the areas affected both directly and indirectly by the construction, operation, and decommissioning of the proposed terminal. Therefore, listed marine mammals have the potential to be affected by collisions and noise anywhere on the high seas where they operate in these species' habitats. All the species in Table 1 are recommended for inclusions in an effects analysis from vessel operation in the BA prepared for this project.

Table 1. Threatened and endangered species in the Gulf of Mexico potentially affected by Port Dolphin.

Common Name	Scientific Name	Status
Sea turtles		
Kemp's ridley sea turtle	*Lepidochelys kempii*	endangered
leatherback sea turtle	*Dermochelys coriacea*	endangered
hawksbill sea turtle	*Eretmochelys imbricata*	endangered

Common Name	Scientific Name	Status
green sea turtle	*Chelonia mydas*	threatened
loggerhead sea turtle	*Caretta caretta*	threatened
Cetaceans		
sperm whale	*Physeter macrocephalus*	endangered
humpback whale	*Megaptera novaeangliae*	endangered
fin whale	*Balaenoptera physalus*	endangered
sei whale	*Balaenoptera borealis*	endangered
blue whale	*Balaenoptera musculus*	endangered
Fishes		
smalltooth sawfish	*Pristis pectinata*	endangered

Pipeline Construction

Pipeline construction has the potential to alter habitat conditions and habitat utilization of smalltooth sawfish and sea turtles. Smalltooth sawfish are usually found in shallow waters very close to shore over muddy and sandy bottoms of the project area. The occurrence of smalltooth sawfish in the deeper depths of the terminal site is believed to be low; however, pipeline construction may affect this species and its habitat. Although smalltooth sawfish may be found anywhere in coastal waters near the construction area, mangrove habitat is important to this species, especially juveniles. This species may also respond to pipeline construction activity by avoiding the area. Avoidance behavior may result in temporary or long-term abandonment of important foraging habitat that may affect individuals. Factors affecting the magnitude of avoidance behavior may include the availability and proximity of prey and shelter in adjacent habitats to the project area.

Although the exact pipeline route has not yet been determined, it appears likely to cross smalltooth sawfish habitat and possibly mangroves. Impacts to coastal habitats should be minimized to the greatest extent practicable, including avoiding any loss of mangroves. Possible actions that may result in habitat effects include, but are not limited to, jetting of sediments to lay the pipeline, anchoring of the jetting and lay barges, dragging and sweeping of the anchor cables, and impacts associated with a pipeline making landfall.

In addition to effects to smalltooth sawfish, impacts associated with sea turtle nesting beaches and foraging sea turtles should be considered in the impact analysis. Sea turtles may be found anywhere throughout the construction area. Although some impacts to benthic prey species would be expected, the greater potential impact to sea turtles may be the annoyance and possible exclusion of sea turtles from a foraging area during construction. The types of impacts expected, including their duration and magnitude of impact of individuals should be assessed.

For both smalltooth sawfish and sea turtles, the EIS alternatives considered should take into consideration the magnitude of the effects associated with the installation and operation of the pipeline. It is recommended that alternative pipeline routes and installation methods be considered that would result in minimal impacts to both protected species and their habitats. The rationale for the preferred alternative should be clearly stated in regard to minimizing impacts to protected species.

Marine Debris Reduction

Previously USCG/MARAD-licensed LNG terminals have required a marine debris training and certification program for offshore personnel to further implement existing laws prohibiting the unauthorized discharge of any material into marine waters. The USCG has used the provisions in MMS NTL 2007-G03, which has been developed in coordination between NMFS and MMS, to reduce expected impacts to protected species from offshore oil and gas operations. Pursuant to this NTL companies are required to provide all offshore workers on the OCS an annual training on marine debris laws and requirements, post signs, and provide documentation to the licensing agency of all personnel that have received the marine debris training. We recommend that these requirements also be required of Port Dolphin should a license be issued. NMFS has been a partner in developing training materials with the Offshore Operators Committee (OCC) and the materials currently available to meet the certification and training requirements can be found at www.offshoreoperators.com/marinedebris.

Vessel Operation

Vessels transmit noise through water and cumulatively are a significant contributor to increases in ambient noise levels in many areas and affect local noise levels when considered as a point source. Increases in ambient noise are believed to be a potential threat for marine animals such as mysticetes, sea turtles, and fishes, which have greatest hearing sensitivities at lower frequencies that overlap with the main frequency level of energy produced by vessels. However, the potential for disturbance from noise resulting from individual LNGTs associated with the terminal would be limited to within proximity of a vessel's noise field. It is recommended that the effects of vessel noise on behavioral reactions and masking of calls be considered in the BA from both the perspective of sources of noise from LNGTs associated with Port Dolphin and the cumulative effects of vessel noise in the ocean.

Pile Driving

Although Port Dolphin has not identified the type of piles yet, it expects to use either steel piles or suction piles. The 70-in-diameter, 20-30 m long (65-98 ft), steel piles would require installation with a percussive hammer, which can produce loud underwater noise levels. Steel piles are usually removed below the mudline with the use of explosives, and could injure or kill protected species if explosives are used during decommissioning. If steel piles are used, noise impacts to protected species would be expected, and the methods of removal would need to be considered to estimate any potential impacts that may occur during decommissioning.

Port Dolphin has identified suction pies as an alternative to percussive-driven steel piles. If alternative suction pile anchors are used, noise is expected to be below injurious or harassing levels; however, the pile diameters of 4-5 m (14-16 ft) will impact a greater area of seafloor. An additional benefit of suction anchors is that they can be removed without the use of explosives during decommissioning of the terminal. If steel piles are driven in by percussive hammers, noise modeling will be required to minimize any potentially adverse effects on listed species. Please note that incidental takes of bottlenose dolphins and Atlantic spotted dolphins are not authorized through the ESA section 7 process. If you believe there is a potential for impacts to marine mammals, please contact Kenneth Hollingshead of our Headquarters Protected Resources staff at (301) 713-2055 for additional information regarding an MMPA take authorization. If feasible, it is recommended that suction piles be used for the mooring structures for the proposed terminal to minimize the potential for adverse impacts to protected species.

Impingement and Entrainment

The impacts of cooled seawater discharges and the potential effects of the impingement and entrainment of eggs and larvae of protected species' prey from LNGTs and warming water intakes should be discussed. Previously, we have not found any adverse impacts from seawater intakes from LNGTs and LNG terminals on protected species; however, there is little scientific information available regarding the potential impacts to listed species from these activities. LNG terminal water intake designs may vary, resulting in different levels of impacts expected between projects (e.g., the mesh, size, intake velocities, water treatment, amount of water withdrawn, and thermal discharges). Due to the uncertainty regarding these impacts, NMFS recommends the potential effects be analyzed in the BA.

There may be other impacts we have not yet identified due to the early planning stages of this project. Project modifications and additional project details we result in new impacts that we have identified above. Thank you for the opportunity to comment and early coordination on this project. Please contact Kyle Baker, fishery biologist, at (727) 551-5789 or at Kyle.Baker@noaa.gov with any questions about this letter.

Sincerely,

David Bernhart
Assistant Regional Administrator
for Protected Resources

Vessel Strike Avoidance Measures and Reporting for Mariners
NOAA Fisheries Service, Southeast Region

Background

The National Marine Fisheries Service (NMFS) has determined that collisions with vessels can injure or kill protected species (e.g., endangered and threatened species, and marine mammals). The following standard measures should be implemented to reduce the risk associated with vessel strikes or disturbance of these protected species to discountable levels. NMFS should be contacted to identify any additional conservation and recovery issues of concern, and to assist in the development of measures that may be necessary.

Protected Species Identification Training

Vessel crews should use an Atlantic and Gulf of Mexico reference guide that helps identify protected species that might be encountered in U.S. waters of the Atlantic Ocean, including the Caribbean Sea, and Gulf of Mexico. Additional training should be provided regarding information and resources available regarding federal laws and regulations for protected species, ship strike information, critical habitat, migratory routes and seasonal abundance, and recent sightings of protected species.

Vessel Strike Avoidance

In order to avoid causing injury or death to marine mammals and sea turtles the following measures should be taken when consistent with safe navigation:

1. Vessel operators and crews should maintain a vigilant watch for marine mammals and sea turtles to avoid striking sighted protected species.
2. When whales are sighted, maintain a distance of 100 yards or greater between the whale and the vessel.
3. When sea turtles or small cetaceans are sighted, attempt to maintain a distance of 50 yards or greater between the animal and the vessel whenever possible.
4. When small cetaceans are sighted while a vessel is underway (e.g., bow-riding), attempt to remain parallel to the animal's course. Avoid excessive speed or abrupt changes in direction until the cetacean has left the area.
5. Reduce vessel speed to 10 knots or less when mother/calf pairs, groups, or large assemblages of cetaceans are observed near an underway vessel, when safety permits. A single cetacean at the surface may indicate the presence of submerged animals in the

vicinity; therefore, prudent precautionary measures should always be exercised. The vessel should attempt to route around the animals, maintaining a minimum distance of 100 yards whenever possible.

6. Whales may surface in unpredictable locations or approach slowly moving vessels. When an animal is sighted in the vessel's path or in close proximity to a moving vessel and when safety permits, reduce speed and shift the engine to neutral. Do not engage the engines until the animals are clear of the area.

Additional Requirements for the North Atlantic Right Whale

1. If a sighted whale is believed to be a North Atlantic right whale, federal regulation requires a minimum distance of 500 yards be maintained from the animal (50 CFR 224.103 (c)).

2. Vessels entering North Atlantic right whale critical habitat are required to report into the Mandatory Ship Reporting System.

3. Mariners should check with various communication media for general information regarding avoiding ship strikes and specific information regarding North Atlantic right whale sighting locations. These include NOAA weather radio, U.S. Coast Guard NAVTEX broadcasts, and Notices to Mariners. Commercial mariners calling on United States ports should view the most recent version of the NOAA/USCG produced training CD entitled "A Prudent Mariner's Guide to Right Whale Protection" (contact Kristin.Thoms@noaa.gov for more information regarding the CD).

4. Injured, dead, or entangled right whales should be immediately reported to the U.S. Coast Guard via VHF Channel 16.

Injured or Dead Protected Species Reporting

Vessel crews should report sightings of any injured or dead protected species immediately, regardless of whether the injury or death is caused by your vessel.

Report marine mammals to the Southeast U.S. Stranding Hotline: 877-433-8299
Report sea turtles to the NMFS Southeast Regional Office: 727-824-5312

If the injury or death of a marine mammal was caused by a collision with your vessel, responsible parties should remain available to assist the respective salvage and stranding network as needed. NMFS' Southeast Regional Office should be immediately notified of the strike by email (takereport.nmfsser@noaa.gov) using the attached vessel strike reporting form

NMFS Southeast Region Vessel Strike Avoidance Measures and Reporting for Mariners, revised August 2007.

Observed or Noted Strike Resulting in Death or Injury of a Right or Other Large Whale

Ray:

I have elevated the response so it will take a bit longer (especially with the holidays and everyone's vacation schedule). I may have it by the end of the week.

Lisa

Subject: RE: Port Dolphin - ichthyo analysis

Lisa,

Has any progress been made identifying the taxa that you believe would be more representative for the Port Dolphin proposed site?

Port Dolphin anticipates providing responses to all the remaining outstanding data gaps by the middle of December.

Patience has accepted a position with another agency and her last day at CGHQ is next week so please ensure all Port Dolphin correspondence is sent to me.

Thanks,
Ray

Subject: Port Dolphin - ichthyo analysis

Dear Lisa,

One of the issues discussed during our conference call on September 28, 2007 was e²M's efforts to refine the study area for SEAMAP data relevant to the ichthyoplankton impact assessment for Port Dolphin. As a follow-up to this, please find attached a map that shows the revised study area. To screen the SEAMAP samples, the data was first queried by latitude and longitude for a rectangle that extended 0.75 degrees north and south of the proposed project location and 0.75 degrees east and west. Then the data query was screened to include only samples that were in water depths greater than 65 feet. The area shown on the map that roughly parallels the coast represents the resultant study area.

The screening resulted in identification of 143 samples. This number is comparable with evaluations conducted for other Gulf of Mexico LNG Deepwater Port projects. The taxa identified in the samples are listed below, in order of relative density. The taxa with the highest relative densities are on top. Please note that these data are preliminary and have been subjected to limited QA. This is the raw "TAXONOMIC" field from the "ichsarwk" data set.

The field is described as: "13-character containing abbreviated SEAMAP taxonomic code. At the species level the first 7 characters refer to the genus and the last 6 characters refer to the species. At taxonomic levels greater than species the whole field is used to identify a taxon."

You previously stated that the four species used in evaluations of other Gulf of Mexico projects were not all valid for this area. If possible, please identify the taxa that you believe would be more representative for the Port Dolphin proposed site. It is very important that we identify representative species soon so we can determine if sufficient life history data is available for each species to allow quantitative analysis. In identifying representative species, it would be most helpful if you could explain your reasoning for selecting each species, as is done in the impact analyses for

other projects. For the reasons explained above, we would appreciate receiving a response at your earliest convenience.

Thank you for your assistance in this effort. Please feel free to contact me if you have any questions.

January 30, 2008

Mr. Mark Prescott
Chief, Deepwater Ports Standards Division
U.S. Coast Guard
2100 Second Street, S.W.
Washington, DC 20593-0001

Dear Mr. Prescott:

The Florida Fish and Wildlife Conservation Commission (FWC) is supportive of developing alternative energy projects that would benefit Florida, and therefore has been working closely with the U.S. Coast Guard on plans for both the proposed Calypso liquefied natural gas (LNG) deepwater port (DWP) in the Atlantic off of Florida, and the proposed Port Dolphin LNG DWP in the Gulf of Mexico. It is the responsibility of the FWC to ensure that facilities supporting alternative energy sources are designed, constructed and operated in a way that does not result in adverse consequences to the State's fish and wildlife resources.

With respect to the proposed Port Dolphin facility, I would like to call your attention to, and find a resolution for, issues that FWC staff has consistently raised regarding the applicability of the data that the U.S. Coast Guard staff plans to use to assess potential impacts to fishery resources. Our concerns revolve around the reliance on data from the Southeast Area Monitoring and Assessment Program (SEAMAP) and application of such data in the age-one-equivalent model to assess potential impacts to fishery resources.

While we do not dispute the quality of SEAMAP data for the purposes for which it was collected, our staff believe that SEAMAP data are inappropriate for use in any impact assessment model. SEAMAP data collection is not seasonally distributed, the methodology does not include discrete depth sampling, and it does not include egg identification data to support an impact assessment model. In addition, the larvae of some of the species (e.g., gag grouper, striped mullet, sheepshead, tarpon) of particular importance to Florida's recreational and commercial fisheries are known to be present in the proposed project area, but are not represented in the SEAMAP data which is likely due to the deficiencies previously stated.

Our staff discussed their concerns about using SEAMAP data in conjunction with the age-one-equivalent model with Dr. Joanne Lyczkowski-Schultz and Dr. Terry Henwood at the National Marine Fisheries Service laboratory in Pascagoula. Dr. Lyczkowski-Schultz is the NMFS Pascagoula ichthyoplankton expert who was involved with the development of the age-one-equivalent model. Dr. Terry Henwood is acting director of the NMFS Pascagoula laboratory, and an experienced fisheries statistician. Drs. Lyczkowski-Schultz and Henwood both agreed that the age-one-equivalent model is not applicable to the Central-West Florida shelf because the SEAMAP ichthyoplankton database from the West Florida Shelf does not contain the data necessary for the model.

MyFWC.com

On October 22, 2007, we received an email from Ms. Patience Whitten of your staff requesting assistance in selecting fish taxa that would represent species present at the proposed Port Dolphin project site. This email made it apparent that regardless of stated FWC concerns, the Coast Guard intends to pursue the use of SEAMAP data and the age-one-equivalent model for impact assessment purposes.

It is important I convey to you that until we can reach resolution regarding our concerns about the assessment of impacts to Florida's marine fisheries from the proposed Port Dolphin project, the FWC will not be able to help develop the appropriate avoidance, minimization, and compensatory mitigation plans that would allow us to support construction and operation of this port.

The FWC appreciates the opportunity to plan this and other similar projects with the U.S. Coast Guard in a manner that meets Florida's energy needs and also protects our marine resources. FWC staff stands ready to work with the U.S. Coast Guard, the National Marine Fisheries Service, other relevant agencies, and the applicant to resolve these issues.

If you have any questions or need any additional information, please contact Mark Robson, Director of our Division of Marine Fisheries Management at (850) 487-0554 or mark.robson@myfwc.com .

Sincerely,

Kenneth D. Haddad
Executive Director

FLORIDA FISH & WILDLIFE CONSERVATION COMMISSION
MEMORANDUM

TO: **Ray Martin, USCG**
Project Manager, Port Dolphin LNG DWP

FROM: **Lisa Gregg, FWC**
Agency Project Lead, Port Dolphin LNG DWP

DATE: **January 30, 2008**

SUBJECT: **Marine fishery resource impact assessment**

The following is an FWC staff summary of the outstanding issues regarding the assessment of potential impacts to marine fisheries resources associated with the proposed Port Dolphin Liquefied Natural Gas (LNG) Deep Water Port (DWP) project.

Issue #1: Adequacy of fish taxa to be used for the ichthyoplankton assessment. On October 22, 2007, FWC staff received an email from Ms. Patience Whitten requesting assistance in selecting fish taxa that would represent species present at the proposed Port Dolphin project site. The first sentence of Ms. Whitten's email states, "One of the issues discussed during our conference call on September 28, 2007 was e²M's efforts to refine the study area for SEAMAP data relevant to the ichthyoplankton impact assessment for Port Dolphin." The refinement referred to in the email consisted of increasing the number of SEAMAP ichthyoplankton stations from a larger portion of the Central-West Florida Shelf thereby increasing the number of SEAMAP samples to 143. The email states, "This number is comparable with evaluations conducted for other Gulf of Mexico LNG Deepwater Port projects." A taxonomic list, arranged in descending order of abundance, was included with the email. This list does not include any information on which SEAMAP stations or samples were queried to produce the list. The list does not include any information on how many of the 143 samples each taxon occurred in, nor does it provide data on how many specimens of each taxon are present in the samples where they do occur. Nevertheless, Ms. Whitten requested that FWC "please identify the taxa that you believe would be more representative for the Port Dolphin proposed site." The Taxonomic list contains 217 taxa. Only 1/3 (72) of these taxa are species. The remaining 2/3 are genera, subfamilies, families, suborders or orders; consequently, they are not germane to species-based analyses.

Issue #2: Appropriateness of the age-one-equivalent model. The Coast Guard and e^2M requested that FWC select representative taxa from the list they provided so that SEAMAP ichthyoplankton data for the selected taxa could be used in an age-one-equivalent model. The model, which was developed by the Coast Guard and staff of the National Marine Fisheries Service, was used in Draft Environmental Impact Statements for several proposed LNG facilities off the coasts of Louisiana and Mississippi. The purpose of the model is to use egg and larval data to estimate the potential impacts of proposed LNG facilities on fishery stocks of select taxa.

On October 16, 2007, FWC Senior Ichthyologist Mark Leiby discussed our concerns about the applicability of the model with Dr. Joanne Lyczkowski-Schultz and with Dr. Terry Henwood at the NMFS Pascagoula laboratory. Dr. Lyczkowski-Schultz is the NMFS Pascagoula ichthyoplankton expert who was involved with the development of the age-one-equivalent model. Dr. Terry Henwood is

acting director of the NMFS Pascagoula laboratory, and an experienced fisheries statistician. Drs. Lyczkowski-Schultz and Henwood both agreed that the age-one-equivalent model is not applicable to the Central-West Florida shelf because the SEAMAP ichthyoplankton database from the West Florida Shelf does not contain the data necessary for the model.

Issue #3: Inappropriate application of SEAMAP data and the age-one-equivalent model. FWC's primary reasons for stating that a scientifically valid, *a priori* assessment of impacts to the plankton community, which might be a result of the construction and operation of the proposed Port Dolphin LNG facility, cannot be made using the SEAMAP database and the age-one-equivalent model are as follows:

- The SEAMAP database does not contain any zooplankton data. Consequently, it is not possible to determine whether the proposed facility could have a significant impact on the larvae of commercially and recreationally important decapod crustaceans (e.g., crabs and shrimp).

- The distance between SEAMAP plankton stations, and the distance of each station from the proposed Port Dolphin project precludes using SEAMAP data to assess potential, localized impacts. The complex current patterns on the Central-West Florida shelf produce frontal systems. Fish larvae are frequently concentrated at frontal systems. These frontal systems may, or may not, be present in the vicinity of the proposed Port Dolphin site but not at the SEAMAP ichthyoplankton stations. A fine-scale sampling grid centered on all of the proposed Port Dolphin deep-water port site alternatives is necessary to obtain sufficient, reasonably accurate, plankton data for analysis.

- The age-one-equivalent model requires data on the number of eggs per-unit-volume for each taxon being evaluated. It is extremely difficult, or impossible, to identify the eggs of most fish taxa. Consequently, fish eggs taken in SEAMAP samples are not included in the SEAMAP database.

- The age-one-equivalent model requires reliable information on natural mortality rates for the eggs and larvae of the taxa being evaluated. This vital information is unavailable for most, perhaps all, of the 72 species on the taxonomic list provided by Ms. Whitten.

- SEAMAP ichthyoplankton samples on the Central-West Florida Shelf are depth-integrated samples, not discrete-depth samples. In order to use the SEAMAP ichthyoplankton data in an age-one-equivalent model, it is necessary to assume that the larvae of the species being evaluated are randomly distributed throughout the sampled water column. Since the complex current patterns on the Central-West Florida shelf produce vertical stratification of the water column, it is not valid to assume that the larvae of species being evaluated are randomly distributed throughout the water column.

- It is not possible to be reasonably certain that accurate abundance estimates of larval fish taxa have been obtained without year-round sampling. Reasonably accurate abundance estimates are necessary for the age-one-equivalent model. For example, commercially and recreationally important species such as *Mycteroperca microlepis* (gag grouper), *Mugil cephalus* (striped mullet), *Archosargus probatocephalus* (sheepshead) and *Megalops atlanticus* (Atlantic tarpon) are offshore spawners, but they are not represented on the taxonomic list provided by Ms. Whitten. *Mycteroperca microlepis, M. cephalus* and *A. probatocephalus* are primarily winter spawners (Coleman et al. 1996; Crabtree et al. 1992; Crabtree 1995; Ditty et al. 2006; Ditty and

Shaw 1996; Powell and Greene 2006; Mark Leiby pers. obs.). *Megalops atlanticus* is primarily a summer spawner (Smith 1989; Mark Leiby pers. obs.). These and other commercially and recreationally important species may be absent from or rare on the taxonomic list because SEAMAP ichthyoplankton sampling is concentrated in the spring and the fall. Approximately 42% of the SEAMAP ichthyoplankton samples on the Central-West Florida Shelf were taken in April, May and June. Approximately 51% of the samples were taken in September, October and November. Approximately 6% of the samples were taken in December.

We are of the opinion that FWC staff have consistently stated and restated concerns that 1) SEAMAP data is not appropriate, and 2) the age-one-equivalent model is not an appropriate method, for assessing the potential impacts of the proposed Port Dolphin facility on the plankton community. These concerns have been raised during every project meeting or discussion with the Coast guard and/or the applicant beginning in May 2006, but most expressly in our December 11, 2006, email regarding ichthyoplankton data syntheses, our August 29, 2007, letter to the Florida Department of Environmental Protection regarding preparation of an Environmental Impact Statement (provided to the Coast Guard as an attachment to the State of Florida letter), and during the September 28, 2007 conference call. Nevertheless, it appears that the Coast Guard and e^2M seem intent on using inappropriate data and methodology. The rationale that has been provided for this approach is "SEAMAP ichthyoplankton data is the only available data," and "that's the way we've done it for other Gulf Coast projects". We feel this has not been an appropriate response to stated FWC concerns as it does not provide a solution to obtaining the data necessary to determine potential impacts from this proposed project. We are concerned that unless the considerable data gaps that FWC staff has identified are addressed, the result will be a significantly incomplete DEIS which may unfortunately result in a lack of FWC support for this project.

We look forward to working with the Coast Guard and the applicant to resolve these issues.

February 1, 2008

Mr. Mark Sramek
Fishery Management Specialist
U.S. Department of Commerce, National Oceanic and Atmospheric Administration
National Marine Fisheries Service, Southeast Regional Office (F/SER25)
263 13th Avenue South
St. Petersburg, FL 33701

Dear Mr. Sramek:

As a participating agency in the review of deepwater port licenses we respectfully request NOAA's advice regarding the ichthyoplankton assessment for the proposed Port Dolphin deepwater port. Enclosed is a letter from the Florida Fish and Wildlife Conservation Commission (FWC) dated January 30, 2008, responding to our October 22, 2007 request for FWC input on this issue. As you are probably aware, we have been actively seeking FWC input on this issue for several months. Also attached is a memo from Lisa Gregg dated January 30, 2008.

As you are aware, the impacts on fisheries resources are assessed, in part, through the use of an ichthyoplankton model developed with NOAA after considerable consultation. It has provided a fair and consistent method for conducting assessments of proposed deepwater ports in the Gulf of Mexico. Additionally it is the basis, with some modification, for the assessments of deepwater ports proposed in the Northeast and California. The FWC letter and memo express concern with the adequacy of SEAMAP data and age-one-equivalent modeling that is integral to this model. The concerns are supported by referencing discussions with National Marine Fisheries Service personnel. However, it had been our understanding that not withstanding some shortcomings with SEAMAP data that NOAA was supportive of following the established processes for estimating fisheries impacts.

We note that Miles Croom's letter of August 9, 2007, regarding the Port Dolphin license application recommended using any additional data available for the State of Florida. FWC's recent correspondence was in response to the request of October 22, 2007 to determine what additional information the State of Florida desired. The correspondence has not identified any additional data sources or alternative methodologies for accomplishing the fisheries assessment.

The Deepwater Port Act sets a required timeline for the processing of license applications. Our intent is to go forward with publication of the draft environmental impact statement using the best available data and methodology. If NOAA has concerns with the methodology or is aware of additional specific data that should be considered we request to be advised of this as soon as possible. Recommendations from NOAA and the State of Florida can be incorporated into the NEPA and DWPA process as we move forward or the deepwater port license, if issued.

16613
February 1, 2008

Subject: Port Dolphin Energy LLC Deepwater Port Environmental Impact Statement

The proposed assessment methodology will provide the public and decision-makers with a proven, consistent quantitative and qualitative estimate of the relative impact of this proposed project on fisheries resources. Further, the deepwater port licensing process provides sufficient flexibility to ensure these estimates are reasonable and provides that the State can recommend conditions to any license granted to insure that the State's coastal environment is protected should future monitoring reveal unanticipated impacts.

If you have any comments on the FWC correspondence or any other input please contact me or Mr. Mark Lumen at (202) 372-1444.

Sincerely,

M. A. PRESCOTT
Chief, Deepwater Ports Standards Division
U.S. Coast Guard
By direction

Re: DHR Project File No.: 2008-00136
Received by DHR: January 23, 2007
FERC Docket Nos.: CP07-191-000 and CP07-192-000
Cultural Resource Assessment Survey of the Reroute of the Port Dolphin Permitting Project, Manatee County, Florida

Dear Mr. Nodine:

Our office received and reviewed the above referenced survey report in accordance with Section 106 of the *National Historic Preservation Act of 1966* (Public Law 89-665), as amended in 1992, and *36 C.F.R., Part 800: Protection of Historic Properties*, and *18 C.F.R., Part 380,* for assessment of possible adverse impact to cultural resources (any prehistoric or historic district, site, building, structure, or object) listed, or eligible for listing, in the National Register of Historic Places (NRHP).

Between January and December 2007, Southeastern Archaeological Research, Inc. (SEARCH) conducted an archaeological and historical Phase I survey of the Port Dolphin Deepwater Port revised pipeline corridor on behalf of Continental Shelf Association, Inc. SEARCH identified two archaeological occurrences but no other cultural resources within the project corridor during the investigation.

SEARCH did not relocate one archaeological site (8MA1228) that was previously recorded within the project corridor. The site was originally recorded as an isolated find and was likely fully collected during the investigation in which it was initially recorded.

SEARCH determined that the proposed pipeline will have no effect on cultural resources listed, or eligible for listing, in the NRHP. SEARCH recommends no further investigation of the project corridor.

❒ Central Florida Regional Office (813) 272-3843 • FAX: 272-2340

Based on the information provided, our office concurs with these determinations and finds the submitted report complete and sufficient in accordance with Chapter 1A-46, *Florida Administrative Code.*

However, for future projects conducted in accordance with federal permitting, Section 106 of the *National Historic Preservation Act of 1966* (Public Law 89-665), as amended in 1992, and *36 C.F.R., Part 800: Protection of Historic Properties*, and *18 C.F.R., Part 380* must be cited.

For any questions concerning our comments, please contact April Westerman, Historic Preservationist, by electronic mail at amwesterman@dos.state.fl.us, or by phone at (850) 245-6333. We appreciate your continued interest in protecting Florida's historic properties.

Sincerely,

Frederick P. Gaske

Mr. Mark Prescott, Chief
Deepwater Ports Standards Division
United States Coast Guard, CG-3PSO-5
2100 Second Street, SW
Washington, D.C. 20593-0001

Dear Mr. Prescott:

The National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS), has received the United States Coast Guard's (USCG) February 1, 2008, letter requesting our advice regarding the ichthyoplankton assessment for the proposed Port Dolphin deepwater port (Port Dolphin) license application. Port Dolphin would be located in a water depth of 100 feet, approximately 28 miles southwest of Tampa Bay, off Manatee County, Florida.

Your letter included two enclosures from the Florida Fish and Wildlife Conservation Commission (FWC), both dated January 30, 2008. In their letter, FWC expressed concern with the adequacy of utilizing available Southeast Area Monitoring and Assessment Program (SEAMAP) data and age-one equivalency modeling to estimate ichthyoplankton impacts for Port Dolphin.

While NMFS recognizes age-one equivalency models utilizing SEAMAP data have been used in other offshore liquefied natural gas terminals proposed and constructed throughout the Gulf of Mexico, we remain concerned with the sufficiency of the SEAMAP data near the Port Dolphin site. By letters of April 13, 2007, and August 9, 2007, NMFS expressed similar concerns as FWC about the adequacy of the available SEAMAP data. We also recommended that more detailed modeling of entrainment losses utilizing additional ichthyoplankton data for the eastern Gulf of Mexico be included in the project environmental impact statement (EIS).

To address this issue, NMFS staff participated via teleconference in an interagency meeting on February 11, 2008, concerning the Port Dolphin project. During that meeting, FWC reiterated their concern with the USCG's proposed utilization of SEAMAP data in the age-one equivalency model. FWC believes utilization of this data in an impact assessment model is inappropriate given: 1) the limited seasonal distribution of sampling events; 2) distances between the project site and nearest SEAMAP stations; 3) lack of discrete depth sampling; 4) lack of egg identification data; and 5) deficiencies

in ichthyological data representative of larval gag grouper, mullet, tarpon, and sheepshead, which are known to be present in the project area. Additional discussions during that meeting identified existing fisheries studies within the eastern Gulf of Mexico as potential data sources for zooplankton, egg, and larvae abundance and distribution information which may be used to complete the necessary equivalency models. Furthermore, the applicant agreed to investigate the development of an empirical transport model that could use data from existing grouper family studies in the Gulf of Mexico.

The NMFS continues to recommend that a revised ichthyoplankton modeling effort be conducted utilizing other existing data sources in addition to the SEAMAP samples to analyze and identify potential entrainment and impingement impacts to commercially, recreationally, and ecologically important fish and invertebrate species from operation of the Port Dolphin facility. To assist the applicant, we have enclosed a preliminary list of published studies that may be useful in model development. This list is by no means comprehensive, and we recommend the applicant also conduct a literature search for other relevant studies conducted in the eastern Gulf of Mexico.

NMFS also notes that existing SEAMAP surveys performed in the Port Dolphin project vicinity identified families of fish, which include overfished species managed under federal fishery management plans. Natural mortality of fish eggs and larvae is quite high, and stock success of managed fisheries can hinge on the survival and transport of relatively few recruits to their nursery habitats. NMFS considers mortality caused by the proposed Port Dolphin project as an additional mortality factor to the natural conditions that affect the sustainability of overfished stocks. If it is found that the proposed facility kills a measurable number of the few recruits otherwise destined for survival, the Port Dolphin facility could have a negative effect on managed fisheries. Therefore, NMFS recommends that the impacts from the proposed offshore port operations on fishery stocks, particularly those under a fishing moratorium (e.g., red drum) or undergoing rebuilding efforts, be analyzed thoroughly in the draft EIS.

In order to determine potential impacts on fishery resources and to fully assess ichthyoplankton impacts from the Port Dolphin project, NMFS continues to recommend additional data sources for zooplankton, egg, and larvae abundance and distribution be used in conjunction with SEAMAP data to complete the necessary age-one equivalency models. Once a thorough analysis of ichthyoplankton impacts has been completed, mitigative measures may need to be developed to ensure that unavoidable entrainment and impingement impacts are fully offset. These mitigation measures should include an adaptive management plan for the deepwater port that identifies and requires operational or mechanical project modifications to minimize adverse fishery impacts. NMFS looks forward to continued coordination with the USCG and the applicant in the development and implementation of such a plan.

Lastly, the project area is within the known distribution limits of a federally listed threatened species under purview of NMFS. In accordance with the Endangered Species Act of 1973, as amended, it is your responsibility to review this proposal and identify

actions that may affect endangered or threatened species. Determinations involving listed species should be reported to our Southeast Regional Office, Protected Resources Division, at the above letterhead address. If it is determined that the proposed activities may adversely affect any species listed as endangered or threatened and under Protected Resources Division purview, formal consultation must be initiated.

Thank you for the opportunity to provide these comments concerning the proposed licensing of the Port Dolphin project. If we may be of further assistance, please contact Mr. Mark Sramek at the letterhead address above, by telephone at (727) 824-5311, or by electronic mail at Mark.Sramek@noaa.gov.

Sincerely,

Miles M. Croom

Re: *Archaeological Assessment of Marine Remote Sensing Surveys Conducted for the Port Dolphin Project, Gulf of Mexico and Tampa Bay, Manatee County* and *Archaeological Assessment of A Marine Remote Sensing Re-Route Survey Conducted For the Port Dolphin Project, Tampa Bay, Manatee and Hillsborough Counties, Florida*
DHR Project File No. 2008-1251; 2007-6248

Dear Mr. Marcoux:

Our office received and reviewed the above referenced project in accordance with Section 106 of the *National Historic Preservation Act of 1966*, as amended and *36 CFR Part 800: Protection of Historic Properties*, and with this agency's responsibilities under Section 267.061, *Florida Statutes*. The State Historic Preservation Officer is to advise Federal and State agencies as they identify historic properties (listed or eligible for listing, in the *National Register of Historic Places*), assess effects upon them, and consider alternatives to avoid or minimize adverse effects.

Staff of the Underwater Archaeology Program and Compliance and Review Section of the Division of Historical Resources reviewed the above referenced two cultural resource surveys and find them to be complete and sufficient. We note that the results of the survey of the original route indicated that three unidentified side scan sonar anomalies and fifteen magnetic anomalies may be the remains of historic shipwrecks. The consultant recommends avoidance of these areas by a distance of at least 300 feet and 200 feet respectively. In addition, the recommendation is to avoid the boundaries of the relict channels by 250 feet. The alternate route study identified one side scan sonar contact associated with five magnetic anomalies which may represent shipwreck locations. An avoidance distance of 1,000 feet is recommended, along with avoiding the edges of buried relict fluvial channels, in which prehistoric archaeological resources may be present, by 200 feet. This agency concurs with these recommendations.

500 S. Bronough Street • Tallahassee, FL 32399-0250 • http://www.flheritage.com

❒ Director's Office (850) 245-6300 • FAX: 245-6436
❒ Archaeological Research (850) 245-6444 • FAX: 245-6452
✓ Historic Preservation (850) 245-6333 • FAX: 245-6437
❒ Historical Museums (850) 245-6400 • FAX: 245-6433
❒ South Regional Office (561) 416-2115 • FAX: 416-2149
❒ North Regional Office (850) 245-6445 • FAX: 245-6435
❒ Central Regional Office (813) 272-3843 • FAX: 272-2340

The archaeological survey for the re-route of the proposed pipeline to avoid the Terra Ceia Aquatic Preserve encountered one unidentified side scan sonar anomaly associated with three magnetic anomalies which may represent the remains of historic shipwrecks. It is the consultant's recommendation that these anomalies be avoided by 500 feet. This agency concurs with this recommendation.

Thus, conditioned upon the avoidance of the referenced unidentified side scan sonar and magnetic anomalies which are addressed in more detail in the reports, and the avoidance of relict channels, it is the opinion of this office that the proposed project will have no effect on historic properties listed, or eligible for listing in the National Register of Historic Places, or otherwise of historical or archaeological value.

If you have any questions concerning our comments, please do not hesitate to contact Susan Harp at (850) 245-6333. Thank you for your interest in protecting Florida's historic resources.

Sincerely,

Frederick P. Gaske

DRAFT

NOAA/NATIONAL MARINE FISHERIES SERVICE
SOUTHEAST REGION
HABITAT CONSERVATION DIVISION

Southeast Regional LNG Monitoring Plan Considerations

This document presents a list of considerations for monitoring plans that would be required as a condition of licensing at liquefied natural gas (LNG) facilities licensed by either the Federal Energy Regulatory Commission (FERC) or the U. S. Coast Guard and the Maritime Administration (USCG/MARAD). This document has been developed by the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS), Southeast Regional Office, Habitat Conservation Division, with the advice of the Southeast Fisheries Science Center (SEFSC). These monitoring plan considerations are intended to address potential impacts that may occur to living marine resources and essential fish habitat (EFH) as described pursuant to the Magnuson-Stevens Fishery Conservation and Management Act. Impacts to resources managed under other authorities, such as the Endangered Species Act or the Marine Mammal Protection Act, are not addressed in this document. Background information was compiled from: guidance on evaluating cooling water structures (EPA 1977); case studies developed for the 316(b) Phase II regulations (EPA 2002); a 316(b) resource assessment for the Morro Bay Power Plant (Tenera 2001); research presented at an American Fisheries Society symposium on "Fisheries, Reefs, and Offshore Development" (Hernandez and Shaw 2003); and comments provided by the SEFSC on the draft fisheries monitoring plan for the proposed El Paso (now Excelerate) Energy Bridge deepwater LNG terminal (Thompson 2004).

Monitoring requirements for LNG facilities are based on the need to determine the impacts of terminal and pipeline installation and operations on resources of concern. For facilities utilizing open-loop regasification systems, those impacts potentially represent direct threats to marine fishery organisms through impingement, entrainment, and water quality changes, as well as indirect threats to those species through EFH degradation and loss. The purpose of monitoring is to determine the level of impacts to marine fishery species and EFH and to identify the need for potential mitigative actions, if monitoring shows impacts to be individually or cumulatively significant.

The following questions are those most necessary to answer via monitoring to determine whether individual or cumulative impacts to marine fishery species and their EFH are occurring as a result of LNG construction or operation. Monitoring data are also needed to identify mitigative actions. Questions 1 through 5 relate to monitoring requirements specific to LNG facilities that utilize an open-loop system (i.e., one that cycles large volumes of ambient water through a heat exchanging device to regasify LNG for transmission).

1. Does entrainment represent a significant impact to marine fishery species, including economically important crustaceans?
2. Are the densities of entrained fish eggs and larvae significantly different (less) than those densities in the natural system adjacent to the terminal(s)?

3. Does impingement represent a significant impact to marine fishery species?
4. What are the physical and chemical characteristics of the discharge plume?
5. Does the discharge plume have a significant impact on benthic marine communities in the vicinity of the terminal?
6. Does the installation of other terminal features (e.g., pipelines, gravity-based structures, etc.) have an impact on EFH?
7. Taken in combination with other LNG proposals and habitat impacting activities, what are the cumulative impacts to EFH and marine fishery resources and the overall health of Gulf of Mexico ecosystems?

Question 1: Monitoring the Impacts to Marine Fishery Species from Entrainment

To accurately assess the impacts of entrainment on the early life stages of marine fishery species, it is important to determine the existing densities of fish and crustacean eggs and larvae (hereafter referred to as ichthyoplankton) at the LNG facility site and the quantity of that ichthyoplankton stock that is subject to entrainment. Therefore, it is necessary to collect reference ichthyoplankton samples near the facility as well as ichthyoplankton entrainment samples directly from the open-loop regasification system.

Sampling Gear
Sampling gear should have known performance characteristics under the conditions in which it is to be utilized. New gear, or gear that has not been tested under the conditions in which it is to be used, should be tested and compared against standard gear under project-specific conditions.

The NMFS recommends using bongo nets or a Tucker trawl with opening/closing mechanisms. A net mesh size of 0.333 millimeter should be used, similar to that used to collect SEAMAP ichthyoplankton samples (Thompson 2004). The mouth of the net must be large enough to filter an adequate volume of water per sample (see below). The minimum mouth diameter of the net should be 0.6 meter. All nets should include flow meters.

Monitoring Duration
While 15 to 25 years is required for many cyclic biological phenomena to become evident, a study of this length may not be feasible, though it may be possible to obtain data from historical studies. The U. S. EPA (1977) has suggested that three years is sufficient for detecting an exceptional/outlier year, though this length of time has been criticized for being too short to understand events in the context of long-term trends.

The NMFS recommends five years as a required minimum initial period for monitoring of LNG entrainment impacts on marine fishery species. At the end of this five-year period, a determination should be made regarding the necessity for additional monitoring and/or modifications to the monitoring protocol. Such a determination, made by the U.S. Coast Guard and the Maritime Administration (USCG/MARAD) in consultation with the NMFS and the applicant, should be based on the analysis and findings of the initial, five-year sampling period.

Sampling Frequency

It is important to design the entrainment monitoring plan such that it captures temporal variability in organism abundance at the seawater intake structure of an LNG facility. Organism abundance may vary over a 24-hour (diel) period, throughout the course of lunar cycles, and from season to season. Many studies have shown that certain species migrate vertically in the water column over a 24-hour period. To accurately assess potential impacts to marine fishery species, it is critical to sample at night as well as during the day to determine the position of fish eggs and larvae in the water column. The monitoring plan should consider and account for differences in expected catch efficiency based on the time of day. Night tows frequently produce larger catches, which may be due to gear avoidance abilities in relation to light level as well as diel differences in abundance. The monitoring plan also should consider and account for differences in ichthyoplankton abundance and expected catch efficiency based on lunar cycles (Hernandez and Shaw 2003). Studies have shown that larval abundance is often higher during the new moon (Rooker *et al.* 1996; Victor 1986), possibly due to increases in spawning and settlement success by minimizing mortality from visual predators (Thresher 1984). In addition, gear avoidance capabilities may be lower during the new moon due to reduced visibility (Rooker *et al.* 1996). The monitoring plan also should capture the entire seasonal cycle of organisms present at the intake structure, as densities of different species and life stages fluctuate throughout the year.

The NMFS recommends 24-hour sampling be conducted, usually on a monthly basis. The recommended frequency of sampling over the diel cycle is at least four times daily: at dawn, mid-day, dusk, and mid-night. Because the location of the proposed terminal could differentially affect various species of concern, the sampling frequency should be adjusted to target those species of concern. For example, for terminals in nearshore waters where red drum are more common and have greater potential impact from terminal operations, sampling should be conducted every two weeks from mid-August to mid-October. Failure to sample at that frequency could mean that the peak of the red drum spawning season and highest densities of eggs and larvae are missed completely, and that all results from that year of sampling would be of little use for that important species. Where platforms are further offshore, the spawning of red snapper or grouper species might be of more concern and therefore targeted for greater sampling frequency.

Concerning the frequency of sampling during each trip, there is often substantial variability in ichthyoplankton data. Such variability would affect the ability to identify significant differences among important variables. Therefore, a power analysis may be necessary to allow for a determination of the number of samples necessary to achieve a specified degree of precision. The discrimination power of the survey should be adequate for the purposes for which the data are intended. Lacking such a power analysis, the NMFS recommends that minimally, all samples be taken in triplicate.

Sampling Locations and Volumes

The density of the ichthyoplankton of some fishery species has been shown to vary with depth. Therefore, the location of the seawater intake in the water column has been identified as a

potential mitigative feature reducing entrainment. For this reason, ichthyoplankton reference samples should be taken at different locations in the water column in order to identify species density by depth. The NMFS recommends that oblique bongo or Tucker trawl net tows covering each third (i.e., top, middle, and bottom third) of the water column be employed to collect reference ichthyoplankton samples (Thompson 2004).

Based on tidal cycle and current flows, all ichthyoplankton reference samples should be taken up-current from the intake structure to ensure that monitoring results are not affected by entrainment of fish eggs and larvae resulting from LNG terminal operations. Therefore, the exact location of sampling in relation to the LNG terminal likely will change daily and seasonally to ensure samples are always taken up-current from the terminal.

The volume of water sufficient for each ichthyoplankton sample is dependent on the actual densities of eggs and larvae in the area surrounding the intake. Sample volume should be determined based on the least dense species/life stage of concern. Initially, as large a sample as can be handled should be collected. The NMFS recommends a target of 500 cubic meters of water be filtered per sample. Such a volume could be filtered during one sampling effort through the use of 1 or more nets, with the samples (and flow meter counts) being combined.

Net Extrusion Analysis

The standard 0.333-millimeter mesh nets employed in ichthyoplankton studies are a compromise used to reduce net clogging and sorting times. However, there is substantial evidence that small fish larvae are extruded through nets of this mesh size. Therefore, the NMFS recommends triplicate plankton tows be collected with a smaller mesh size net (about 0.200 millimeter) for comparison with the 0.333 millimeter net to determine extrusion rates and to derive a gear efficiency factor (Thompson 2004). As with the larger mesh nets, a power analysis should be conducted to determine the appropriate number of samples to be taken. With the exception of mesh size, all other variables must be the same in this sampling effort. These smaller mesh samples will be taken at approximately the same time and with the same frequency and depth as the larger mesh samples. The proposed duration of this portion of the study would be one year, with a determination to be made based on a review of data variability and usefulness as to whether additional sampling efforts using 0.200 millimeter mesh nets are necessary.

Data Analysis

Data collection must be conducive to biostatistical analyses. It is important to determine the means for data reduction and analysis in the early stages of plan design. Standards should be established to consistently report findings (e.g., as number(s) of organisms per unit volume).

The NMFS recommends all ichthyoplankton samples be sorted and identified to species or the lowest possible taxonomic level. This level of identification should be consistent with current analyses of SEAMAP samples, except that larval crustacean data also should be processed similarly to the fish eggs and larvae. All fish eggs should be counted and identified, if possible. Larval stages of economically important crustaceans also should be identified to the lowest possible taxonomic level, counted and data analyzed. The methodology developed by the

USCG/MARAD and the NMFS should be used to analyze the monitoring data and extrapolate the results to age-one equivalents and fishery production of the appropriate fishery species. Raw data and all data analyses should be provided annually to the NMFS.

Question 2: Monitoring the Differences in Densities between Entrained Fish Eggs and Larvae and the Natural Environment

Some LNG license applicants have suggested that features such as screen size, flow velocity, and laminar flow reduce entrainment of fishery species. It is thus necessary to determine if fish egg and larval densities are significantly less in entrained waters than source waters. The NMFS recommends entrainment ichthyoplankton samples be taken directly from the open-loop regasification system at a point downstream from the seawater intake point. The mechanism for collecting these samples would depend upon the intake design and internal flow rate, but a system similar to high-speed plankton samplers used on moving ships may have to be designed. Triplicate samples should be collected concurrently with upstream sampling and the same approximate volume of water should be filtered. Data from those samples should be compared against samples taken during the same date, time of day and at the same depth as the intake pipe.

Question 3: Monitoring the Impacts to Marine Fishery Species from Impingement

It is unclear whether impingement represents a significant impact to marine fishery species. Through the utilization of marine life exclusion devices, relatively low seawater intake velocities (frequently less than 0.5 ft/sec), and other mitigative features, it is possible that most larger life stages of marine fishery species can avoid impingement. However, the degree to which impingement could occur and the potential impacts to marine fishery species resulting from impingement are unknown. Therefore, monitoring of impingement rates for at least a relatively short period of time is justified.

The NMFS recognizes that impingement monitoring of organisms in offshore, deeper waters that can occasionally be turbid may be difficult. However, efforts should be made to quantify the impacts of impingement on fish and crustaceans. In fresh water systems, complete daily counts of impinged organisms may be obtained by collecting organisms from the intake screen backwash material in collection baskets placed over intake structure(s) (EPA 1977). If it is not feasible to sample the entire intake structure due to size, a portion of the structure could be sampled and the results from that area extrapolated to the entire structure(s).

The NMFS is cognizant that the methodology developed for fresh water systems may not be feasible in the marine environment. Methods such as: 1) collecting the impinged species from the backwash coming off a known size of a screen and extrapolating that catch to the entire screen; and/or, 2) using video cameras to record impingement on the screen should be considered. Both methodologies have their drawbacks. As such, the NMFS is willing to leave the development and selection of a specific methodology to the recommendation of the licensee and their experts. Whatever methodology is proposed should be based on samples collected as least as frequently as every two weeks, and should quantify impingement, on a species level,

throughout an entire 24-hour period. Those data then should be used to extrapolate impacts to species of concern throughout the year.

At the end of a one-year monitoring period, a determination should be made regarding the necessity for additional monitoring and/or modifications to the monitoring protocol. Such a determination should be made by the USCG/MARAD in consultation with the NMFS and the applicant.

Question 4: Monitoring the Physical and Chemical Characteristics of the Discharge Plume

Water discharged from the open-loop regasification system will be approximately 10 to 20 degrees Fahrenheit cooler than ambient sea water temperatures. This temperature differential makes the discharged water denser than ambient sea water and causes the plume to sink through the water column to the sea floor. Discharged water also will contain biocides, such as sodium hypochlorite or copper. It is necessary to determine how the chemical and physical properties of the discharge plume are altered as the plume moves away from the outfall, as well as the geographical extent of the discharge plume, to determine its potential impact to benthic organisms.

The NMFS recommends that water quality testing be conducted monthly over various tidal conditions to determine the behavior of the discharge plume. Physical and chemical properties of the discharge plume also should be tracked and recorded in a grid pattern at varying distances and water depths from the outfall. The geographic extent of discharge plume monitoring should be determined by the distance required for temperature and the concentrations of chemical additives to become indistinguishable from ambient seawater levels (using standard analytical techniques). The NMFS recommends that computer generated graphical depictions which show the geographic extent and physical/chemical properties of the discharge plume under various flow and tidal direction/velocity scenarios be developed from the monitoring data. Discharge plume modeling should be conducted until the model has been verified to a high level of predictability for all tidal cycles and seasons. Such a determination should be made by the USCG/MARAD in consultation with the NMFS and the applicant.

Question 5: Monitoring Benthic Impacts Caused by the Discharge Plume

It is possible that the chronic discharge of large quantities of cold water containing biocides would have adverse impacts on the benthic community near the outfall site.

To monitor the impacts of the discharge plume on the benthos, the NMFS recommends collecting sediment grabs with a Peterson dredge or similar sampling equipment at varying distances (approximately every 50 to 100 feet) from the outfall. Triplicate benthic samples should be taken monthly for a year prior to facility construction to determine spatial and temporal variations in the densities of benthos. Because the exact distance and trajectory of discharge plume impact, measured from the outfall pipe will not be known, pre-construction samples should be taken every 45 degrees throughout a 360-degree circle around the platform

location. The locations of samples taken should be recorded on a Global Positioning System (GPS) to allow that area to be sampled repeatedly over time. Initially, the geographic extent of benthic monitoring should be larger than the estimated area of impact of the discharge plume.

After the development of the outfall model, the NMFS, in consultation with the applicant, will develop the recommended sampling grid points based on the results of the model. At a minimum, benthic samples should be taken monthly during the preconstruction period and for one year after the LNG facility becomes operational. Samples should be taken annually for an additional five years, to determine the level of short-term and/or long-term impacts to the benthic community. The geographic extent of benthic monitoring after facility operations commence should be determined by the geographic extent of the discharge plume monitoring (i.e., by the distance required for temperature and the concentrations of chemical additives to return to ambient seawater levels). At the end of the 1- and 5-year monitoring periods, a determination should be made regarding the necessity for additional monitoring and/or modifications to the monitoring protocol. This determination should be made by the USCG/MARAD in consultation with the NMFS and the applicant.

Macrobenthos and benthic infauna should be identified to the lowest possible taxonomic level, counted, and weighed. Any notable degradation of benthic communities should be reported with sample data. Both sediment and porewaters from benthic samples should be tested for levels of biocides (e.g., sodium hypochlorite and copper) and their marine by-products (e.g., bromoform), as well as levels of other potential marine pollutants discharged by the facility (e.g., brine solution, petroleum, and lubricants).

Question 6: Monitoring of the Impacts Associated with the Installation of Related Terminal Features

LNG facilities must transport the regasified product to market through pipelines. These pipelines begin at the terminal and may tie-in with other natural gas pipelines located either offshore or onshore. Often, these pipelines are proposed to be constructed on productive water bottoms and/or through wetlands, both of which may be designated as EFH supportive of marine fishery resources. If a pipeline impacts EFH, the NMFS recommends the habitat be restored after the pipeline has been constructed. Alternatively, NMFS may recommend a different pipeline route that would avoid or minimize impacts on EFH.

Monitoring of the pipeline right-of-way (ROW) is necessary to document pre-construction conditions as well as the level of successful restoration and the need for remedial actions. The following constitutes typical monitoring recommendations associated with the installation of pipelines in areas classified as EFH:

1. The licensee should conduct a pre-construction survey of the pipeline ROW and all work areas to document pre-project conditions. The survey should include a GIS analysis using recent aerial photographs of the project area with the pipeline ROW superimposed on the photograph and identify all habitat types using Cowardin codes (Cowardin et al.

1979) or other accepted measures. The survey also should identify elevations of all wetland areas crossed and include a description of major wetland vegetative communities. Where shell reefs may be impacted, the survey should document the geographic extent and productivity of those shell reefs.

2. Ground photographs of those portions of the pipeline ROW which cross marsh should be taken prior to construction and immediately after construction. The photographs should be taken at 500-ft intervals from the center of the ROW with two photographs being taken at each location, one in each direction. GPS should be used during photography such that pre- and post- construction photographs could be taken from the same locations.

3. Following one growing season after construction, the licensee should undertake a post-construction survey similar to that taken prior to construction. The intent of the post-construction survey is to identify areas where pre-construction contours were not successfully restored or where vegetative or shell reef communities did not become re-established.

4. All monitoring information should be provided to the NMFS within 3 months of its development.

Question 7: Monitoring of cumulative impacts of LNG terminals on EFH and marine fishery species.

The analyses of the results of monitoring plans for each individual terminal should be used to estimate the cumulative impacts of LNG operations in the Gulf of Mexico on EFH and living marine resources (with particular emphasis on age-1 equivalents of important fishery species and their forage species). Efforts to apply the results of individual monitoring studies to predict probable cumulative fishery impacts resulting from the operation of other existing LNG facilities should be made. The methodology developed by the USCG/MARAD and NMFS should be used to analyze the monitoring data, develop cumulative impact estimates, and predict the impacts on age-1 equivalents and equivalent yield of the appropriate fishery species. Raw data, all data analyses, and any assumptions necessary to prepare the cumulative impact assessment should be provided to NMFS for review.

Reporting of Monitoring Result

1. Monitoring methodologies, sample locations, monitoring results and analysis, and any resulting recommendations for change of facility operations or monitoring protocols are to be prepared and submitted to the federal licensing agency and the NMFS annually.

2. Annual reports are to be submitted by March 30 and will encompass the previous calendar year (or portion of a year if monitoring was not conducted for an entire 12 month period).

Re: Draft Environmental Impact Statement on the Port Dolphin LLC Liquified Natural Gas Deepwater Port License Application (Docket No. USCG-2007-28532)

Dear Mr. Prescott:

The National Oceanic and Atmospheric Administration (NOAA) is pleased to provide comments on the Draft Environmental Impact Statement (DEIS) of the lead agencies, U.S. Coast Guard and the Maritime Administration, dated April 18, 2008 for the Port Dolphin LLC Liquefied Natural Gas Deepwater Port License Application (Docket No. USCG-2007-28532). According to the DEIS, Port Dolphin LLC is proposing to own, construct and operate a deepwater port in the Federal waters of the Outer Continental Shelf in lease blocks designated by the Minerals Management Service (MMS) as St. Petersburg (PB) blocks: PB545, PB589, and PB590. These blocks are approximately 28 miles off the west coast of Florida to the southwest of Tampa Bay, in a water depth of approximately 100 feet. Port Dolphin would consist of a permanently moored unloading buoy system with two submersible buoys separated by a distance of approximately 3 miles. The buoys would be designed to moor a specialized type of liquefied natural gas (LNG) vessel called a Shuttle and Regasification Vessel (SRV).

The comments and recommendations enclosed are based on NOAA's National Marine Fisheries Service's (NMFS) special expertise and responsibility to protect essential fish habitat under the Magnuson-Stevens Fishery Conservation and Management Act and to protect listed species under the Endangered Species Act and protected species under the Marine Mammal Protection Act. These comments and recommendations also reflect NMFS' views as to the possible effects of the operation of the proposed facility on the marine environment.

In licensing and regulatory matters, decisions and judgments are made based on the best scientific data available at that time. Where data is abundant, precise requirements may be in order. Where available scientific data is not comprehensive, precision is not always possible, and more projections and judgments are used. While NOAA has certain scientific data relevant to the effects of the operation of the proposed facility on ocean resources, marine species and habitat, they are not necessarily comprehensive on all matters related to the projected effects of the facility operation. In fact, in certain areas the available scientific data are quite sparse. Therefore, estimated ranges of effects are included in portions of the comments and

Printed on Recycled Paper

recommendations.

It should also be noted that the Deepwater Port Act provides that a license condition should require the best technology available to prevent or minimize "adverse impact on the marine environment." The enclosed comments describe what NOAA considers to be significant adverse impacts on the marine environment.

Sincerely,

for Rodney F. Weiher, Ph.D.
NOAA NEPA Coordinator

Re: Draft Environmental Impact Statement for the Port Dolphin LLC Deepwater Port License Application (Docket No. USCG-2007-28532)

Dear Mr. Prescott:

Thank you for providing the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS) the opportunity to comment on the draft Environmental Impact Statement (DEIS) for the Port Dolphin, LLC Deepwater Port liquefied natural gas facility, dated April 2008 (docket number USCG-2007-28532). According to the DEIS, Port Dolphin, LLC is proposing to construct and operate a liquefied natural gas regasification facility in the Gulf of Mexico approximately 25 miles off the west coast of Florida, southwest of Tampa Bay.

These comments address issues related to the Magnuson-Stevens Fishery Conservation and Management Act (MSA), Endangered Species Act (ESA), the Marine Mammal Protection Act (MMPA) and the National Environmental Policy Act (NEPA). The enclosed comments and recommendations are intended to facilitate the consultation processes of the ESA, satisfy our commenting requirements under the MSA, and ensure a full analysis is conducted under NEPA.

If there are questions on MSA issues, please contact Rusty Swafford at (409) 766-3699. For questions related to the ESA or MMPA, please contact Kyle Baker at (727) 551-5789.

Sincerely,

Phil Steele for

Roy E. Crabtree, Ph.D.
Regional Administrator

ENCLOSURE – NOAA's National Marine Fisheries Service
Comments and Recommendations
Draft Environmental Impact Statement
Port Dolphin LLC, Liquefied Natural Gas Deepwater Port

Below, the National Marine Fisheries Service (NMFS) offers comments pursuant to its responsibilities under the National Environmental Policy Act, the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), the Endangered Species Act (ESA), and the Marine Mammal Protection Act (MMPA). NMFS is using the Draft Environmental Impact Statement (DEIS) to: 1) provide comments for the improvement of the Final Environmental Impact Statement (FEIS), 2) to provide the United States Coast Guard (USCG) with Essential Fish Habitat (EFH) conservation recommendations, and 3) to make recommendations on additional information needed to further the ESA consultation.

National Environmental Policy Act

Federal agencies that have jurisdiction by law or special expertise with respect to any environmental impact resulting from an agency action are required to comment on draft environmental impact statements. *See* 40 C.F.R. §1503.2. NOAA maintains expertise and jurisdiction by law over the nation's marine resources and offers the following comments and recommendations on the DEIS for the Port Dolphin LLC, Deepwater Port (Port Dolphin). This document contains comments and recommendations from the National Oceanic and Atmospheric Administration's (NOAA) NMFS regarding the DEIS, dated April 2008, on the Port Dolphin License Application. These comments and recommendations are provided to the USCG and the Maritime Administration (MARAD) pursuant to the interagency Memorandum of Understanding Related to the Licensing of Deepwater Ports.

Description of the Proposed Action

Port Dolphin, LLC, proposes to construct and operate a liquefied natural gas (LNG) deepwater port facility located in the Gulf of Mexico, approximately 28 miles southwest of Tampa Bay, off Manatee County, Florida. Port Dolphin would consist of two, permanent mooring unloading buoys connected to a 36-inch diameter, 41-mile long gas transport pipeline constructed from the offshore port to landward portions of existing natural gas pipelines in Manatee County. The proposed mooring buoys would be sited approximately three miles apart in water depth of approximately 100 feet. The two mooring buoys would have eight mooring lines connected to eight pile-driven anchor points on the seafloor. Up to two shuttle and regasification vessels (SRV) would moor at Port Dolphin to offload regasified LNG between four to eight-day evolutions. When not connected to an SRV, the mooring buoys would be submerged 60 to 70 feet below the sea surface. A marker buoy and retrieval line would be used to locate and recover the buoy as an SRV arrives at the deepwater port. The unloading buoy would be removed from its submerged position and hoisted in through a moon-pool in the forward part of the SRV where it would be positioned in a receiving cone within the hull trunk. After the buoy is locked in position, unloading of regasified LNG would begin. The SRVs would be equipped to transport, store, vaporize, and meter natural gas. A closed-loop, glycol-

water heat transfer media would be used to vaporize the LNG. Natural gas flowlines from Port Dolphin would connect to a 36-inch diameter gas transmission line, which would interconnect with the existing Gulfstream Pipeline natural gas transmission line located approximately 46 miles east of the project site.

As proposed, Port Dolphin activities would require approximately 9.8 million gallons of seawater per day (MGD) for LNG regasification operations aboard each SRV. An additional 2.3 MGD of ballast seawater would also be required during SRV off-loading, requiring approximately 24 MGD for regasification activities aboard two SRVs. It is expected between 45 and 90 SRVs would utilize Port Dolphin for LNG vaporization annually, requiring some 540 million to 1.1 billion gallons of seawater annually. Deepwater port construction is expected to take 11 months to complete, with operations planned to commence in the second quarter of 2011.

Magnuson-Stevens Fishery Conservation and Management Act (16 U. S. C. SS 1801 et seq.)

Below are NMFS' recommendations regarding the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act). For each of the issues discussed below, NMFS is available to assist USCG, MARAD, or the project applicant in identifying relevant studies and information sources that may assist in completing subsequent environmental impact statements (EIS).

Alternative Technologies

The DEIS describes LNG vaporization alternatives available for use aboard SRVs at Port Dolphin. In summary, the applicant proposes the use of a closed-loop vaporization system, utilizing an intermediate water-glycol fluid to regasify LNG prior to offloading. The proposed Calypso LNG (Calypso) project off the east coast of Florida has proposed the use of a similar, closed loop vaporization system aboard special regasification ships (SRS) moored at one of two buoys. The Calypso SRS include a system capable of vaporizing the LNG in a closed-loop system and cooling the electricity-generating engines. The Calypso SRS also include an open-loop mode used when LNG is not being vaporized, and a closed-loop mode not requiring any seawater intake. To further minimize ichthyoplankton impacts, NMFS recommends the final EIS include discussions and evaluations of entirely closed-loop LNG vaporization alternatives, which use a small portion of LNG to effectively heat and regasify LNG for offloading. Further, additional discussion is warranted why the SRS vaporization technology used for Calypso would not be available for Port Dolphin. We believe utilization of an entirely closed-loop regasification system would reduce necessary seawater consumption to 2.3 MGD for vessel ballasting, and eliminate ichthyoplankton impacts resulting from the consumption of 9.8 MGD per SRV.

Recommendations for information needs in the final EIS

Based on our review of the DEIS, NMFS provides the following additional recommendations for improving the final EIS:

1. Additional detail describing alternative vaporization technologies as noted above, under "Alternative Technologies," is needed for the discussion comparing environmental impacts and environmental costs from alternative closed-loop vaporization technologies;

2. The EIS should include an analysis of anticipated ichthyoplankton impacts potentially affected by Loop Current anomalies in the project area. In addition, the analysis should identify trends in abundance, distribution, and seasonal timing of ichthyoplankton in the project area resulting from subsea and surface currents; and

3. The EIS should include a breakout of the expected volumes and rates of seawater used by the number and type of diesel engine(s) specifically required for propulsion, LNG vaporization, and hotel services of an SRV while moored at the Dolphin Port facility.

Essential Fish Habitat (EFH) Consultation Background

The NMFS, Southeast Region, Habitat Conservation Division previously provided the USCG and Federal Energy Regulatory Commission (FERC) comments and recommendations on Port Dolphin as follows:

1. USCG license application completeness review (April 13, 2007);
2. USCG Notice of Intent to prepare an EIS for the project (August 9, 2007);
3. USCG request to consult with NMFS regarding the presence of EFH in the project area (September 20, 2007);
4. FERC scoping notice for onshore components of the project pipeline (February 12, 2008);
5. USCG request for advice on an ichthyoplankton assessment for the DWP (March 3, 2008); and
6. interim DEIS comments (March 14, 2008).

NMFS also provided USCG staff with informal comments regarding Port Dolphin through numerous electronic mail messages and has participated as a cooperating agency in interagency conference calls and public scoping meetings.

EFH Assessment

Adverse Impacts to Ichthyoplankton from Port Operation

The DEIS indicates two 11.4-megawatt (MW) diesel engines would be used to supply electrical power while the SRV is moored; one 5.7-MW diesel engine would be needed for propulsion and electrical power generation when the SRV is underway, positioning, and providing hotel services at the DWP. NMFS requests a breakout of the expected volumes and rates of seawater used by the number and type of diesel engine(s) specifically required for propulsion, LNG vaporization, and hotel services of an SRV while moored at the DWP. Such data would be used by NMFS to more accurately determine ichthyoplankton entrainment impacts solely attributable to LNG vaporization.

Discrepancies exist in the numbers of animal egg and entrainment estimates for bay anchovy and gulf menhaden between the interim DEIS and DEIS (see Table 4.2-8). Accordingly, NMFS recommends the discrepancies in Table 4.2-8 be resolved and the table be revised, if needed, prior to publishing the final EIS.

The methodology to evaluate impacts of seawater intakes associated with deepwater ports in the Gulf of Mexico was previously developed for the Gulf Landing Deepwater Port License Application EIS and was used to determine impacts resulting from Port Dolphin. Four fish species (red drum, red snapper, gulf menhaden, bay anchovy), represented in the Southeast Area Monitoring and Assessment Program (SEAMAP), were selected to represent broad categories of the species included in the SEAMAP data. Based on previous discussions with NMFS and the Florida Fish and Wildlife Conservation Commission, two additional fish species, gag grouper and sheepshead, were selected based on economic and ecological importance, availability of life history data, and the similarity to other population types. It is assumed impacts on other species in the Port Dolphin project area would be similar to impacts on these representative species.

Between 1984 and 2002, 143 samples were taken in the SEAMAP study area, and eggs and larvae were collected between May and November. Although the DEIS concludes the 17 years of SEAMAP data represents the best available data for conducting the ichthyoplankton analysis and utilizes methodology developed with our agency for the Gulf Landing Deepwater Port Application, NMFS remains concerned with utilization of the existing SEAMAP data in the age-1 equivalency model because of limited seasonal distribution of SEAMAP sampling events. To offset the lack of year-round data, SEAMAP data used for age-1 equivalency calculations in the DEIS was adjusted for seasonality by weighting the data using values in literature. Table 4.1 in Appendix E summarizes existing ichthyoplankton data limitations and describes corresponding assumptions or data adjustments to overcome these limitations. For example, to offset the lack of year-round data, SEAMAP data used for age-1 equivalency calculations in the DEIS was adjusted for seasonality by weighing the data using values in literature. NMFS recommends the final EIS include a discussion of the weighted seasonality adjustment and literature used to make these adjustments.

Further, NMFS previously expressed concern regarding the distances between the project site and nearest SEAMAP stations. To expand the sampling area, sample size was increased by increasing the study area to habitat representative of the study area based on depth and distance from shore. NMFS remains concerned with the appropriateness of the SEAMAP indicator species and relative remote sample sites for determining ichthyoplankton impacts at the project area.

In addition, our review of the SEAMAP ichthyoplankton data reveals high densities of Spanish sardine (*Sardinella aurita*) in the Port Dolphin project area. Spanish sardine are an important forage species for many commercially and recreationally important fish in the eastern Gulf of Mexico, and significant impacts on their ichthyoplankton from entrainment at Port Dolphin has the potential to reduce the availability of forage resources to higher trophic-level species. Further, because pink shrimp (*Farfantepenaeus duorarum*) and spiny lobster (*Panulirus argus*) larvae are planktonic and may be found in the project area, these species also have the potential to be affected by entrainment at the

project site. To determine anticipated losses on Spanish sardine, pink shrimp, and spiny lobster as a direct result of shipboard LNG vaporization, we recommend the final EIS include annual egg and larval entrainment estimates for each of these species, and lower and upper ranges of age-1 equivalents and equivalent yields for Spanish sardine, pink shrimp and spiny lobster. Annual equivalent yield estimates for pink shrimp and spiny lobster should be expressed as a percentage of total Florida west coast landings for these species.

The DEIS includes a discussion indicating eddies from the Loop Current in the Gulf of Mexico have the potential to transport deepwater fish larvae onto the Florida shelf. The applicant is conducting Loop Current modeling to assess what effect these phenomena may have on larval transport into the project area. The results of this modeling effort, when available, should be considered in the ichthyoplankton impact analysis for the final EIS.

In order to determine potential impacts on fishery resources and to fully assess ichthyoplankton impacts from the Port Dolphin project, NMFS continues to recommend additional data sources for zooplankton, egg, and larvae abundance and distribution be used in conjunction with SEAMAP data to complete the necessary age-1 equivalency models. We further recommend these additional data sources from existing fishery studies in the Gulf of Mexico be utilized in the development of an empirical transport model to be included in the final EIS.

Adverse Impacts to EFH from Port Construction

In reviewing Figure 3.2-3 depicting hardbottom habitats at the proposed mooring buoy sites, it appears the figure erroneously depicts the original mooring array anchor configuration. NMFS received a copy of the applicants' letter dated December 14, 2007, regarding "Deepwater Port Application Addendum - Project Design Changes and Corresponding Impacts –December 2007." Attached to that letter was an optimized buoy anchoring arrangement and associated tables indicating reduced acreages of benthic habitats affected by anchor sweep during routine SRV mooring operations.

In reviewing the Executive Summary and Section 4 of the DEIS, NMFS notes varying acreage values listed for anticipated impacts on benthic resources in the mooring array and pipeline areas. Specifically, the Executive Summary indicates approximately 300 acres of impacts to benthic impacts would occur from port and pipeline installation from the project. Further, Table 4.2-1 indicates approximately 8,786 acres of soft and hardbottom habitats would be affected from port construction activities. NMFS recommends the applicant's proposed December 2007 revised mooring array be selected as the preferred alternative and that the associated impact tables in the final EIS also be revised to reflect the reduced benthic resource impacts.

The two mooring buoys would have eight mooring lines connected to eight pile-driven anchor points in the seafloor. Approximately 30 acres of recurring, long-term impacts to benthic habitats would be caused by cable sweeping during SRV mooring activities. To avoid impacts to these habitats from cable sweep, NMFS recommends the use of mid-line buoys to reduce sweep impacts.

Because benthic marine habitats are categories of EFH, NMFS disagrees with the statement that impacts on benthic resources in the project area would be minor. Live/hard bottom habitats in the project area provide EFH for several life stages of federally managed fish and invertebrate species, including: juvenile and adult red grouper; adult black grouper; adult lane, red and yellowtail snapper; juvenile vermillion snapper; adult spiny lobster; juvenile Spanish mackerel; and postlarval bluefish. In addition to providing EFH for federally managed species, live and hard bottoms provide nursery, foraging, and refuge habitat for other commercially, recreationally, and ecologically important fish and shellfish. Potential impacts to live and hard bottom habitats at Port Dolphin, as well as in the pipeline corridors, would alter fishery habitat and diminish ecological diversity within the Gulf of Mexico and Tampa Bay. Accordingly, NMFS recommends a compensatory mitigation plan for unavoidable impacts to hard bottom marine habitats be developed and coordinated with state and federal resource agencies.

Baseline Pre-project sampling

Because Port Dolphin construction activities would take 11 months to complete, and operations are expected begin in 2011, NMFS recommends a minimum three-year pre-project baseline ichthyoplankton survey be developed and coordinated with state and federal natural resources agencies to determine existing, size-specific, year-round characteristics of the ichthyoplankton resources present at the Port Dolphin site. Since Port Dolphin may be operational in approximately three years, pre-project ichthyoplankton data collection should begin as soon as possible, be performed throughout the year, and may be conducted concurrent with port and pipeline construction. Acquired data can then be used to quantitatively assess potential impacts of port operation on identified fishery resources and, if determined necessary, adaptive management mitigation options to further reduce such impacts could be implemented.

Submerged Aquatic Vegetation (SAV)

The DEIS indicates SAV occurs approximately 75 feet southwest of the proposed horizontal directional drill exit location in Tampa Bay. Because SAV is dynamic and may colonize areas of unvegetated substrates, a thorough seagrass survey should be conducted prior to construction to determine the current status and location of seagrass in the area of horizontal directional drill (HDD) exit location. NMFS recommends pre-project SAV surveys be conducted up to 500 feet from the proposed HDD exit location during peak SAV abundance, which is May 1 through September 30.

Mitigation for Adverse Impacts to Ichthyoplankton and EFH

Once a thorough analysis of the ichthyoplankton entrainment impacts has been completed utilizing the collected baseline data, NMFS recommends that mitigative measures be developed and implemented to ensure that unavoidable entrainment impacts are fully offset. The mitigation plan should be linked to an adaptive management plan for the deepwater port that would identify and require operational or mechanical modifications to minimize adverse fishery impacts. Further, a mitigation plan which offsets the

anticipated unavoidable impacts to benthic habitats from the reduced mooring array should be developed and coordinated with review agencies for inclusion in the final EIS. NMFS looks forward to coordinating with the USCG/MARAD and the applicant in the development of such plans.

EFH Conservation Recommendations

1. A minimum three-year baseline survey should be developed and coordinated with state and federal natural resource agencies to determine existing, site-specific, year round characteristics of the fish and invertebrate ichthyoplankton resources present at the Port Dolphin site. Data collection should begin as soon as possible and may be conducted concurrent with port and pipeline construction. Acquired data can then be used to quantitatively assess potential impacts of port operations on identified fishery resources and, if determined necessary, to develop and implement adaptive management mitigation options to further reduce such impacts.

2. A conceptual compensatory mitigation plan for impacts to hard bottom marine habitats should include the following elements: 1) description of the mitigation plan, 2) quantification of anticipated hard bottom impact acreage versus proposed mitigation acreage and justification for the proposed mitigation acreage; 3) scientific criteria for determining mitigation success; 4) a project and mitigation implementation schedule; 5) targeted hard bottom climax communities expected in mitigation area(s), including their acreage and configurations; 6) materials and methods to be used to achieve the intended mitigation; 7) comprehensive five-year monitoring and reporting schedules; and 8) contingency plans by which equivalent mitigation would be completed if the proposed mitigation fails.

Please be advised that the Magnuson-Stevens Act and the regulations to implement the EFH provisions (50 CFR Section 600.920) require the USCG to provide a written response to this letter. That response must be provided within 30 days and at least 10 days prior to final agency action. A preliminary response is acceptable if final action cannot be completed within 30 days. The USCG's final response must include a description of measures to be required to avoid, mitigate, or offset the adverse impacts of the activity. If the USCG's response is inconsistent with these EFH conservation recommendations, the USCG must provide an explanation of the reasons for not implementing these recommendations.

Endangered Species Act (16 U.S.C. §§ 1531 *et seq.*) and Marine Mammal Protection Act (16 U.S.C. §§ 1361 *et seq.*)

NMFS' Protected Resources Division has previously provided comments on this project on April 13, 2007, September 24, 2007, and March 14, 2008. The following comments and recommendations are in addition to those previously provided regarding protected species under the Endangered Species Act and Marine Mammal Protection Act.

Adverse Effects from Port Construction and Operation

The DEIS estimates the distance from pile driving and pipeline laying/burying activities in which injury (permanent threshold shift or PTS) and behavioral harassment may occur to protected species. Although JASCO (2008) is referenced, no source levels, frequencies, or duration of the noise are provided, nor is modeling provided to demonstrate how these zones of influence were estimated. From NMFS' review of the literature, no measurements of pile driving noise have been taken from any LNG deepwater port in the southeast United States, or from any other marine construction project in the Gulf of Mexico. Although the DEIS states that the same type of hammer type will be used as referenced in JASCO Research Limited (2005), the amount of noise produced is highly dependent on the force required to drive the pile, which is dependent upon various factors such as pile diameter and substrate being driven through, as well as the pile type (e.g., concrete or steel). Additionally, the propagation environment (e.g., water depth and substrate type) will also determine how the noise is transmitted through the water. Due to the uncertainty in the assumptions used in estimating the noise characteristics and propagation in the project area, we are unable to clearly determine the level and magnitude of potential effects to protected species at this time.

Page 4-13 of Appendix G states that sawfish are uncommon in the project area. NMFS agrees that the density of sawfish may be lower in the terminal construction area; however, the majority of sightings of this species are reported in inshore areas where pipeline construction will occur. This section should be clarified to reflect these differences in species abundance between project areas and the greater likelihood of interactions or impacts occurring to this species in the inshore construction areas.

General Comments

Table 3-1 (Appendix G, page 3-1) incorrectly lists green sea turtles as threatened in Florida. Green sea turtles are listed as threatened throughout much of their range, with the exception of the Florida breeding population. The table should be corrected to list their status as endangered with the following footnote: The green sea turtle Florida breeding population is listed as endangered; however, the species in the Atlantic is threatened throughout the rest of its range.

NMFS recently changed our marine mammal stranding hotline number. The number given in Appendix G (page 6-6) is incorrect. Although the old number is still temporarily functional, the new stranding number should be given as 1-877-433-8299.

On page 4-10 of Appendix G, harassment distances from SRV and LNG tanker noise during offloading or construction vessel noise associated with Port Dolphin are not estimated. These noise sources are discussed in the DEIS and should appear in these tables (note, the tables are on page 4-9).

On page 4-10 of Appendix G, it is stated that the applicant might need to seek an incidental harassment authorization for sperm whales. In previous comments provided, NMFS has indicated it is unlikely sperm whales will be affected due to their offshore association with deeper water off the west coast of Florida; however, Atlantic spotted dolphins and bottlenose dolphins are common to the area and should be included in the analysis.

8

The continuous noise levels associated with the diesel electric propulsion system of the SRV and LNG thrusters should be included in Tables 4-2 and 4-3. The diesel electric propulsion system of the LNG tankers and thruster noise levels should be included in the table of noise levels. Modeling for all noise levels should be explained in greater detail (e.g., the transmission loss assumed, the specific mode, used, source data from which source levels were derived, and any other assumptions).

Mitigation and Recommendations
The following best management practices (BMPs) and measures are proposed by the USCG to avoid or reduce the potential for adverse effects to protected species:

- MMS NTL 2005-G14 Marine Trash and Debris Awareness and Elimination;
- BMPs to avoid entanglement of sea turtles, smalltooth sawfish, and marine mammals;
- BMPs to reduce accidental discharges of marine debris;
- BMPs to reduce adverse effects to water quality;
- NMFS Sea turtle and smalltooth sawfish construction guidelines;
- NMFS Vessel Strike Avoidance Guidance for Mariners; and
- BMPs to reduce the effects of noise.

NMFS believes all of our previous comments regarding impacts to listed species and marine mammals have been sufficiently addressed and (impacts sufficiently?) reduced by the implementation of the above measures detailed in the DEIS with the exception of noise resulting from construction and operation of the Port Dolphin LNG terminal. NMFS recommends the following issues be addressed before section 7 consultation can be initiated under the ESA:

1. Construction vessels will result in 900 trips from Port Manatee, with 360 to 600 supply vessel trips associated with construction. These vessel trips will result in increased noise in the project area. NMFS recommends that the noise level characteristics (frequency, duration, and source level) be quantified with the other noise sources listed in the DEIS.

2. Please provide additional information regarding source levels and modeling of transmission loss used to estimate zones of influence stated in the DEIS.

3. NMFS has previously commented on alternatives that should be considered (e.g., press in piles and pile driving sleeves). Aside from ramping up during pile driving, it remains unclear what type of mitigation measures are being proposed to reduce noise from noise-producing activities, if any. Please state any measures proposed and their effectiveness at reducing noise in the marine environment, if known.

4. NMFS is not aware of noise measurements for the noise sources discussed above and recommends that field measurements be planned to characterize this and other operational noise sources. NMFS' March 14, 2008, letter from the Protected Resources Division recommended that noise-reduction methods be

utilized, that noise levels be measured in the field to verify noise measurements from construction and operation activities and the effectiveness of any noise-reduction methods or technologies be utilized during construction. To date, there are no measurements of pile driving noise from offshore LNG terminals and all modeling has been based on other studies from areas and projects that may not be comparable to the methods being proposed for Port Dolphin. In addition to pile driving, other potential noises of concern include those from pipeline laying, vessel construction operations, and SRV and thruster noise during LNG tanker offloading during terminal operation. David Mann at the University of South Florida (USF), college of Marine Science is installing autonomous recorders in waters off west Florida, including the project area. NMFS recommends Port Dolphin utilize this existing study to monitor noise levels as part of ESA consultation with NMFS to address uncertainties in the noise estimates used in the DEIS, and to monitor the effectiveness of any noise-reduction methodologies proposed. NMFS is available to assist in the design of a monitoring protocol to measure construction noise and further information regarding the current study underway at USF.

Based on the information provided in the DEIS, an incidental take authorization under MMPA section 101 (a)(5) is necessary for Atlantic spotted dolphins and bottlenose dolphins. Atlantic spotted dolphins and bottlenose dolphins are common to the project area. A publication is available on these dolphin species in the proposed project area,[1] and studies are ongoing by these authors at Mote Marine Laboratory on these species. Please contact Kenneth Hollingshead of our Protected Resources Division at (301) 713-2289 for additional information regarding an incidental take authorization. Additional information is also available at http://www.nmfs.noaa.gov/prpermits/incidentat.htm

The USCG requested informal section 7 consultation under the ESA on August 24, 2007. Although most of our previous comments regarding impacts to listed species and marine mammals have been sufficiently addressed, our comment regarding noise impacts, modeling, and field measurements have not been sufficiently addressed for us to initiate section 7 consultation under the ESA. Once these remaining comments are sufficiently addressed, NMFS believes we will be able to initiate section 7 consultation with the USCG on Port Dolphin.

Subject: Port Dolphin Deepwater Port Environmental Impact Statement Essential Fish Habitat (EFH) Consultation

Dear Dr. Crabtree:

In accordance with Section 305(b)(4)(A) of the Magnuson-Steven Fishery Conservation and Management Act (MSA), U.S. Coast Guard and Maritime Administration have reviewed the recommendations provided by the National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) in response to the EFH Assessment as presented in the draft Environmental Impact Statement (EIS) for the Port Dolphin Deepwater Port Application. Per the implementing regulation at 50 CFR 600.920(k) this letter fulfills our requirement to respond to NOAA Fisheries within 30 days of receipt of its recommendations.

Your comment letter dated May 29, 2008 included the following EFH conservation recommendations to avoid, minimize, or mitigate adverse effects on EFH:

EFH Conservation Recommendations

1. A minimum three-year baseline survey should be developed and coordinated with state and Federal natural resource agencies to determine existing, site-specific, year-round characteristics of the fish and invertebrate ichthyoplankton resources present at the Port Dolphin site. Data collection should begin as soon as possible and may be conducted concurrent with port and pipeline construction. Acquired data can then be used to quantitatively assess potential impacts of port operations on identified fishery resources and, if determined necessary, to develop and implement adaptive management mitigation options to further reduce such impacts.

Subject: Port Dolphin Deepwater Port Environmental Impact Statement Essential Fish Habitat (EFH) Consultation

Dear Dr. Crabtree:

In accordance with Section 305(b)(4)(A) of the Magnuson-Steven Fishery Conservation and Management Act (MSA), U.S. Coast Guard and Maritime Administration have reviewed the recommendations provided by the National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) in response to the EFH Assessment as presented in the draft Environmental Impact Statement (EIS) for the Port Dolphin Deepwater Port Application. Per the implementing regulation at 50 CFR 600.920(k) this letter fulfills our requirement to respond to NOAA Fisheries within 30 days of receipt of its recommendations.

Your comment letter dated May 29, 2008 included the following EFH conservation recommendations to avoid, minimize, or mitigate adverse effects on EFH:

EFH Conservation Recommendations

1. A minimum three-year baseline survey should be developed and coordinated with state and Federal natural resource agencies to determine existing, site-specific, year-round characteristics of the fish and invertebrate ichthyoplankton resources present at the Port Dolphin site. Data collection should begin as soon as possible and may be conducted concurrent with port and pipeline construction. Acquired data can then be used to quantitatively assess potential impacts of port operations on identified fishery resources and, if determined necessary, to develop and implement adaptive management mitigation options to further reduce such impacts.

16613
June 26, 2008

Subject: Port Dolphin Deepwater Port Environmental Impact Statement EFH Consultation

2. A conceptual compensatory mitigation plan for impacts to hard bottom marine habitats should include the following elements: 1) description of the mitigation plan; 2) quantification of anticipated hard bottom impact acreage versus proposed miligation acreage and justification for the proposed mitigation acreage; 3) scientific criteria for determining mitigation success; 4) a project and mitigation implementation schedule; 5) targeted hard bottom climax communities expected in mitigation area(s), including their acreage and configurations; 6) materials and methods to be used to achieve the intended mitigation; 7) comprehensive five year monitoring and reporting schedules; and 8) contingency plans by which equivalent mitigation would be completed if the proposed mitigation fails.

We would like to thank NMFS for these recommendations and its continued input as a federal cooperating agency in preparation of the EIS. The EFH assessment is an integral part of the EIS being prepared for the project. Once completed, the analysis will contain a complete discussion of the effects of the proposed activity and description of what measures will be required to avoid, mitigate, or offset any adverse impacts from the proposed activity. As a result, the U.S. Coast Guard and the Maritime Administration expect that the final EIS will address the NMFS conservation recommendations. Other comments in your letter that are not specifically EFH recommendations will be addressed in the FEIS.

We will send you a final letter with detailed responses to your recommendations at least 10 days prior to the final decision of the proposed action, thereby fulfilling our obligations under the MSA. Should you have any questions regarding this response for the Port Dolphin project review, please contact Mr. Ray Martin at 202-372-1449.

Sincerely,

M.A. PRESCOTT

Subject: Port Dolphin Deepwater Port Environmental Impact Statement Essential Fish Habitat (EFH)

Dear Dr. Crabtree:

In accordance with Section 305(b)(4)(B) of the Magnuson-Steven Act (MSA), U.S. Coast Guard and Maritime Administration have reviewed the recommendations provided by the National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) in response to the EFH Assessment as presented in the draft Environmental Impact Statement (EIS) for the Port Dolphin Deepwater Port Application. Per the implementing regulation at 50 CFR 600.920(k) our preliminary response was provided on June 26, 2008. This letter fulfills our requirement to respond to the NMFS' EFH Conservation Recommendations.

Your comment letter dated May 29, 2008 included the following EFH conservation recommendations to avoid, minimize, or mitigate adverse effects on EFH:

EFH Conservation Recommendations

1. A minimum three-year baseline survey should be developed and coordinated with state and Federal natural resource agencies to determine existing, site-specific, year-round characteristics of the fish and invertebrate ichthyoplankton resources present at the Port Dolphin site. Data collection should begin as soon as possible and may be conducted concurrent with port and pipeline construction. Acquired data can then be used to quantitatively assess potential impacts of port operations on identified fishery resources and, if determined necessary, to develop and implement adaptive management mitigation options to further reduce such impacts.

16613
May 26, 2009

Subject: Port Dolphin Deepwater Port Environmental Impact Statement EFH Consultation

2. A conceptual compensatory mitigation plan for impacts to hard bottom marine habitats should include the following elements: 1) description of the mitigation plan; 2) quantification of anticipated hard bottom impact acreage versus proposed mitigation acreage and justification for the proposed mitigation acreage; 3) scientific criteria for determining mitigation success; 4) a project and mitigation implementation schedule; 5) targeted hard bottom climax communities expected in mitigation area(s), including their acreage and configurations; 6) materials and methods to be used to achieve the intended mitigation; 7) comprehensive five year monitoring and reporting schedules; and 8) contingency plans by which equivalent mitigation would be completed if the proposed mitigation fails.

Coast Guard/Maritime Administration Response

1. If a license is issued, Port Dolphin Energy LLC will be required to conduct site-specific, year-round surveying to collect data on existing fish and invertebrate ichthyoplankton populations. Data collection should begin as soon as a license is issued, and continue for a minimum of three years, one of which must be completed prior to the start of operations. Surveying shall be developed and coordinated with state and Federal natural resource agencies. This would be consistent with requirements placed on other LNG deepwater ports licensed by the Maritime Administration, specifically, the Northeast Gateway and Neptune projects off of Massachusetts and the Gulf Gateway project off of Louisiana.

   Requiring Port Dolphin Energy LLC to acquire a minimum of three years of baseline survey data prior to operations is inconsistent with the intent of the Memorandum of Understanding (MOU) on Deepwater Port Licensing of May 20, 2004 signed by the participating agencies. The MOU is based on National Energy Policy and Presidential Executive Order (EO) 13212 issued on May 18, 2001. EO 13212 requires that executive departments and agencies take appropriate actions, to the extent consistent with applicable law, to expedite projects that will increase the production, transmission, or conservation of energy. Federal agencies are directed to expedite their reviews of authorizations for energy-related projects and to take other action necessary to accelerate the completion of such projects, while maintaining safety, public health and environmental protections.

   The potential impacts to fish and invertebrate ichthyoplankton populations are presented in Appendix G of the Port Dolphin Deepwater Port License Application EIS.

2. If a license is issued, Port Dolphin Energy LLC will be required to develop a Prevention, Monitoring, and Mitigation Plan to assess, minimize, and mitigate impacts on marine fisheries species (including ichthyoplankton) associated with port operations. The plan would be developed in consultation with NMFS and other cooperating agencies, as appropriate, and subject to approval by the Maritime Administrator. The requirements for

16613
May 26, 2009

Subject: Port Dolphin Deepwater Port Environmental Impact Statement EFH Consultation

this plan are contained in Appendix H of the Port Dolphin Deepwater Port License Application EIS. In addition, Port Dolphin has included a draft monitoring and mitigation plan for both state and federal waters in their December 2008 submission to the Florida Department of Environmental Protection that includes the elements described in the EFH Conservation Recommendation number 2 above. A final plan would be developed in coordination with appropriate state and federal agencies.

If you have any questions you may contact me at (202) 372-1440 or Ms. Yvette Fields at (202) 366-0926.

Sincerely,

Appendix D
Principal Laws and Executive Orders

Table of Applicable Laws and Executive Orders [1]

Title, Citation	Summary
Archaeological and Historical Preservation Act, 16 U.S.C. 469	Protects and preserves historical and archeological data. Requires Federal agencies to identify and recover data from archeological sites threatened by a proposed action(s).
Clean Air Act, 42 U.S.C. 7401–7671q, as amended	Establishes Federal standards for air pollutants. Prevents significant deterioration in areas of the country where air quality meets Federal standards.
Clean Water Act, 33 U.S.C. 1251–1387 (also known as the Federal Water Pollution Control Act)	Comprehensively restores and maintains the chemical, physical, and biological integrity of the nation's waters. Implemented and enforced by the U.S. Environmental Protection Agency (USEPA).
Coastal Barrier Resources Act, 16 U.S.C. 3501–3510	Discourages coastal barrier island degradation by prohibiting direct or indirect Federal financial funds (including flood insurance) for development, except for emergency life-saving activities.
Coastal Zone Management Act of 1972, 16 U.S.C. 1451–1464	Establishes a policy to preserve, protect, develop, and, where possible, restore and enhance the resources of the nation's coastal zone. Encourages and assists states in developing and implementing coastal zone management programs.
Comprehensive Environmental Response, Compensation, and Liability Act of 1980, 42 U.S.C. 9601–9675 (also known as "Superfund")	Provides for liability, compensation, cleanup, and emergency response for hazardous substances released into the environment and cleanup of inactive hazardous substances disposal sites. Establishes a fund financed by hazardous waste generators to support cleanup and response actions.
Deepwater Port Act of 1974, 33 U.S.C. 1501–1524	Assigns responsibility to the Secretary of Transportation to license the construction and operation of all oil and natural gas deepwater ports beyond the U.S. territorial sea and off the U.S. coast.
Endangered Species Act of 1973, 16 U.S.C. 1531–1543, as amended	Protects threatened, endangered, and candidate species of fish, wildlife, and plants and their designated critical habitats. Prohibits Federal action that jeopardizes the continued existence of endangered or threatened species. Requires consultation with U.S. Fish and Wildlife Service (USFWS) and National Oceanic and Atmospheric Administration (NOAA) Fisheries and a biological assessment when such species are present in an area affected by government activities.

Title, Citation	Summary
Fish and Wildlife Coordination Act, 16 U.S.C. 661–667e, as amended	Authorizes the Secretaries of the Interior and Commerce to provide assistance to and cooperate with Federal and state agencies to protect, rear, stock, and increase the supply of game and fur-bearing animals, as well as to study the effects of domestic sewage, trade wastes, and other polluting substances on wildlife. The 1946 amendments require consultation with the USFWS and the state fish and wildlife agencies involving any waterbodies that are proposed or authorized, permitted, or licensed to be impounded, diverted, or otherwise controlled or modified by any agency under a Federal permit or license.
Magnuson-Stevens Fishery Conservation and Management Act, 16 U.S.C. 1801–1883, as amended	Establishes regional fisheries councils that set fishing quotas and restrictions in U.S. waters. Requires Federal agencies to consult with NOAA Fisheries on all actions (authorized, funded, or undertaken) that might adversely affect essential fish habitat.
Marine Mammal Protection Act of 1972, 16 U.S.C. 1361–1389, 1401–1407, 1538, 4107	Establishes a moratorium on the taking and importation of marine mammals. Prohibits harassing, hunting, capturing, collecting, or killing of marine mammals or attempting such actions. Requires permits for taking marine mammals. Requires consultations with USFWS and NOAA Fisheries if impacts on marine mammals are possible.
Marine Protection, Research, and Sanctuaries Act of 1972, 33 U.S.C. 1401–1445	Regulates dumping of materials into ocean waters. Provides a permitting process to control ocean dumping of dredged materials. Establishes the marine sanctuaries program.
Maritime Transportation Security Act of 2002, Pub. L. 107–295	Extends the Deepwater Port Act application to include facilities and operations related to natural gas.
Migratory Bird Treaty Act, 16 U.S.C. 703–712	Implements various treaties for protecting migratory birds; the taking, killing, or possession of migratory birds is unlawful.
National Environmental Policy Act of 1969, 42 U.S.C. 4321–4370e, as amended	Requires Federal agencies to use a systematic approach when assessing environmental impacts of government activities. Proposes an interdisciplinary approach in a decisionmaking process designed to identify unacceptable or unnecessary impacts to the environment.
National Historic Preservation Act, 16 U.S.C. 470–470x-6	Requires Federal agencies to consider the effect of any federally assisted undertaking or licensing on any district, site, building, structure, or object eligible for inclusion, or listed in the National Register of Historic Places (NRHP). Provides for the nomination, identification (through NRHP listing), and protection of significant historical and cultural properties.

Title, Citation	Summary
National Marine Sanctuaries Act, 16 U.S.C. 1431 *et seq.*	Authorizes the Secretary of Commerce to designate national marine sanctuaries based on statutory criteria and stipulated factors to be considered by the Secretary as a basis for designation. Stipulates consultation requirements with various Federal agencies, Congressional committees, state agencies, and regional fishery councils.
Natural Gas Act of 1938, 15 U.S.C. 717	Designates the Federal Energy Regulatory Commission—an independent agency within the Department of Energy—to regulate the transmission and sale of natural gas for resale in interstate commerce.
Natural Gas Pipelines and Safety Act of 1968 and Hazardous Liquid Pipeline Safety Act of 1979, as amended, 49 U.S.C. 601	The Natural Gas Pipelines and Safety Act of 1968 authorizes the Department of Transportation to regulate pipeline transportation of natural (flammable, toxic, or corrosive) gas and other gases as well as the transportation and storage of liquefied natural gas (LNG). The Hazardous Liquid Pipeline Safety Act of 1979 authorizes the Department of Transportation to regulate pipeline transportation of hazardous liquids (crude oil, petroleum products, anhydrous ammonia, and carbon dioxide). Both of these Acts have been recodified as 49 U.S.C. Chapter 601.
Noise Control Act of 1972, 42 U.S.C. 4901–4918	Establishes a national policy to promote an environment free from noise that jeopardizes health and welfare. Authorizes the establishment of Federal noise emissions standards and provides relevant information to the public.
Nonindigenous Aquatic Nuisance Prevention Control Act of 1990, 16 U.S.C. 4701–4751	Establishes aquatic nuisance species.
Northwest Atlantic Fisheries Convention Act of 1995, 16 U.S.C. 5601–5610	Implements provisions of international conventions and establishes regulatory framework.
Occupational Safety and Health Act of 1970, 29 U.S.C. 651–678	Establishes standards to protect workers, including standards on industrial safety, noise, and health standards.
Outer Continental Shelf Lands Act of 1953, 43 U.S.C. 1331–1356, as amended	Defines the Outer Continental Shelf as all submerged lands lying seaward of state coastal waters that are 3 miles offshore. Delegates leasing authority to the Secretary of the Interior to promulgate regulations in an effort to reduce waste and conserve natural resources.
Port and Waterways Safety Act, 33 U.S.C. 1221–1232	Sets boat operating and towing safety requirements and established enforcement provisions. Authorizes the U.S. Coast Guard (USCG) to establish vessel traffic service/separation schemes for ports, harbors, and other waters subject to congested vessel traffic.

Title, Citation	Summary
Resource Conservation and Recovery Act, 42 U.S.C. 6901–6992k	Establishes requirements for safely managing and disposing of solid and hazardous waste and underground storage tanks.
Executive Order (EO) 12372, *Intergovernmental Review of Federal Programs*, July 14, 1982, 47 FR 30959 (6/16/82), as supplemented	Requires Federal agencies to consult with state and local governments when proposed Federal financial assistance or direct Federal development impacts interstate metropolitan urban centers or other interstate areas.
EO 12898, *Environmental Justice,* February 11, 1994, 59 FR 7629 (2/16/94), as amended	Requires certain Federal agencies, to the greatest extent practicable permitted by law, to make environmental justice part of their missions by identifying and addressing disproportionately high and adverse health or environmental effects on minority and low-income populations.
EO 13089, *Coral Reef Protection*, June 11 1998, 64 FR 232 (12/3/99)	Mandates that all Federal agencies whose actions might affect U.S. coral reef ecosystems (1) identify their actions that might affect U.S. coral reef ecosystems; (2) use their programs and authorities to protect and enhance the conditions of such ecosystems; and (3) to the extent permitted by law, ensure that any actions they authorize, fund, or carry out will not degrade the conditions of such ecosystems. Federal agencies shall, subject to the availability of appropriations, provide for the implementation of measures needed to research, monitor, manage, and restore affected ecosystems, including measures reducing impacts from pollution, sedimentation, and fishing.
EO 13148, *Greening the Government Through Leadership in Environmental Management*, April 21, 2000, 65 FR 24595 (4/26/00)	Designates the head of each Federal agency to ensure that all necessary actions are taken to integrate environmental accountability into agency day-to-day decision making and long-term planning processes, across all agency missions, activities, and functions. Establishes goals for environmental management, environmental compliance, right-to-know (informing the public and their workers of possible sources of pollution resulting from facility operations) and pollution prevention, and similar matters.
EO 13175*, Consultation and Coordination with Indian Tribal Governments,* November 6, 2000, 65 FR 67249 (11/09/00)	Requires Federal agencies to establish an accountable process that ensures meaningful and timely input from tribal officials in developing policies that have tribal implications.

Title, Citation	Summary
EO 13186*, Responsibilities of Federal Agencies to Protect Migratory Birds,* January 10, 2001, 66 FR 3853 (1/17/01)	Requires each agency to ensure that environmental analyses of Federal actions (required by the National Environmental Policy Act or other established environmental review processes) evaluate the effects of actions and agency plans on migratory birds, emphasizing species of concern. Agencies must support the conservation intent of migratory bird conventions by integrating bird conservation principles, measures, and practices into agency activities, and by avoiding or minimizing, to the extent practicable, adverse impacts on migratory bird resources when conducting agency actions.
EO 11593, *Protection and Enhancement of the Cultural Environment*, May 13, 1971, 36 FR 8921 (5/15/71)	Requires all Federal agencies to locate, identify, and record all cultural resources, including significant archeological, historical, or architectural sites.

1. Introduction

The Endangered Species Act (ESA) of 1973 (16 United States Code (U.S.C.) 1531–1534) establishes protection and conservation of threatened and endangered species and the ecosystems upon which they depend. The ESA is administered by the U.S. Fish and Wildlife Service (USFWS) and the National Oceanic and Atmospheric Administration's (NOAA) National Marine Fisheries Service (NMFS). Under the ESA, an "endangered species" is defined as any species in danger of extinction throughout all or a significant portion of its range. A "threatened species" is defined as any species likely to become an endangered species in the foreseeable future. Critical habitat is designated under the ESA as "a specific geographic area that is essential for the conservation of a threatened or endangered species and that could require special management or protection." Critical habitat can include an area that is not occupied by a species, but is needed for the recovery of that species.

Under Section 7 of the ESA, Federal agencies must consult with the USFWS and NMFS (as appropriate) when any action the agency carries out, funds, or authorizes (such as through a permit) could affect a listed endangered or threatened species or their critical habitat. Candidate species and proposed critical habitat are also considered. The process usually begins as informal consultation. A Federal agency, in the early stages of project planning, approaches the USFWS and NMFS (as appropriate) and requests informal consultation. Discussions between the two agencies may include what types of listed species may occur in the Proposed Action area, and what effect the Proposed Action might have on those species.

If it appears that the agency's action might affect a listed species, that agency could prepare a Biological Assessment (BA) to assist in its determination of the project's effect on a species. If the action agency determines that the project is not likely to adversely affect federally listed species and the critical habitat or proposed critical habitat and the USFWS and NMFS (as appropriate) concur, then no further action is necessary.

The U.S. Coast Guard (USCG) and Maritime Administration initiated informal consultation with both the USFWS and NMFS on August 24, 2007, in conjunction with Port Dolphin Deepwater Port License Application Environmental Impact Statement (EIS). The USCG and Maritime Administration have prepared this BA to assist in determining the impacts of the proposed Port Dolphin Deepwater Port and to facilitate ESA Section 7 consultation for the Port Dolphin License Application EIS. The conclusion of this BA is that the Proposed Action is not likely to adversely affect federally listed species.

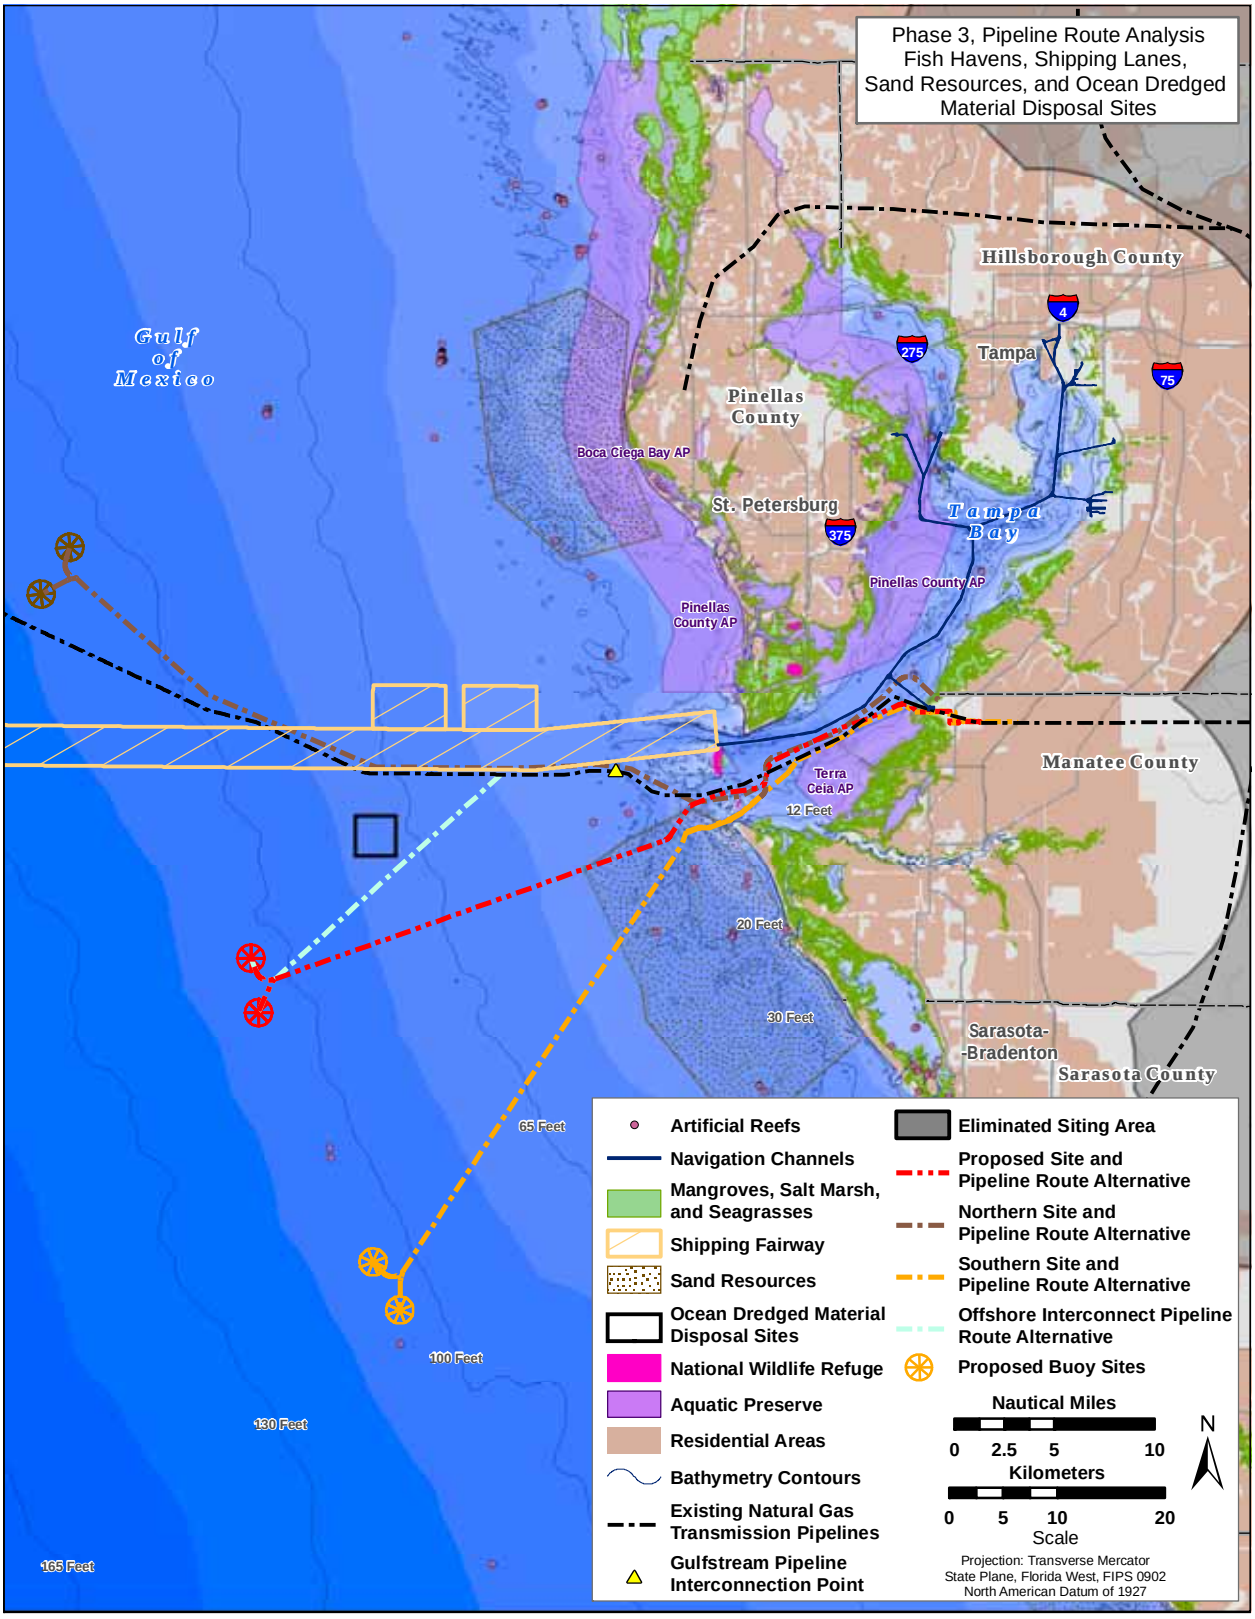
In accordance with ESA regulations (50 CFR Part 402.12[f]) and guidance, this BA includes (1) a description of the proposed agency action and any alternatives being considered; (2) a description of the federally listed species potentially affected by the Proposed Action; (3) an analysis of the Proposed Action's potential effects on protected species and critical habitat, including direct, indirect, and cumulative effects; (4) proposed mitigation measures; and (5) copies of pertinent reports, including any EIS, environmental assessment (EA), or other analyses prepared, or any other relevant information.

THIS PAGE INTENTIONALLY LEFT BLANK

2. Description of the Proposed Action

2.1 Overview

The Applicant proposes to construct, own, and operate a deepwater port, named Port Dolphin (herein referred to as the Port), in the Federal waters of Minerals Management Service (MMS) St. Petersburg (PB) lease blocks PB545, PB546, PB547, PB548, PB504, PB505, PB506, PB507, PB463, and PB589, approximately 45 kilometers (km) (28 nautical miles [NM]) southwest of Tampa, Florida in the Gulf of Mexico (GOM), in water with a bottom depth of approximately 30.5 meters (m) (100 feet). The proposed location of the Port is shown in **Figure 2-1**. The Port would be connected to existing onshore natural gas distribution pipeline systems in Manatee County, Florida, approximately 73.9 km (46 mi) east of the Port location.



The Port would be capable of mooring shuttle and regasification vessels (SRVs) with capacities of either approximately 145,000 cubic meters (m^3) or 217,000 m^3. Up to two SRVs would temporarily moor at the Port by means of a submerged turret loading (STL) buoy system. Two unloading buoys would be separated by a distance of approximately 5 km (3.1 NM). The unloading buoys would moor each SRV on location throughout the unloading cycle. Each unloading buoy would have eight mooring lines consisting of wire rope and chain. The mooring lines would connect each unloading buoy to eight anchor points consisting of driven piles on the seafloor. An SRV would typically moor at the deepwater port for between 4 and 8 days, depending on SRV size, vaporizer throughput, and send-out rate. The two separate buoys would allow natural gas to be delivered in a continuous flow, without interruption, by having a brief overlap between arriving and departing SRVs.

When not connected to an SRV, the unloading buoy would be submerged and held on the unloading buoy landing pad by the mooring lines with the top of the buoy approximately 18.3 to 21.3 m (60 to 70 feet) below the sea surface. A marker buoy and retrieval line would be used to locate and recover the buoy as an SRV arrives at the Port. The unloading buoy would be retrieved from its submerged position by means of a winch and recovery line. The unloading buoy would be hoisted into a trunk constructed in the forward part of the SRV where it would be located in a receiving cone. After the buoy is locked in position, unloading of natural gas would begin.

The SRVs would be equipped to store, transport, and vaporize liquefied natural gas (LNG), and to meter natural gas that would then be sent out through conventional subsea pipelines. Each SRV would have insulated LNG storage tanks within its hull. Each tank would be equipped with an in-tank pump to circulate and transfer LNG, at a temperature of -160 degrees Celsius (°C) (-256 degrees Fahrenheit [°F]), to the vaporization facilities on the deck of the SRV. The vaporization system would have a closed-loop, glycol/water-brine cycle with recirculating heat exchangers.

The Port would have an average throughput capacity of 800 million standard cubic feet per day (MMscfd) and a peak capacity of approximately 1,200 MMscfd. At the average throughput capacity, 50 SRV round trips per year would be required to supply the Port with LNG. However, the Port can handle up to 90 SRV round trips per year. Natural gas would be sent out by means of two flexible risers and two subsea flowlines leading to a single 36-inch gas transmission line. The gas transmission line would extend approximately 67.6 km (42 NM) to the east to landfall in Manatee County.

Onshore, the pipeline would proceed east across Port Manatee property through a tidally influenced conveyance ditch through Reeder Road to just west of the CSX railroad for approximately 1,981 m (6,500 feet). At that point the pipeline would turn south on the west side of U.S. Highway 41 and proceed

Source of Proposed Piplines: ConShelf 2007. Source of Florida Gas Transmission Pipeline: ConShelf 2007. Source of Eliminated Siting Area: e²M Inc 2008.

Figure 2-1. Port Dolphin Project Location, Tampa Bay, Florida

south for approximately 481 m (1,580 feet) through the Florida Power and Light Company (FPL) tank farm before turning east again. It would cross the CSX railroad and parallel the FPL Transmission Line right-of-way (ROW) across U.S. Highway 41. The pipeline would end at the collocated interconnection with the Gulfstream and Tampa Electric Company (TECO) pipelines within industrial property owned by Port Dolphin. From those two interconnection points, natural gas would be transported to serve residential, commercial, and industrial consumers, primarily in the west-central parts of Florida.

LNG delivered to the Port would be obtained from LNG supply at locations including the Caribbean, Africa, and the Middle East. The Applicant intends to procure LNG from supplies available through LNG supply markets. Construction of the Port components would be expected to take approximately 11 months beginning with offsite fabrication of project components starting in August 2010, with startup of commercial operations in mid-2011. Construction of the onshore pipeline would commence in summer 2010 and be completed in approximately 3 months. The Port would be designed, constructed, and operated in accordance with applicable codes and standards and would have an expected operating life of approximately 25 years.

The functions of the Port would be to temporarily moor SRVs, vaporize LNG, meter natural gas, and send out natural gas by pipeline. The major fixed components of the Port would be two unloading buoy systems in a water depth of approximately 30.5 m (100 feet); eight mooring lines consisting of wire rope and chain connecting each unloading buoy to anchor points on the seafloor; eight driven pile anchor points; one flexible pipe riser to each buoy; riser manifolds; one flowline from the north buoy approximately 3.2 km (2 miles) in length; one flowline from the south buoy approximately 3.2 km (2 NM) in length; a single 36-inch offshore natural gas transmission line (approximately 67.6 km [42 NM]) to landfall in Manatee County; and a continuation of the 36-inch natural gas pipeline from its landfall point for 6.4 km (4 NM) to the collocated Gulfstream and TECO Interconnection Station where it would tie into metering facilities, transition manifolds, hot taps, and connecting pipes tying into the existing Gulfstream and TECO pipelines. These components are further described in subsequent subsections.

The Port would be designed to have a 25-year service life. At the end of that time the principal elements of the Port would be decommissioned. The unloading buoys, umbilicals, PLEM and mooring lines would be removed. Anchor piles would be abandoned in place. The ends of the pipeline would be cut, plugged and buried under at least 1 m (3 feet) of cover. The pipeline would be abandoned in place. Aboveground portions of the onshore pipeline would be removed.

THIS PAGE INTENTIONALLY LEFT BLANK

3. Protected Species

Species listed under the ESA are considered in the potential effects of the Proposed Action. The Action Area is considered to be all terrestrial and aquatic environments affected by the construction and operation of the LNG terminal and pipelines. The estuarine and marine portion of the project area is considered to be all the areas affected both directly and indirectly by the construction, operation, and decommissioning of the proposed terminal. ESA-listed species occurring in the offshore waters (mouth of Tampa Bay to the Terminal Area) of the GOM and the Tampa Bay area are included in **Table 3-1**.

3.1 Marine Mammals

Under the authority of the Marine Mammal Protection Act (MMPA) of 1972 (16 U.S.C. §§ 1361 et seq.), the Secretary of Commerce is responsible the protection of all marine mammals except walruses, polar bears, sea otters, manatees, and dugongs which are the responsibility of the Secretary of the Interior. These responsibilities have been delegated to NMFS and the USFWS, respectively, and include providing overview and advice to regulatory agencies on all Federal actions that might affect these species.

Seven of the marine mammal species occurring in the coastal and offshore vicinity of Tampa Bay are federally listed under the ESA. They include one sirenian (West Indian manatee) and six cetacean species (blue, fin, sei, North Atlantic right, humpback, and sperm whales) (see **Table 3-1**). The GOM is outside the normal distributional range of the sei whale, blue whale, and fin whale. Although the sperm whale is common in the GOM, it is found only around and seaward of the shelf break in the GOM (Würsig et al. 2000); which would be approximately 79 NM from the Project area. Only the West Indian manatee is common within Tampa Bay; rare occurrences of the North Atlantic right whale, West Indian manatee, and humpback whale are possible in the offshore waters of the proposed Project area.

Humpback Whale. Humpback whales are not usually encountered in the GOM (Weller et al. 1996). In the North Atlantic Ocean, humpbacks are found from spring through fall on feeding grounds from south of New England to northern Norway (NMFS 1991). The Gulf of Maine is one of the principal summer feeding grounds for humpback whales in the North Atlantic; the largest numbers of humpback whales are present from mid-April to mid-November. During the winter, most of the North Atlantic population of humpback whales is believed to migrate south to calving/breeding grounds in the West Indies region (Smith et al. 1999, Stevick et al. 2003). Not all of the stock migrates to the West Indies every winter; significant numbers of animals are found in mid- and high-latitude regions along the U.S. Atlantic Coast during the winter months (Waring et al. 2008). In recent years, there have been a number of wintertime humpback sightings in coastal waters of the southeastern United States including the GOM (Weller et al. 1996, Waring et al. 2008). Humpbacks occurring in the GOM are likely juveniles that have wandered there from the nearby Caribbean Sea and Atlantic Ocean during the breeding season or on their migration northward (Weller et al. 1996, Jefferson and Schiro 1997), although a review of the available records suggests that such occurrences in the GOM could actually occur during any time of the year.

Humpback whales feed on a wide variety of invertebrates and small schooling fishes. The most common invertebrate prey are euphausiids (krill); the most common fish prey are herring, mackerel, sand lance, sardines, anchovies, and capelin (*Mallotus villosus*) (Clapham and Mead 1999). Humpback whales are classified as endangered under the ESA (NMFS 1991) and, therefore, are considered to be a strategic stock (Waring et al. 2008). The NOAA Stock Assessment Report states that the best estimate of abundance for the Gulf of Maine stock of humpback whales is 847 individuals (Waring et al. 2008). Potential biological removal rates (PBR) for the Gulf of Maine humpback whale stock is 1.1 whales (Waring et al. 2008). There is no critical habitat designated for the humpback whale anywhere in its range.

Table 3-1. Likelihood of Occurrence of ESA-Listed Species within the Offshore Waters (Mouth of Tampa Bay to the Terminal Area), Inshore Waters (Inside the Mouth of Tampa Bay), and Onshore (Along the Onshore Pipeline Route) Areas of the Port Dolphin Project

Notes:

E – Federally listed as endangered; T – Federally listed as threatened, P – Proposed, Y – Yes, N – No, NA – Not Applicable

a. Although the species as a whole is listed as threatened, the Florida and Mexican Pacific nesting stocks of the green turtle and the Mexican Pacific nesting stocks of the olive ridley turtle are listed as endangered. Since the nesting areas for turtles encountered at sea often cannot be determined, a conservative approach to management requires the assumption that all greens in the GOM are endangered.

b. Smalltooth sawfish are expected to be rare in the Terminal area and offshore areas of the Pipeline, but will have a greater likelihood for interaction in the shallower, inshore areas of the Pipeline, during construction. There are few documented captures of smalltooth sawfish north of Charlotte Harbor (which is approximately 40 NM south of Tampa Bay) on Florida's west coast (NMFS 2009a). However, recent work to document sawfish encounters has increased the numbers of reported occurrences in the upper half of the west coast of the Florida Peninsula and in the area north of Charlotte Harbor (NMFS 2009a). As of 2008, there had been 20 encounters of smalltooth sawfish in 10 years (FMNH 2008).

North Atlantic Right Whale. The North Atlantic right whale is the most endangered large whale species in the world (Perry et al. 1999; IWC 2001a, 2001b; NMFS 2005) with between 350 and 400 known individuals left in the western North Atlantic population (Kraus et al. 2005, Waring et al. 2008). PBR for this population is set to zero (Waring et al. 2008).

North Atlantic right whales are most often sighted in nearshore and continental shelf waters between Florida and Nova Scotia. North Atlantic right whales feed on zooplankton and tend to prefer large calanoid copepods such as *Calanus* sp. (Kenney et al. 1985, Beardsley et al. 1996). Typical feeding grounds for right whales are areas where bottom topography, water column structure, currents, and tides combine to physically concentrate zooplankton into extremely dense patches. The majority of the North Atlantic right whale population leaves the feeding grounds for unknown habitats in the winter but returns to the feeding grounds coinciding with the return of cow-calf pairs (Waring et al. 2008). North Atlantic right whales are typically found in Cape Cod Bay in February through April; in Canadian feeding grounds from June through November; and in coastal waters off North Carolina, Georgia, and Florida from November through March (Waring et al. 2008).

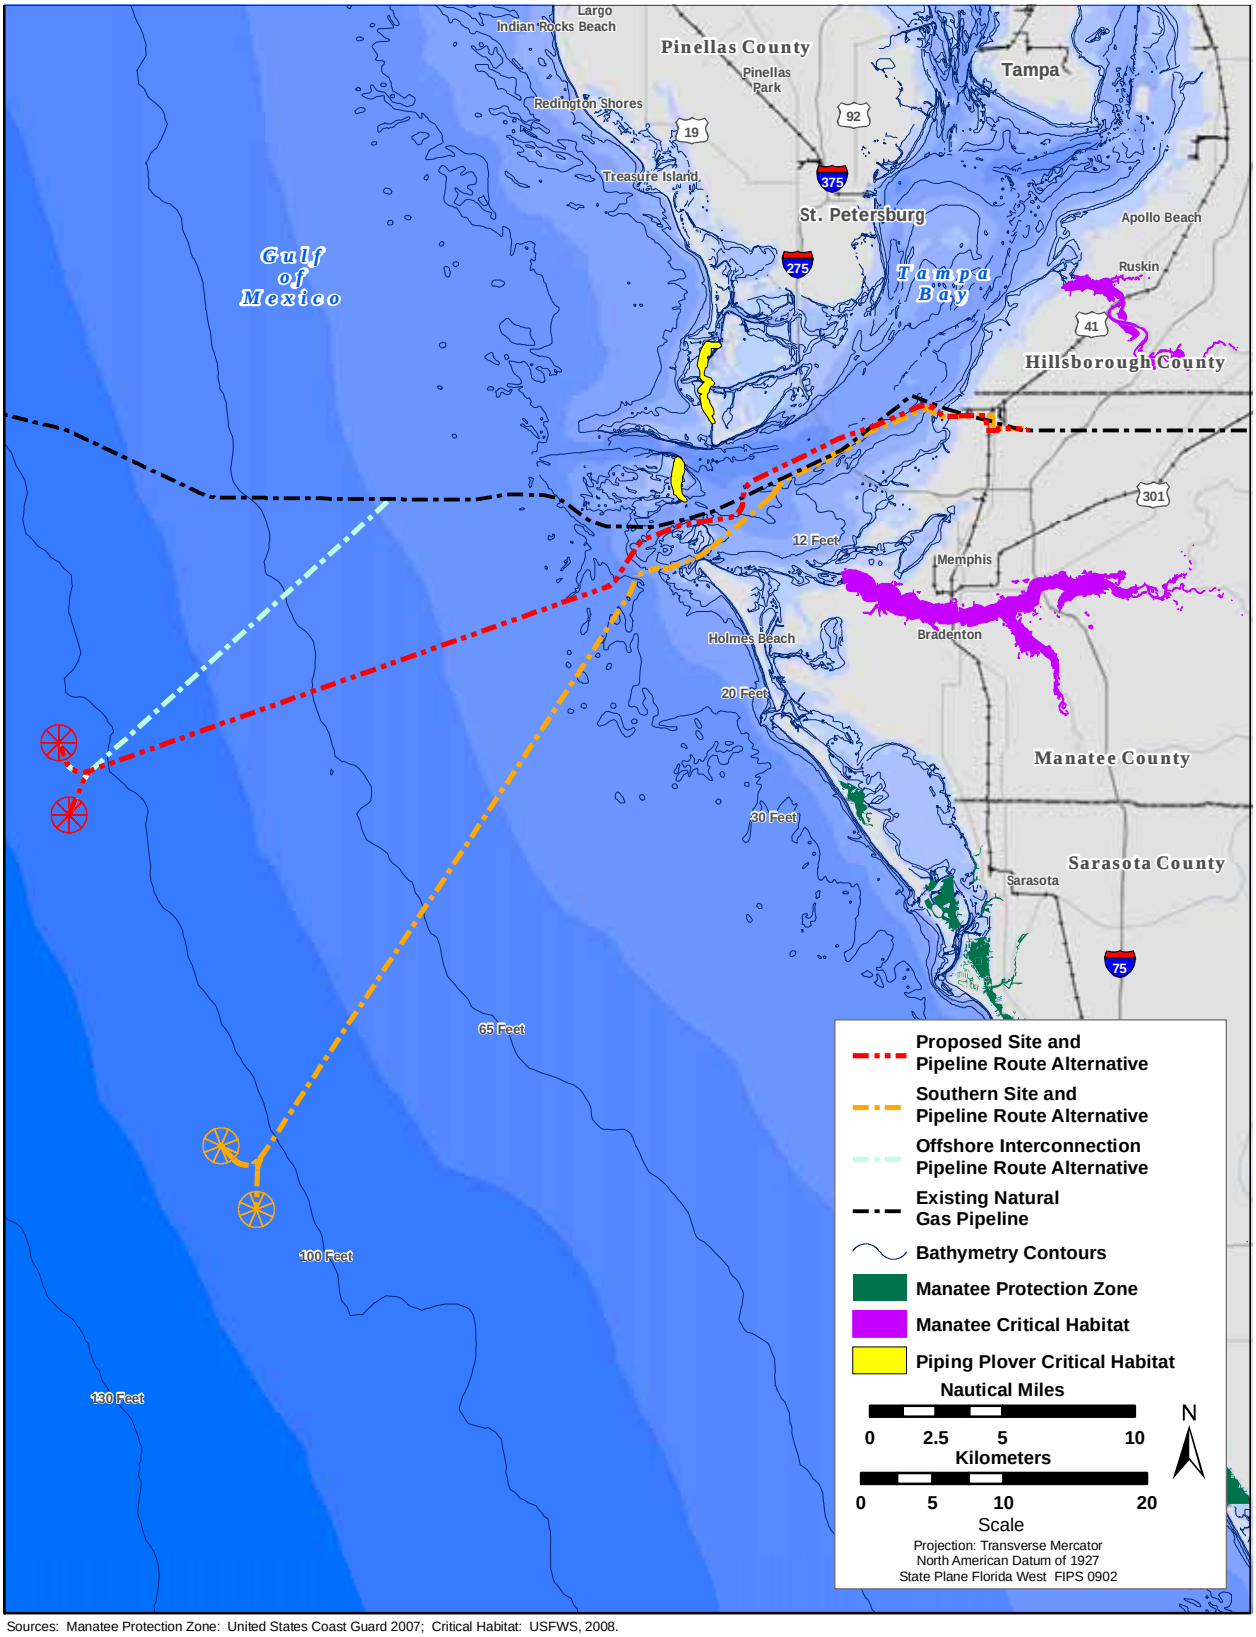
Right whales on the winter calving grounds are most often found in very shallow nearshore waters, in cooler temperatures inshore of a mid-shelf front (Kraus et al. 1993, Ward 1999). Most sightings of right whales have occurred within five high use areas including the coastal waters of the southeastern United States (Georgia and Florida), Cape Cod and Massachusetts Bays, the Great South Channel, the Bay of Fundy, and the Nova Scotian Shelf (Winn et al. 1986, NMFS 2005). Calving occurs from December through March (NMFS 2005). Based on these areas of high occurrence, critical habitat has been designated for feeding grounds off Cape Cod and calving grounds off the Atlantic coast of Florida and Georgia (59 FR 28805). However, there are also rare occurrences in the GOM and nearshore sightings have included individual whale as well as mother-calf pairs (Moore and Clark 1963, Layne 1965, Smith and Windham-Reid 2004, NOAA and FWC 2006, Zoodsma 2006). These records likely represent extralimital strays from the wintering grounds or might even reflect a more extensive historic range beyond the known calving and wintering ground in the waters of the southeastern United States (Jefferson and Schiro 1997, Waring et al. 2008).

West Indian Manatee. The Florida manatee is a subspecies of the endangered West Indian manatee. It inhabits coastal marine, brackish, and freshwater habitats from Virginia to Brazil and is exclusively herbivorous, feeding on both submergent and emergent aquatic vegetation (Würsig et al. 2000, USFWS 2001). During 2009, a preliminary count of 3,807 manatees statewide was reported; 1,654 on the west coast of the state (FWC 2009). The Southwest Management Unit, which inhabits all areas between the Pasco-Hernando County line southward to Whitewater Bay in Monroe County, has declined at an estimated rate of 1.1 percent per year over the 8-year period prior to 2002 (USFWS 2007a). The manatee count for Tampa Bay, which in the past has topped 300 individuals, turned out to be just 176 in 2009 (Pittman 2009). It should be noted, however, that some of Tampa Bay's manatees might have traveled north to Crystal River or south to the Caloosahatchee River at the time of the survey (Pittman 2009).

Sightings of manatees tend to be restricted to warm freshwater, estuarine, and extremely nearshore coastal waters. Manatees occur in very shallow waters of 2 to 4 m (7 to 13 feet) deep, generally close to shore (< 1 km) and in close proximity to seagrass beds (USFWS 2001). Historically, the winter range of the manatee was thought to focus on south Florida, with some animals ranging north of Charlotte Harbor on Florida's west coast and north of Sebastian on Florida's east coast (USFWS 2001). In summer, they inhabit estuaries and coastal bays, but in winter they migrate to warmer waters, or seek warmwater refugia, with appropriate food sources (Gannon et al. 2007, Laist and Reynolds 2005). During the cold months, manatees frequently aggregate at warmwater discharges of powerplants and at natural warmwater springs during the passage of cold fronts because they cannot tolerate water temperatures less that 20 °C (68 °F) (Irvine 1983, Laist and Reynolds 2005). During warm interludes, manatees leave these areas to feed on nearby seagrass beds (Hartman 1979, Stith et al. 2007).

During the winter months most manatees in Tampa Bay are typically found around the TECO Big Bend power plant discharge at Apollo Beach and the Florida Power Corporation's Bartow power plant discharge in St. Petersburg (Frisch et al. 2003). The number of manatees using Tampa Bay has steadily

increased in the past decade, likely as a result of improved habitat and the presence of power plants that provide warmwater refuges for manatees wintering in the bay. More than 350 individuals have been counted in the bay in the winter months. About 150 animals are found in the bay in the summer, when the entire Florida West Coast population is more scattered (TBEP 2006).



Vessel strikes can contribute to more than 30 percent of the documented annual mortalities of manatees (Ackerman et al. 1995). From 1998 through 2001, watercraft collisions attributed to 89 manatee deaths (approximately 26 percent) in Hillsborough, Manatee, and Pinellas counties (Frisch et al. 2003). During the period 2000 through 2006, 58 manatee deaths in Hillsborough, Manatee, and Pinellas counties were attributed to watercraft collisions (27, 14, and 17, respectively) (FWC MMPL 2007). In 2006, nearly one manatee per month was killed by watercraft in the three Tampa Bay counties (FWC MMPL 2007). However, these reported deaths do not take into account the latent impacts on feeding, mating, or birthing that are a direct result of a boat strike (Nowacek et al. 2004); therefore, the actual mortality due to watercraft is likely higher than expected..

Critical habitat for the manatee has been designated in two areas of the project area: the Little Manatee River downstream from the U.S. Highway 301 Bridge in Hillsborough County, and the Manatee River downstream from the Lake Manatee Dam in Manatee County. The nearest designated critical habitat areas for manatees are (1) the Manatee River, which is approximately 5 km (2.69 NM) ; and (2) the Little Manatee River, which is approximately 13 km (7 NM) away from the nearest point on the pipeline route.

In addition to the critical habitat areas, a number of manatee protection areas have been created in the Tampa Bay region. Several year-round slow-speed zones have been created through state or local regulations, and two no-entry areas have been created around the power plant outfalls at Tampa Electric's Big Bend complex and the Bartow plant at Weedon Island. In addition, extensive shoreline speed zones are in place in Hillsborough County from Tampa's Rocky Point area south to the Gandy Bridge, from the Alafia River to E.G. Simmons Park south of Ruskin, in Terra Ceia Bay, the Manatee River, and in Pinellas County north of the Courtney Campbell Causeway to Oldsmar. Finally, Pinellas County has implemented seagrass protection zones at Fort DeSoto Park, Weedon Island, and north of the Courtney Campbell Causeway that also serve to protect manatees feeding and resting in the shallow grass beds (TBEP 2006). Manatee protection zones within the Tampa Bay area are illustrated in **Figure 3-1**. The proposed pipeline would be constructed about 11.5 NM from a manatee protection area.

Marine Mammal Hearing. When considering the potential impact of various types of noise on the marine environment, it is necessary to understand that different kinds of marine life are sensitive to different frequencies of sound. Information on hearing in marine mammals is based on the frequencies of sounds produced, behavioral observations, anatomical evidence, and extrapolations from what is known about other marine mammal hearing. Marine mammal hearing varies among species; however, as a group, marine mammal hearing ranges are generally from 0.01 to 200 kilohertz (kHz). Broad generalizations can be made about groups of marine mammals. For example, most toothed whales (Odontocetes) hear well in ultrasonic ranges, with functional hearing from 0.15 kHz to 180 kHz. Some toothed whales are able to hear frequencies as high as 200 kHz (NRC 2003). Southall et al. (2007) delineated three groups of cetaceans based on similarities in their hearing: low-frequency cetaceans (0.007 kHz to 22 kHz), mid-frequency cetaceans (150 Hz to 160 kHz), and high-frequency cetaceans (0.2 kHz to 180 kHz).

Data on the hearing abilities of cetaceans are sparse, particularly for the larger cetaceans such as the baleen whales. The auditory thresholds of some of the smaller toothed whales (Odontocetes) have been determined in captivity (Ljungblad et al. 1982, Thomas et al. 1988, Houser et al. 2008). It is generally believed that cetaceans should at least be sensitive to the frequencies of their vocalizations. Comparisons

Figure 3-1. Piping Plover Critical Habitat and Manatee Protection Zones and Critical Habitat in the Vicinity of Port Dolphin

of the anatomy of cetacean inner ears and models of the structural properties and the response to vibrations of the ear's components in different species provide an indication of likely sensitivity to various sound frequencies. The ears of small-toothed whales are structurally optimized for receiving high-frequency sound, while baleen whale inner ears are best optimized for low to infrasonic frequencies (Ketten 1992, 1997). As such, baleen whales are considered to be low-frequency cetaceans (Southall et al. 2007).

Ketten et al. (1992) concluded that, based on the ear morphology and studies on other manatee subspecies (Klishin et al. 1990, Popov and Supin 1990), manatees likely hear best in the lower frequencies (1 kHz to 5 kHz) and are not likely to hear above 20 kHz. More recently, a behavioral audiogram for a sirenian revealed peak sensitivity of hearing between 16 and 18 kHz with functional hearing limits between 0.4 kHz and 46 kHz (Gerstein et al. 1999, Gerstein 2002).

3.2 Sea Turtles

NOAA's NMFS and the USFWS share responsibility for implementing the Endangered Species Act (ESA). Marine turtle species under NMFS' Jurisdiction include the green (*Chelonia mydas*), hawksbill (*Eretmochelys imbricata*), Kemp's ridley (*Lepidochelys kempii*), leatherback (*Dermochelys coriacea*), loggerhead (*Caretta caretta*), and olive ridley (*Lepidochelys olivacea*) sea turtles. All six species found in U.S. waters are currently listed as either threatened or endangered under the ESA (see **Table 3-2**).

Table 3-2. ESA-Listed Sea Turtle Species with Potential Occurrence in the Port Dolphin Project Area

Common Name	Scientific Name	ESA Status
Family Cheloniidae		
Green sea turtle	*Chelonia mydas*	T *
Hawksbill sea turtle	*Eretmochelys imbricata*	E
Kemp's ridley sea turtle	*Lepidochelys kempii*	E
Loggerhead sea turtle	*Caretta caretta*	T
Olive ridley sea turtle	*Lepidochelys olivacea*	T*
Family Dermochelyidae		
Leatherback sea turtle	*Dermochelys coriacea*	E

Source: Meylan et al. 2003

Notes:

E – Federally listed as endangered under the ESA of 1973.

T – Federally listed as threatened under the ESA of 1973.

* Although the species as a whole is listed as threatened, the Florida and Mexican Pacific nesting stocks of the green turtle and the Mexican Pacific nesting stocks of the olive ridley turtle are listed as endangered. Since the nesting areas for turtles encountered at sea often cannot be determined, a conservative approach to management requires the assumption that all greens in the GOM are endangered.

In the GOM, the number of turtle sightings is highest in continental shelf waters in summer and fall but sightings occur in the shelf and deeper waters throughout the study area in winter and spring (McDaniel et al. 2000). Reports by Lohoefener et al. (1990), Davis et al. (2000), McDaniel et al. (2000), and Mullin and Davis (2001) indicate that sea turtles are far more abundant in GOM waters east of the mouth of the Mississippi River than in waters to the west. Coastal waters of the GOM also serve as developmental

habitat for juvenile Kemp's ridleys (Musick and Limpus 1997). Loggerhead sea turtles are the most abundant sea turtle in Florida and the GOM (FWRI 2006, NMFS and USFWS 2008). Leatherbacks are the most abundant along the northern GOM continental slope (Viada 2000). It is likely that leatherback sea turtles would occur within offshore waters of the Project area. The hawksbill turtle occurs along all of the Gulf states and along the eastern seaboard as far north as Massachusetts, but sightings north of Florida are rare. Although hawksbill sea turtles are the least common sea turtle in the GOM, they have been recorded in waters of all of the states along the GOM (NMFS and USFWS 1993). Although there are currently no records for olive ridleys in the Tampa Bay area, extralimital occurrences are documented for the Florida Keys (Foley et al. 2003).

Sea turtle life history stages include eggs, hatchling, juvenile, and adult (MMS 2002a). In general, sea turtles nest along the entire GOM coastline; however, nesting activity in the Project area is described below. Hatchling sea turtles move offshore in a swimming frenzy immediately after hatching. Post-frenzy hatchling sea turtles move to areas of convergence or to *Sargassum* mats and undergo passive oceanic migrations (Wyneken 2001). Juvenile sea turtles actively recruit to nearshore nursery habitat and move into adult foraging habitat when approaching sexual maturity. At the onset of nesting, adults move between foraging habitats and nesting beaches. Mating habitat depends on species and might occur off nesting beaches or remotely. Females reside near nesting beaches during nesting season (MMS 2002a).

Although data on the seasonality of the various species in the bay are limited, it appears that at least the loggerhead and ridley are year-round residents; this could eventually prove to be the case for the green turtle, as well. The hawksbill, a more tropical species than the others, appears to be rare in the bay.

The bay serves as habitat for several life history stages of marine turtles, including foraging adults, foraging juveniles and subadults, and nesting females. Recent research has revealed that Tampa Bay is an important nursery area for young Kemp's ridley sea turtles (TBEP 2006). The Gulf waters adjacent to Anna Maria Island, Egmont Key, and all of Pinellas County can be expected to be visited by both reproductive males and females during the mating and nesting season (Meylan et al. 2003).

Loggerheads, greens, and leatherbacks nest regularly on Florida's beaches (Meylan et al. 1995, Meylan et al. 2006). Approximately 350 sea turtles nest annually on beaches surrounding Tampa Bay (TBEP 2006). Nearly all ocean-facing (Gulf) sandy beaches in the Tampa Bay area are used as nesting habitat by sea turtles (Meylan et al. 2003). The most pristine nesting beach in the TBEP area is Egmont Key, which lies in the mouth of Tampa Bay. An average of 44 loggerhead nests has been documented on the key annually from 1989 to2001 (Meylan et al. 2003).

Surveys conducted by the Fish and Wildlife Research Institute (FWRI) recorded sightings of marine turtles in all sectors of Tampa Bay, with higher densities in the southern part of the bay, particularly in the area around Terra Ceia, just south of the Sunshine Skyway Bridge (Meylan et al. 2003). Based on stranding records, aerial surveys, and incidental captures, the occurrence of sea turtles in the Tampa Bay area suggests that turtles are common inhabitants of the bay. Their great mobility and tendency to remain submerged most of the time contribute to their inconspicuous nature. The following species were observed during the surveys (in decreasing order of abundance): loggerheads, Kemp's ridleys, greens, and hawksbills.

Strandings of dead or injured marine turtles along Florida's coastline are monitored by FMRI as part of the Sea Turtle Stranding and Salvage Network (STSSN). A total of 298 records of dead or injured turtles exist for the inshore waters of the Tampa Bay area for 1980 through 2001. Loggerhead turtles are by far the species most frequently documented. Strandings of loggerheads were most numerous from March through June, with a smaller peak in October and November. Green turtle strandings were documented primarily outside the summer months, with a peak in February and March. Strandings of Kemp's ridleys

have occurred in all months, with no obvious seasonal pattern. Dead or injured loggerheads and Kemp's ridleys have been recovered in all sectors of the bay; green turtle strandings have been far more restricted in distribution, with most occurring near the mouth of the bay. All hawksbill strandings have been in the outer bay area (Meylan et al. 2003).

Although they are all now protected by law from harvesting, it is clear from stranding records that numerous mortality factors are still operating. Many are human-related, such as boat collisions, entanglement, and incidental catch. Boat-related injuries (including propeller wounds and possible boat collision injuries), were the most frequently observed carcass anomaly for loggerheads; 16 Kemp's ridleys and 1 hawksbill also showed evidence of boat injuries. Seven cases of entanglement were reported, affecting all species (Meylan et al. 2003).

The 2005, 2006, and 2007 reports of sea turtle strandings are preliminary data and are subject to change; therefore they are not referenced here. In 2004, sea turtle strandings in the Tampa Bay region accounted for 13.5 percent of the total offshore strandings and 14.7 percent of the inshore strandings in the entire GOM (see **Table 3-3**). A total of 107 sea turtle strandings were verified in the offshore and inshore areas of Tampa Bay, with loggerhead strandings accounting for 70 percent of the total.

Table 3-3. Offshore and Inshore Sea Turtle Strandings in Tampa Bay and the Entire GOM Region in 2004

Sea Turtles	Offshore		Inshore	
	Tampa Bay	GOM	Tampa Bay	GOM
Green	13	89	9	103
Hawksbill	1	20	0	1
Kemp's ridley	5	94	3	26

Loggerhead	55	322	20	77
Olive ridley	NA	NA	NA	NA
Unknown	0	19	0	8
Total	75	557	32	217

Source: STSSN 2004
Notes:
The Tampa Bay area was characterized by the "zone 5" designation on the STSSN zone map.
NA – Not applicable because, although there are no records of this species in the area, only extralimital occurrences are recorded in the Florida Keys

There are no designated critical habitats or migratory routes for sea turtles in the GOM. However, NMFS recognizes many coastal areas as preferred habitat (i.e., important habitats for the species within a specific geographic area) for sea turtles. For example, nearshore or inshore areas are preferred habitat for green sea turtles, while bays are preferred habitat for Kemp's ridley sea turtles (MMS 2002a). *Sargassum* mats are also recognized as preferred habitat for juvenile sea turtles.

Green Sea Turtle. Green sea turtles are found throughout the GOM, where they inhabit shallow waters (except when migrating) inside reefs, bays, and inlets and tend to be found in areas with marine grass and algae (USFWS 2002b). Green turtles nest on both island and continental beaches between 30ºN and 30ºS latitudes (Witherington et al. 2006). Early life stages are spent in open ocean pelagic habitats (bottom

depths > 200 m), feeding primarily on planktonic animals (Musick and Limpus 1997). After several years of the early developmental stage, green sea turtles leave oceanic/pelagic habitats and recruit to neritic/benthic habitats (bottom depth < 200 m) also known as developmental areas, (where they forage on seagrasses and algae (Musick and Limpus 1997). During maturation, juveniles can pass through multiple developmental habitats in coastal waters (Witherington et al. 2006). Sexually mature turtles migrate between foraging areas and nesting areas every few years (Hirth 1997). Green turtles nest in Florida from June to late September on Florida's east coast. Nesting has been reported on Anna Maria Island (2002) and Longboat Key North (2003) in Manatee County and Fort DeSoto County Park (1994) and north Pinellas County Beaches (2000) in Pinellas County (FMRI 2006).

It is expected that green sea turtles would occur within offshore and nearshore waters of the Project area. The green sea turtle is currently listed as a threatened species internationally and as an endangered species in Florida. No critical habitat has been designated in the GOM.

Hawksbill Sea Turtle. The hawksbill turtle has a circumglobal distribution in tropical, and to a lesser extent, subtropical seas of the Atlantic, Pacific, and Indian oceans (MTSG 2007). Early juveniles occur in open ocean habitats in *Sargassum* or flotsam lines (Meylan and Redlow 2006). They recruit into a neritic (shallow waters extending to about 200 m) developmental foraging habitat that can comprise coral reefs or other hardbottom habitats, seagrass, algal beds, or mangrove bays and creeks (Musick and Limpus 1997). As they increase in size, immature hawksbills typically inhabit a series of developmental habitats, with some tendency for larger turtles to inhabit deeper sites (Van Dam and Diez 1997, Bowen et al. 2007). Hawksbills use caves, crevices, and ledges for resting (Meylan and Redlow 2006). Coral reefs and hardbottom areas are generally recognized as the resident foraging habitat for juveniles and adults (Meylan and Redlow 2006). Adult hawksbills feed on encrusting organisms such as sponges, tunicates, bryozoans, algae, mollusks, and a variety of other items such as crustaceans and jellyfish (Bjorndal 1997). Older juveniles and adults are more specialized and feed primarily on sponges. Sponges compose as much as 95 percent of their diet in some locations (Witzell 1983, Meylan 1988).

Nesting within the continental United States is limited to southeastern Florida and the Florida Keys (Viada 2000). One hawksbill nest was found on Longboat Key, in Manatee County, in 1980 (FMRI 2006). In most locations, nesting occurs between April and November, but varies depending on the area.

It is expected that hawksbill turtles would occur within nearshore waters of the Project area. The hawksbill is listed as endangered. No critical habitat has been designated in the GOM.

Kemp's Ridley Sea Turtle. The Kemp's ridley is restricted to the North Atlantic (Marquez-M. 1994). Adults are largely confined to the GOM, with moderate numbers along the U.S. Atlantic Coast as far north as Nova Scotia (Lazell 1980; Morreale et al. 1992). Offshore water temperatures play a major role in determining the number of Kemp's ridleys present in the North Atlantic Ocean. During the winter, Kemp's ridleys could migrate to warmer waters and then return to their former habitat or bury themselves in mud bottoms to avoid low temperatures (Márquez-M. 1994). Seasonal coastal migration occasionally brings them to overwinter in central to south Florida. Although Kemp's ridleys can be observed in Florida waters year-round, the highest abundances have been documented during December through March (Henwood and Ogren 1987). Kemp's ridley turtles overwintering in Florida waters are expected to move north as water temperatures increase, foraging along the way, and return south to Florida in the fall when temperatures cool. These seasonal movements can continue until turtles reach sexual maturity, at which time turtles might return to breeding grounds in the GOM (Henwood and Ogren 1987). Kemp's ridley turtles feed primarily on portunids and other types of crabs but are also known to prey on mollusks, shrimp, fish, and plant material (Márquez-M. 1994, Schmid and Barichivich 2006).

Kemp's ridleys travel near the coast and are considered relatively common within all sectors of Tampa Bay (Meylan et al. 2003). Stranding and capture records indicate that Kemp's ridleys were most often encountered in west Florida in the late spring and summer. This temporal pattern is likely due to migration or winter dormancy (Mahmoudi et al. 2002).

Nesting occurs primarily on a single nesting beach at Rancho Nuevo, Tamaulipas, Mexico (USFWS and NMFS 1992), with a few additional nests in Texas, Florida, and the Carolinas (Schmid and Barichivich 2006). Nesting occurs from April into July (NMFS 2002). Kemp's ridley nests were recorded within Pinellas County on Madeira Beach in 1989 (Meylan et al. 2003), 1994, and twice in 2002 (FMRI 2006).

It is expected that Kemp's ridley turtles would occur within offshore, nearshore, and coastal waters of the Project area. The Kemp's ridley is currently listed as an endangered species and is considered the most endangered sea turtle in the world (USFWS and NMFS 1992). No critical habitat has been designated in the GOM.

Leatherback Sea Turtle. The leatherback sea turtle is the most abundant sea turtle on the northern GOM continental slope (Viada 2000). They are the largest, deepest diving, most migratory, widest ranging, and most pelagic sea turtle (USFWS 2002a). There is limited information available regarding the habitats utilized by early juvenile leatherbacks because this age class is entirely oceanic. However, scientists are relatively certain that these individuals do not associate with floating debris or vegetation (NMFS and USFWS 1998). Late juvenile and adult leatherback turtles are known to range from mid-ocean to the continental shelf and nearshore waters (Schroeder and Thompson 1987, Shoop and Kenney 1992, Grant and Ferrell 1993, Starbird et al. 1993). Hatchlings and smaller-sized juveniles are limited to tropical waters, where temperatures are above 26 ºC (Eckert 2002). Juvenile and adult foraging habitats include both coastal feeding areas in temperate waters and offshore feeding areas in tropical waters (Frazier 2001). Leatherbacks are highly migratory and can be found within convergence zones and upwelling areas in the open ocean, along continental margins, and in archipelagic waters (Morreale et al. 1996, Shoop and Kenney 1992). Leatherback sea turtles tend to stay in temperate waters to forage, with only the females returning to tropical beaches to lay eggs (NMFS and USFWS 1998). The diet of the leatherback sea turtle generally consists of gelatinous zooplankton such as cnidarians (jellyfish and siphonophores) and tunicates (salps and pyrosomas) in the pelagic environment (Bjorndal 1997, James and Herman 2001, Stewart and Johnson 2006).

The leatherback has a wide nesting distribution in the tropical Pacific and Atlantic, especially on mainland shores, but with a somewhat widespread island nesting in the Antilles (TEWG 2007). Global abundance estimates of breeding female leatherbacks range from 70,000 to 115,000, and the number of nests reported in Florida ranges from 39 to 188 since 1979. Leatherbacks nest in Florida from April through July, but they are observed along Florida's west coast during all months except February and April. Sightings in southwestern Florida have been concentrated between 27 and 166 km from shore (Mahmoudi et al. 2002).

It is likely that leatherback sea turtles would occur within offshore waters of the Project area. Leatherbacks are listed as endangered but no critical habitat has been designated in the GOM.

Loggerhead Sea Turtle. Loggerhead sea turtles occur in subtropical and temperate regions of the Atlantic, Pacific, and Indian oceans (Dodd 1988). Although the major nesting concentrations in the United States are found in South Florida, loggerheads nest from Texas to Virginia. The loggerhead turtle occurs worldwide in habitats ranging from coastal estuaries to waters far beyond the continental shelf (Dodd 1988). Long-term in-water studies indicate that late juvenile loggerheads reside in particular developmental foraging areas for many years (NMFS and USFWS 2008). Loggerheads often associate with natural and artificial hard substrates (e.g., live hard bottom, artificial reefs, shipwrecks, oil/gas

structures), which provide an abundance of prey, as well as sheltered locations where they can rest (Dodd 1988, Makowski et al. 2006). Seasonal movements of juvenile loggerheads along the Atlantic coast, from more northerly resident areas during warmer months to more southerly or offshore resident areas during colder months, have been well-documented (NMFS and USFWS 2008). Results from satellite telemetry have demonstrated that a small proportion of the juvenile stage might return to the oceanic zone particularly in the winter (Mansfield 2006). Loggerhead turtle diet changes with age and size of the individual. The gut contents of post-hatchlings found in masses of *Sargassum* contained parts of *Sargassum*, zooplankton, jellyfish, larval shrimp and crabs, and gastropods (Richardson and McGillivary 1991). Juvenile and subadult loggerhead turtles are omnivorous, foraging on pelagic crabs, mollusks, jellyfish, and vegetation captured at or near the surface (Dodd 1988). Adults are generalized carnivores that forage on nearshore benthic invertebrates (Dodd 1988).

About 14,000 female loggerheads nest in the southeastern United States annually, and this species accounts for approximately 98 percent of the total sea turtle nesting activity in Florida. In 2006, 377 loggerhead nests were found in Manatee, Hillsborough, and Pinellas counties (191, 21, and 165 respectively) (FMRI 2006). Nests are documented annually on the barrier islands off Pinellas and Manatee counties, with Egmont Key providing the most pristine nesting beach remaining (an average of 44 loggerhead nests has been documented on the key annually from 1989 through 2001) (Meylan et al. 2003). Florida's west coast is also a major feeding area for non-nesting loggerheads. Nesting females remain in shallow areas near beaches during the nesting season. They then disperse to feeding grounds throughout the Bahamas, Cuba, Dominican Republic, north along the eastern U.S. coast and south through the Florida Keys and GOM (late April to September).

It is expected that loggerhead sea turtles would occur within offshore, nearshore, and coastal waters of the Project area. The loggerhead is currently listed as a threatened species.

Sea Turtle Hearing. Sea turtle hearing sensitivity, in air and underwater, is not well-studied. Sea turtles do not have an external ear; rather the tympanum is a continuation of the facial tissue (Moein Bartol and Musick 2003). Reception of sound is also through bone conduction, with the skull and shell acting as receiving structures (Lenhardt et al. 1983). Sea turtles appear to hear best in the lower frequencies (< 1 kHz) (Moein Bartol and Ketten 2006). The effective dynamic hearing range for sea turtles is probably between 0.1 to 1 kHz (Ridgway et al. 1969, Lenhardt 1994, Moein et al. 1994, Moein Bartol et al. 1999). Also, calculated in-water hearing thresholds appear to be high (160 to 200 dB re 1 µPa) (Lenhardt 1994). Research based on brain physiology indicates that sea turtles are able to hear sounds with frequencies ranging from 0.08 to 2 kHz, with maximum sensitivity levels reported between 0.1 and 0.8 kHz and 0.3 and 0.4 kHz (Lenhardt 1994, NRC 2003). Moein Bartol et al. (1999) reported that juvenile loggerhead turtles hear sounds between 0.25 (lowest frequency that could be tested due to equipment) and 1.0 kHz (most sensitive at 0.25k Hz) using the auditory brainstem response (ABR) technique, while Lenhardt (2002) found that adults can hear sounds from 0.030 kHz to 1 kHz (most sensitive at 0.4 to 0.5 kHz) using startle response (i.e., contract neck or dive) and ABR techniques. Loggerhead sea turtle hearing ranges from 0.25 to 0.75 kHz with peak sensitivity at 0.25 kHz (Richardson et al. 1995). ABR data analyzed in Moein Bartol and Ketten (2006) found that subadult green turtles detect frequencies between 0.1 and 0.8 kHz and that their most sensitive hearing was between 0.2 and 0.7 kHz. Moein Bartol and Ketten (2006) also found that two juvenile Kemp's ridley turtles had a more restricted range of between 0.1 and 0.5 kHz with their most sensitive hearing between 0.1 and 0.2 kHz (Moein Bartol and Ketten 2006).

Lenhardt (2002) found that at received levels from 151 to 161 dB re 1 µPa, adult loggerheads showed a marked response (i.e., increase swimming speeds) and avoided areas where low-frequency air guns were being used at up to 175 dB re 1 µPa. However, they eventually habituated to these received levels. During the same trials, one turtle exhibited temporary threshold shift (TTS) of more than 15 decibels (dB)

for up to 2 weeks after exposure to these received levels (Lenhardt 2002). Juveniles also have been found to avoid low-frequency sound (less than 1 kHz) produced by airguns (O'Hara and Wilcox 1990). In a separate study, green and loggerhead sea turtles exposed to seismic air guns began to noticeably increase their swimming speed, as well as swimming direction, when received levels reached 155 dB re: 1 μPa^2-s for green turtles and 166 dB re: 1 μPa^2-s for loggerhead turtles (McCauley et al. 2000). In terms of sound production, nesting leatherback turtles have been recorded producing sounds (sighs or belch-like sounds) up to 1.2 kHz with most energy ranging from 0.3 to 0.5 kHz (Mrosovsky 1972, Cook and Forrest 2005).

3.3 Coastal and Marine Birds

The USFWS is responsible for coastal and marine bird protection and recovery under the authority of the ESA. The federally listed birds that occur in the Project area are identified in **Table 3-4**. Of these species, only the piping plover (*Charadrius melodus*), listed as threatened, and wood stork (*Mycteria americana*), listed as endangered, are known to inhabit or frequent coastal areas and waters of the inner continental shelf.

Table 3-4. Federally Listed Birds in Hillsborough, Manatee, Pinellas Counties, Florida

Common Name	Scientific Name	Federal Status
Audubon's Crested Caracara	*Polyborus plancu audubonii*	T
Piping Plover	*Charadrius melodus*	T, CH
Florida Scrub-jay	*Aphelocoma coeruluscens*	T
Wood Stork	*Mycteria americana*	E
Red-cockaded Woodpecker	*Picoides borealis*	E

Source: USFWS 2007b

Notes: T = Threatened; E = Endangered; CH = Critical Habitat

Piping Plover. Piping plovers are migrant shorebirds that overwinter along the southeastern U.S. and GOM coasts. Piping plovers from all three breeding populations winter along South Atlantic, Gulf Coast, and Caribbean beaches and barrier islands, primarily on intertidal beaches with sand or mud flats with no or very sparse vegetation. Plovers depart for the wintering grounds from mid-July through late October. Breeding and wintering plovers feed on exposed wet sand in wash zones; intertidal ocean beaches; wrack lines; washover passes; mud-, sand-, and algal flats; and shorelines of streams, ephemeral ponds, lagoons, and salt marshes by probing for invertebrates at or just below the surface. They use beaches adjacent to foraging areas for roosting and preening (USFWS 2007c). Christmas Bird Count (CBC) census surveys during the 2006 to 2007 season recorded only three individuals within the St. Petersburg survey area, and none within the Alafia Banks Sanctuary, the Tampa survey area, and the Bradenton survey area (Audubon Society 2007).

Critical habitat for the wintering piping plover occurs along the Florida GOM shorelines. Six units of piping plover critical habitat occur within Pinellas and Hillsborough counties (USFWS 2007b). The closest unit to the Project area is on Egmont Key, Hillsborough County (FL-21). The Proposed Route is approximately 800 m (2,625 feet) from Passage Key National Wildlife Refuge (NWR) and 1,750 m (5,742 feet) from Egmont Key NWR. The majority of the unit is within Egmont Key NWR. This unit includes the entire island to mean lower low water (MLLW).

Wood Stork. Wood storks are the only storks that regularly inhabit North America. These wading birds are year-round residents of Florida and Georgia, though sightings occur within the other Gulf coastal

states. Wood storks frequent freshwater and brackish coastal wetland habitats. This endangered species nests at a single site in Tampa Bay, the Dot-Dash colony at the mouth of the Braden River. During the 1994 through 2001 census, numbers varied from about 40 to 160 pairs annually, with the high in 2000. In 1994 the colony was abandoned following disturbance by jet skiers, and numbers were reduced in 1995; possibly increasing with improved protection of colony by Audubon (Paul and Paul 2003). CBC census surveys during the 2006 to 2007 season recorded 110 individuals within the St. Petersburg survey area, 83 individuals within the Alafia Banks Sanctuary, 30 individuals within the Tampa survey area, and 208 individuals within the Bradenton survey area (Audubon Society 2007). The wood stork is currently listed as endangered. No critical habitat has been designated for wood storks in the GOM.

3.4 Fish Species

Under the authority of the ESA, USFWS and NMFS are responsible for the protection and recovery of endangered and threatened fish species. NMFS has jurisdiction over most marine and anadromous fish listed under the ESA. Marine fish spend their entire life in salt water; anadromous fish are born in freshwater, migrate to the ocean to grow into adults, and then return to freshwater to spawn. USFWS has jurisdiction over freshwater fish. NMFS has jurisdiction over smalltooth sawfish (a marine/estuarine fish). USFWS and NMFS share jurisdiction over Gulf sturgeon (an anadromous fish). The only ESA-listed species that have the potential to occur in the Project area are smalltooth sawfish (*Pristis pectinata*) and Gulf sturgeon (*Acipenser oxyrinchus desotoi*). Smalltooth sawfish are expected to be rare in the Terminal area and offshore areas of the Pipeline, but will have a greater likelihood for interaction in the shallower, inshore areas of the Pipeline, during construction. There are few documented captures of smalltooth sawfish north of Charlotte Harbor (which is more than approximately 40 NM south of Tampa Bay) on Florida's west coast (NMFS 2009a). However, recent efforts to document sawfish encounters have increased the numbers of reported occurrences in the upper half of the west coast of the Florida Peninsula and in the area north of Charlotte Harbor (NMFS 2009a). As of 2008, there had been 20 encounters of smalltooth sawfish in Tampa Bay in 10 years (FMNH 2008). Gulf sturgeon are expected to be rare in both the Terminal and Pipeline areas.

Smalltooth Sawfish. Endangered smalltooth sawfish (*Pristis pectinata*) is one of seven sawfish species that occur worldwide in tropical and subtropical rivers, lakes, and coastal areas. Like sharks and rays, smalltooth sawfish are elasmobranchs, and share life history characteristics similar to sharks. They are long-lived, slow-growing, slow to mature, and bear few young. These traits make all sawfish vulnerable to overfishing and slow to recover from depletion (NMFS 2009a).

Smalltooth sawfish range from Brazil through the Caribbean and Central America, the GOM, and the Atlantic coast of the United States, and have also been recorded in Bermuda. Forms of smalltooth sawfish have been reported from the eastern Atlantic in Europe and West Africa; the Mediterranean; South Africa; and the Indo-West Pacific, including the Red Sea, India, Burma, and the Philippines. However, it is unknown whether populations outside the Atlantic are truly smalltooth sawfish or closely related species. Pacific Coast records of smalltooth sawfish off Central America need to be confirmed (NMFS 2009a).

The range of the smalltooth sawfish in the Atlantic has been reduced over the past century. The northwestern extent of this species' Atlantic range is located in the waters of the eastern United States. Records of this species north of Florida occur during spring and summer periods (May to August). These are likely seasonal migrants, wanderers, or colonizers from a historic Florida core population to the south (NMFS 2009a). Peninsular Florida has been the U.S. region with the largest numbers of capture records of smalltooth sawfish and seems to be the primary area where the species historically occurred year-round. The region where the largest numbers of smalltooth sawfish occur is in southern and southwestern Florida from Charlotte Harbor through the Dry Tortugas (NMFS 2009a).

Smalltooth sawfish occur on the west coast of Florida, north of Charlotte Harbor, but historically appear to never have been as common in this region as in the east coast lagoons and South Florida. One of the earliest published records from the west coast was reported in 1883 from the Cedar Keys off the northwestern Florida peninsula and hundreds of smalltooth sawfish reported on the Gulf coast of peninsular Florida in the late 1800s. Other 1800s captures were documented in Tampa Bay and in the southwestern coast off Charlotte Harbor and San Carlos Bay. Records of capture since that time period have been limited. There are few documented captures of sawfish from the area north of Charlotte Harbor. However, the recent work to document sawfish encounters has increased the numbers of reported occurrences in the upper half of the west coast of the Florida Peninsula and in the area north of Charlotte Harbor (NMFS 2009a).

Smalltooth sawfish are found very close to shore in muddy and sandy bottoms, seldom descending to depths greater than 10 m (32 feet). They are often found in sheltered bays, on shallow banks, and in estuaries or river mouths. Most encounters of smalltooth sawfish occurred on mud substrates. One study reports encounters by substrate as type as 61 percent on mud, 11 percent on sand, 10 percent seagrass, 7 percent limestone, 4 percent rock, 4 percent coral reef, and 2 percent sponge. Smalltooth sawfish are also reported to be associated with mangroves, seagrasses, and the shorelines. Encounter data have also demonstrated that smaller smalltooth sawfish occur in shallower water, and larger sawfish occur regularly at depths greater than 10 m (32 feet) (NMFS 2009a).

The primary reason for the decline of the smalltooth sawfish population has been bycatch in various commercial and recreational fisheries. The secondary reason for the decline of the smalltooth sawfish population is habitat loss and degradation. Other threats to the species include entanglement in marine debris, injury from saw removal, pollution, and disturbance of natural behavior by divers and other marine activities (NMFS 2009a). NMFS listed the U.S. population of the smalltooth sawfish as an endangered species on April 1, 2003 (68 FR 15674–15680). There is no critical habitat currently designated for smalltooth sawfish. NMFS proposed two units of critical habitat on November 20, 2008, approximately 40 NM from the Project area in Charlotte Harbor and south (73 FR 70290–70308). Critical habitat is not proposed within the Project area.

Gulf Sturgeon. The threatened Gulf sturgeon is an anadromous fish with a partially cylindrical body imbedded with bony plates or scutes (USFWS and GSMFC 1995). The current population levels of Gulf sturgeon (*Acipenser oxyrinchus desotoi*) in rivers other than the Suwannee and Apalachicola are unknown, but are thought to be reduced from historic levels. Historically, the subspecies occurred in most major rivers from the Mississippi River to the Suwannee River, and marine waters of the central and eastern GOM to Florida Bay (USFWS and GSMFC 1995).

Tampa Bay was the location of the first recorded significant sturgeon fishery on the GOM coast; however it only lasted 3 years from 1886 through 1889, when only seven sturgeon were caught. Sturgeon catches have been reported sporadically since 1890. In the Tampa Bay basin, a commercial netter incidentally caught and released a Gulf sturgeon, one mile west of Redington Beach near St. Petersburg in December 1992. Before this time, the most recent Gulf sturgeon catch reported from Tampa Bay was collected in December 1987 near Pinellas Point. Recent sightings have been limited to coastal Alabama, Mississippi, and the Florida Panhandle (USFWS 2004a).

As anadromous fish, Gulf sturgeon feed in estuarine waters and spawn in fresh water. Subadult and adult Gulf sturgeon are believed to spend 8 to 9 months in rivers and 3 to 4 months (the cooler months) in estuaries. Gulf sturgeon that are less than 2 years old remain in estuaries throughout the year. In the Suwannee River, the primary habitat is limestone and sand. In the rivers, Gulf sturgeon are known to congregate below springs and areas of turbulent flows. Open water habitats are believed to be muddy and soft bottom and possibly seagrass (USFWS and GSMFC 1995).

The decline of Gulf sturgeon was likely caused by overexploitation and exacerbated by damming of rivers (USFWS and GSMFC 1995). Critical habitat for Gulf sturgeon was designated in March 2003 (68 FR 13370–13494). There is no critical habitat for Gulf sturgeon in the Project area. The closest critical habitat for Gulf sturgeon is approximately 90 NM from the Project area.

3.5 Terrestrial Resources

Threatened and endangered species have been observed in the Project area. **Table 3-5** provides a list of federally threatened and endangered species that occur in Manatee County. The habitat types for these species can be found either within or adjacent to the proposed onshore route.

Table 3-5. Federally Listed Species Potentially Occurring in the Proposed Onshore Route

Common Name	Scientific Name	Federal Status
Audubon's crested caracara	*Caracara cheriway*	T
Wood stork	*Mycteria americana*	E
Eastern indigo snake	*Dymarchon corais couperi*	T

Source: USFWS 2007b

Notes: T = Threatened; E = Endangered

Audubon's Crested Caracara. The caracara is a large, long-legged, hawk-like bird that is often seen on the ground. It is a scavenger and has a varied diet and often seen eating fresh kills or carrion with vultures. Caracaras are found in open grassland habitats such as dry prairies and improved rangeland. Breeding is from January through March. The nest is bulky and constructed of slender vines and sticks and is usually found in a cabbage palm (Farrand and Bull 1994).

Wood Stork. Wood storks are the only storks that regularly inhabit North America. These wading birds are year-round residents of Florida and Georgia, though sightings occur within the other Gulf coastal states. Wood storks frequent freshwater and brackish coastal wetland habitats. This endangered species nests at a single site in Tampa Bay, the Dot-Dash colony at the mouth of the Braden River (Paul and Paul 2003). During the field survey of the tidally influenced canal (south conveyance ditch) in the Project area and adjacent mangrove site, multiple wood storks were observed (Port Dolphin 2007b).

Eastern Indigo Snake. The eastern indigo snake is a large, docile, nonpoisonous snake growing to a maximum length of about 8 feet. The color in both young and adults is shiny bluish-black, including the belly, with some red or cream coloring about the chin and sides of the head. They feed on an assortment of amphibians, reptiles, and small mammals. Most notably found in dryer habitats (like gopher tortoise burrows), these creatures also inhabit hydric hammocks and areas around ponds. In wetter habitats that lack gopher tortoise burrows, Eastern indigo snakes can take shelter in hollowed root channels, hollow logs, or the burrows of rodents. In central and coastal Florida, they are mainly found within many of the State's high, sandy ridges. The Eastern indigo snake has been observed laying eggs in gopher tortoise burrows in high pineland areas, and in stump holes in flatwoods and pond edge habitats. Based on observations of captive indigos at Auburn University, mating begins in November, peaks in December, and continues into March. Clutches averaging eight to nine eggs laid in late spring hatch approximately 3 months later. The snakes remain active to some degree throughout the winter, often emerging from their dens whenever air temperatures exceed 50 °F (USFWS 1991).

4. Potential Effects on Federally Listed Species

As discussed in **Section 3.1**, the Maritime Administration has the responsibility under the ESA to determine whether or not the Project would adversely affect federally listed threatened or endangered marine mammals and their critical habitat. In accordance with Section 7 of the ESA, the Maritime Administration initiated informal consultation with the USFWS and NMFS on August 24, 2007.

Potential impacts on ESA-listed species could occur during Project installation, operation, and decommissioning, and would be associated with seafloor disturbance and turbidity, hydrostatic testing, increased vessel traffic, noise, entanglement, lighting, pipeline intake and discharges, routine discharges, marine debris, and potential hydrocarbon or LNG spills.

Minimization measures to reduce potentially adverse impacts on protected marine mammals are described in **Section 6**. Various Federal and state agencies have requested specific measures including monitoring in order to minimize or offset potential impacts on natural resources. The Applicant has also committed to several best management practices (BMPs) and minimization practices during construction and operations to reduce potential impacts. Determinations of effect submitted by the USCG to USFWS and NMFS are summarized in **Table 4-1** and discussed throughout **Sections 4, 5,** and **6** of this BA.

4.1 Marine Mammals

ESA-listed marine mammals with documented occurrence in the northern GOM are listed in **Tables 3-1** and **4-1**. Of these species, only the West Indian manatee regularly occurs in the project area. The humpback whale and North Atlantic right whale are sporadically sighted in the northern GOM, including along the west coast of Florida. Sperm whale, while common in the GOM, only occurs seaward of the 200-m isobath (Jochens et al. 2008), and the closest approach of the 200-m isobath to the project area is 146 km (79 NM). Sei whale, blue whale, and fin whale would be considered extralimital (beyond their normal range) in the northern GOM (Würsig et al. 2000), but areas within their normal range would be traversed by SRVs en route to the proposed port. The West Indian manatee is the only marine mammal species with designated critical habitat in the northern GOM (see **Section 3** for more details).

4.1.1 Construction Impacts

Seafloor Disturbance. Installation of Port components and pipelines would temporarily disrupt benthic habitat in the immediate vicinity of the construction areas. Manatees could be indirectly impacted if aquatic vegetation were displaced or destroyed by construction activities. The pipeline route does not pass through any manatee protected areas including manatee protection zones and manatee critical habitat (see **Figure 3-1**). The proposed pipeline's route would be constructed within a half of a mile of the Terra Ceia Aquatic Preserve (AP), about 7.2 km (4.5 mi) from manatee critical habitat and about 21.2km (13.2 mi) from a manatee protection area. In the nearshore areas, seagrass was observed predominantly near Manbirtee Key, the spoil island near Port Manatee, and in water with a bottom depth shallower than 2 m (7 feet) (Port Dolphin 2007b). The nearest seagrasses are 23 m (75 feet) to the southwest and distances greater than 59 m (194 feet) to the northeast of the horizontal directional drill (HDD) exit point. Therefore, adverse impacts from seafloor disturbance during construction on West Indian manatee would be unlikely, and minor if they did occur. Seagrasses would be avoided and mitigated based on the BMPs and the Project-specific Wetland and Waterbody Construction and Mitigation Procedures Plan. The plan would be developed in coordination with appropriate regulatory agencies and implemented prior to and during construction activities. The specific recovery plan would address mitigating unavoidable impacts on wetlands and waters of the United States (inland, coastal, and seagrasses). Neither manatees nor their

Table 4-1. Determinations of Effect* Under ESA for Threatened and Endangered Species in the Project Area

Common Name	Scientific Name	ESA Status	Determination of Effect*
Cetaceans

Notes:

E – Federally listed as endangered; T – Federally listed as threatened

* These determinations of effect have been made by the USCG based upon best professional judgment and consultation with cooperating agencies. ESA consultation with NMFS and FWS is ongoing at this time. Consultation documents generated after the publication of the FEIS will be posted on the docket at *www.regulations.gov*, docket # USCG-2007-28532.

a. Although the species as a whole is listed as threatened, the Florida and Mexican Pacific nesting stocks of the green sea turtle and the Mexican Pacific nesting stocks of the olive ridley turtle are listed as endangered. Since the nesting areas for turtles encountered at sea often cannot be determined, a conservative approach to management requires the assumption that all green sea turtles in the GOM are endangered.

b. Smalltooth sawfish are expected to be rare in the Terminal area and offshore areas of the Pipeline, but will have a greater likelihood for interaction in the shallower, inshore areas of the Pipeline, during construction. There are few documented captures of smalltooth sawfish north of Charlotte Harbor (which is approximately 40 NM south of Tampa Bay) on Florida's west coast (NMFS 2009a). However, recent work to document sawfish encounters has increased the numbers of reported occurrences in the upper half of the west coast of the Florida Peninsula and in the area north of Charlotte Harbor (NMFS 2009a). As of 2008, there had been 20 encounters of smalltooth sawfish in 10 years (FMNH 2008).

feeding areas would be directly impacted by seafloor disturbance with the use of BMPs and mitigation measures.

The potential for impacts on cetaceans from seafloor disturbance would be via indirect impacts by disturbing feeding grounds. Threatened and endangered baleen whales, including humpback whales and North Atlantic right whales, are only sporadically sighted in the GOM and have not been observed to feed there. Feeding grounds for both the humpback whale and North Atlantic right whale are off the northeastern United States. Therefore, adverse impacts on threatened and endangered whale species would be unlikely to result from seafloor disturbance during construction. Short-term, minor, indirect, adverse impacts on threatened and endangered marine mammals could occur as a result of seafloor disturbance caused during construction.

***Turbidity*.** The main source of water quality impacts would be pipeline trenching, which would produce turbidity along the pipeline route. Other sources of turbidity include pipeline burial, as well as anchoring of the lay barge, placement of the pipeline and mattresses, and HDD of the shore approach. The clamshell dredge method to be used during the Proposed Action is expected to produce much less turbidity than jetting (ASA 2008). As indicated in **Section 4.1.1**, turbidity modeling (SSFATE) conducted by the Applicant was used to estimate the area in which sediment concentrations would continue to exceed 100 mg/L after 30 minutes. Under worst-case conditions, it is estimated that sediment concentration would exceed 100 mg/L for less than 2 hours (ASA 2008). Turbidity modeling indicates that turbidity plumes would be short-lived and remain fairly close to their source (ASA 2008). The total areal extent of the turbidity plumes created during pipeline installation is estimated to be approximately 4,679 acres (1,894 hectares) (ASA 2008). However, the actual distance from the source would depend on the source (e.g., HDD, dredge) and prevailing conditions (e.g., weather and tide). Water turbidity appears to have little or no direct impact on manatees or threatened and endangered whales, as they are sighted in both clear and muddy waters (Hartman 1979). However, suspended sediments in the water column reduce light availability and, therefore, seagrass production (SCDNR 1995), and seagrass beds serve as feeding areas for manatees. Due to the temporary nature of water quality changes following construction

activities, impacts on manatee feeding areas are expected to be negligible. Manatees and threatened and endangered whales could be indirectly impacted as a result of any hazardous substances in sediment being resuspended and bioaccumulated in food items from contaminated suspended sediments. Due to the temporary nature of water quality changes following construction activities, impacts on manatees or threatened or endangered whales are expected to be negligible. Additionally, threatened and endangered baleen whales are only sporadically sighted in the GOM and have not been observed to feed there, and feeding grounds for both the humpback whale and North Atlantic right whale are off the northeastern United States. Due to the short-term nature of potential indirect effects and the low potential for whales to be in the vicinity, turbidity during construction would not likely adversely affect ESA-listed marine mammals.

Hydrostatic Pipeline Integrity Testing. During the construction phase, seawater would be used for hydrostatic testing of the offshore pipeline and flowlines. The seawater would be taken onboard a marine vessel at five locations along the route. Hydrostatic testing is a one-time temporary event that will require filling the pipeline twice. Hydrostatic integrity testing might entrain and subsequently kill plankton (via the seawater intake system). To assist in leak detection during testing, an environmentally benign dye, Hydro Tag Green Fluorescent Dye, would be added to the flooding and test water. Hydro Hib P would be added as a corrosion inhibitor; it is widely used in the offshore pipeline industry and has been approved by the USEPA and certified by USEPA-approved laboratories. Hydro Hib P requires no neutralization and the treated water can be discharged into the sea (subsea) through specially designed diffusers. This is intended to release the treated seawater into a larger volume of water than if diffusers were not used. As the test water is released to the sea, the concentration will be immediately diluted well below the toxicity limit via the diffusers, thereby further rendering the test water as uninhibited or "Non-Toxic." The hydrostatic test water discharge would occur offshore from a marine vessel at one of the STL buoy locations rather than at Port Manatee. No water quality impacts are expected from the water additives.

Manatees feed primarily on aquatic vegetation, so no impacts are expected on this species. There is no evidence of feeding by humpback or North Atlantic right whales during their rare occurrences in the GOM as feeding grounds are off the northeastern United States for these two species. Therefore, adverse impacts are not expected on ESA-listed marine mammals from hydrostatic pipeline integrity testing.

Vessel Traffic. Construction activities associated with the Proposed Action would result in increased vessel traffic in the Tampa Bay region. As specified by the Applicant, approximately 1,800 vessel trips would be required during construction (Port Dolphin 2008). Twelve types of vessels might be used during construction (weather contingent); the supply vessel (360 to 600 total trips) and material barges (720 to 900 total trips) represent the most frequent vessel movements. Frequency of vessel movements ranges from 2 trips per year for jack-up and dragline barges to approximately 900 trips per year for material barges. Expected vessel traffic during construction would consist of approximately 1,796 trips over the 11-month construction period. Approximately 125,000 boats were registered in Manatee, Hillsborough, and Pinellas counties in 2006, of which approximately 2,800 are considered commercial and include charter vessels and commercial fishing vessels (HSMV 2005). From a broader perspective, upwards of 1,000 commercial vessels pass through the Straits of Florida daily, and there are tens of thousands of vessel transits annually in the GOM. The worldwide commercial fleet was estimated to include at least 81,867 vessels in 1999 and is reportedly increasing at about 12 percent per year (2003). Vessel traffic might affect marine mammals by direct collisions with vessels, wave action from boat wakes impacting seagrasses, noise (which might cause behavioral disturbance), and accidental hydrocarbon spills. Potential impacts of noise from vessel traffic are discussed in the following section on noise. Increased vessel traffic is likely to increase inadvertent petroleum hydrocarbons discharged into the water; those possible impacts are discussed in the marine mammal sections regarding hydrocarbon spills.

The largest problem presently faced by manatees in Florida is death or injury from boat strikes (USFWS 2001). Vessel collisions (particularly from small watercraft) are identified as a major source of mortality, where more than 30 percent of all documented deaths have been attributed to vessel strikes (Nowacek et al. 2004). Deaths from boat strikes involve all age classes and occur year-round over much of the manatee's range in the GOM (Nowacek et al. 2004). A large percentage of adult manatee carcasses bear scars from previous boat strikes and the healed, skeletal fractures of some indicate that they had survived previous traumatic impacts.

Many living manatees have been scarred by boat collisions, especially on the tail and back. Nonlethal injuries can reduce the breeding success of wounded females and could permanently remove some animals from the breeding population. Vessel traffic that disturbs manatees can cause them to leave preferred habitats and could alter biologically important behaviors such as feeding, nursing, or resting (FWC 2006).

To help reduce the chance of vessel strikes, the State of Florida has established manatee protection zones, including those in the Tampa Bay area. Two types of manatee protection areas also have been developed by USFWS: manatee sanctuaries and manatee refuges. Manatee sanctuaries are areas in which all waterborne activities are prohibited, and manatee refuges are areas where certain waterborne activities are restricted or prohibited (designation of refuges or sanctuaries, however, would not eliminate waterway property owner access rights). To date, FWS has established seven winter sanctuaries to protect manatees in association with the Crystal River NWR. The most recent was a 0.25-acre sanctuary established in 1997 at Three Sisters Spring run (FWC 2006). The pipeline route where construction activities would occur does not pass through any manatee protection zones (approximate closest distance from pipeline route to manatee protection areas is 11.5 NM).

Injuries and deaths resulting from ship collisions also represent a significant threat to several large whale populations (Laist et al. 2001, Jensen and Silber 2003). All types and sizes of vessels hit whales, but most lethal and serious injuries are caused by larger vessels. Laist et al. (2001) report that of 15 whales considered severely injured by ship strikes, 3 were struck by vessels less than 20 m (65.6 feet) long, 3 were struck by vessels 20 to 80 m (65.6 to 262.5 feet) long, and 9 were struck by vessels longer than 80 m (262.5 feet). Of the 23 whales killed by vessel collisions, at least 20 whales (87 percent) were struck by vessels more than 80 m (262.5 feet) long (Laist et al. 2001).

Vessel speed is a principal factor in the severity of injury or likelihood of mortality among whales struck by ships (Jensen and Silber 2003). Vessel speed at the time of strike was reported for 58 of the 292 strikes recorded in NOAA's Large Whale Ship Strike Database (Jensen and Silber 2003). The range of speeds at which vessels were operating when a whale was hit was 2 to 51 knots, with a mean speed of 18.1 knots. This category for the Proposed Action would include SRVs, which typically travel at speeds up to 19.5 knots in the open ocean. However, once approaching the vicinity of the terminal, SRVs would slow to about half-speed. The mean vessel speed which resulted in injury or mortality to the whale was 18.6 knots. The majority (79 percent) of these strikes occurred at speeds of 13 knots or greater. Of the 58 cases, 19 (32.8 percent) resulted in serious injury to the whale and 20 (34.5 percent) resulted in death. In total, 39 (67.2 percent) ship strikes in which ship speed was known resulted in serious injury or death (Jensen and Silber 2003). In a more recent study by Pace and Silber (2005) which evaluated 64 ship strike records in which vessel speed was known, there was strong evidence that the probability of death or serious injury increased rapidly with increasing speed. The predicted probability of death or serious injury increased from 45 percent to 75 percent as vessel speed increased from 10 to 14 knots, and exceeded 90 percent at 17 knots. Speeds of 25 knots and greater resulted in a 100 percent probability of death or serious injury. A reduction in speed from 18 knots to 12 knots would give whales an additional 2.6 seconds (at a distance of 50 m) to avoid a vessel.

Increases in vessel traffic (with no mitigation or monitoring) during construction could potentially increase the likelihood for collisions with ESA-listed marine mammals, thereby increasing the occurrence of serious injuries or mortality. While it is known that an increase in vessel traffic increases the risk of collision, the probability of that risk cannot be quantified. Any vessel strike of a threatened and endangered marine mammal would be considered a "take" under both the MMPA and ESA.

Additional indirect effects from increased vessel traffic include increased wave action due to vessel wakes and scarring of seagrass beds by propellers (EPC 2007). Seagrasses are important foraging areas for the manatee. Wakes affect seagrass beds by the increase of wave action which might play a role in the decline of longshore sandbars that help protect seagrasses (Lewis 2002), as well as increased turbidity that, as noted earlier, reduces light availability and, therefore, seagrass production. Turbidity modeling indicates that turbidity plumes would be short-lived (settle to close to background levels within 5 hours) and remain fairly close to their source (ASA 2008). It also indicates that sediment resuspended by plowing would not reach seagrass beds near the landfall. However, resuspended sediment from HDD pit excavation would reach seagrass beds south of the HDD pit. The seagrass beds would be exposed to suspended sediment levels of 0 to 5 milligrams per liter (mg/L) and the total area of seagrasses affected would be 1.93 acres (0.78 hectares). However, no measurable sediment accumulation on seagrasses is predicted (Port Dolphin 2008). As stated above, seagrass beds are dynamic, and a thorough seagrass survey would be conducted prior to construction to determine the current status and location of seagrass in the area of HDD exit location (Port Dolphin 2007b).

Seagrasses would be avoided and mitigated based on the BMPs and the Project-specific Wetland and Waterbody Construction and Mitigation Procedures Plan. The plan would be developed in coordination with appropriate regulatory agencies and implemented prior to and during construction activities. The specific recovery plan would address a preconstruction seagrass survey, consistent with NMFS recommendations and mitigating unavoidable impacts on wetlands and waters of the United States (inland, coastal, and seagrasses).

No direct impacts to manatees are expected, or indirectly to their feeding areas (i.e., seagrasses) when taking BMPs and mitigation measures into consideration. No adverse impacts on ESA-listed cetaceans are expected from construction-related vessel traffic since these species are only sporadically sighted in the GOM and have not been observed to feed there.

Based on NMFS recommendations, the Applicant has proposed BMPs for all vessels used during installation routine operations and decommissioning to reduce or avoid direct impacts of vessel traffic on marine mammals (see **Section 6**). In addition, to minimize potential indirect impacts, seagrasses would be avoided and mitigated based on the BMPs and the Project-specific Wetland and Waterbody Construction and Mitigation Procedures Plan. The plan would be developed in coordination with appropriate regulatory agencies and implemented prior to and during construction activities. The specific recovery plan would address a preconstruction seagrass survey, consistent with NMFS recommendations and mitigating unavoidable impacts on wetlands and waters of the United States (inland, coastal, and seagrasses).

Noise. Marine mammals rely heavily on the use of underwater sounds to communicate and gain information about their environment. Even in the absence of man-made sounds, the sea is noisy and ambient background noise can interfere with the ability of marine mammals to detect sound signals even when they are above its absolute hearing threshold. Ambient background noise includes natural contributions from wind, waves, precipitation, and other animals, as well as sounds from distant human activities such as shipping or oil exploration and production (Richardson et al. 1995). Ambient noise is highly variable over continental shelves, and this inevitably results in a high degree of variability in the range at which marine mammals can detect man-made sounds.

Known effects of noise on marine mammals have been reviewed by various sources (Richardson et al. 1995, Hildebrand 2005, NRC 2005, Nowacek et al. 2007, Weilgart 2007a, 2007b). Human-made sounds can affect the ability of marine mammals to communicate and to receive information about their environment. Such noise can interfere with or mask the sounds used and produced by these animals and thereby interfere with their natural behavior.

Observed effects of noise on marine mammals include changes in vocalizations; respiration, swim speed, diving, and foraging behavior; displacement; avoidance; shifts in migration path; stress; hearing damage; and strandings. The response threshold depends on whether habituation (gradual waning of behavioral responsiveness) or sensitization (increased behavioral responsiveness) occurs (Richardson et al. 1995); however, as noted by Wright et al. (2007a, 2007b) an interpretation of a reduction in behavioral responses to noise as acclimation will be a mistake in many situations, as alternative reasons for the observed results are much more likely. Sounds can cause reactions that might include disruption of marine mammals' normal activities (behavioral or social disruption) and, in some cases, short- or long-term displacement from areas important for feeding and reproduction (Richardson et al. 1995). Marine mammal responses to noise vary widely depending on the species, the context and duration of exposure, the properties of the stimuli (e.g., low-frequency versus high-frequency, continuous versus pulsive), the time of day or year, the reproductive state of the animal, the activity of the animal at the time of exposure, and the experience or prior exposure of the animal (NRC 2003, Richardson et al. 1995). Responses also vary widely among individuals of a species or group.

Disturbance is one of the main concerns of the potential impacts of man-made noise on marine mammals, but for many species and situations, there is no detailed information about reactions to noise. Behavioral reactions of marine mammals to sound are difficult to predict because they are dependent on a variety of factors. Preliminary research suggests that most small- and medium-sized toothed whales are unlikely to be displaced when exposed to prolonged or repeated underwater sound unless the overall received sound level exceeds 140 dB re 1µPa at 1 m. Baleen whales are probably more sensitive to low-frequency sounds and have been shown to react to sound levels of 120 dB re 1µPa at 1 m. Toothed whales also appear to exhibit a greater variety of reactions to man-made sound than baleen whales. While toothed whale reactions vary from approaching the vessel to strong avoidance, baleen whale reactions range from neutral to strong avoidance (Richardson et al. 1995).

The energetic consequences of one or more disturbance-induced periods of interrupted feeding or rapid swimming, or both, have not been evaluated quantitatively. Energetic consequences would depend on whether suitable food is readily available. Of the animals responding to noise, females in late pregnancy or lactating would probably be most affected. Human-made noise can cause temporary or permanent hearing impairment in marine mammals if the noise is strong enough. Such impairment would have the potential to diminish the individual's chance for survival.

Determining if short-term changes in behavior represent a biologically significant effect is difficult (Wright 2006). Immediate or short-term changes in behavior could represent short- or long-term effects on a population. Short-term changes in behavior can include many of the changes described in previous literature including increases in dive duration or changes in direction of travel. However, long-term impacts or effects include changes such as reduced health and viability of a population. For example, short-term changes in activity budgets that reduce amount of time feeding could represent long-term challenges by reducing energy acquisition. These short-term changes could also have a greater impact on a population depending on resource availability.

Nonauditory physical effects can also occur in marine mammals exposed to very strong underwater sound. Possible types of nonauditory physiological effects or injuries that, in theory, might occur include

stress, neurological effects, bubble formation, resonance effects, and other types of organ or tissue damage.

The potential impacts of noise on marine mammals can be based on specific zones of influence (ZOIs): (1) the zone of audibility (within which the animal can hear the sound), (2) the zone of responsiveness (within which the animal reacts to the sound), (3) a zone of masking (within which the noise levels can interfere with other sounds and signals), and (4) the zone of hearing loss or discomfort (within which the animal's physical auditory structures are temporarily or permanently damaged). ZOI refers to the distances at which marine mammals are affected by man-made noise. Marine mammals usually do not respond overtly to audible but weak man-made sounds, so the zone of "responsiveness" is usually much smaller than the zone of audibility. Potential effects of noise on marine mammals include masking, behavioral disturbance, hearing impairment in the form of permanent or temporary threshold shifts (PTS and TTS, respectively), and nonauditory physiological effects (Richardson et al. 1995). Noise can also elicit behavioral responses such as cessation of feeding, resting, or social interaction; onset of alertness or avoidance; or attraction to the noise source. Behavioral responses vary widely both within and among species, and many marine mammals habituate easily to underwater noise (Watkins 1986). Alternatively, noise can be detectable but have no effect on an animal's behavior, hearing, or physiology.

Very high sound levels can rupture the eardrum or damage the small bones in the middle ear. Continuous sound exposure and loud sounds can temporarily or permanently affect the auditory sensitivity of animals by causing an upward shift in auditory threshold; such an effect is called a sound-induced threshold shift, or simply a threshold shift. A threshold shift can be either permanent, in which case it is termed a PTS, or it can be temporary, in which case it is termed a TTS. Still lower levels of sound can result in auditory masking, which can interfere with an animal's ability to hear other concurrent sounds.

Injury (Level A Harassment). Nonlethal injurious impact is defined as eardrum rupture (i.e., tympanic-membrane (TM) rupture). This is considered indicative of the onset of injury. This recognizes that TM rupture is not necessarily a life-threatening injury, but is a useful index of possible injury that is well-correlated with measures of permanent hearing impairment. This is often referred to as PTS.

The primary factors thought to cause a PTS are sound impulse duration, peak amplitude, and rise time. However, no data are available on noise levels that might induce PTS in marine mammals. Damage to a marine mammal's hearing apparatus could theoretically occur if an animal is exposed to sound impulses that have very high peak pressures, especially if they have very short rise times. Also, very prolonged exposure to a noise strong enough to elicit a TTS, or shorter-term exposure to noise levels well above the TTS level, could cause hearing impairment in marine mammals. For sound exposure at or somewhat above the TTS level, hearing sensitivity presumably recovers rapidly after exposure to the noise ends, and the received sound level from a single noise exposure must be far above the TTS level for there to be any risk of PTS. It has been suggested that PTSs caused by prolonged exposure to continuous man-made noise is not likely to occur in marine mammals for sounds with source levels less than 200 dB re 1μPa at 1 m (Richardson et al. 1995).

Level A harassment has an exposure criterion of 180 dB re 1 μPa^2-s.

TTS and Sub-TTS (Level B Harassment). There are two thresholds for noninjurious harassment, also known as Level B harassment. The first is TTS, which is a temporary, recoverable, loss of hearing sensitivity that is considered to result from the temporary, noninjurious distortion of hearing-related tissues. The duration of the TTS varies depending on the nature of the stimulus, but by definition, there is generally recovery of full hearing over time (Hastings and Popper 2005). A TTS is the mildest form of hearing impairment and occurs when exposure to a strong sound results in a nonpermanent elevation in hearing threshold making it harder for an animal to hear sounds. TTS can last from minutes or hours to

days and the magnitude of the TTS depends, upon other factors, on the level and duration of noise exposure. For sound exposures at or somewhat above the TTS level, hearing sensitivity usually recovers rapidly after exposure to the noise ends (Richardson et al. 1995). Only a few data on sound levels and durations necessary to elicit mild TTSs have been obtained for marine mammals. Although TTS studies on humans and terrestrial mammals provide insight on understanding the principles of TTS, it is unclear to what extent these data can be extrapolated to marine mammals (LGL and JASCO 2005).

The second threshold is termed "sub-TTS" and is used to account for behavioral disturbance significant enough to be judged as harassment, but occurring at lower sound energy levels than those that cause TTS. Behavioral modification has been defined to address a noise level or other activities that could potentially cause marine mammals to alter normal biological behavior. NMFS defines these behavior responses as modifications resulting from repeated noise exposures (below TTS) to the same animals (i.e., resident) over a relatively short period of time (Southall et al. 2007). Behavioral disturbance criteria for impulse/intermittent sounds is set at an sound pressure level (SPL) value of 160 dB re 1 µPa at 1 m and 120 dB re 1 µPa at 1 m for continuous noise (70 FR 18871–1875). The exposure zone for Level B harassment includes both behavioral effects and physiological effects and includes the region in which TTS is predicted to occur.

NMFS recognizes three general kinds of sounds: continuous (e.g., shipping sounds), intermittent (e.g., vibratory pile-driving sounds), and impulsive (e.g., conventional pile driving) (NMFS 2008a). Noise sources associated with construction activities of the Proposed Action include pipe laying, pipe burial, vessel traffic, and anchor installation. It should be noted that sounds from moving sources might be continuous, but for an animal at a given location, these sounds would be a transient impact on the animal as the vessel passes by. Marine mammal hearing capabilities are described in **Section 3**. Baleen whales (such as right whales and humpback whales) and the West Indian manatee are considered to be most sensitive to low-frequency sounds (about 7 hertz (Hz) to 22 kHz) (Southall et al. 2007). Manatees are considered to hear predominantly low frequency sounds (Gerstein et al. 1999). Therefore, all ESA-listed marine mammal species assessed for the Proposed Action are low-frequency hearing specialists (e.g., manatee, North Atlantic right whale, humpback whale).

The noise associated with construction would be broadband noise (over a wide range of frequencies, as described above) and most marine mammals present would be capable of hearing it. The frequencies (10 to 2,000 Hz) and source levels for noise associated with construction activities are presented in **Table 4-2**. Underwater noise would travel in all directions from the source. **Tables 4-3** and **4-4** present results of the noise modeling in terms of radii to threshold values of 120 dB to 190 dB Root Mean Square (RMS). **Table 4-3** presents modeling results which show the distance from noise sources that Level A and Level B harassment of marine mammals and other listed species could occur for offshore construction activities. **Table 4-4** presents the distance from noise sources that Level A and Level B harassment of marine mammals and other listed species could occur for inshore construction activities.

In order to take into account the differential hearing capabilities of various groups of marine mammals, the M-weighting frequency weighting approach described by Miller et al. (2005) was applied. The M-weighting filtering process is similar to the C-weighting method that is used for assessing impacts of loud impulsive sounds on humans. It accounts for sound frequencies extending above and below the most sensitive hearing range of marine mammals within each of five functional groups: low-frequency cetaceans, mid-frequency cetaceans, high-frequency cetaceans, pinnipeds in water, and pinnipeds in air (Southall et al. 2007); only low-frequency cetaceans would rarely occur in the area of the Proposed Action. Measurements on captive manatees (Gerstein et al. 1999) indicate a functional hearing range of 400 Hz to 46 kHz, which are within the bounds listed for pinnipeds. As such, M-weightings for pinnipeds are used as a precautionary approximation of impact for manatees.

Table 4-2. Third-Octave Band Source Levels for Construction Modeling Scenarios.

Freq (Hz)	Pile Driving[a]	Anchor Operations[b]	Pipe-laying[b]	Tug Anchor Pull[c]	Tug Half-Speed Transit[c]	Dredging[d]
	Source level (dB re μPa)

Notes:

Level A harassment: intensities above 180 dB re 1 µPa at 1 m RMS

Level B harassment (impulse noises): intensities above 160 dB re 1 µPa at 1 m RMS

Level B harassment (continuous noises): intensities above 120 dB re 1 µPa at 1 m RMS

Table 4-4. Distance from Broadband Noise Sources that Level A and Level B Harassment of Marine Mammals and other Listed Species Could Occur for Inshore Construction Activities.

	Pile Driving (distance from source)	Pipe Laying: Passage Key (distance from source)	Pipe Laying: Tampa Bay (distance from source)	Pipe Burial: Tampa Bay (distance from source)
Low-Frequency Hearing Cetaceans				
Level A	7 to 30 m	< 20 m	< 20 m	< 20 m
Level B	30 m to 1.9 km	20 m to 1.6 km	20 to 6 km	20 to 6.7 km
Manatee				
Level A	6 m to 26 m	< 20 m	< 20 m	< 20 m
Level B	26 m to 1.8 km	20 m to 1.5 km	20 m to 6.0 km	20 m to 6.7 km

Source: JASCO 2008

Notes:

Level A harassment: intensities above 180 dB re 1 µPa at 1 m RMS

Level B harassment (impulse noises): intensities above 160 dB re 1 µPa at 1 m RMS

Level B harassment (continuous noises): intensities above 120 dB re 1 µPa at 1 m RMS

Manatees are common in nearshore areas associated with the Proposed Action. Right whales and humpback whales are not likely to occur anywhere in the Proposed Action area. Based on the types of noise and the distances affected, mitigation and monitoring measures would be taken to avoid both Level A and Level B harassment of ESA-listed marine mammals. Avoidance and mitigation measures are presented below and in **Section 6**. Overall, the amount of noise created during buoy installation, pipe laying, and pipe burial would be consistent with other man-made underwater noise sources in the area (e.g., commercial shipping, dredging). Continuous noise created by construction vessels could potentially mask sounds produced and received by marine mammals. Masking occurs when underwater noise interferes with an animal's ability to hear other concurrent sounds such as other group members, or predators. This can, in turn, affect an animal's ability to feed, mate, or travel efficiently and safely through an environment. While no data exist for the specific area associated with the Proposed Action, Phillips et al. (2006) found that ambient noise measurements near the mouth of the Crystal River, approximately 130 km (70 NM) north of the Proposed Action area, were 105 dB. While we cannot

quantifiably analyze the noise levels specifically in the Proposed Action area, a reasonable assumption is that the ambient noise levels will increase, but construction-related noise that contributes to the increase would be temporary.

Noise from Pile Driving. The hammer to be used for pile driving would be similar to the Menck MHU 3000 hydraulic hammer (JASCO 2008). Impact hammering noise source levels that were used for noise modeling were based on the LGL Limited and JASCO Research Limited (2005) underwater noise modeling report developed for the Neptune Deepwater Port EIS and are based on measurements and computations based on Greene and Davis (1999) and Malme et al. (1998) (Port Dolphin 2009a). There are only rare occurrences of the humpback whale, North Atlantic right whale, and West Indian manatee in the offshore component of the project (STL buoy locations). Pile driving would occur approximately 7.6 km from the nearest manatee critical habitat and approximately 21.7 km (11.5 NM) from the nearest manatee protection zone. Therefore, ESA-listed marine mammals are not likely to be adversely affected by pile driving and other noise related to buoy installation in offshore waters.

The following BMPs were proposed by the Applicant to reduce impacts associated with noise.

1. Anchors for the unloading buoys would be driven piles. Pile-driving would be confined to an approximately 2-week period. Bubble curtains, mufflers, sound-muffling devices, and engine covers would be used where appropriate to reduce the noise associated with pile driving and vessel noise. Additionally, engines and equipment would be turned off when not in use. To minimize excessive noise, engines on all equipment and vessels would be maintained in accordance with manufacturer's recommendations.
2. All vessel crew members and contractors would be requested to "ramp-up" (also known as "soft start" or "slow build up"), which entails the gradual increase in intensity of a sound source. Soft start (ramp-up) is a practiced mitigation measure used during pile driving (see recent NEPA documents and marine mammal permit authorizations (Thomsen et al. 2006; (documents for download, particularly bridge and wind farm construction projects that utilize pile driving, may be found at the NMFS LOA/IHA Applications for Public Review Web site: http://www.nmfs.noaa.gov/pr/permits/incidental.htm#applications) and seismic surveys (MMS 2007a; Weir and Dolman 2007, Abgrall et al. 2008). The intent of ramp-up is to either avoid or reduce the potential for instantaneous hearing damage to an animal (from the sudden initiation of an acoustic source at full power) that might be located in close proximity. Increasing sound levels are designed to warn animals of pending operations, and to allow sufficient time for those animals to leave the immediate area. There is ongoing discussion about its effectiveness and the level of safety it provides to marine mammals (Richardson et al. 1995, David 2006). Numerous sources including the Marine Mammal Commission, NMFS, and the MMS note that the effectiveness of soft start, although theoretically sound, has yet to be verified empirically (David 2006, Ragen 2008).

Humpback whales, right whales, and manatees are expected to be rare in the offshore Project areas. Manatees are expected to occur in the inshore Project areas. The proposed BMPs are expected to be effective in reducing the magnitude and extent of impacts of noise on marine mammals. The performance of the measures should be monitored during construction to verify their effectiveness. Therefore, the noise associated with the construction of the Port is not likely to adversely affect ESA-listed marine mammal species.

Noise from HDD. The noise from HDD activities, both onshore and offshore, is generated from the diesel engines that power the drilling and pull-in winches. The HDD could take between 3 to 4 weeks each to accomplish, during which the equipment would be running most of the time. However, the in-air noise near the HDD equipment is normally within 88 dB, which is a decibel level where ear protection is

not required as defined by Occupational Safety and Health Administration (OSHA) rules and regulations. It is anticipated that the noise generated by both onshore and offshore HDD operations would be less than that caused by ongoing large bulk carrier ships that traverse the shipping lanes in the same area of the planned HDD. With strict adherence to the proposed BMPs, there would be a full-time manatee watch during construction of the pipeline and all operations would cease when a manatee is sighted in the vicinity of the HDD. It should also be noted that most of the noise generated by the HDD operations is above the surface of the water (either on land or on a fixed jack-up vessel) and therefore noise generated by HDD operations would have to travel down the legs of the jack-up into the water, which would quickly dissipate and would have a minimal effect on manatees. Based upon the very low probability of their occurrence in nearshore waters during the short time period of HDD activities, no impacts are expected on ESA-listed whales from noise generated by HDD or other construction activities in nearshore waters.

Noise from Vessel Traffic During Construction. Vessels contribute noise primarily through propeller cavitation, propeller singing, and propulsion or other machinery (Richardson et al. 1995). Characteristic ship noise is a combination of narrowband, tonal sounds and broadband sounds with energy continuously over a wide range of frequencies (Richardson et al. 1995). Levels and frequencies of both tonal and broadband sounds tend to be related to vessel size; for example, large vessels create stronger and lower-frequency sounds (Richardson et al. 1995). For medium to large vessels, tones dominate up to about 50 Hz (Richardson et al. 1995). Broadband components can extend up to 100 kHz, peaking at 50 to 150 Hz (Richardson et al. 1995). Vessel noise (particularly from large ships) is a major contributor to low-frequency ambient noise in the ocean and is a major environmental concern (NRC 2003, 2005). During 2004, NOAA and a number of other government, industry, and academic partners convened the first formal meeting ("Shipping Noise and Marine Mammals: A Forum for Science, Management, and Technology") to consider the effects of sounds from large vessels on marine life. During 2007, NOAA convened a symposium to assess quieting applications for large commercial vessels.

Vessel traffic is considered continuous noise, and as noted earlier in the discussion of acoustic criteria, subject to level A and B thresholds for continuous noise (180 dB and 120 dB, respectively). Continuous noise from vessels is a main sound source during construction. Listed species that could be exposed to construction vessel noise include the West Indian manatee (for the inshore portion of pipeline construction) and any rare occurrences of the humpback whale and North Atlantic right whale (at the STL buoy locations and anywhere along the pipeline route). However, ESA-listed whale species are expected to be rare in the Project area. Although sounds created by construction equipment and vessels would be continuous during pipeline installation, activities would progress slowly along the route as the pipeline is laid, buried, and the trench backfilled. Thus, any one area would be subject to the maximum sound levels for only a day or two each time as the construction activities pass that area. The pipeline route does not pass through any manatee protection zones; the nearest point is 11.5 NM from a manatee protection zone.

The following types of vessels are likely to be involved during the two types of installation:

- Buoy installation. A large crane vessel and a cargo barge. Depending on the chosen installation method, one or several assisting installation vessels might be required for the installation.
- Pipeline installation. An inshore pipelaying barge and two smaller anchor-handling support vessels. Pipeline burial would most likely be done using an advanced burial plow and backfill plow system. Each crossing of the Gulfstream Pipeline would require two jack-up barges in the 200-Class range.

The noise associated with construction would be broadband noise (over a wide range of frequencies, as described above) and most marine mammals present would be capable of hearing it. The frequencies (10

to 2,000 Hz) and source levels for noise associated with construction activities are presented in **Table 4-2**. Underwater noise would travel in all directions from the source. **Tables 4-3** and **4-4** present results of the noise modeling in terms of radii to threshold values of 120 dB to 190 dB Root Mean Square (RMS). **Table 4-3** presents modeling results which show the distance from noise sources that Level A and Level B harassment of marine mammals and other listed species could occur for offshore construction activities. **Table 4-4** presents the distance from noise sources that Level A and Level B harassment of marine mammals and other listed species could occur for inshore construction activities.

In addition, the Project includes mitigation that would help reduce exposure of manatees to construction activities (see **Section 6**). Therefore, impacts on manatees are expected to be negligible.

In general, baleen whale reactions to transient vessel noise include changes in swimming direction and speed, respiration, dive cycle, and the frequency and kinds of vocalizations (Richardson et al. 1995). Baleen whales occasionally approach stationary or slow-moving boats, but they more commonly avoid them. Avoidance is strongest when boats approach directly or when vessel noise changes abruptly. Long-term reactions of baleen whales to vessel noise vary, but some species seem to show habituation to frequent boat traffic.

Based on proposed mitigation measures, the Proposed Action is not likely to adversely affect ESA-listed marine mammals.

Entanglement. It is possible that marine mammals might become entangled by anchors, anchor lines, or buoy lines deployed during construction. For example, as noted by NMFS (2007), entanglement in fishing vessel anchor lines has been documented historically; however, NMFS also notes that no information is available on the prevalence of such events. However, with strict adherence to proposed BMPs for detection of marine mammals in the area, the potential for entanglement associated with construction activities of the Proposed Action would be minimized, and adverse impacts unlikely.

Lighting. Construction activities would take place 24 hours per day, 7 days per week, during the installation period. For identification and safety purposes, construction and support vessels would be required to display lights when operating at night. The use of vessel lights during construction would be short-term, temporary, and transient. All lights would be installed and used in accordance with USFWS guidelines designed to reduce impacts on marine mammals (USFWS 2000). The Applicant has committed to using downshielding on lights used during construction, and has stated further that lighting would not be allowed to reflect on the water surface. Additionally, during installation an environmental coordinator would be on site to ensure no violations would occur. This would decrease attraction by fish and invertebrates to the area, as well as marine mammals that might be attracted by their presence, thereby reducing the vulnerability of ESA-listed marine mammals to possible disorientation, construction-related vessel strikes, noise impacts, predation, and entanglement. As such, adverse impacts on ESA-listed marine mammals from lighting during construction would be unlikely.

Marine Debris. Both entanglement in and ingestion of debris have caused death or serious injury to marine mammals (Laist 1997). The discharge and disposal of garbage and other solid debris from vessels by lessees is prohibited by the MMS (30 CFR 250.300) and the USCG (MARPOL Annex V, Public Law 100-220 [Statute 1458]) (33 CFR Part 151). The discharge of plastics, including ashes from burned plastics, is strictly prohibited and is therefore never authorized. All plastics must be returned to shore, and are tracked. These prohibitions on the discharge and disposal of garbage and other solid debris from vessels would be incorporated as enforceable conditions into the Deepwater Port Act (DWPA) license. The USCG would enforce MARPOL and the Deepwater Port License, if issued, and fines or penalties could be assessed where laws and regulations are violated. Based on the measures that would be

implemented to reduce the discharge of marine debris, it is unlikely that ESA-listed marine mammals would be adversely impacted marine debris associated with the construction of Proposed Action.

4.1.2 Operations Impacts

Seafloor Disturbance and Turbidity. Operations activities would cause long-term disturbances in both soft- and hard-bottom habitat. The placement of buoy system parts and concrete mattresses along the pipeline route, as well as anchor sweep would result in 16.32 acres of long-term disturbance on soft-bottom habitat and 19.42 acres of long-term disturbance on hard-bottom habitat. An additional 18.98 acres of soft substrate/sand habitat would be disturbed due to anchor sweep. It is anticipated that long-term STL buoy anchor chain sweep would cause the resuspension of fine sediments and result in a sediment drape within immediately adjacent areas. Turbidity associated with long-term chain scour is expected to be localized and in the lower portion of the water column. This area is not expected to recolonize because of long-term chain scour. Turbidity could spread from the immediate area of the proposed Port and affect different areas depending on the currents.

Removal of bottom habitat, along with resident benthic organisms within the area, affects not only the benthic communities, but also the fish assemblages that rely on the benthos for food, which in turn are preyed upon by marine mammals. Threatened and endangered baleen whales are only sporadically sighted in the GOM and have not been observed to feed there (feeding grounds for both the humpback whale and North Atlantic right whale are off the northeastern United States). Water turbidity appears to have little or no direct impact on manatees or threatened or endangered whales, as they are sighted in both clear and muddy waters (Hartman 1979). Additionally, manatees are expected to be rare in the offshore project area. Therefore, seafloor disturbance and turbidity associated with Port operation is not expected to result in adverse impacts associated on ESA-listed marine mammal species.

Vessel Traffic. A maximum of 90 SRVs could call on Port Dolphin per year. In the open ocean, where ESA-listed whales may occur, SRVs typically travel at speeds of up to 19.5 knots. However, once approaching the vicinity of the terminal, SRVs would slow to about half-speed. Manatees, which occur inshore, would not be affected by SRV traffic. [However, supply and crew vessels, which have the potential to affect manatees while en route in nearshore waters, are expected to call on the SRVs while at Port Dolphin.] Based on the estimated 90 calls a year, 938 supply vessel trips from 22 locations onshore in Tampa Bay are anticipated.

Increases in vessel traffic (with no mitigation or monitoring) could potentially increase the likelihood for collisions with ESA-listed marine mammals, thereby increasing the occurrence of serious injuries or mortality. Additional indirect effects from increased vessel traffic include increased wave action due to vessel wakes and scarring of seagrass beds by propellers, noise from vessel traffic (potential impacts and analyses discussed in detail under noise), and accidental hydrocarbon spills (potential impacts and analyses discussed in detail under hydrocarbon spills).

While it is known that an increase in vessel traffic increases the risk of collision, the probability of that risk cannot be quantified. Any vessel strike of a threatened and endangered marine mammal would be considered a "take" under both the MMPA and ESA. Based on NOAA and USFWS recommendations, the Applicant has proposed BMPs for all vessels used during installation routine operations, and decommissioning to reduce or avoid impacts of vessel traffic on marine mammals (see **Section 6**). Additionally, threatened and endangered baleen whales are only sporadically sighted in the northern GOM, and are not known to feed there. With adherence to the proposed BMPs associated with the Proposed Action, the potential for adverse impacts on ESA-listed marine mammals would be low.

Noise. Long-term underwater noise impacts would be created by the operation of various equipment and powering systems on the SRVs and other support vessels, the vaporization of the LNG at the mooring buoy, and the acoustic transponder.

Noise associated with SRVs and support vessels. An overlap is anticipated between arriving and departing SRVs; consequently, an SRV would be present most of the time. Under the Proposed Action, the Port would operate 24 hours a day, 365 days per year to provide a continuous supply of natural gas. Noise levels in the offshore area would be elevated when two SRVs are on buoys at the same time (separated by a distance of approximately 3.1 miles) (JASCO 2008). While SRVs are moored at the Port, main engines would not be operational, but shipboard machinery used to regasify or offload LNG, generate power, and maintain facilities, would produce continuous sources of noise. An additional noise source could include the sound produced by the flow of gas through the proposed flowline, although very little noise in the underwater environment would be expected (JASCO 2008).

Noise modeling was conducted for the SRVs for the offshore transit (full speed was assumed), buoy approach (half speed was assumed), and docking (three thrusters was assumed). However, it was later noted that a total of four thrusters could potentially be used. It was determined that the use of three thrusters rather than four thrusters would cause an increase of 1 or 2 dB re µPa and this difference would not be discernible due to ambient noise (Port Dolphin 2009b). Noise modeling indicates that overall, operational noise associated with the proposed Project is consistent with other man-made underwater noise sources in the area (e.g., commercial shipping, dredging). The source levels and frequencies for noise associated with operation are presented in **Table 4-5**. **Table 4-6** presents the distance from noise sources that Level A and Level B harassment of marine mammals and other listed species could occur associated with SRVs under the different operational scenarios.

The SRV traffic associated with the Project would contribute incrementally to the underwater noise environment of the world's oceans. The main sources of vessel noise are propeller cavitation, propeller singing, and propulsion; other sources include auxiliaries, flow noise from water dragging along the hull, and bubbles breaking in the wake (Richardson et al. 1995). Vessel traffic is a major contributor to noise in the world's oceans, especially at low frequencies between 5 and 500 Hz (NRC 2003). During 2004, NOAA and a number of other government, industry, and academic partners convened the first formal meeting ("Shipping Noise and Marine Mammals: A Forum for Science, Management, and Technology") to consider the effects of sounds from large vessels on marine life. During 2007, NOAA convened a symposium to assess quieting applications for large commercial vessels.

Although each vessel has a unique acoustic signature, individual vessels are indistinguishable at a distance. Above 300 Hz, the level of weather-related noise might exceed shipping noise. Wind, wave, and precipitation noise originating close to the point of measurement dominate frequencies from 500 to 50,000 Hz. The ambient noise frequency spectrum and level can be predicted fairly accurately for most shallow-water areas based primarily on known shipping traffic density and weather or sea conditions (wind speed, Beaufort wind force, or sea state) (Urick 1983, Zakarauskas 1986). Other anthropogenic sources of underwater noise include oil and gas drilling and production activities, seismic air guns, and SONARs. While the level of noise from ships is not of a magnitude likely to cause death, injury, or auditory trauma, the noise can affect the ability of marine mammals to communicate and receive information about their environment (Richardson et al. 1995). These sounds might frighten, annoy, or distract marine mammals and lead to physiological and behavioral disturbances. However, the incremental contribution of the planned SRV traffic to the level of vessel traffic in the GOM and the world ocean is minor. Moreover, compared to the world fleet, the SRVs would be newer ships, which tend to have several noise-mitigating characteristics such as quieter propulsion systems and deeper propellers that are less prone to cavitation (NRC 2003).

Table 4-5. Third-Octave Band Source Levels for Operational Modeling Scenarios (source depth is 6 m in all cases).

Frequency (Hz)	SRV, full speed transit	SRV, half speed transit	SRV, docking	SRV, docking, all 4 thrusters (not modeled)

Source: Port Dolphin 2009b

It is anticipated that noise from support vessels would be comparable to noise generated by vessels already operating in the Tampa Bay area, and would be unlikely to produce a measurable increase in underwater noise levels. SRVs would not operate in nearshore areas where manatee occur; therefore, no impacts are expected on manatee from Project-related vessels during operation. ESA-listed whales are not expected to occur in the area of the proposed Port; however, SRVs in transit to the proposed Port would likely traverse areas where ESA-listed whales are known to occur.

Table 4-6. Distance from Noise Sources that Level A and Level B Harassment of Marine Mammals and other Listed Species Could Occur from SRV Operation.

	SRV Transit (distance from source)	SRV Buoy Approach (distance from source)	SRV Docking (distance from source)
Low-Frequency Hearing Cetaceans			
Level A	<0.01 km	NA	< 0.01 km
Level B	0.01 to 3.8 km	0.01 to 1.6 km	0.01 to 3.5 km
Manatee			
Level A	<0.01 km	NA	< 0.01 m
Level B	0.01 to 1.7 km	0.01 to 0.5 km	0.01 to 1.7 km

Source: JASCO 2008

Notes:

Level A harassment: intensities above 180 dB re 1 µPa at 1 m RMS

Level B harassment (impulse noises): intensities above 160 dB re 1 µPa at 1 m RMS

Level B harassment (continuous noises): intensities above 120 dB re 1 µPa at 1 m RMS

Noise associated with regasification. The source levels associated with the regasification process are expected to be low (nearly 110 dB in the water, near the vessel). There are no situations where the noise level exceeds 120 dB even a few meters from the vessel (LGL 2008). Therefore, no adverse effects on ESA-listed marine animals are expected from noise associated with regasification.

Noise associated with acoustic transponder. The acoustic transponder would emit a 30 kHz signal at 188 to 192 dB re µPa at 1 m when signaled by an incoming SRV. This signal is within the functional hearing range of the manatee, but not in its range of best hearing (6–20 kHz). Noise modeling indicates that this signal would drop to below 180 dB re µPa at approximately 3 m and to 160 dB re µPa at approximately 32 m. Manatees are not expected to occur in the offshore component of the study area and, as such, would not be impacted by the acoustic transponder. While rare occurrences of the North Atlantic right whale and humpback whale are anticipated, the transponder's frequency is higher than that of the hearing range for the humpback and North Atlantic right whales, as well as manatees. Therefore, no adverse effects on ESA-listed marine mammals are expected from noise associated with acoustic transponder.

Entanglement. It is possible that ESA-listed marine mammals might become entangled in anchors, anchor lines, or buoy lines associated with operations of the Port in offshore waters. For example, as noted by NMFS (2007), whale entanglement in fishing vessel anchor lines has been documented historically; however, NMFS also notes that no information is available on the prevalence of such events. With strict adherence to proposed BMPs, the potential for entanglement associated with construction activities of the Proposed Action would be minimized. Because right and humpback whales are expected to be rare in the Project area and manatees are expected to be rare in the offshore Project area, the potential for such an event would be very low. Therefore, no adverse effects on ESA-listed marine mammals are expected from entanglement during Port operation.

Lighting. SRVs would be guided to the submerged unloading buoys by two lighted buoys floating on the sea surface. The lighted buoys would include flashing yellow lights, with an average lighting level of 900 to 1,000 Candela. Once SRVs are securely moored, lighted buoys would be taken on board and turned off. Moored SRVs would be required to exhibit light signals appropriate for vessels at anchor. Deck lights would also be used to illuminate working decks during LNG regasification activities. Lighting

from the Port and buoys would likely attract marine mammals and food sources of marine mammals. This may lead to potential impacts on marine mammals that would then be affected by noise and vessel traffic associated with the Port. However, North Atlantic right whales and humpback whales are expected to be rare in the Project area and manatees are expected to be rare in the offshore Project area, where Port operations occur. Therefore, ESA-listed marine mammals are unlikely to be adversely affected by lighting associated with Port operation.

Seawater Intake and Cooling Water Discharge. Seawater would be taken in through one of two sea chests covered with a lattice screen and used to cool the ship's engines. Marine mammals would not be directly impacted because they would be able to swim faster than the seawater intake velocity, which would not exceed 0.15 meters per second (m/s) (0.5 feet/s). Average swimming speeds for ESA-listed marine mammal species in the area of the Proposed Action include 2.2 to 4.0 m/s (7.2 to 13.1 feet/s) for humpback whales and 4.5 m/s (14.8 feet/s) for North Atlantic right whales (Noren 2004). Hartman (1979) estimated a top swim speed of 6.25 m/s (20.5 feet/s) for manatees, though it should be noted that since manatees are rarely observed in offshore waters, the manatee would likely not be affected by seawater intake or discharge. Seawater intake might indirectly impact threatened and endangered marine mammals, since plankton species could be entrained and subsequently killed by the seawater intake system. Plankton mortality could indirectly impact invertebrate and fish populations that feed on plankton.

Cooling water would be discharged at 10 °C (18 °F) above ambient seawater temperature. Modeling indicates that cooling water temperature would be 1 °C (1.8 °F) above ambient temperature within 100 m (328 feet) of the discharge. The cooling water discharge is not expected to reach the seafloor. An increase in temperature could potentially result in short-term behavioral and physiological impacts. However, the cooling water plumes would compose a relatively small area close to the discharge point. In addition, North Atlantic right whales, humpback whales, and manatees are expected to be rare in the offshore Project area. Therefore, no adverse effects on ESA-listed marine mammals are expected from seawater intake and cooling water discharge

Other Routine Discharges. While SRVs are present at the Port, they would not discharge domestic waste, bilge water, or ballast water. In addition, on the SRVs, gutter bars would be replaced around equipment where oil leaks could occur (e.g., mooring winches, cranes). Rain water from these areas would be drained to a bilge holding tank. No rain water would be discharged overboard, from areas around equipment where oil leaks would occur, while at the buoy. The firewater system discharges consist of uncontaminated seawater from testing the firefighting system on the SRVs. Based on the infrequent nature of the discharge; its short duration; the lack of contaminants; and the rare potential for occurrence of right whales, humpback whales, and manatees in the offshore Project area, adverse effects on ESA-listed marine mammals from other routine discharges during operation would be unlikely.

Marine Debris. Both entanglement in and ingestion of debris have caused the death or serious injury of marine mammals (Laist 1997). The discharge and disposal of garbage and other solid debris from vessels by lessees is prohibited by the MMS (30 CFR 250.300) and the USCG (MARPOL Annex V, Public Law 100-220 [Statute 1458]) (33 CFR Part 151). The discharge of plastics, including ashes from burned plastics, is strictly prohibited and is therefore never authorized. All plastics must be returned to shore, and are tracked. These prohibitions on the discharge and disposal of garbage and other solid debris from vessels would be incorporated as enforceable conditions into the DWPA license. The USCG enforces MARPOL and the Deepwater Port License and fines or penalties could be assessed where laws and regulations are violated. In addition, North Atlantic right whales, humpback whales, and manatees are expected to be rare in the offshore Project area. Therefore, adverse effects on ESA-listed marine mammals from marine debris associated with the operation of the Port would be unlikely.

Planned and Unplanned Maintenance and Emergencies. Planned and unplanned maintenance, emergencies, repair, inspection, and surveys could both directly and indirectly affect marine mammals, including ESA-listed marine mammals, if they occur in the proposed project vicinity. Impacts would be expected to be similar in nature to some construction impacts (see **Section 4.1.1**). In general, the potential impacts of planned maintenance, repair, inspection, and surveys would be similar or of less magnitude than construction impacts with adherence to the same recommended mitigation measures, monitoring, and BMPs. Unplanned maintenance and emergencies are expected to occur infrequently. Therefore, impacts on marine mammals from planned and unplanned maintenance, emergencies, repair, inspection, and surveys would be expected to be low. In some cases when unplanned maintenance, repairs, or emergencies occur, it might not be possible to follow some of the recommended mitigation measures, monitoring, and BMPs. In these cases of unplanned maintenance and emergencies, resource agencies (NMFS, USFWS, and state agencies, as appropriate) would be informed. ESA consultation could potentially be reinitiated after emergency situations and for cases where mitigation measures and BMPs could not be followed.

Hydrocarbon Spills. An oil spill in coastal waters could affect the West Indian manatee, humpback whale, and North Atlantic right whale should they come into direct contact with the spill. Marine mammals can incidentally ingest floating or submerged oil or tar and consume oil-contaminated food (Geraci 1990, St. Aubin and Lounsbury 1990). Spilled oil can foul the baleen fibers of baleen whales, temporarily impairing food-gathering efficiency or resulting in the ingestion of oil or oil-contaminated prey (Geraci 1990). Spilled oil might affect the quality or availability of aquatic vegetation (St. Aubin and Lounsbury 1990). Because the distribution of this species is largely limited to coastal waters along the Florida peninsula, the West Indian manatee would be most vulnerable to a spill reaching the preferred river system and canals where it congregates.

Oil-spill response activities can affect marine mammals, either through exposure to response chemicals (e.g., dispersants or coagulants) applied to control or break down spilled surface oil or through disturbance by or collision with spill response vehicles. The chemicals used during a spill response are toxic, but are considered much less so than the constituents of spilled oil (NRC 1989); there is little information regarding their potential effects on marine mammals. The presence of, and noise generated by, oil-spill response equipment and support vessels could temporarily disturb marine mammals in the vicinity of the response action, with affected individuals likely leaving the area. Oil-spill response support vessels can also increase the risk of collisions between these vessels and marine mammals in the vicinity of the spill response.

Hydrocarbons stored on the SRVs would be small amounts. There would be no ship-to-ship fuel oil transfer and the Port would operate under the provisions of an approved oil spill contingency plan. SRVs and service vessels are designed with features to minimize the potential for oil spills. It would be unlikely that humpback whales and North Atlantic right whales would be found in the area surrounding the Port, where potential hydrocarbon spills from SRVs would have adverse effects on marine life; and manatee would not be expected in the Port vicinity at all. Manatee would potentially be affected by a spill from a support vessel if it occurred in nearshore waters; however, support vessels would be expected to carry only small amounts of hydrocarbons. Due to the small amounts of hydrocarbons on SRVs and support vessels, and the low likelihood of ESA-listed marine mammals being in the area of a potential spill, adverse effects on ESA-listed marine mammals from hydrocarbon spills during operation would be unlikely.

LNG Spills. All SRVs are designed with features to minimize the potential for LNG spills. However, if an LNG spill were to occur, potential impacts would include exposure to low-temperature LNG at the water surface, possibly resulting in frostbite or death, and asphyxiation by natural gas vapors above the surface of the water. These impacts would likely occur in the immediate vicinity of the spill location and

for a short period of time, as LNG would evaporate when exposed to ambient temperatures. Since LNG does not dissolve in water, no adverse toxic impacts would be expected after the LNG boiled off and the vapors dispersed. Due to the short timeframe within which adverse effects on marine life would occur from an LNG spill, and the low likelihood of ESA-listed marine mammals being in the area of a potential spill, adverse effects on ESA-listed marine mammals from LNG spills during operation would be unlikely.

4.1.3 Decommissioning

Under decommissioning, impacts measurably less than construction would be expected. In general, the reverse of the Port installation processes would occur; however, impacts would be less because driven piles would not be recovered and the pipeline would be abandoned in place. Port components would be removed from the seafloor or reused, as appropriate. Unlike construction, there would be no pile driving at the STL buoy locations, so this source of noise would be absent. The process would probably result in temporary turbidity increases in the immediate vicinity of the proposed decommissioning activities. These increases could indirectly affect ESA-listed marine mammals by impacting their prey species (see previous sections on turbidity). Additionally, the presence of additional vessels during decommissioning and typical debris-removal practices could potentially affect ESA-listed marine mammals (see previous sections on vessel traffic). Decommissioning activities would occur mainly in the STL buoy area and would not involve any activities along the pipeline route or in nearshore waters. Decommissioning involves no use of explosives. According to current data, North Atlantic right whales, humpback whales, and manatees are expected to be rare in the offshore Project areas where decommissioning activities would take place, and monitoring efforts during decommissioning would detect the presence of ESA-listed marine mammal species and mitigate any impacts. Therefore, decommissioning activities would be unlikely to have adverse effects on ESA-listed marine mammals.

Given that decommissioning would occur 25 years from now, it seems reasonable to expect that technologies for decommissioning and removal, as well as species distributions and the understanding of impacts on the marine ecosystem, might be different from current conditions. This issue will be addressed at the time of decommission (estimated at 2034), at which time the owner would be required to consult with appropriate Federal agencies, submit a decommissioning plan for review and approval, and adhere to all applicable and appropriate requirements. The owner would consult with the appropriate Federal agencies at the time and submit a decommissioning plan to the Secretary for approval.

4.2 Sea Turtles

The Maritime Administration has the responsibility under the ESA to determine whether or not the Project would adversely affect federally listed threatened or endangered sea turtles and their critical habitat. In accordance with Section 7 of the ESA, the Maritime Administration and USCG informally initiated consultation with the USFWS and NMFS on August 24, 2007. Minimization measures to reduce potentially adverse impacts on protected sea turtles are described in **Section 6**. Federally listed sea turtles with documented occurrence in the northern GOM are the following: green sea turtle, hawksbill sea turtle, Kemp's ridley sea turtle, leatherback sea turtle, loggerhead sea turtle and olive ridley sea turtle, also listed in **Tables 3-1** and **4-1**.

4.2.1 Construction Impacts

Seafloor Disturbance. Installation of Port components and pipelines would temporarily disrupt benthic habitat in the immediate vicinity of the construction areas. Of the six turtle species, the loggerhead, Kemp's ridley, green, and hawksbill are known to inhabit Tampa Bay and use benthic habitats for

foraging. Although sea turtles do not directly use such habitat, they might feed on benthic species that could be temporarily displaced or destroyed by construction activities. Construction would result in a short-term loss of soft-bottom foraging habitat and a long-term loss of hard- and live-bottom foraging habitat. Most soft-bottom areas disturbed during pipeline burial would be backfilled and remain usable as potential foraging habitat. The areal extent of seafloor disturbance is approximately 9,272 acres (3,756 hectares), of which about 33 percent or 3,025.54 acres (1,224.39 hectares) would be hard- or live-bottom habitats. Most of the damage would occur during pipeline installation, including plowing of the seafloor, placement of barge anchors, and anchor sweep. Damage to the hard-bottom substrate is considered irreversible. The recovery of benthic communities associated with damaged hard-bottom areas would be much slower than for soft-bottom areas due to the slow growth rate of corals and other hard-bottom epibiota.

Seagrass beds and macroalgae are also important foraging habitat for sea turtles. In offshore areas deepwater seagrass patches of paddlegrass and macroalgae would be impacted either directly by mechanical damage during plowing or indirectly by a reduction of photosynthesis due to sediment redeposition. These impacts are expected to be long-term to permanent. In the nearshore areas, seagrass was observed predominantly near Manbirtee Island, the spoil island near Port Manatee, and in water depths shallower than 2 m (7 feet) (Port Dolphin 2007b). The nearest seagrasses are 23 m (75 feet) to the southwest and greater than 59 m (194 feet) to the northeast of the HDD exit point. However, all impacts on seagrasses would be mitigated. Therefore, it is unlikely that sea turtles would be adversely affected.

It is possible that an inadvertent release of drilling fluid, called a frac-out, could occur during HDD activities. If a frac-out were to occur, short-term sediment transport, water quality impacts, and bottom disturbance would likely occur, which could indirectly affect sea turtles. The Federal Energy Regulation Commission (FERC) Procedures require the Applicant to develop an HDD Plan that includes a description of how a frac-out would be contained and cleaned up. The Applicant would file all HDD plans with the FERC staff prior to construction. The non-Federal agencies with jurisdiction over HDD in Tampa Bay include Florida Department of Environmental Protection (FDEP) (habitat and submerged lands), Florida Fish and Wildlife Conservation Commission (FWC) (habitat and species), Tampa Port Authority (habitat and submerged lands in Tampa Bay), and Tampa Bay Regional Planning Council (regional planning council). Although Tampa Bay Regional Planning Council does not have a permitting process, they are a commenting agency for all proposed land alterations within the Tampa Bay Region. Because of the required plan to contain and clean up a frac-out, it is unlikely sea turtles would be affected by a frac-out, should one occur.

Turbidity. Turbidity increases could cause sea turtles to avoid commonly used feeding or resting habitats. Adverse impacts on the seagrass beds and macroalgae could result from increases in turbidity. The main source of water quality impacts is pipeline trenching, which would produce turbidity along the pipeline route. Turbidity modeling indicates that the total areal extent of the turbidity plumes created during pipeline installation would be approximately 4,679 acres (1,894 hectares) (ASA 2008). The turbidity plumes would be short-lived and remain fairly close to their source.

Suspended sediments in the water column reduce light availability and, therefore, seagrass production. Seagrass beds serve as feeding areas for sea turtles, thus reduction in seagrass production would indirectly affect sea turtles. However, water quality changes following construction activities would be short-term, and thus changes in seagrass productivity, if any, would not be measurable. Therefore, adverse effects on sea turtles from construction-related turbidity is unlikely.

Hydrostatic Pipeline Integrity Testing. The proposed use of approximately 24 million gallons of filtered, surface seawater during flushing and hydrostatic testing of the pipeline would result in the entrainment of phytoplankton. The intake velocity (through-screen) for hydrostatic testing would be maintained below

0.15 m/s (0.5 feet/s). Average swimming speeds for sea turtle hatchlings are 0.44 m/s (1.43 feet/s) for green turtles, 0.36 m/s (1.17 feet/s) for loggerhead turtles, and 0.25 m/s (0.83 feet/s) for leatherback turtles (Wyneken 2001). These speeds are faster than both the average and maximum intake velocities, so hatchlings would likely be able to outswim the seawater intake if they were in the area. Therefore, no measurable direct impacts on sea turtles would be expected to occur as a result of seawater intake associated with the Project.

The following BMPs were proposed by the Applicant to reduce impacts associated with hydrostatic testing or to meet specific regulatory requirements.

1. Hydrostatic test water would be discharged offshore.
2. Fresh water for the onshore pipe would be discharged on land using industry standard filtering procedures prior to release.

These BMPs are expected to be effective in reducing the magnitude and extent of impacts of hydrostatic testing on sea turtles. However, the performance of the measures should be monitored during construction to verify their effectiveness.

Vessel Traffic. Sea turtles can be injured or killed if struck by a vessel, particularly if struck by an engaged propeller. Increased vessel traffic could result in a higher number of collisions between ships and sea turtles, thereby increasing the occurrence of serious sea turtle injuries or fatalities.

Although adult turtles are visible at the surface during the day and in clear weather, they can be difficult to spot from a moving vessel when resting below the water surface or during nighttime or periods of inclement weather. Sea turtles spend most of their lives submerged and thus are not visible by vessel operators. The average percentage of time spent submerged time is 89 percent for Kemp's ridleys and 91 percent for greens (Meylan et al. 2003). While the risk of a vessel striking a sea turtle cannot be quantified, it is known to exist because of data from turtle stranding networks. A total of 298 records of dead or injured turtles exist for the inshore waters of the Tampa Bay area for 1980 through 2001. Boat-related injuries (including propeller wounds and possible boat collision injuries), were the most frequently observed carcass anomaly for loggerheads; 16 Kemp's ridleys and 1 hawksbill also showed evidence of boat injuries (Meylan et al. 2003).

The ability of an animal to appropriately respond to an approaching source of danger is constrained by how soon the animal can detect the danger. Knowledge of the sensory biology of sea turtles indicates that sound and light offer the only potential cues for detecting an approaching vessel. In one study of green turtles, flight initiation distances did not exceed 12 m (39 feet), possibly indicating a dependence on visual cues rather than sound cues. The proportion of turtles that fled to avoid the vessel decreased significantly as vessel speed increased. Turtles fled frequently in encounters with slow vessels (4 km per hour [km/h] [2.5 miles per hour (mph)]), infrequently in encounters with moderate vessel (11 km/h [6.8 mph]), and rarely in encounters with a fast vessel (19 km/h [11.8 mph]) (Hazel et al. 2007).

High volumes of vessel traffic adjacent to shallow foraging habitat could be particularly dangerous for turtles because of the tendency to flee towards deeper water and to use deeper water to rest between foraging bouts. The collision risk for turtles in all areas is likely to be further exacerbated if water clarity is low and during the night (Hazel et al. 2007). Supply vessels and crew/survey vessels would make regular trips between Port Manatee and the construction site for approximately 11 months. It is possible for sea turtles to be present in nearshore areas where seagrass has been observed (i.e., Spoil Island near Port Manatee). Potential indirect impacts include disruption of sea turtles' activities (foraging and nesting) and, in some cases, short- or long-term displacement from areas important for feeding and reproduction. Short-term changes in activity budgets that reduce amount of time feeding could represent

long-term challenges by reducing energy acquisition. These short-term changes could also have a greater impact on a population depending on resource availability. The energetic consequences of one or more disturbance-induced periods of interrupted feeding have not been evaluated quantitatively. Energetic consequences would depend on whether suitable food is readily available.

Increases in vessel traffic during construction could potentially increase the likelihood for collisions with sea turtles, thereby increasing the occurrence of serious injuries or mortality. While it is known that an increase in vessel traffic increases the risk of collision, the probability of that risk cannot be quantified. Increases in vessel traffic during construction would be moderate in Egmont Channel in comparison with existing vessel traffic. These increases would last for the time of construction, approximately 11 months. Therefore, the risk of vessel strikes and impacts on behavior could occur on sea turtles that are present in areas where construction-related vessel traffic would occur. If a sea turtle were to be struck, it would be considered a "take" under the ESA. Therefore, mitigation measures would be taken to minimize the potential for vessel collisions during construction.

The following BMPs were proposed by the Applicant to reduce impacts associated with vessel traffic or to meet regulatory requirements.

1. All personnel associated with the Project shall be advised of the potential presence of sea turtles and the need to avoid collisions.
2. All vessel crew members and contractors would participate in a fisheries training for sea turtle presence and emergency procedures in the event a sea turtle is struck by a vessel.
3. All construction personnel are responsible for observing water-related activities for the presence of sea turtles.
4. All construction personnel shall be advised that there are civil and criminal penalties for harming, harassing, or killing sea turtles, which are protected under the ESA.
5. If a sea turtle is seen within 100 yards of the active daily construction/dredging operation or vessel movement, the following precautions shall be implemented to ensure its protection.
   - Cessation of operation of any moving equipment closer than 50 feet to a sea turtle
   - Operation of any mechanical construction equipment shall cease immediately if a sea turtle is seen within a 50-foot radius of the equipment
   - Activities may not resume until the sea turtle has departed the Project area of its own volition. Attempts to scare or encourage the protected species to leave the area would be prohibited.
6. All vessels associated with the construction project shall operate at "no wake/idle" speeds at all times while in the construction area and while in water depths where the draft of the vessel provides less than a 4-foot clearance from the bottom. All vessels would preferentially follow deepwater routes (e.g., marked channels) whenever possible.
7. During installation and decommissioning, lookouts are required to scan for surfacing turtles and report sightings to captain, who would notify the Environmental Coordinator.
8. Any collision with or injury to a sea turtle would be required to be reported immediately to the NOAA Fisheries Protected Resources Division (1-727-824-5312), the FWC Law Enforcement (1-850-488-6251), and the local authorized sea turtle stranding/rescue organization.
9. During construction of the facility, an Environmental Coordinator would be on site to document the effectiveness of the BMPs.

With strict adherence to the proposed BMPs, adverse impacts on sea turtles from increased vessel traffic during construction would be minimized.

Noise. The main noise sources include pile driving (at the STL buoy locations) and vessel engines. Pile driving would occur in offshore waters; therefore noise would not affect sea turtles in nesting areas onshore or breeding and foraging areas in nearshore waters approximately 30 miles from the STL buoy locations. However, noise impacts on breeding and foraging sea turtles are possible in offshore waters, including in the proposed Port location.

Noise modeling indicates that sea turtles in the Project area could hear the broadband noise (over a wide range of frequencies) associated with construction of the deepwater port and pipeline. **Table 4-3** presents the distance from noise sources that Level A and Level B harassment of listed species could occur for offshore construction activities. **Table 4-4** presents the distance from noise sources that Level A and Level B harassment of listed species could occur for inshore construction activities. Based on the types of noise and the distances affected, measures should be taken to reduce or avoid both Level A and Level B harassment on sea turtles.

The possibility of TTS exists for sea turtles. Lenhardt (2002) found that at received levels from 151 to 161 dB re 1 µPa, adult loggerheads showed a marked response (i.e., increase swimming speeds) and avoided areas where low-frequency air guns were being used at up to 175 dB re 1 µPa. However, they eventually habituated to these received levels. During the same trials, one turtle exhibited a TTS of more than 15 dB for up to 2 weeks after exposure to these received levels (Lenhardt 2002). Juveniles also have been found to avoid low-frequency sound (less than 1,000 kHz) produced by airguns (O'Hara and Wilcox 1990). TTS can last from minutes or hours to days and the magnitude of the TTS depends, upon other factors, on the level and duration of noise exposure. For sound exposures at or somewhat above the TTS level, hearing sensitivity usually recovers rapidly after exposure to the noise ends (Richardson et al. 1995). Because sea turtles would be expected to leave the area, auditory trauma such as TTS or PTS is unlikely. The Applicant has identified and committed to mitigation to reduce the likelihood of a sea turtle being exposed to the highest sound levels during pile driving. "Ramp-up" procedures would be used to gradually increase the sound intensity during pile driving and allow time for sea turtles to leave the area before the sound reaches its full intensity. The intent of ramp-up is to either avoid or reduce the potential for instantaneous hearing damage to an animal (from the sudden initiation of an acoustic source at full power) that might be located in close proximity. Numerous sources including the Marine Mammal Commission, NMFS, and the MMS note that the effectiveness of "soft start," although theoretically sound, has yet to be verified empirically (David 2006, Ragen 2008).

Behavioral responses to underwater noise can occur during pile driving. Avoidance behavior could reasonably be expected to occur at distances ranging from a few meters to a few hundred meters from a pile driver. Exposure to pile-driving noise could interrupt feeding, resting, or other behaviors or could cause a turtle to change its course of travel. The interruptions might continue for as long as the pile driving continues, or until the sea turtle could swim outside of the ZOI. Short-term changes in activity budgets that reduce amount of time feeding could represent long-term challenges by reducing energy acquisition. Energetic consequences would depend on whether suitable food is readily available. The energetic consequences of one or more disturbance-induced periods of interrupted feeding have not been evaluated quantitatively. Because of the limited areal extent of impacts and the short duration of the pile-driving activity, no significant impacts on sea turtles are expected.

All six species of sea turtles (possibly present at the STL buoy locations and anywhere along the pipeline route) could be exposed to construction vessel noise. Although sounds created by construction equipment and vessels would be continuous during pipeline installation, activities would progress slowly along the route as the pipeline is laid, buried, and the trench backfilled. Thus, any one area would be subject to the

maximum sound levels for only a day or two each time as the construction activities pass that area. It is likely that sea turtles would be able to hear low-frequency underwater noise from construction vessels and possibly experience some disturbance. The most likely impacts would be short-term behavioral changes such as diving and evasive swimming, disruption of activities, or departure from the area.

The following BMPs were proposed by the Applicant to reduce impacts associated with noise or to meet specific regulatory requirements.

1. Anchors for the unloading buoys would be driven piles. Pile-driving would be confined to an approximately 2-week period. Bubble curtains, mufflers, sound-muffling devices, and engine covers would be used where appropriate to reduce the noise associated with pile driving and vessel noise. Additionally, engines and equipment would be turned off when not in use. To minimize excessive noise, engines on all equipment and vessels would be maintained in accordance with manufacturer's recommendations.
2. All vessel crew members and contractors would be requested to "ramp-up" (also known as "soft start" or "slow build up"), which entails the gradual increase in intensity of a sound source. The intent of ramp-up is to either avoid or reduce the potential for instantaneous hearing damage to an animal (from the sudden initiation of an acoustic source at full power) that might be located in close proximity. Increasing sound levels are designed to warn animals of pending seismic operations, and to allow sufficient time for those animals to leave the immediate area.

With strict adherence to the proposed BMPs, noise is not likely to adversely affect sea turtles. Most construction-related noise (i.e., pile driving) would be temporary and localized.

Entanglement. Entanglement of sea turtles in discarded fishing gear and other marine debris is a serious and growing problem (USFWS and NMFS 1992, 1993, 2008). Once entangled, turtles can be injured by the line itself, become susceptible to predation because of reduced mobility, or drown if they are unable to surface for air. The risk of a sea turtle becoming entangled in buoy anchor lines is very low because the anchor chains would be large, heavy, and taut. In addition, there would be no horizontal link between anchor lines, eliminating this potential for entanglement. The derrick/lay barge could use up to 10 anchor cables, including the anchor, anchor line, and mid-line buoy. The mid-line buoy would be a single buoy and line used to suspend the anchor line to avoid dragging and scouring the seafloor. All lines would be greater than 4 inches in diameter. Anchor lines on the derrick/lay barge would be set and raised once during the installation of each unloading buoy, but they would be set and raised repeatedly during pipeline installation. Other construction vessels could also employ anchors and anchor lines.

The following BMPs were proposed by the Applicant to reduce impacts associated with entanglement or to meet specific regulatory requirements.

1. Siltation barriers shall be made of material in which a sea turtle cannot become entangled (not monofilament net), be properly secured, and be regularly monitored to avoid protected species entrapment.

1. Siltation barriers may not block sea turtle entry to or exit from designated critical habitat without prior agreement from the NOAA Fisheries Protected Resources Division, St. Petersburg, Florida.
2. Any lines or other equipment that have the potential to become a source of entanglement for sea turtles would only be deployed as long as necessary to complete the task and would then be removed from the site.

3. Any lines or other equipment that have the potential to become a source of entanglement for sea turtles would be kept as taut as possible to prevent entanglement; however, a certain amount of slack is necessary to account for currents, tides, and other factors.
4. In the unlikely event that entanglement appears likely, the operator would remove the source as quickly as possible or take in the slack.
5. If temporary buoys need to be placed, materials such as heavy chains or cables would be used to avoid material that could enable entanglement.
6. Lines with mandated modifications, such as knotless and nonfloating material, would be used on construction vessels.
7. Any collision with or injury to a sea turtle would be required to be reported immediately to the NOAA Fisheries Protected Resources Division (727-824-5312), the FWC Law Enforcement (850-488-6251), and the local authorized sea turtle stranding/rescue organization, as appropriate.

With strict adherence to the proposed BMPs, entanglement is not likely to adversely affect sea turtles.

Lighting. The lighting associated with this Project's construction can affect nesting and hatching sea turtles adjacent to the shoreline where the construction will occur. The main issue concerning lighting and sea turtles is disorientation of hatchlings by artificial lighting on or near nesting beaches (Witherington 1997). Under natural conditions, hatching sea turtles typically emerge from nests at night and move toward the brightest, most open horizon which is over the ocean. However, when bright light sources are visible on the beach, they become the brightest spot on the horizon and attract hatchlings in the wrong direction making them more vulnerable to predators, desiccation, entrapment in debris or vegetation, and exhaustion, and often lure them onto roadways and parking lots where they are run over. Artificial lights can also disorient hatchlings once they reach the water. Electroretinography (ERG) data show that green turtles are most sensitive to light in the violet to orange region of the visible spectrum, from 400 to 640 nanometers. Green turtles, hawksbills, and olive ridleys were most strongly attracted to light in the near-ultraviolet to yellow region of the spectrum and were weakly attracted or indifferent to orange and red light. Loggerheads were most strongly attracted to light in the near-ultraviolet to green region. A light source emitting both 525-nanometer (green) and 645-nanometer (red) light, a source highly attractive to hatchlings, appears to a human observer to emit yellow light comparable to a 588-nanometer monochromatic source, which would be only weakly attractive to hatchlings (Witherington and Martin 1996).

Nearly all ocean-facing (Gulf) sandy beaches in the Tampa Bay area are used as nesting habitat by sea turtles, primarily loggerheads. The NMFS notes that attraction to offshore locations is less problematic than attraction to landside locations, as the issue is to ensure that hatchlings head to sea rather than remaining onshore. NMFS concludes that while some adverse effects could occur from brightly lit platforms, "it is unlikely that they would appreciably reduce the reproduction, numbers, or distribution of sea turtles in the wild" (NMFS 2001, 2002).

The following BMPs were proposed by the Applicant to reduce impacts associated with lighting.

1. Lighting used during all activities would be regulated to reduce wattage and quantity of lights to complete the activity.
2. Lighting would be downshielded to prevent unnecessary upward illumination, while directing the light to vessel decks as needed.
3. Lighting would be turned off when not being used.

Strict adherence to these BMPs would decrease light attraction by sea turtles thereby reducing their vulnerability to disorientation, vessel strikes, noise, predation, and entanglement. As such, impacts on sea turtles would be insignificant. Therefore, adverse effects on sea turtles during construction would be unlikely.

4.2.2 Operations Impacts

Seafloor Disturbance and Turbidity. Operations activities would cause long-term disturbances in both soft- and hard-bottom habitat in the offshore portion of the Project area. The placement of buoy system parts, direct placement of the pipelines, and concrete mattresses along the pipeline route, as well as anchor sweep, would result in 36.76 acres of long-term disturbance on soft-bottom habitat and 34.53 acres of long-term disturbance on hard-bottom habitat. Although sea turtles do not directly use such habitat, they might feed on benthic species that could be temporarily displaced or destroyed by operation activities and thus minor, indirect, adverse impacts on sea turtles from seafloor disturbance and turbidity would be expected.

Vessel Traffic. Sea turtles can be injured or killed if struck by a vessel, particularly if struck by an engaged propeller. Increases in vessel traffic (with no mitigation or monitoring) could potentially increase the likelihood for collisions with sea turtles, thereby increasing the occurrence of serious injuries or mortality. While it is known that an increase in vessel traffic increases the risk of collision, the probability of that risk cannot be quantified.

The following BMPs were proposed by the Applicant to reduce impacts associated with vessel traffic or to meet specific regulatory requirements.

1. All personnel associated with the Project shall be advised of the potential presence of sea turtles and the need to avoid collisions.
2. All vessel crew members and contractors would participate in a fisheries training for sea turtle presence and emergency procedures in the unlikely event a sea turtle is struck by a vessel.
3. If a sea turtle is seen within 100 yards of the active daily construction/dredging operation or vessel movement, all appropriate precautions shall be implemented to ensure its protection. These precautions shall include the following:
   - Cessation of operation of any moving equipment closer than 50 feet to a sea turtle
   - Operation of any mechanical construction equipment shall cease immediately if a sea turtle is seen within a 50-foot radius of the equipment
   - Activities may not resume until the protected species has departed the Project area of its own volition.
4. Any collision with or injury to a sea turtle would be required to be reported immediately to the NOAA Fisheries Protected Resources Division (1-727-824-5312), the FWC Law Enforcement (1-850-488-6251), and the local authorized sea turtle stranding/rescue organization.

With strict adherence to the proposed BMPs, no significant impacts on sea turtles are expected as the result of increased vessel traffic associated with the Proposed Action.

Noise. Continuous, yet transient noise would be created by SRVs, support vessels, and pilot vessels in transit. The acoustic transponder would emit a 30-kHz signal at 188 to 192 dB re µPa when signaled by an incoming SRV. Therefore, this signal would not be within the hearing range of sea turtles, which generally range from 0.08 to 2 kHz with the best dynamic hearing range between 0.1 and 1 kHz (Ridgway

et al. 1969, Lenhardt 1994, Moein et al. 1994, Moein Bartol et al. 1999). Overall, the amount of noise created by vessel traffic during routine Port operations would be consistent with other man-made underwater noise sources in the area (e.g., commercial shipping). Ambient underwater noise conditions are expected to vary, depending on factors such as wind and waves, precipitation noise, biological noise in the area, and tidally generated noise (JASCO 2008).

Entanglement. The possibility exists that a sea turtle could become entangled in the messenger or recovery line. Although there is evidence that some sea turtles take up residence, at least briefly or seasonally, at platforms or other hard-bottom structures, a statistical study of such associations in the GOM produced mixed results, with positive associations in a few areas but little or no association in others (Lohoefener et al. 1990). The buoy locations are in an area where extensive low-relief hard-bottom habitat already exists, so the subsea buoys would not constitute a unique feature likely to attract large numbers of turtles from surrounding areas. There would be two buoy locations in a small area, and relatively few turtles would be expected to encounter them. The likelihood of entanglement is insignificant because the anchor chains securing the unloading buoys would be large, heavy, and taut. In addition, there would be no horizontal link between anchor lines.

The following BMPs were proposed by the Applicant to reduce impacts associated with entanglement or to meet specific regulatory requirements.

1. Any lines or other equipment that have the potential to become a source of entanglement for sea turtles would be kept as taut as possible to prevent entanglement; however, a certain amount of slack is necessary to account for currents, tides, and other factors.
2. In the unlikely event that entanglement appears likely, the operator would remove the source as quickly as possible or take in the slack.
3. If temporary buoys need to be placed, materials such as heavy chains or cables would be used to avoid material that could enable entanglement.
4. Lines with mandated modifications, such as knotless and nonfloating material, would be used on construction vessels.
5. Any collision with or injury to a sea turtle would be required to be reported immediately to the NOAA Fisheries Protected Resources Division (727-824-5312), the FWC Law Enforcement (850-488-6251), and the local authorized sea turtle stranding/rescue organization, as appropriate.

With strict adherence to the proposed BMPs, no significant impacts on sea turtles are expected as a result of entanglement.

Lighting. Due to the distance offshore, lighting at the STL buoy locations is expected to have no detectable impact (beneficial or adverse) on sea turtle hatchlings. Offshore structures such as drilling rigs or drill ships typically are visible from shore at distances of 5 to 16 km (3 to 10 NM), and on a clear night, lights on top of offshore structures could be visible to humans on shore to a distance of approximately 32 km (20 NM) (MMS 2002b). The buoy locations are 45 km (28 NM) offshore and, therefore, the associated lighting would not be visible to humans or turtle hatchlings. Also, the distribution of hatchlings in offshore waters is likely to be much more diffuse than at the nesting beach, and the chance of numerous turtle hatchlings encountering a particular offshore structure (e.g., a ship moored at the STL buoy) is remote. The average level of lighting at the vessel side (at sea level) would be 50 to 55 Lux, and at the buoy markers would be 900 to 1,000 Candela (Alards method) and a peak of 400 to 500 Candela (Clear lens).

As of 2005, there were more than 4,000 bottom-founded structures (e.g., jacketed platforms, caissons, and well protectors) and 29,500 well-related structures in the northern GOM (MMS 2005). Many of these structures are well-lit, and the MMS (2002b) speculated that if hatchlings were attracted to brightly lit platforms, they could be susceptible to increased predation since large birds and predatory fish also congregate around these structures. The NMFS addressed this issue in biological opinions (BOs) for several oil and gas lease sales in the GOM (NMFS 2001, 2002). The NMFS analysis notes that attraction to offshore locations is less problematic than attraction to landside locations, as the issue is to ensure that hatchlings head to sea rather than remain onshore. NMFS concludes that while some adverse effects might occur from brightly lit platforms, "it is unlikely that they would appreciably reduce the reproduction, numbers, or distribution of sea turtles in the wild" (NMFS 2001, 2002).

The following BMPs were proposed by the Applicant to reduce impacts associated with lighting and or to meet specific regulatory requirements. All lights would be installed and used in accordance with NMFS and USFWS guidelines designed to reduce impacts.

1. Lighting used during all activities would be regulated to reduce wattage and quantity of lights to complete the activity.
2. Lighting would be downshielded to prevent unnecessary upward illumination, while directing the light to vessel decks as needed.
3. Lighting would be turned off when not being used.

Strict adherence to these BMPs would decrease light attraction by sea turtles thereby reducing their vulnerability to disorientation, vessel strikes, noise, predation, and entanglement. As such, adverse impacts on sea turtles would be unlikely.

Seawater Intake and Cooling Water Discharge. Seawater would be taken in through one of two sea chests covered with a lattice screen. The two intakes would be located 4.5 m (14.8 feet) and 7.5 m (24.6 feet) below the water line of a fully loaded vessel. The water intake velocity (through-screen) would be maintained below 0.15 m/s (0.5 feet/s) independent of vessel size. The speeds of several measured sea turtle hatchling species are faster than both the average and maximum intake velocities, so hatchlings would be able to outswim the seawater intake. Average swimming speeds for sea turtle hatchlings are 0.44 m/s (1.43 feet/s) for green turtles, 0.36 m/s (1.17 feet/s) for loggerhead turtles, and 0.25 m/s (0.83 feet/s) for leatherback turtles (Wyneken 2001). In addition, only juvenile and adult sea turtles would be present in the Project area and they would also be capable of outswimming the seawater intake. No measurable direct impacts on sea turtles would be expected to occur as a result of seawater intake associated with the Project.

Indirect, adverse impacts of seawater intake on sea turtles would primarily be associated with the impingement or entrainment of marine organisms. Impingement would occur if organisms became trapped against the seawater intake screens; entrainment would occur if small marine organisms (e.g., ichthyoplankton) were drawn into the seawater intake system. The mortality rate of all entrained organisms is conservatively assumed to be 100 percent. The entrainment and subsequent mortality of eggs, larvae, phytoplankton, and zooplankton would potentially impact the juvenile and hatchling sea turtles that feed on them. However, considering the overall availability of food in this area, these impacts would be insignificant. Therefore, adverse impacts on sea turtles would be unlikely.

Cooling water would be discharged at 10 °C (18 °F) above ambient seawater temperature. Modeling indicates that cooling water temperature would be 1 °C (1.8 °F) above ambient temperature within 100 m (328 feet) of the discharge. In compliance with NPDES permits, the cooling water discharge plume is not expected to reach the seafloor. An increase in temperature could result in adverse behavioral and

physiological impacts. The main difference in comparison between sea turtles and marine mammals is that sea turtles are ectothermic (cold-blooded) animals and, thus, could potentially be more adversely affected by warmed seawater discharges from engine cooling. However, due to the localized nature of the discharges and dilution in the open ocean (MMS 2007c), it is unlikely that a threatened or endangered sea turtle would be within the discharge plume long enough for more than a minor impact to occur.

Most sea turtles would be expected to avoid the cooling water discharge during the summer months and be attracted to the cooling water during the winter months. There would be a marine growth prevention system on the SRV for ballast water treatment, but this system would not be used while at the buoy site. The effects of cooling water discharges would decrease water quality in a localized area but would be expected to dilute rapidly.

Routine Discharges. Testing of the firefighting system associated with operation of the Port would comply with NPDES permit conditions. While SRVs are present at the Port, they would not discharge domestic waste, bilge water, or ballast water. In addition, on the SRVs, gutter bars would be replaced around equipment where oil leaks could occur (e.g., mooring winches, cranes). Rain water from these areas would be drained to a bilge holding tank. No rain water would be discharged overboard, from areas around equipment where oil leaks would occur, while at the buoy. The firewater system discharges consist of uncontaminated seawater from testing the firefighting system on the SRVs. Based on the infrequent nature of the discharge, its short duration, and the lack of contaminants, no impacts on sea turtles are expected.

Marine Debris. Sea turtles could be seriously injured or killed if they became entangled in or ingested construction debris or other materials accidentally released by SRVs moored at the Port, should that occur. Marine debris could also affect a sea turtle's ability to successfully migrate, feed, mate, or nest. The discharge and disposal of garbage and other solid debris from vessels by lessees is prohibited by the MMS (30 CFR 250.300) and the USCG (MARPOL Annex V, Public Law 100-220 [Statute 1458]) (33 CFR Part 151). The discharge of plastics, including ashes from burned plastics, is strictly prohibited and is therefore never authorized. All plastics must be returned to shore, and are tracked. These prohibitions on the discharge and disposal of garbage and other solid debris from vessels would be incorporated as enforceable conditions into the DWPA license. The USCG enforces MARPOL and the Deepwater Port License and fines or penalties could be assessed where laws and regulations are violated.

No food or garbage would be discharged into the sea. All such materials would be placed in proper containers and disposed of in accordance with applicable regulations. No wildlife would be fed or intentionally attracted to the SRVs or support vessels, and no fishing by crewmembers would be allowed. Given the relatively small amount of marine debris associated with the Project, significant increases in sea turtle ingestion of or entanglement in debris would not be expected.

The following BMPs were proposed by the Applicant to reduce impacts associated with marine debris or to meet specific regulatory requirements.

1. All vessel crew members and contractors would be responsible for ensuring that no debris would inadvertently enter the water, thus reducing the chance of entanglement and eliminating pollution to marine habitats.
2. Discharge or disposal of garbage and other solid debris from vessels would be prohibited, consistent with MMS (30 CFR 250.300) and the USCG). Discharge of plastics would be strictly prohibited and would never be authorized; this includes ashes from burned plastics. All plastics would be returned to shore and would be tracked. Marine debris training consistent with MMS NTL 2007-G03 Marine Trash and Debris Awareness and Elimination would be required for all

personnel working on the project. No food or garbage would be discharged; all waste would be offloaded onshore for proper disposal.

3. No wildlife would be fed or attracted to the vessel and no fishing would be allowed.
4. A waste management plan would be developed and implemented as part of the port operations manual.

With strict adherence to the measures that would be implemented to reduce the discharge of marine debris, no significant impacts on sea turtles are expected as the result of marine debris associated with the Proposed Action. Therefore, adverse effects on sea turtles are unlikely.

Planned and Unplanned Maintenance and Emergencies. Planned and unplanned maintenance, emergencies, repair, inspection, and surveys could both directly and indirectly affect sea turtles if they occur in the proposed project vicinity. Impacts would be expected to be similar in nature to some construction impacts (see **Section 4.1.1**). In general, the potential impacts of planned maintenance, repair, inspection, and surveys would be similar or of less magnitude than construction impacts with adherence to the same recommended mitigation measures, monitoring, and BMPs. Unplanned maintenance and emergencies are expected to occur infrequently. Therefore, impacts on sea turtles from planned and unplanned maintenance, emergencies, repair, inspection, and surveys would be expected to be low. In some cases when unplanned maintenance, repairs, or emergencies occur, it might not be possible to follow some of the recommended mitigation measures, monitoring, and BMPs. In these cases of unplanned maintenance and emergencies, resource agencies (NMFS, USFWS, and state agencies, as appropriate) would be informed. ESA consultation could potentially be reinitiated after emergency situations and for cases where mitigation measures and BMPs could not be followed.

Hydrocarbon Spills. A hydrocarbon spill associated with fuel and lubricating oil on the vessels could adversely affect sea turtles. Approximately 3 percent of annual south Florida sea turtle strandings are associated with oil spills. Oil spills in shipping lanes result in surface contamination along ocean tanker lanes and coastal areas. Like any living resource at risk, turtles are susceptible to a number of potential indirect impacts, which would generally be less obvious than short-term direct impacts such as mortality, but might ultimately cause more harm to populations. Dietary differences can potentially increase or decrease risk from hydrocarbon ingestion. Kemp's ridley and loggerhead turtles, for example, feed primarily on crustaceans and mollusks, which bioaccumulate petroleum hydrocarbons because they cannot efficiently clear contaminants from their bodies. Thus Kemp's ridleys and loggerheads might be at greater risk of exposure by ingesting food than leatherback turtles, which feed primarily on coelenterates. Trapped oil in sediments of intertidal beds of turtle grass (*Thalassia testudinum*) kills the seagrass, a significant component of green turtle diets. Decreases in invertebrates and sponge populations also affect hawksbills, loggerheads, and Kemp's ridleys (NOAA 2003).

There would be no ship-to-ship fuel oil transfer and the Port would operate under the provisions of an approved oil spill contingency plan. Vessels would be operated in compliance with all applicable spill prevention requirements and would have spill response plans. Pursuant to the USCG's deepwater port regulations, the USCG will prepare an Independent Risk Assessment to assess the risk and consequences of accidental and intentional events that compromise cargo containment.

LNG spills. The diving behavior of sea turtles puts them at risk in the unlikely event of an LNG spill. They rapidly inhale a large volume of air before diving and continually resurface over time. Adults doing this would experience extended physical exposure to the spill and prolonged exposure to vapors. Compared to hatchlings, however, juveniles and adults spend less time at the sea surface, which potentially reduces their chances of exposure (NOAA 2003). A release of natural gas would rise to the surface and dissipate. The pipeline would be monitored and be capable of being shut down in the event of

a release. Pursuant to the USCG's deepwater port regulations, the USCG will prepare an Independent Risk Assessment to assess the risk and consequences of accidental and intentional events that compromise cargo containment.

4.2.3 Decommissioning

Under decommissioning, it would be expected that the reverse of the Port installation processes would occur. Port components would be removed from the seafloor or reused, as appropriate. Unlike construction, there would be no pile driving at the STL buoy locations, so this source of noise would be absent. The process would probably result in temporary turbidity increases in the immediate vicinity of the proposed decommissioning activities. These increases could indirectly affect sea turtles by impacting their prey species (see section on turbidity). Additionally, the presence of additional vessels during decommissioning and typical debris-removal practices could potentially affect sea turtles (see section on vessel traffic). Decommissioning activities would occur mainly in the STL buoy area and would not involve any activities along the pipeline route or in nearshore waters. Decommissioning involves no use of explosives. Decommissioning is not likely to have adverse effects on sea turtles because decommissioning is a one-time event and monitoring efforts during decommissioning would detect presence of sea turtles and mitigate any impacts.

Given that decommissioning would occur 25 years from now, it seems reasonable to expect that technologies for decommissioning and removal, and the understanding of impacts on the marine ecosystem, might be different from current conditions. This issue will be addressed at the time of decommission (estimated at 2034), at which time the owner would be required to adhere to all applicable and appropriate requirement. The owner would consult with the appropriate Federal agencies at the time and submit a decommissioning plan to the Secretary for approval.

4.3 Coastal and Marine Birds

The federally listed birds that occur in the Project area are Audubon's crested caracara, piping plover, Florida scrub-jay, wood stork, and red-cockaded woodpecker, also identified in **Tables 3-1** and **4-1**. Of these species, only the piping plover (*Charadrius melodus*), listed as threatened, and wood stork (*Mycteria americana*), listed as endangered, are known to inhabit or frequent coastal areas and waters of the inner continental shelf where proposed project activities would take place.

Only three piping plover individuals have been recorded within the St. Petersburg survey area last year; none within the Alafia Banks Sanctuary, the Tampa survey area, or the Bradenton survey area (Audubon Society 2007), which would be in the vicinity of the project area. Critical habitat for wintering piping plovers is designated in the Project area on Egmont Key in Hillsborough County (66 FR 36038-36086). Although foraging wood storks were observed in the Project area during the October to November 2007 field surveys, rookeries are not known within or adjacent to the proposed construction area (Port Dolphin 2007b). However, a wood stork nesting colony exists within 15 miles of suitable foraging habitat within the proposed project area.

4.3.1 Construction Impacts

Vessel Traffic. Traffic increases associated with construction would be short-term and temporary. Approximately 1,800 vessel trips are anticipated during the construction of Port Dolphin (within 11 months). Vessel traffic could result in degraded water quality and disturbance of foraging/reproductive activity. Disturbance often curtails breeding success; excessive disturbance can cause individuals to desert the nest, exposing eggs or chicks to the elements and predation. Interrupted feedings can stress juvenile birds during critical periods in their development (USFWS 2007c). The

Project area is a busy Port with vessel traffic. Foraging wood storks in the Project area are currently exposed to vessel traffic. The Proposed Route is approximately 800 m (2,625 feet) from Passage Key NWR and 1,750 m (5,742 feet) from Egmont Key NWR. Vessels would travel south of Egmont Key, which is designated as critical habitat for wintering piping plovers.

The following BMPs were proposed by the Applicant to reduce impacts associated with vessel traffic or to meet a regulatory requirement.

1. Plan vessel routes to avoid sensitive receptors (e.g., bird colonies) to the extent feasible. This would require consultation with USFWS and FWC to determine locations and seasonal occurrences of protected species' colonies within the Project area.
2. Limit the number of vessel trips by using full-capacity crew boats as much as possible.

These restrictions would be mandated on all vessels, except when USCG regulations or safety precautions supersede them. These BMPs would reduce physical contact, thereby decreasing impacts on threatened and endangered coastal and marine birds. Therefore, temporary impacts associated with construction vessel traffic are expected to be insignificant.

Noise. Localized, short-term increases in noise associated with construction could potentially affect coastal birds. The level of impact would vary depending on the bird species, type of vessel or machinery, vessel speed, relative noise level, distance, frequency, and season (MMS 2002b). During Project installation, increased noise levels could temporarily displace coastal and marine birds from commonly used feeding or resting areas, but displaced birds would be expected to return shortly after construction ceased. During construction, increased noise levels could temporarily displace foraging wood storks and piping plover, but displaced individuals would be expected to return shortly after construction ceased. The lay barge and support vessels move very slowly down the pipeline corridor during installation activities to decrease the level of disturbance from wakes. Any local noise ordinances would also dictate construction work hours in this area. Animals, in general, tend to become less sensitive to those types of noise and disturbance to which they are repeatedly exposed (Richardson et al. 1995). Because the Proposed Action occurs in a busy Port, wood storks and piping plovers would be expected to have adapted to the variety of noise levels associated with Port Manatee and local industry. Therefore, adverse impacts on wood storks and piping plovers from noise would be so low as to be discountable.

Lighting. The use of lights on construction and support vessels would be short-term, temporary, and transient. The construction activities would be performed to the extent practicable to avoid sensitive areas during bird nesting seasons. In North Florida these birds are more numerous in summer than in winter, indicating a fall migration to South Florida (FWC 2003). The Applicant has proposed to construct nearshore and onshore components early in the 11 month construction schedule, which would avoid the fall migration. In addition, the lay barge and support vessels move very slowly down the pipeline corridor during installation activities. The slow movement of steady light is expected to not surprise bird in flight over the water. On land, construction would be limited by local noise ordinances , which would limit on land contraction to normal business hours, which would also reduce nighttime lighting that would affect nesting birds near the onshore construction zone.

The following restrictions would be mandated on all vessels, except when USCG regulations or safety precautions supersede them.

1. Lights would be installed and used in accordance with USFWS guidelines designed to reduce impacts in comparable construction projects (USFWS 2000).

2. Lighting would be downshielded to prevent unnecessary upward illumination, while directing the light to decks as needed.
3. Lighting would be turned off when not being used.
4. Plan vessel routes to avoid sensitive receptors (e.g., bird colonies) to the extent feasible.
5. Limit the number of vessel trips by using full-capacity crew boats as much as possible.
6. During construction of the facility, an Environmental Coordinator would be on site.
7. In the unlikely event a pelagic bird is injured, immediately notify the USFWS Division of Migratory Birds, Southeast Regional Division office (404-679-7189).

With strict adherence to the proposed BMPs, lighting associated with the Proposed Action is not likely to adversely affect threatened and endangered coastal and marine birds.

4.3.2 Operations Impacts

Vessel Traffic. Traffic increases associated with routine Port operations would be minor compared to the total vessel traffic in the Project area. SRVs and support vessels in transit to and from the Port could result in long-term, minor, direct, adverse impacts on threatened and endangered coastal and marine birds. The Applicant has identified BMPs and minimization measures for birds in the Project area to include planning vessel routes to avoid sensitive receptors (e.g., bird colonies) to the extent feasible and limiting the number of vessel trips as much as possible. These restrictions would be mandated on all vessels, except when USCG regulations or safety precautions supersede them. These BMPs would reduce physical contact; therefore, impacts on threatened and endangered coastal and marine birds would be insignificant.

Noise. Noise created by SRVs and support vessels in transit to and from the Port would be continuous, yet transient, for short periods of time. Animals, in general, tend to become less sensitive to those types of noise and disturbance to which they are repeatedly exposed (Richardson et al. 1995). Because the construction activities, associated with the Proposed Action, occur in a busy Port and shipping channel, wood storks and piping plovers would be expected to have adapted to the variety of noise levels associated with Port Manatee and local industry. Therefore, impacts on wood storks and piping plovers would be insignificant.

Lighting. Lighting aboard SRVs would be low, and all lights would be installed and utilized in accordance with USFWS guidelines designed to reduce migratory bird impacts (USFWS 2000). The use of solid or pulsating red lights would be avoided, and all vessel lights would be downshielded to minimize visibility to birds above. Based on the proposed BMPs, the effects of lighting associated with the Proposed Action on wood storks and piping plovers would be insignificant.

Seawater Intake and Cooling Water Discharge. Negligible impacts on wood storks would occur as a result of seawater intake and cooling water discharges associated with the Project. Seawater intakes would be below the sea surface, which would preclude birds from being entrained or impinged. Cooling water would be discharged at 10 °C (18 °F) above ambient seawater temperature. Due to dilution in the open ocean and because the cooling water plumes compose a relatively small localized area, impacts are expected to be negligible.

Routine Discharges. Routine discharges from project-related vessels (i.e., grey water) would have an effect on water quality and therefore an indirect effect on birds. Due to dilution in the open ocean and because the discharges would be localized, impacts on threatened and endangered birds are expected to be negligible.

Marine Debris. Wood storks foraging in the Project area could be seriously injured or killed if they became entangled in or ingested construction debris or other materials accidentally released by SRVs moored at the Port. Marine debris could also affect a bird's ability to successfully migrate, feed, mate, or nest. Short-term, minor, direct, adverse impacts on coastal and marine birds could occur as a result of marine debris associated with the Project. The discharge and disposal of garbage and other solid debris from vessels by lessees is prohibited by the MMS (30 CFR 250.300) and the USCG (MARPOL Annex V, Public Law 100-220 [Statute 1458]) (33 CFR Part 151). The discharge of plastics, including ashes from burned plastics, is strictly prohibited and is therefore never authorized. All plastics must be returned to shore, and are tracked. These prohibitions on the discharge and disposal of garbage and other solid debris from vessels would be incorporated as enforceable conditions into the DWPA license. The USCG enforces MARPOL and the Deepwater Port License and fines or penalties could be assessed where laws and regulations are violated.

In addition, no food or garbage would be discharged into the sea. All such materials would be placed in proper containers and disposed of in accordance with applicable regulations. No wildlife would be fed or intentionally attracted to the SRVs or support vessels, and no fishing by crewmembers would be allowed. Given the relatively small amount of marine debris associated with the Project, major increases in coastal and marine bird ingestion of or entanglement in debris would not be expected. The relatively small amount of marine debris potentially generated at the Port, along with required avoidance measures would result in insignificant impacts on threatened and endangered coastal and marine birds.

Planned and Unplanned Maintenance and Emergencies. Planned and unplanned maintenance, emergencies, repair, inspection, and surveys could both directly and indirectly affect coastal and marine birds if they occur in the proposed project vicinity. Impacts would be expected to be similar in nature to some construction impacts (see **Section 4.1.1**). In general, the potential impacts of planned maintenance, repair, inspection, and surveys would be similar or of less magnitude than construction impacts with adherence to the same recommended mitigation measures, monitoring, and BMPs. Unplanned maintenance and emergencies are expected to occur infrequently. Therefore, impacts on coastal and marine birds from planned and unplanned maintenance, emergencies, repair, inspection, and surveys would be expected to be low. In some cases when unplanned maintenance, repairs, or emergencies occur, it might not be possible to follow some of the recommended mitigation measures, monitoring, and BMPs. In these cases of unplanned maintenance and emergencies, resource agencies (NMFS, USFWS, and state agencies, as appropriate) would be informed. ESA consultation could potentially be reinitiated after emergency situations and for cases where mitigation measures and BMPs could not be followed.

Hydrocarbon Spills. The impacts of hydrocarbons on wood storks and piping plovers are caused by the physical and chemical nature of the spill, by clean-up operations, or indirectly through physical damage to the foraging habitats in the Project area. There would be no ship-to-ship fuel oil transfer and the Port would operate under the provisions of an approved oil spill contingency plan. Vessels would be operated in compliance with all applicable spill prevention requirements and would have spill response plans. Pursuant to the USCG's deepwater port regulations, the USCG will prepare an Independent Risk Assessment to assess the risk and consequences of accidental and intentional events that compromise cargo containment.

LNG Spills. Potential impacts would include exposure to low-temperature LNG at the water surface, possibly resulting in frostbite or death, and asphyxiation by natural gas vapors above the surface of the water. These impacts would likely occur in the immediate vicinity of the spill location; the timeframe of the impact is limited. Since LNG does not dissolve in water, the timeframe for these potential impacts would be limited, and no adverse toxic impacts would be expected after the LNG boiled off and the vapors dispersed. Because of the low temperatures in the vicinity of the spill, coastal and marine birds

would be expected to avoid the area. Because wood storks and piping plovers would be located inshore, LNG spills would not be likely to adversely affect listed coastal and marine bird species.

4.3.3 Decommissioning

Under decommissioning, it would be expected that the reverse of the Port installation processes would occur. Port components would be removed from the seafloor or reused, as appropriate. Unlike construction, there would be no pile driving at the STL buoy locations, so this source of noise would be absent. Decommissioning activities would occur mainly in the STL buoy area and would not involve any activities along the pipeline route or in nearshore waters. Decommissioning involves no use of explosives. Decommissioning is not likely to have adverse effects on ESA-listed coastal and marine bird species, including wood storks and piping plovers.

Given that decommissioning would occur 25 years from now, it seems reasonable to expect that technologies for decommissioning and removal, and the understanding of impacts on the marine ecosystem, might be different from current conditions. This issue will be addressed at the time of decommission (estimated at 2034), at which time the owner would be required to adhere to all applicable and appropriate requirement. The owner would consult with the appropriate Federal agencies at the time and submit a decommissioning plan to the Secretary for approval.

4.4 Fish Species

4.4.1 Construction Impacts

Seafloor Disturbance. Construction machinery and the direct placement of the pipelines and concrete mattresses would result in seafloor disturbance. The redeposition of sediments could cause additional impacts. While impacts could result in the direct mortality, injury, or displacement of fish and their prey, it is expected that fish would avoid the construction zone due to noise, minimizing the potential for direct mortality and injury from construction equipment. Short-term, minor, direct and indirect, adverse impacts on smalltooth sawfish and Gulf sturgeon could occur as a result of seafloor disturbance caused during the installation of the pipeline. Smalltooth sawfish are expected to be rare in the Terminal area and offshore areas of the Pipeline, but will have a greater likelihood for interaction in the shallower, inshore areas of the Pipeline, during construction (see **Section 3.4**). Gulf sturgeon are expected to be rare in both the Terminal and Pipeline areas (see **Section 3.4**). Additionally, critical habitat is greater than 40 NM from the Project area for smalltooth sawfish and 90 NM for Gulf sturgeon. Seafloor disturbance could degrade potential smalltooth sawfish habitat (primarily mud or soft-bottom sediments) during construction in the inshore Pipeline area. However, smalltooth sawfish occurrence in the inshore pipeline installation area is expected to be sporadic. Because impacts on soft-bottom sediments would be temporary and because potential occurrence of smalltooth sawfish and Gulf sturgeon would be rare to sporadic, seafloor disturbance associated with Port construction is not likely to adversely affect Gulf sturgeon or smalltooth sawfish.

Additionally, the following BMPs were proposed by the Applicant to reduce impacts associated with seafloor disturbance and mitigate for unavoidable impacts.

1. Midline buoys would be utilized to the extent practicable on anchor chains to reduce the amount of anchor chain sweep.
2. During detailed design, an anchoring plan would be developed that would provide procedures for anchor deployment to minimize impacts on hard- and live-bottom habitat.

3. A Mitigation Plan to compensate for unavoidable impacts on hard bottom would be developed during the permitting process.

Proper design and implementation of BMPs and mitigation would minimize seafloor disturbance from the construction of the pipeline and, therefore, would reduce impacts on smalltooth sawfish and Gulf sturgeon, if present in the Project area. However, the performance of the BMPs should be monitored during construction to verify their effectiveness. BMPs that reduce impacts on hard bottom and impacts at the Terminal sight would not benefit smalltooth sawfish and Gulf sturgeon because these species are not expected to occur in hard bottom areas.

Turbidity. Direct impacts of turbidity could include clogged fish gills and lower growth rates (Berry et al. 2003). Indirect impacts include the reduction of abundance in part by a reduction in prey and a reduction in light reducing foraging or predation success (SCDNR 1995). However, these potential indirect impacts would be spatially limited and short-term in nature, as the suspended sediment would redeposit soon after the buoy system array and pipeline components were installed.

Turbidity modeling (SSFATE) indicates that turbidity associated with the installation of the proposed Port components would begin to subside within 30 minutes of each turbidity event and would reach acceptable levels in 5 hours. The total areal extent of the turbidity plumes created during pipeline installation would be approximately 4,679 acres (1,894 hectares) (ASA 2008). Turbidity events could occur any time during Port installation, which would take approximately 11 months. Turbidity modeling also indicates that turbidity would remain fairly close to the source of the disturbance (e.g. the plowing for pipeline installation or location of installation of anchor piles) (ASA 2008). The distance from the source would depend on the source (e.g., HDD, dredge), sediment size, and prevailing conditions (e.g., weather and tide). Overall turbidity increases would be temporary in duration and localized in scope. Therefore, short-term, minor, indirect, adverse impacts on phytoplankton would occur as a result of turbidity increases associated with the installation of the Port and Pipeline. Smalltooth sawfish are expected to be rare in the Terminal area and offshore areas of the Pipeline, but will have a greater likelihood for interaction in the shallower, inshore areas of the Pipeline, during construction (see **Section 3.4**). Gulf sturgeon area expected to be rare in both the Terminal and Pipeline areas (see **Section 3.4**). Additionally, critical habitat is approximately 40 NM for smalltooth sawfish and 90 NM for Gulf sturgeon. Turbidity could degrade potential smalltooth sawfish habitat (primarily mud or soft-bottom sediments) during construction in the inshore Pipeline area. However, smalltooth sawfish occurrence in the inshore pipeline installation area is expected to be sporadic. Because turbidity impacts would be temporary and because potential occurrence of smalltooth sawfish and Gulf sturgeon would be rare to sporadic, turbidity associated with construction of the Port and pipeline is not likely to indirectly, adversely affect Gulf sturgeon and smalltooth sawfish.

Additionally, the following BMPs were proposed by the Applicant to reduce impacts associated with turbidity.

1. Trenching and burial of the gas transmission pipeline would be performed using a pipeline plow to the maximum extent practicable. The towed plow trenching and burial technology was selected primarily because it does not fluidize bottom sediments. Therefore, it causes minimal impacts from sediment resuspension in comparison to other more conventional trenching and burial technologies (e.g., clamshell dredging).
2. Minimize the duration of construction in order to minimize impacts on marine resources by using the most efficient and effective construction equipment and methods available.
3. The use of turbidity curtains or other methods to reduce turbidity for pipeline installation under the Skyway Bridge, in Outstanding Florida Waters, and during HDD.

These measures are expected to be effective in reducing the magnitude and extent of impacts resulting from sediment suspension during pipeline construction and therefore, the impact of turbidity on smalltooth sawfish and Gulf sturgeon. However, the performance of the measures should be monitored during construction to verify their effectiveness. The Applicant plans to apply for a variance from turbidity standards which could result in an increase in adverse impacts from turbidity, if granted.

Pipeline Intake and Discharges. Hydrostatic testing would require the use of approximately 24 million gallons of treated and filtered surface seawater. This volume includes flooding the pipeline twice, once for flushing and once for hydrostatic testing. Water would be withdrawn from surface waters at a velocity of 0.15 m/s (0.5 feet/s). Upon completion of the pipeline integrity hydrotest and flushing, the water would be discharged offshore. Because the pipeline dewatering discharges would occur offshore (and only during construction), discharges are not expected to impact smalltooth sawfish or Gulf sturgeon, which, if present, would be more likely to occur in nearshore waters. Therefore, pipeline intake and discharges would have no effect on smalltooth sawfish and Gulf sturgeon.

Additionally, the following BMPs were proposed by the Applicant to reduce impacts associated with hydrostatic testing.

1. Hydrostatic test water would be discharged offshore.
2. Fresh water for the onshore pipe would be discharged on land using industry standard filtering procedures prior to release.

These BMPs are expected to be effective in reducing the magnitude and extent of impacts of hydrostatic testing on smalltooth sawfish and Gulf sturgeon. However, the performance of the measures should be monitored during construction to verify their effectiveness.

Noise. Continuous sound exposure and loud sounds can cause a TTS in fish. The duration of the TTS varies depending on the nature of the stimulus, but by definition, there is generally recovery of full hearing over time (Hastings and Popper 2005). Permanent hearing loss or PTS is caused by acoustic trauma (Hastings and Popper 2005). Other potential impacts of sound exposure on fish include physical damage to the ear region; physiological stress responses; and behavioral responses such as startle response, alarm response, avoidance, and a potential lack of response due to masking of acoustic cues. Although no hearing data are available specifically for smalltooth sawfish (an elasmobranch); however, hearing data are available for a variety of bullhead sharks (also elasmobranchs). Hearing for bullhead sharks ranges from 0.02 kHz through 3.0 kHz. Based on the available data for other elasmobranchs, it is assumed that smalltooth sawfish could hear the broadband noise (noise over a wide range of frequencies) associated with the deepwater Port and Pipeline. Noise modeling indicates that broadband noise (0.001 to 2 kHz) could travel up to 20 km (13 mi) at intensities above 140 dB re 1µPa for pile driving, up to 3.9 km (2 mi) at intensities above 120 dB re 1µPa for buoy installation, up to 7.5 km (5 mi) at intensities above 120 dB re 1µPa for pipe laying offshore, up to 6 km (4 mi) at intensities above 120 dB re 1µPa for pipe laying onshore, and up to 1.6 km (1 mi) at intensities above 120 dB re 1µPa for pipe laying at Passage Key. The most pervasive noise would be pile driving which would occur in the offshore areas. As both species are expected to be rare in the offshore areas of the Project, pile driving would be expected to have no effect on smalltooth sawfish and Gulf sturgeon. Because populations of both species occurring in the Tampa Bay vicinity are accustomed to the noise associated with busy port areas, pipeline construction noise would not likely adversely affect smalltooth sawfish or Gulf sturgeon if present during pipeline construction within Tampa Bay.

Additionally, the following BMPs were proposed by the Applicant to reduce impacts associated with noise.

1. Anchors for the unloading buoys would be driven piles. Pile driving would be confined to an approximately 2-week period. Bubble curtains, mufflers, sound-muffling devices, and engine covers would be used where appropriate to reduce the noise associated with pile driving and vessel noise. Additionally, engines and equipment would be turned off when not in use. To minimize excessive noise, engines on all equipment and vessels would be maintained in accordance with manufacturer's recommendations.
2. All vessel crew members and contractors would be requested to "ramp-up" (also known as "soft start" or "slow build up"), which entails the gradual increase in intensity of a sound source. The intent of ramp-up is to either avoid or reduce the potential for instantaneous hearing damage to an animal (from the sudden initiation of an acoustic source at full power) that might be located in close proximity. Increasing sound levels are designed to warn animals of pending seismic operations, and to allow sufficient time for those animals to leave the immediate area. NMFS has recommended "ramp-up" procedures for pile driving in past projects and believes that it would help to minimize impacts on fish habitat (NMFS 2009b).

These BMPs would be expected to reduce the magnitude and extent of impacts of noise on smalltooth sawfish and Gulf sturgeon, in the event they were present in the Project area. However, the performance of the measures should be monitored during construction to verify their effectiveness.

Entanglement. The entanglement of smalltooth sawfish and Gulf sturgeon in anchors, anchor lines, or deployment of anchor chains/lines for the unloading buoys during installation is unlikely. The derrick/lay barge could use up to 10 anchor cables, including the anchor, anchor line, and mid-line buoy. The mid-line buoy would be a single buoy and line used to suspend the anchor line to avoid dragging and scouring the seafloor. All lines would be greater than 4 inches in diameter. Anchor lines on the derrick/lay barge would be set and raised once during the installation of each unloading buoy, but they would be set and raised repeatedly during pipeline installation. Other construction vessels could also employ anchors and anchor lines.

The size of the anchor chains/lines relative to the size of these two species would interact with the species as a structure rather than a line because of their weight and immobility, preventing fish from getting entangled. Therefore, no adverse impacts on smalltooth sawfish or Gulf sturgeon would be expected as a result of entanglement associated with anchor lines associated with construction.

Lighting. According to the BMPs provided by the Applicant, lights used to identify construction vessels and illuminate working decks would be down shielded but would not illuminate surrounding waters. During installation an environmental coordinator would be on site to ensure no violations would occur. Therefore, no adverse impacts on smalltooth sawfish or Gulf sturgeon would be expected as a result of lighting associated with construction of the Port and pipeline.

4.4.2 Operations Impacts

Smalltooth sawfish and Gulf sturgeon are found in nearshore waters, and are not expected to be found offshore (see **Section 3.4**). As such, smalltooth sawfish and Gulf sturgeon are expected to be rare in the STL buoy area. Therefore, the only potential impact on ESA-listed fish species would be from planned and unplanned maintenance, repair, inspection, and surveys.

Planned and Unplanned Maintenance and Emergencies. Planned and unplanned maintenance, emergencies, repair, inspection, and surveys could both directly and indirectly affect ESA-listed fish species if they occur in the proposed project vicinity. Impacts would be expected to be similar in nature to some construction impacts (see **Section 4.1.1**). In general, the potential impacts of planned

maintenance, repair, inspection, and surveys would be similar or of less magnitude than construction impacts with adherence to the same recommended mitigation measures, monitoring, and BMPs. Unplanned maintenance and emergencies are expected to occur infrequently. Therefore, impacts on ESA-listed fish species from planned and unplanned maintenance, emergencies, repair, inspection, and surveys would be expected to be low. In some cases when unplanned maintenance, repairs, or emergencies occur, it might not be possible to follow some of the recommended mitigation measures, monitoring, and BMPs. In these cases of unplanned maintenance and emergencies, resource agencies (NMFS, USFWS, and state agencies, as appropriate) would be informed. ESA consultation could potentially be reinitiated after emergency situations and for cases where mitigation measures and BMPs could not be followed.

Therefore, adverse impacts on smalltooth sawfish or Gulf sturgeon from operation of the Port would be unlikely.

4.4.3 Decommissioning

Smalltooth sawfish and Gulf sturgeon are found in nearshore waters, and are not expected to be found offshore (see **Section 3.4**). As such, smalltooth sawfish and Gulf sturgeon are expected to be rare in the STL buoy area, which would be the site of most of the decommissioning activities. Impacts associated with decommissioning would occur mostly in the STL buoy area because various Port components (e.g., anchor chains, unloading buoys, and piles) would be removed and retrieved. No explosives would be used for the removal of these components. Impacts along the pipeline route are not expected because the pipeline would be abandoned in place (ends of the pipeline would be capped, filled, and left in place) subject to the terms of negotiated land lease conditions. Minor, temporary increases in turbidity are expected at each end of the pipeline route only. Therefore, adverse impacts on smalltooth sawfish and Gulf sturgeon from decommissioning would be unlikely.

Given that decommissioning would occur 25 years from now, it seems reasonable to expect that technologies for decommissioning and removal, and the understanding of impacts on the marine ecosystem, might be different from current conditions. This issue will be addressed at the time of decommission (estimated at 2034), at which time the owner would be required to adhere to all applicable and appropriate requirements. The owner would consult with the appropriate Federal agencies at the time and submit a decommissioning plan to the Secretary for approval.

4.5 Terrestrial Resources

Section 7 consultation with the USFWS initiated on August 24, 2007 to determine the existence of suitable habitat and listed species within the proposed onshore route. The Applicant conducted a field survey in January 2007 and again in October and November 2007 for the presence of threatened and endangered species.

Federally endangered wood storks were observed foraging in the proposed construction area during the latter surveys. No known rookeries are located in the project area; however, they are known within 15 miles of the project area. The (FERC) Plan would address methods for restoring wetland vegetation and functions and values associated with wood stork foraging habitat; therefore, the Port Dolphin Project is not likely to adversely affect the wood stork in the long term. However, short-term disturbances during onshore pipeline construction have the potential to affect wood stork. The (FERC) Plan would address methods for restoring wetland vegetation and functions and values associated with wood stork foraging habitat; therefore, the proposed project would be expected to have no adverse effects on the wood stork in the long term.

Additional potential federally listed species found in Manatee County include Audubon's crested caracara and the Eastern indigo snake. Neither of these species were observed during the surveys. The proposed onshore pipeline, valve station, and aboveground facilities do not cross suitable habitat for the caracara; therefore, no adverse effects on Audubon's crested caracara are expected as a result of the proposed Project.

Although the Eastern indigo snake was not observed during the survey, potentially suitable habitat exists in the project area. Federal protection measures are presented in the following section should the snake be observed during construction activities. An onsite Environmental Coordinator would be present during construction operations and would follow the required Federal and state guidelines should any listed species be observed. Therefore, the proposed project is not likely to adversely affect the Eastern indigo snake.

4.5.1 Construction

Potential federally listed species in the vicinity of the proposed Project area would be expected to have adapted to the variety of noise levels associated with Port Manatee, local industry, and the maintenance associated with the existing pipeline and would likely move back into the area following the estimated 3 months of construction. Adverse, minor, short-term effects would occur on these species as a result of temporary noise disturbances associated with the pipeline, valve station, and aboveground facilities construction activities.

The following sections describe specific construction impacts on federally listed species.

Audubon's Crested Caracara. The proposed onshore pipeline, valve station, and the aboveground facilities do not cross suitable habitat for the caracara; therefore, no adverse effects on this species are expected from construction of the project.

Florida Scrub Jay. Although no Florida scrub jays were observed during surveys of the onshore project area, suitable habitat, shrub and brushland, does exist within 1.57 acres proposed for construction of the interconnect station. Construction of the interconnect station would last 2 to 3 months, and during this time could cause scrub jays to leave the area. Construction of the proposed project is not expected to have long-term effects on Florida scrub jays.

Red-Cockaded Woodpecker. The proposed onshore pipeline, valve station, and the aboveground facilities do not cross suitable habitat for the red-cockaded woodpecker; therefore, no adverse effects on this species are expected from construction of the project.

Wood Stork. Although wood storks were observed during one of the surveys, rookeries are not known within or adjacent to the proposed construction area, and occasional foraging wood storks in the proposed construction area could leave the active construction ROW with minimal disruption. The FERC Plan and Procedures would address methods for restoring wetland vegetation and functions and values associated with wood stork foraging habitat; thus the Project is not likely to adversely affect the wood stork. Proper design and implementation of the required wetland mitigation measures would ensure the project would not adversely affect the wood stork in the long term; however, short-term disturbances during onshore pipeline construction could occur.

Eastern Indigo Snake. The Applicant would survey for the Eastern indigo snake before construction of the pipeline, valve station, and the aboveground facilities begins**.** Protective measures would be implemented to avoid the potential impacts on the Eastern indigo snake from direct physical effects associated with construction activities should it be observed during construction activities. Incidental

contact with personnel equipment could result in trampling or crushing of the Eastern indigo snake. If issued, the license would require the mitigation and monitoring plan following the USFWS Standard Protection Measures (USFWS 2004b) for the Eastern indigo snake be developed prior to construction. The following protection measures would be incorporated into the plan.

a. Description of the Eastern indigo snake, its habits, and protection under Federal Law
b. Instructions not to injure, harm, harass, or kill this species
c. Directions to cease clearing activities and allow the Eastern indigo snake sufficient time to move away from the site on its own before resuming clearing
d. Telephone numbers of pertinent agencies to be contacted if a dead Eastern indigo snake is encountered. The dead specimen should be thoroughly soaked in water and then frozen.

If not currently authorized through an Individual Take Statement met in association with a BO, only an individual who has been either authorized by a section 10(a)(1)(A) permit issued by the USFWS, or designated as an agent of the State of Florida by the FWC for such activities, is permitted to come in contact with or relocate an Eastern indigo snake.

An Eastern indigo snake monitoring report must be submitted to the appropriate Florida Field Office within 60 days of the conclusion of clearing phases. The report should be submitted whether or not Eastern indigo snakes are observed. The report should contain the following information:

a. Any sightings of Eastern indigo snakes; and
b. Other obligations required by the FWC, as stipulated in the permit.

Proper design and implementation of the Federally required mitigation and monitoring plan and protection measures would ensure the project would not adversely affect the Eastern indigo snake in the long-term; however, short-term disturbances during onshore pipeline construction could occur if a snake had to be relocated.

Any upsets or accidents during construction would be handled by contingency planning and development of a Spill Prevention, Control, and Countermeasure Plan to respond to spills of any size. Such impacts tend to be temporary, and, therefore, potential impacts on federally listed species would be negligible.

4.5.2 Operations

Federally listed species in the vicinity of the proposed Project area would be expected to have adapted to the variety of noise levels associated with Port Manatee, local industry, and the maintenance associated with the existing pipeline. The area within the ROW corridor would be fully restored to pre-construction conditions according to the FERC Plan and Procedures. Federally listed terrestrial species could potentially be affected by planned and unplanned maintenance and emergencies.

Planned and Unplanned Maintenance and Emergencies. Planned and unplanned maintenance, emergencies, repair, inspection, and surveys could both directly and indirectly affect ESA-listed terrestrial species if they occur in the proposed project vicinity. Impacts would be expected to be similar in nature to some construction impacts (see **Section 4.1.1**). In general, the potential impacts of planned maintenance, repair, inspection, and surveys would be similar or of less magnitude than construction impacts with adherence to the same recommended mitigation measures, monitoring, and BMPs. Unplanned maintenance and emergencies are expected to occur infrequently. Therefore, impacts on ESA-listed terrestrial species from planned and unplanned maintenance, emergencies, repair, inspection,

and surveys would be expected to be low. In some cases when unplanned maintenance, repairs, or emergencies occur, it might not be possible to follow some of the recommended mitigation measures, monitoring, and BMPs. In these cases of unplanned maintenance and emergencies, resource agencies (NMFS, USFWS, and state agencies, as appropriate) would be informed. ESA consultation could potentially be reinitiated after emergency situations and for cases where mitigation measures and BMPs could not be followed.

4.5.3 Decommissioning

Aboveground decommissioning of pipeline components would consist of all of the aboveground equipment and the pipe being removed. The underground decommissioning would consist of the removal of any hydrocarbons in the pipe through flushing, filling the pipe with treated freshwater, and capping the ends of the pipe to abandon in place.

Temporary noise disturbances associated with the pipeline decommissioning activities could potentially impact federally listed terrestrial species. Decommissioning activities and procedures related to listed species would be similar to those presented for construction activities. Most potential federally listed species in the vicinity of the proposed Project area would be expected to have adapted to the variety of noise levels associated with Port Manatee, local industry, and the maintenance associated with the existing pipeline and would likely move back into the area following decommissioning of the pipeline. Proper design and implementation of the required FWC procedures and BMPs would ensure decommissioning activities would not adversely affect federally listed species.

Given that decommissioning would occur 25 years from now, it seems reasonable to expect that technologies for decommissioning and removal, and the understanding of impacts on the marine ecosystem, might be different from current conditions. This issue will be addressed at the time of decommission (estimated at 2034), at which time the owner would be required to consult with appropriate Federal agencies, submit a decommissioning plan for review and approval, and adhere to all applicable and appropriate requirements.

5. Cumulative and Other Impacts

5.1 Introduction

The Council on Environmental Quality (CEQ) defines cumulative impacts as the "impacts on the environment which result from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions" (40 CFR 1508.7). Cumulative impacts can also result from individually minor but collectively significant actions taking place over a period of time within a geographic area.

Port Dolphin would include the construction and operation of two natural gas unloading buoys, two 36-inch flow lines to transfer the natural gas to the transmission line, and the transmission line from the flow lines to the onshore connections in Manatee County, Florida. SRVs would transport LNG to the unloading buoys and vaporize LNG into natural gas for distribution. The Port Dolphin Project would result in water quality, geological resources, biological, air quality, and noise quality impacts on the west coast of Florida, 45 km (28 mi) southwest of Tampa Bay. There would also be socioeconomic, recreational, and transportation impacts.

This cumulative impacts analysis summarizes expected environmental effects from the combined impacts of past, current, and reasonably foreseeable future projects within the geographic study area. The geographic study area used for the cumulative impacts analysis of the Port Dolphin project is characterized by three geographical boundaries: Tampa Bay, the west coast of Florida, and the northeastern GOM. Projects and programs considered for this analysis were identified through consultation with local governments, state and Federal agencies, company news releases, and published media reports. Projects with similar impacts were identified and generally include offshore, nearshore, or onshore commercial and resource agency activities. In Tampa Bay, on the west coast of Florida, and in the northeastern GOM, projects with similar impacts generally include nearshore and deepwater port construction, offshore mineral and oil leases on the Outer Continental Shelf (OCS), resource agency operations, and onshore residential and commercial development. **Figure 5-1** shows the current and future projects identified for Tampa Bay, the west coast of Florida, and the northeastern GOM.

5.1.1 Framework for Assessing Cumulative Impacts

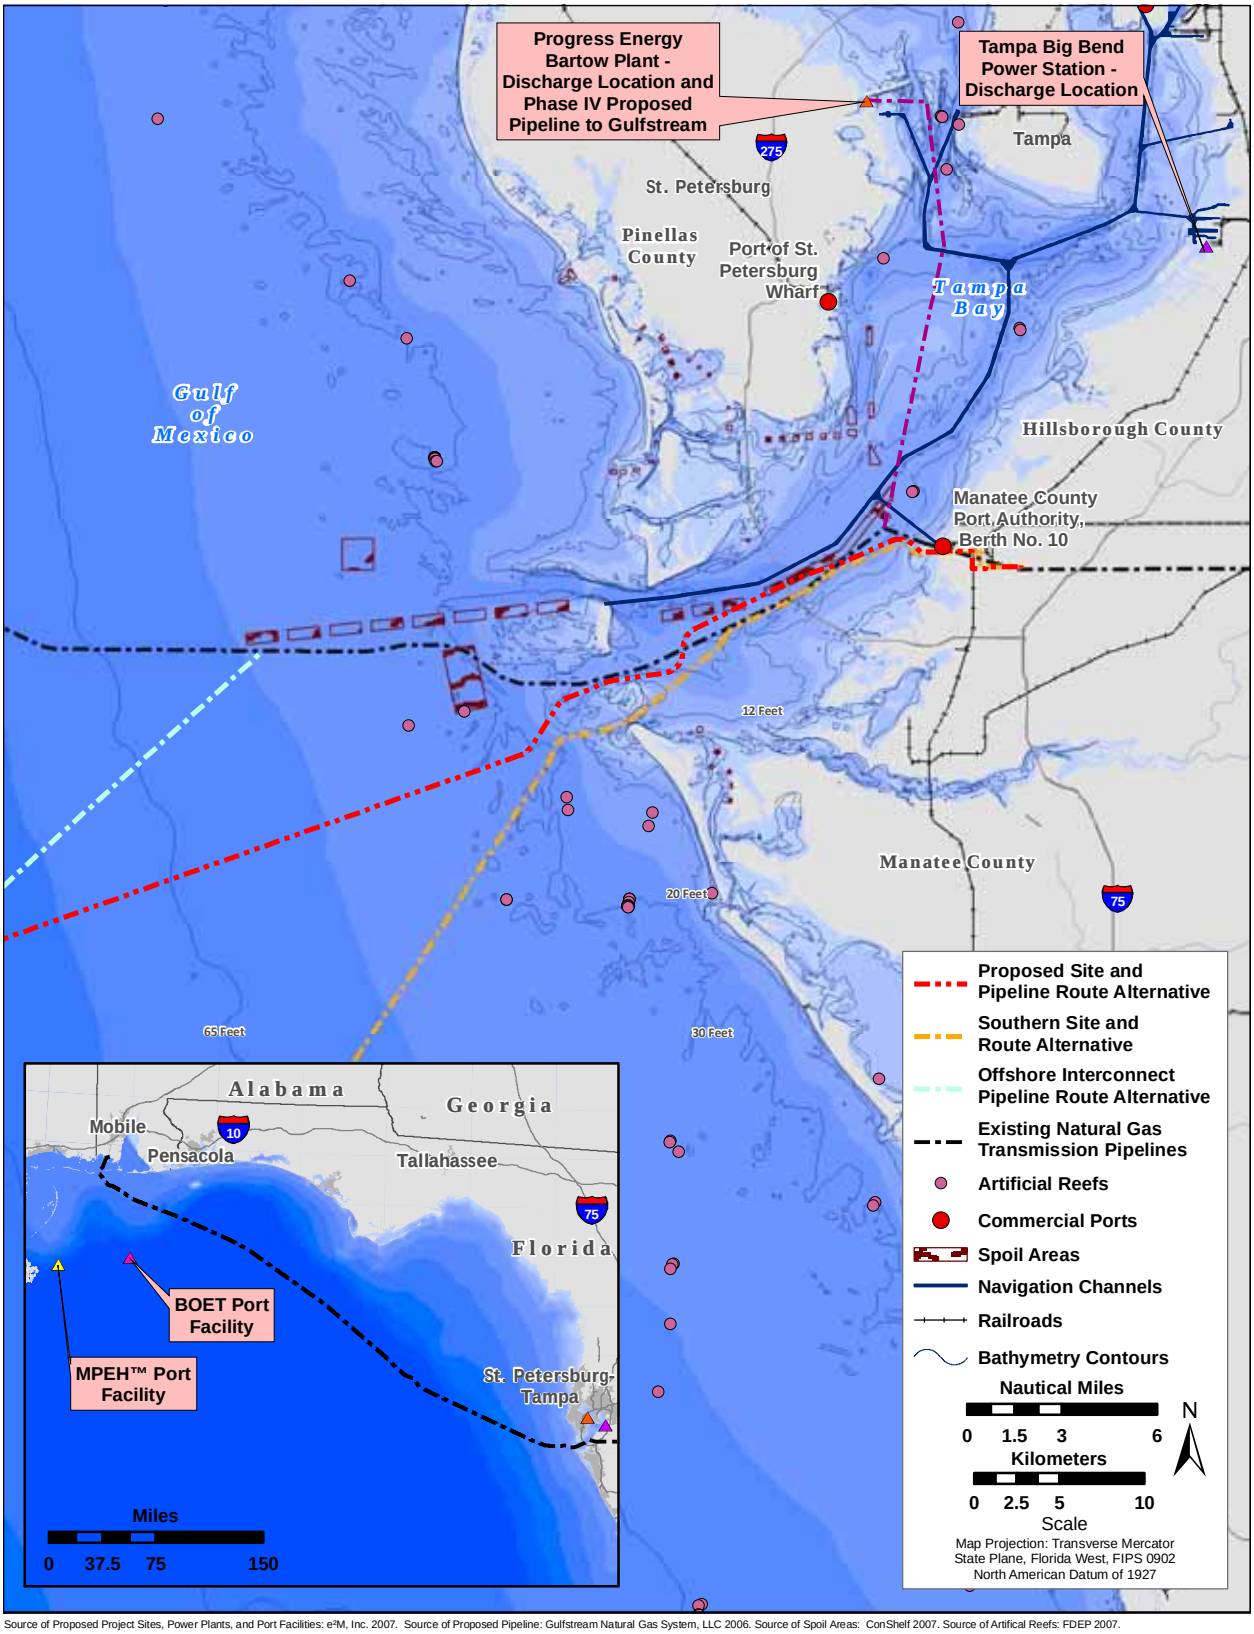
The cumulative impacts analysis focuses on the resource rather than the planned action and considers impacts that take place in both space and time. For the purposes of assessing the potential cumulative effects on natural resources and activities in the marine environment for this and other projects, both within and outside the Project area, the timeline for the construction and operation of the Port Dolphin project was taken into consideration. The timeframe for the Port Dolphin project is estimated at 25 years, with construction activities scheduled to start in August 2010 and to be complete in June 2011. Offshore pipeline construction would be scheduled to take 9 or 10 months. Installation of the STL subsea system is scheduled to take 3 to 4 months. Onshore pipeline construction is expected to take 5 months, and interconnections with the existing pipelines would take an additional 2 to 3 months (Port Dolphin 2007a).

The general approach taken for cumulative impacts analysis is as follows:

- Define other past, present, and reasonably foreseeable activities that could impact resources within the ROI of Port Dolphin
- Assess whether impacts from Port Dolphin overlap impacts (in time and space) from other activities, potentially creating cumulative impacts

- Total the impacts from Port Dolphin with other similar impacts, if impacts are additive and if quantitative information is available, or make a qualitative assessment of total impacts
- Estimate Port Dolphin's incremental contribution to total (cumulative) impacts (as a percentage of total, if quantitative)
- Assign an impact duration (short- or long-term) and an impact descriptor (minor, moderate, or major) to Port Dolphin's contributions to cumulative impacts and discuss whether an impact is adverse or beneficial to the resource
- Review mitigation measures identified throughout **Section 6** (BMPs, Mitigation and Minimization Measures, and Monitoring) for their effectiveness in reducing cumulative impacts and identify further mitigation measures designed to specifically reduce cumulative impacts, where possible.

5.2 Past, Present, and Reasonably Foreseeable Cumulative Actions



5.2.1 LNG Projects

There are five operational LNG terminals in the United States. Two of these operational terminals are located in the GOM. Lake Charles LNG terminal is in Louisiana and is licensed through FERC. The Gulf Gateway Energy Bridge is an offshore LNG terminal in West Cameron Block 603 of the GOM. In addition to these constructed and operational LNG terminals, licenses have also been approved by the Maritime Administrator for Port Pelican deepwater port, the Gulf Landing deepwater port, and the Main Pass Energy Hub (MPEH™) deepwater port. MPEH™ would be located in Main Pass Block 299, off the coast of Louisiana. Port Pelican and Gulf Landing have been delayed indefinitely by the applicants. Currently, the Maritime Administration and USCG are considering an additional proposal for a deepwater port LNG terminal in the GOM in addition to the Port Dolphin project. If approved and constructed, the Bienville Offshore Energy Terminal (BOET) would be located in Main Pass Block 258 off the shore of Alabama. FERC has also approved two additional onshore LNG terminals in the Pascagoula, Mississippi, area.

The projects that could include impacts cumulative to Port Dolphin are presented in **Figure 5-1** and **Table 5-1**. The USCG and Maritime Administration have also received informal inquiries concerning application procedures for other deepwater ports for natural gas; however, this evaluation would include those deepwater port applications of which the USCG is aware.[1]

Impacts on the GOM and Florida as a whole are also assessed where appropriate. All proposed LNG facilities were considered, but only those relevant to the resource in question were addressed in the cumulative impacts assessment. Facilities west of the Mississippi River were considered outside of the range of influence for assessment of cumulative impacts; therefore, LNG facilities west of the Mississippi are not considered to have cumulative impacts on the proposed Project. Using these criteria and the geographic location of ports east or west of the Mississippi River discharge plume, the assessment of cumulative impacts associated with the Port Dolphin project would include the MPEH™, and BOET projects proposed for the northeastern GOM. Given the location of Port Dolphin, concurrent impacts of air emissions on the same airshed would rarely, if ever, occur, since transport conditions that produce impacts from one facility would carry emissions from the other away from shore. Both the Bayou Cassote Energy and the Gulf Clean Energy terminals are more than 600 km (375 mi) northwest of the

[1] The USCG declines to speculate on where additional deepwater ports for natural gas might be located, what technologies they might employ, or whether inquiries that have been made to date will, in fact, result in license applications.

Port Dolphin terminal in coastal waters. Due to the distance between the terminals, current movement between coastal and Federal waters, and meteorology, it would be rare that impacts between Port Dolphin and the two Pascagoula terminals would ever overlap. Therefore, the following LNG terminals will be considered when evaluating cumulative impacts.

- MPEH^{TM} would be approximately 25.7 km (16 mi) southeast of the coast of Louisiana in Main Pass Block 299 in a water depth of approximately 64 m (210 feet). MPEH^{TM} would provide a peak capacity of 1.0 billion cubic feet per day (bcfd). MPEH^{TM}'s major components would include four existing platforms, two new platforms, five natural gas takeaway pipelines, and natural gas liquids pipeline. The proposed natural gas pipelines would connect to the interstate pipeline system off- and onshore. The natural gas liquids pipeline fractionating facility is located in Venice, Louisiana.
- BOET would be approximately 101 km (63 mi) south of Fort Morgan, Alabama, in Main Pass Block 258 in a water depth of approximately 130 m (425 feet). BOET would provide a peak capacity of 1.4 bcfd of natural gas. BOET's major components would include a support platform, two HiLoad LNG regasification units to receive and regasify LNG and parking systems for the HiLoad units, and four offshore gas pipelines totaling 39.8 km (22.7 mi) long. The interconnect pipelines would connect with existing natural gas pipelines on the OCS.

To assess whether impacts from Port Dolphin overlap impacts (in time and space) from activities at these LNG terminals, **Table 5-2** shows the time and spatial comparison of the proposed GOM deepwater ports.

5.2.2 Pipeline Projects

In 2001, Gulfstream Natural Gas System LLC completed a 419-mi, 36-inch offshore pipeline between Mobile Bay, Alabama, and Tampa Bay. Gulfstream is currently proposing to construct approximately

Table 5-2. Time and Spatial Comparison of the Proposed GOM Deepwater Ports

Deepwater Port	Construction Period	Operation Period	Distance Direction to Port Dolphin (Miles)	Distance Direction to MPEH™ (Miles)	Distance Direction to BOET (Miles)	Distance Offshore (Miles)	Depth of Water (Feet)
Port Dolphin	11 months	Estimated to begin mid 2011, lasting for 20 years.	---	363 mi SW	319 mi SW	28 [a]	100
MPEH™	48 months	Estimated to begin 2011, lasting for 30 years. [a]	363 mi NE	---	48 mi W	16 [a]	210 [a]
BOET	7 months	Estimated to begin 2010, lasting for 25 years. [b]	319 mi NE	48 mi E	---	63 [b]	425 [b]

18 mi of 20-inch offshore pipeline from a proposed underwater hot tap with the existing Gulfstream pipeline in the Hillsborough County waters of Tampa Bay and connecting to the existing Progress Energy Bartow Power Plant on the eastern shore of St. Petersburg in Pinellas County (USEPA 2006).

There are two proposed onshore pipeline projects that could have an added impact along with the onshore portion of the Proposed Action. The St. Petersburg Relay Replacement Project and the Phase VII Expansion Project are both located in the same geographical area as the onshore portion of the proposed Port Dolphin pipeline and interconnection facilities. These projects, in combination with the Proposed Action, could have a cumulative impact on resources. **Table 5-3** outlines the existing and proposed natural gas pipelines in Florida that could have direct and indirect additive impacts on resources in the geographical area of cumulative impact.

Table 5-3. Proposed Pipeline Projects in Tampa Bay Area

Project Name	Company	Activity Description
Phase VII Expansion Project	Florida Gas Transmission Company	Request for permission and authorization to construct, own, and operate certain pipeline facilities and additional compression to enable Florida Gas Transmission Company to provide firm transportation services
St. Petersburg Relay Replacement Project	Florida Gas Transmission Company	Florida Gas Transmission Company proposes to replace about 6.6 miles of its St. Petersburg 12-inch-diameter lateral pipeline in east-central Pinellas County

Source: USEPA 2006

Several additional operational pipelines are in the Tampa Bay area. Three operating pipelines are in Manatee County. These pipelines are operated by Florida Gas Transmission Company, Florida Power &

Light, and William Pipeline Transco (PHMSA 2007). Six pipelines, operated by Bayside Power Plant, Central Florida Pipeline Corporation, Florida Gas Transmission Company, Tampa Bay Pipeline Company, Tampa Pipeline Limited Partnership, and William Gas Pipeline Transco, are operated in Hillsborough County. Two pipelines, operated by Florida Gas Transmission Company and Florida Power Corporation, are operated in Pinellas County (PHMSA 2007). **Table 5-4** outlines operational pipelines in the Tampa Bay area. Construction of Port Dolphin could be additive to the operation and maintenance of these pipelines.

5.2.3 Electrical Power Transmission Line Projects

There are two electrical power transmission line projects scheduled for completion in 2011 that could have an added impact along with the onshore portion of the Proposed Action. Power transmission lines are linear projects that can have similar impacts as pipeline projects due to the necessity of a corridor ROW and associated disturbances. **Table 5-5** outlines the proposed electric power transmission line projects in the Project vicinity that could have direct and indirect cumulative impacts on resources in the geographical area of cumulative impact. The preferred corridors for the BobWhite-Manatee Line and the Lake Agnes-Gifford Line are approximately 10 miles and 70 miles, respectively, from the onshore portion of the Proposed Action.

5.2.4 Sand Resources

5.2.4.1 Dredging

Dredging operations include sediment and gravel harvesting; pipeline installation; canal installation, maintenance, and modifications; harbor installation and maintenance; and stream channelization. The U.S. Army Corps of Engineers (USACE) dredges millions of cubic meters of material a year. Materials from maintenance dredging are primarily disposed of on existing dredged-material disposal banks and in dredged-material disposal areas in Federal and state waters. Some dredged material can be used in a beneficial manner such as wetland restoration projects, beach nourishment projects, and industrial and commercial development. Dredged material disposal results in temporarily increased turbidity and resuspension and can release sediment contaminants into coastal waters (MMS 2007b). There are several dredged-material disposal areas in the vicinity of the Port Dolphin Project area.

Currently, dredging to maintain the Tampa Bay's channels generates about a million cubic yards of material each year. Much of the sediment dredged during maintenance activities is deposited on two man-made spoil islands in Hillsborough Bay. Eventually these spoils would reach capacity and alternatives would be necessary to accommodate the nearly 30 million cubic yards that would be created through the year 2030. Options for increasing the capacity of these islands are being studied. USACE is also evaluating the need for additional passing and turning lanes, anchorage areas, creation of a loop channel, and several other navigational safety improvements to accommodate increased maritime commerce in Tampa Bay (TBEP 2006). A comprehensive maintenance and expansion-dredging program is under way at Port Manatee. The Port of St. Petersburg has been approved to initiate studies to widen and deepen the Port basin and approach channel. The Port of Tampa has recently completed the widening of a portion of Sparkman Channel to support larger cruise ship traffic (FSTEDC 2007).

5.2.4.2 Beach Nourishment Projects

Beach nourishment projects on the west coast of Florida are currently occurring in Pinellas County (Long Key and Egmont Key), Manatee County, Sarasota County, Charlotte County, and Lee County (TBW 2007).

Table 5-4. Operational Pipelines in the Tampa Bay Area, Florida

Project Name	Company	Activity Description
Gulfstream Pipeline	Gulfstream LLC	Proposal to construct approximately 18 miles of 20-inch offshore pipeline from a proposed underwater hot tap with the existing Gulfstream pipeline in the Hillsborough County waters of Tampa Bay and connecting to the existing Progress Energy Bartow Power Plant on the eastern shore of St. Petersburg, Florida, in Pinellas County.
Cypress Pipeline Project	Southern Natural Gas Company	Proposal to construct about 165 miles of mainline pipeline in Chatham, Effingham, Bryan, Liberty, Long, McIntosh, Glynn, Camden, and Charlton counties, Georgia; and Nassau, Duval, and Clay counties Florida, about 10 miles of pipeline loop in Chatham and Effingham counties, Georgia; and three new compressor stations in Liberty County and Glynn County, Georgia; and Nassau County, Florida.
Florida Natural Gas Storage Project	Floridian Natural Gas Storage Company, LLC	The project would consist of a natural gas storage facility in Martin County, Florida, north of Indiantown, Florida, and two approximately 4-mile-long natural gas pipelines, extending northwest from the facility to interconnect with the existing interstate pipeline systems of Florida Gas Transmission and Gulfstream Natural Gas System, LLC.
Inglis Hydropower Project	Inglis Hydropower, LLC	The project would be located on the Withlacoochee River, in Levy County, Florida.
Martin Connector	Gulfstream Natural Gas System, L.L.C.	Proposal to construct a 4.98-mile-long pipeline in Martin County, Florida.
Phase III Pipeline Project	Gulfstream Natural Gas System, L.L.C.	Gulfstream proposes to construct, own, and operate a 34.3-mile segment of 30-inch gas pipeline extending from its existing Station 712 in Martin County, Florida, to a newly constructed station that would connect to the proposed FPL gas turbine West County Energy Center in Palm Beach County, Florida.
Phase VII Expansion Project	Florida Gas Transmission Company	Application to expand existing pipeline facilities between Jacksonville and Tampa, Florida. The expansion would consist primarily of 32 miles of looping pipeline and modifying compression at two existing compressor stations. This expansion is planned to transport new volumes of gas to be delivered into Florida by the Cypress Pipeline Project (PF05-7-000).
SR 91 Pipeline Relocation Project	Florida Gas Transmission Company	Approval to abandon certain mainline pipeline, and to construct, modify, and operate mainline pipeline, valves, and ancillary facilities to replace a portion of mainline on the FGT East Leg to accommodate a widening project of State Road 91 in Broward County, Florida.
SR 91 Widening Project	Florida Gas Transmission Company	Proposal to replace/relocate about 13 miles of pipeline to resolve possible conflicts resulting from the widening of State Route 91 in Broward County, Florida.
Turkey Point Project	Florida Gas Transmission Company	Application to construct a new compressor station on an existing lateral on the grounds of the Turkey Point Power Plant in Miami-Dade County, Florida.

Table 5-5. Proposed Electric Transmission Line Projects in Tampa Bay Area, Florida

Project Name	Company	Activity Description
BobWhite-Manatee 230-kV Line	Florida Power and Light	Proposed 25.5mile-long line to connect the Manatee Energy Center near Parrish in Manatee County to a proposed new substation east of I-75 in Sarasota County. Approved by Florida Department of Environmental Protection in November 2008.
Lake Agnes-Gifford 230kV Line	Progress Energy/Tampa Electric	Proposed 27.5-mile line connecting Tampa Electric's existing Lake Agnes substation in Polk County to Progress Energy's planned Gifford Substation in Orange County. Siting Board hearing scheduled January 2009.

Source: FDEP 2008a

5.2.5 Oil and Gas Leasing/Mineral Leasing

No active oil and gas platforms are near the location proposed for the Port Dolphin project. On December 20, 2006, President Bush signed into law the Gulf of Mexico Energy Security Act (GOMESA) of 2006, which increased acreage to be offered for oil and gas leasing in both the Central Gulf Planning Area and the Eastern Gulf Planning Area. One oil and gas lease sale (Lease Sale 224) offered a portion of the "181 Area" in the newly defined Eastern Planning Area; "181 South" is more than 125 miles from Florida (MMS 2007b). Lease Sale 224 offered all blocks in the proposed lease sale area that could contain economically recoverable oil and gas via one lease sale, as authorized under GOMESA. Lease Sale 224 was held on March 19, 2008, in New Orleans, Louisiana. The MMS received 58 bids from 6 companies on 36 tracts, resulting in $64,713,213 in high bids. This oil and gas lease sale falls within the boundaries of this cumulative impacts assessment.

The MMS prepared the *Gulf of Mexico OCS Oil and Gas Lease Sale 224: Eastern Planning Area, Final Supplemental Environmental Impact Statement (EIS)* for the sale (MMS 2007b). The GOMESA also establishes a moratorium on leasing, preleasing, and other activities in the following areas until June 30, 2022:

- The area within 201.17 km (125 mi) of the State of Florida in the MMS Eastern Planning Area
- The "181 Area" in the MMS Central Planning Area that is within 160.93 km (100 mi) of the State of Florida
- The area east of the Military Mission Line.

In April 2007, the MMS prepared an EIS entitled *Gulf of Mexico OCS Oil and Gas Lease Sales: 2007 - 2012* (MMS 2007c). The EIS evaluated five lease sales in the Western Planning Area and six lease sales in the Central Planning Area that are expected to occur through 2012. Its discussions take into account a wide variety of activities that flow from OCS leases: exploration; pipeline and platform construction; emplacement and removal; oil and gas production operations, including use of the support vessels and helicopters; and ship transit and anchoring. The eastern portion of the Central Planning area falls within the boundary for this cumulative impacts assessment. Additionally, many of the activities associated with the lease sales could result in indirect or direct cumulative impacts with the Proposed Action.

The MMS EIS for oil and gas lease sales includes offshore scenario information related to OCS Program activities in the GOM for the years 2007 to 2046. The MMS estimates that as of September 2006 there were 3,350 active offshore platforms. Presently and over the next 20 years, in comparison to other

structure-based activities in the OCS (and based on known applications for future deepwater ports), there would be a substantially smaller number of LNG terminals in the GOM. In addition, adding these deepwater ports to the inventory of offshore facilities, would not affect the MMS estimates of GOM-wide activities. The Louisiana Offshore Oil Port (LOOP), permitted in 1977, was the first deepwater port and remains the only crude oil deepwater port. The LOOP is approximately 18 miles south of Leeville and Grand Isle, Louisiana, in 110 feet of water. Ultra-large crude carriers and very large crude carriers transport crude oil from around the world to the LOOP, where it is offloaded and piped to Fourchon, Louisiana, then to Clovelly Terminal. The LOOP would operate until 2015. However, because the LOOP facility accounts for 13 percent of oil imports to the United States, it is anticipated that the license would be extended beyond 2015.

5.2.6 Cooling Water Withdrawals and Discharges

Two projects in the Tampa Bay area would impact cooling water withdrawals and discharges. Tampa Electric's Big Bend Power Station withdraws and discharges 1.4 billion gallons per day of seawater from Tampa Bay. The Tampa Bay Seawater Desalination Plant, the largest water desalination plant in North America, works in conjunction with the Big Bend Power Station. It is designed to "catch" approximately 44 million gallons per day (MGD) of that warm seawater and separate it into drinking water and concentrated seawater (TBW 2008). The plant returns the concentrated seawater to Big Bend's cooling water stream. It would be mixed with approximately 1.4 billion gallons of cooling water from Big Bend and would be diluted at a concentration of 70 to 1. The water would be discharged at a salinity that is 1.0 to 1.5 percent higher than ambient Tampa Bay water (within Tampa Bay's normal, seasonal fluctuation). The Tampa Bay Seawater Desalination Plant would be an integral part of the Tampa Bay region's drinking water supply. The plant began producing water in March 2003 and operated intermittently through May 2005, supplying nearly 5 billion gallons of fresh drinking water to the regional system. Remediation construction was completed in spring 2007. The plant is now fully operational, providing 25 MGD of fresh drinking water daily (TBW 2008). Progress Energy's upgrade of the Bartow Plant is now 90 percent complete, and could also result in cooling water withdrawal and discharge from Tampa Bay (Progress Energy 2008). The plant began producing water in March 2003 and operated intermittently through May 2005, supplying nearly 5 billion gallons of fresh drinking water to the regional system. The desalination plant is off-line while deficiencies in the design and construction of the pretreatment and intake processes, and the reverse osmosis and intake processes, are being fixed. No expansion of the generating capacity at the Big Bend Power Station is proposed (MMS 2007b).

Progress Energy's proposal to repower the Bartow Station Power Plant could also result in cooling water withdrawal and discharge from Tampa Bay. The repowering of Bartow Station in Pinellas County entails the addition of a natural gas-fired simple cycle unit and a natural gas-fired combined cycle unit, with total generating capacity of 1,475 megawatts (FDEP 2008b). Water withdrawal numbers are unknown at this time.

5.2.7 Area Fisheries Restrictions

The Gulf of Mexico Fishery Management Council (GMFMC) is one of eight regional fishery management councils established by the Magnuson-Stevens Fishery Conservation and Management Act of 1976 (MSFCMA), for the purpose of managing fisheries in the exclusive economic zone (EEZ) of the GOM. The GMFMC has developed seven fishery management plans (FMPs) that manage 55 species of fish and invertebrates plus the coral complex. Overfishing is occurring on four reef fish species: red snapper, greater amberjack, gag, and gray triggerfish. Overfishing occurs when more fish are being taken from a stock than the fish population can replace through reproduction or immigration from other populations. A species is declared overfished when the population size is below a certain level determined by scientists to be healthy (TBEP 2006, GMFMC 2004). The red snapper stock is in the

seventh year of a 31-year rebuilding schedule (NMFS 2008). The greater amberjack stock is projected to be rebuilt in 2010 (GMFMC 2008). The rebuilding schedule for the gag stock is undefined (NMFS 2008). The gray triggerfish stock is projected to be rebuilt in 2017 (GMFMC 2008). In order for these stocks to recover, mortality needs to be reduced (NMFS 2008).

Other activities that could result in impacts on fisheries resources and Essential Fish Habitat (EFH) include overfishing, habitat degradation caused by commercial and recreational fishing, and a general degradation of water quality. Specific activities in Tampa Bay that have an adverse impact on fisheries resources include project installation, cooling water intakes and discharges, other effluent discharge, loss of trash and debris from vessels, vessel traffic, shipping, commercial and recreational fishing, and seawater intake for cooling and warming purposes.

The GMFMC has established two gear-restricted areas to protect species managed under the Reef Fish FMP. The Reef Fish Stressed Area was originally established by the GMFMC to help rebuild overfished reef fish. The Reef Fish Stressed Area is that part of the GOM EEZ shoreward of a rhumb line (a line crossing all meridians at the same angle, i.e., a path of constant bearing) (50 CFR 622.34). The use of fish traps, roller trawls (e.g., rock hopper trawl), and powerheads (e.g., a spear gun shaft with a fire arm ammunition replacing the spearhead) is prohibited in this part of the EEZ to reduce fishing pressure on snapper and grouper species. The Reef Fish Longline/Buoy Gear area was established by the GMFMC to protect the larger red snapper spawning population. The use of long lines and buoy gear are prohibited inshore of 20 fathoms in Florida and inshore of 50 fathoms for the remainder of the GOM (GMFMC 2004).

The FWC, Division of Marine Fisheries (DMF) is the state agency for managing commercial and recreational marine fisheries in Florida. The DMF's Bureau of Marine Fisheries Management administers a state artificial reef program to provide financial and technical assistance to coastal local governments, nonprofit corporations, and state universities to develop artificial reefs and to monitor and evaluate these reefs. Under the program, reefs have been constructed with one or more of the following intended objectives: (1) enhance private recreational and charter fishing and diving opportunities; (2) provide a socioeconomic benefit to local coastal communities; (3) increase reef fish habitat; (4) reduce user conflicts; (5) facilitate reef-related research; and, (6) while accomplishing objectives 1 to 5, do no harm to fishery resources, EFH, or human health. Other reef-building objectives undertaken in Florida but outside this agency include mitigation or restoration reefs to replace hard-bottom habitat lost through such activities as beach renourishment (MMS 2007b).

5.2.8 Onshore Residential and Commercial Construction

The Taylor Woodrow Community of Artisan Lakes, LLC has plans to develop the Artisan Lakes Community in Manatee County, Florida. This area would be adjacent to the FPL and Gulfstream easements. Construction of the community could overlap with construction of the onshore pipeline causing additional impacts on transportation and community infrastructure**.**

The population in Tampa Bay is expected to grow approximately 19 percent by the year 2015 (TBEP 2006). Population increases and development in the Tampa Bay region are related to the major shipping centers and the associated commercial and recreational activities (USEPA 2006). The effects of the population growth, development, and other commercial and recreational activities (such as commercial and recreational fishing) could result in direct and indirect coastal and offshore cumulative impacts with the Proposed Action.

5.3 Impacts on Federally Listed Species

Cumulative impacts on federally listed species from past and ongoing actions in Tampa Bay and the offshore Project area would be expected from vessel operations, onshore cooling water and industrial discharges, dredging and channelization, and offshore vessel discharges which continue to impact biological resources and wildlife habitat. Foreseeable future actions that could contribute to cumulative biological impacts include oil and gas production; vessels; onshore cooling water intake and discharges; dredging; the MPEH™ and BOET projects in the northeastern GOM; and the potential for additional LNG Terminals, future offshore pipelines, and population growth and coastal development in the Tampa Bay area.

5.3.1 Marine Mammals

This cumulative analysis considers the effects related to the Proposed Action along with impacts of other commercial, military, recreational, offshore, and coastal activities that might occur and adversely affect populations of marine mammals in the same general area of the Proposed Action. The analysis of cumulative effects can go beyond the scope of project-specific direct and indirect effects to include expanded geographic and time boundaries and a focus on broad resource sustainability. The contribution of a proposed action to the overall impacts in a region is of particular concern. While a single project can have individually minor impacts, when it is considered together with other projects on a regional scale, the effect can be collectively significant.

ESA-listed marine mammals occurring in the Proposed Action area face threats from a multitude of man-made and natural sources including recreational and commercial fisheries, oil and gas exploration/development activities, military operations, vessel traffic, ecotourism, habitat degradation, ensonification, pollution, toxic algal blooms, disease, predators, and climate change. Threats to threatened and endangered marine mammals are outlined in recovery plans and status reviews drafted by NMFS and USWFS.

Harassment, injury to, or death of any ESA-listed marine mammal species would be considered a "take" under the ESA. Biological significance of any mortality would depend, in part, on the size and reproductive rates of affected stocks, as well as the number, age, and size of animals affected. For ESA-listed species, "takes" are of particular concern, because of depleted status of those species. For example, the USFWS has consistently concluded in Section 7 Biological Opinion, pursuant to the ESA, that the "take" of a single manatee would "jeopardize the continued existence" of the species (USFWS 2000). As noted earlier, the only other ESA-listed marine mammals that might occur rarely in Florida coastal waters of the GOM are the North Atlantic right whale and humpback whale. NOAA Stock Assessment Reports list PBRs (maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population) of 1 individual for the North Atlantic right whale and 1.1 individuals for the humpback whale (Waring et al. 2008). With the proposed mitigation measures, potential for serious injury or mortality of ESA-listed marine mammals from the Port Dolphin project would be minimized.

The incremental contribution of impacts from Port Dolphin, in conjunction with other similar activities in the GOM, would result from an increase in noise, increased risk of collisions with vessels, increase in marine debris, and impacts on water quality. OCS activities in the GOM that could impact ESA-listed marine mammal species include degrading water quality via routine discharges; increasing vessel strikes due to increased vessel traffic; generating noise from platforms, drill ships, helicopters and vessels, seismic surveys, and removal of structures by vessels; inadvertent spills during construction and decommissioning; sodium hypochlorite spills during operation; spill emergency response activities; and discharging debris from offshore service and support vessels and OCS structures. Activities that might

occur or are proposed in the GOM that could contribute to cumulative impacts include installation and operation of LNG regasificiation facilities.

The increase in ambient noise is a concern for ESA-listed marine mammal species. Increased vessel traffic and operations associated with Port Dolphin would overlap with noise generated by other vessels, thus contributing to this concern. Noise produced by service vessels and the construction, operation, and removal of drill rigs might cause physiological stress and make animals more susceptible to disease or predation, as well as disrupt their normal activities.

There were 120,915 recreational vessels and 2,677 commercial vessels registered in Manatee, Hillsborough, and Pinellas counties in 2007 (FHSMV 2008). Total service vessel trips for OCS activities are expected to be between 6 to 9 million trips in the GOM for the years 2007 to 2046 (MMS 2007b). This would equate to an average of 150,000 to 225,000 service vessel trips per year. No comparable numbers specifically for the northeastern GOM are available. In comparison, 938 service vessel trips per year are expected during operation of the Port Dolphin project. Construction and decommissioning would require approximately 1,600 and 154 total trips, respectively.

The increase in vessel activity in inshore and offshore GOM waters due to LNG operations could increase the occurrence of collisions between marine mammals and vessels, potentially resulting in increased injury or death. Manatees are most often found in shallow coastal waters, including bays with seagrass beds. Rare occurrences farther from shore are documented for the GOM. Major threats to the manatee, right whale, and humpback whale include vessel strikes related to recreational and commercial boating activities that occur in both nearshore and offshore waters. Indirect effects from increased vessel traffic include increased wave action due to vessel wakes and scarring of seagrass beds by propellers (EPC 2007). Seagrasses are important foraging areas for the manatee. Wakes affect seagrass beds by the increase of wave action which could play a role in the decline of longshore sandbars that help protect seagrasses (Lewis 2002), as well as increased turbidity that, as noted earlier, reduces light availability and, therefore, seagrass production.

Cumulative impacts associated with additional LNG facilities and other activities could result in an increase in marine debris. Ingestion of or entanglement in marine debris, particularly plastic items lost from SRVs and service vessels, could result in marine mammal injury or death. However, the prohibition of discharge or disposal of garbage and other solid debris from vessels by lessees and operators by the MMS (30 CFR 250.300) and the USCG (MARPOL, Annex V, P.L. 100-220 [101 Statute 1458]) (33 CFR Part 151) is expected to minimize cumulative impacts of marine debris.

Cumulative impacts associated with additional LNG facilities and other activities would result in an increased risk of an oil spill. Although unlikely, oil spills and oil-spill response activities are potential threats that might cause marine mammal deaths. Contact with or consumption of oil and oil-contaminated prey (including seagrasses) might seriously affect marine mammals. The Port Operations Manuals from all approved deepwater ports include detailed engineering and procedural conditions necessary to minimize the potential occurrence of spills and minimize potential impacts from spills that might occur.

Overall, construction and operation of the offshore components of Port Dolphin combined with two other operating or proposed LNG deepwater ports in northeastern GOM and other OCS activities could result in minor, adverse cumulative impacts on marine mammals for the Preferred Alternative and the other alternatives analyzed. It is anticipated that the contribution to cumulative impacts of the other alternatives analyzed would be similar to those of the Preferred Alternative discussed above. The mitigation measures discussed in **Section 6** for marine mammal vessel strike, noise disturbance, and entanglement, and similar mitigation measures proposed at the other LNG facilities, are expected to minimize cumulative impacts on marine mammals. The incremental contribution of Port Dolphin to these cumulative impacts would be

minor compared to the existing levels of commercial, recreational, fishing, military, and oil and gas exploration/development activities in the GOM.

5.3.2 Sea Turtles

Construction and operation of the offshore components of Port Dolphin combined with two other operating or proposed LNG deepwater ports in the northeastern GOM and other OCS activities could result in minor, adverse cumulative impacts on sea turtles. Cumulative impacts on federally listed sea turtles would primarily result from increased vessel traffic, noise, marine debris, and accidental spills and would be the same for all Port Dolphin alternatives analyzed. These impacts could create chronic sublethal effects (e.g., stress) that could cause persistent physiological or behavioral changes, such as the avoidance of impacted areas. This could cause declines in survival or productivity and result in either acute or gradual population reduction. Any harassment of, injury to, or mortality of a sea turtle would be considered a "take" under the ESA.

ESA-listed sea turtles occurring in the Proposed Action area face threats from a multitude of man-made and natural sources. Sources include recreational and commercial fisheries, military operations, vessel traffic, ecotourism, habitat degradation, ensonification, pollution, beach lighting, disease, predators, and climate change. Threats to threatened and endangered sea turtles are outlined in recovery plans and status reviews drafted by NMFS and USWFS as described below.

The increase in vessel activity in inshore and offshore GOM waters could increase the occurrence of collisions between sea turtles and vessels, potentially resulting in increased injury or death. Major threats to sea turtles include vessel strikes related to recreational and commercial boating activities that occur in both nearshore and offshore waters. Indirect effects from increased vessel traffic include increased wave action due to vessel wakes and scarring of seagrass beds by propellers (EPC 2007). Seagrasses are important foraging areas for the green turtle. Wakes affect seagrass beds by the increase of wave action which could play a role in the decline of longshore sandbars that help protect seagrasses (Lewis 2002), as well as increased turbidity that, as noted earlier, reduces light availability and, therefore, seagrass production.

Cumulative impacts associated with additional LNG facilities and other activities could result in an increase in noise. Noise produced by construction vessels; service vessels; SRVs; and the construction, operation, and removal of drill rigs might cause physiological stress and make animals more susceptible to disease or predation, as well as disrupt their normal activities. Adverse effects resulting from construction of the three proposed ports in the northeastern GOM are expected to be temporary. Therefore, cumulative effects would be minor.

Cumulative impacts associated with additional LNG facilities and other activities could result in an increase in marine debris. Ingestion of or entanglement in marine debris, particularly plastic items lost from SRVs and service vessels, could result in sea turtle injury or death. However, the prohibition of discharge or disposal of garbage and other solid debris from vessels by lessees and operators by the MMS (30 CFR 250.300) and the USCG (MARPOL, Annex V, P.L. 100-220 [101 Statute 1458]) (33 CFR Part 151) is expected to minimize cumulative impacts of marine debris. Discharge of plastics is strictly prohibited and is therefore never authorized; this includes ashes from burned plastics. All plastics must be tracked and returned to shore.

Cumulative impacts associated with additional LNG facilities and other activities would result in an increased risk of an oil spill. Although unlikely, oil spills and oil-spill response activities are potential threats that might cause sea turtle deaths. Contact with or consumption of oil and oil-contaminated prey might seriously affect sea turtles, and sea turtles have been seriously harmed by oil spills in the past. The

Port Operations Manuals from all approved deepwater ports include detailed engineering and procedural conditions necessary to minimize the potential occurrence of spills and minimize potential impacts from spills that might occur.

Overall, the mitigation measures discussed in **Section 6** for sea turtle vessel strike and entanglement, and similar mitigation measures proposed at the other LNG facilities, are expected to minimize cumulative impacts on sea turtles. The incremental contribution of Port Dolphin to these cumulative impacts would be minor adverse compared to the existing levels of commercial, recreational, fishing, oil and gas exploration/development, and military activities in the GOM.

5.3.3 Coastal and Marine Birds

Construction and operation of the offshore components of Port Dolphin combined with two other operating or proposed LNG deepwater ports in the northeastern GOM and other OCS activities could result in minor, adverse cumulative impacts on coastal and marine birds. Cumulative effects would result from a minor increase in vessel traffic, noise, marine debris, and offshore lighting and would be the same for all Port Dolphin alternatives analyzed. Considering the narrow coastal ranges of the federally listed piping plover and wood stork, these species are not likely to appear in the vicinity of the proposed LNG facilities. Additionally, mitigation measures proposed in **Section 6**, and similar mitigation measures proposed at the other deepwater ports, are expected to minimize cumulative impacts on coastal and marine birds.

5.3.4 Fish Species

Construction of the deepwater port when combined with other proposed LNG deepwater ports in the northeastern GOM and other OCS activities could result in minor adverse cumulative impacts on the smalltooth sawfish and Gulf sturgeon. Short-term, minor, direct, adverse impacts on smalltooth sawfish and Gulf sturgeon would result from the seafloor disturbance, turbidity, and noise associated with the proposed construction of Port Dolphin and would be the same for all Port Dolphin alternatives analyzed. Reasons for the decline of smalltooth sawfish include bycatch in commercial and recreational fisheries, habitat loss and degradation, entanglement in marine debris, injury from saw removal, pollution, and disturbance of natural behavior by divers and other marine activities (NMFS 2009a). Threats to Gulf sturgeon include exploitation, incidental catch in shrimp and gillnet harvest, and habitat reduction and degradation (e.g., dams, contamination, and navigation activities such as dam construction, and dredging) (USFWS and GSMFC 1995).

The mitigation measures discussed in **Section 6** for smalltooth sawfish strike and entanglement, and similar mitigation measures proposed at the other LNG facilities, are expected to minimize cumulative impacts on threatened and endangered fish species. Overall, Port Dolphin would have an incremental contribution on cumulative impacts of these two fish species.

5.3.5 Terrestrial Resources

There is a potential for short-term minor adverse cumulative impacts on wildlife and threatened and endangered species as a result of temporary noise disturbances associated with pipeline construction activities. As indicated above, land use in the area of the onshore pipeline route is primarily industrial. The incremental contribution of the Proposed Action to noise in the area would be negligible compared to the noise that already occurs there. Any displaced wildlife should recolonize the area after the Project area is revegetated. Additionally, mitigation measures proposed in **Section 6** (e.g., terrestrial pipeline and facilities BMPs), and similar mitigation measures proposed at the other deepwater ports, are expected to minimize cumulative impacts on coastal and marine birds.

5.4 Unavoidable Impacts

Unavoidable impacts are those that would result from the Proposed Action or any alternatives that cannot be mitigated. These impacts might be beneficial or adverse in nature, and have short- and long-term impacts.

Unavoidable effects on threatened and endangered marine mammals, sea turtles, fish, and birds could result from construction and operation of the proposed Port and pipeline, as well as vessel traffic. Marine animals would be affected by noise and disturbances associated with offshore activities. Losses to fishing resources could occur from placement of the proposed pipelines. These impacts would be minor and would not jeopardize the population. Localized populations of fish species would be expected to be impacted; however, these impacts are not expected to result in population-level effects. Construction of the onshore pipeline would have short-term, adverse impacts on vegetation. However, vegetation would be expected to quickly become reestablished. Modification of vegetation type would displace any wildlife species inhabiting the area, and would be considered a long-term, adverse impact. However, none of the species that would be impacted are protected.

5.5 Irreversible and Irretrievable Commitment of Resources

An irreversible or irretrievable commitment of resources refers to impacts on or losses to resources that cannot be reversed or recovered, even after an activity has ended and facilities have been decommissioned. This differs from unavoidable impacts which might be short-term or long-term in nature. A commitment of resources is related to use or destruction of nonrenewable resources, and effects that loss would have on future generations. For example, if a species becomes extinct as a result of a Proposed Action, the loss is permanent. If prime farmland is converted to a residential or commercial development, there is permanent loss of agricultural productivity. Chronic, low-level pollution can injure and kill organisms at virtually all trophic levels. Mortality of individual organisms can be expected to occur, and possibly a reduction or even elimination of a few small or isolated populations. Construction and operation of the Port involves the irreversible and irretrievable commitment of material resources and energy, land and wetland resources, and biological resources. The impacts on these resources would be permanent.

Material resources used for the proposed Port include building materials for new structures and other equipment. Steel might be recyclable after Port decommissioning. No supplies are considered scarce, and would not limit other unrelated construction activities in the region. Construction of the proposed Port would also require use of fossil fuels, a nonrenewable natural resource.

Construction and operation of the proposed Port would result in an irreversible or irretrievable loss of some biological resources. Irreversible losses might also include the loss of various terrestrial organisms during pipeline construction, loss of marine animals in the unlikely event of an LNG spill, and loss of sea turtles or marine mammals due to ship strikes. Some normal and required operations, such as structure removal done in accordance with applicable laws and regulations, can result in the destruction of viable marine life. With the proposed mitigation measures, potential for serious injury or mortality to marine mammals, sea turtles, birds, and fish would be minimized.

5.6 Relationship between Short-Term Uses and Long-Term Productivity

Short-term and long-term characteristics are determined on a case-by-case basis and do not refer to any rigid time period. In general, short-term impacts are those that would occur only with respect to a

particular activity or for a finite period, or only during the time required for installation activities. Long-term impacts are those that are more likely to be persistent and chronic. For instance, air emissions associated with vessels at the deepwater port would occur for 20 years, the estimated useful life of the proposed facilities. Other types of long-term impacts might persist even beyond the Port's authorized operational period. According to the MMS, the short-term uses of the environment, and the cumulative development of OCS oil and gas resources in the GOM are compatible with the maintenance of long-term productivity of the OCS. Unavoidable adverse impacts are anticipated to be primarily short-term and localized in nature (MMS 2002a).

Short-term project operational activities might result in chronic impacts over a longer period. Installation and eventual removal of new structures would cause minor, localized impacts in the short-term; impacts of site clearance and decommissioning might last longer because of minor elements that would be left in place. Short-term use might have long-term impacts on biologically sensitive offshore areas or archaeological resources. Upon completion of DWPA licensed activities, the marine environment would generally be expected to remain at or return to its normal long-term productivity levels.

No long-term productivity or environmental gains are expected as a result of the DWPA development of the OCS. Benefits of the Proposed Action are expected to be principally those associated with an increase in supplies of natural gas for domestic consumption. While no reliable data exist to indicate long-term productivity losses as a result of use of the OCS, such losses are possible.

6. Best Management Practices

The design of the proposed Port, and the construction methods to be employed, are intended to avoid or minimize the impact that construction activities would have on the environment. The potential impacts from the operation of the proposed Port have been minimized by selecting the preferred location and route, and through the design of the SRVs and use of equipment and systems onboard the SRVs. The following BMPs would be implemented to avoid or minimize impacts on environmental resources during installation and operation of the proposed Port.

6.1 BMPs, Mitigation and Minimization Measures, and Monitoring

CEQ specifically defines mitigation as follows:

1. Avoiding the impact altogether by not taking a certain action or parts of an action
2. Minimizing impacts by limiting the degree or magnitude of the action and its implementation
3. Rectifying the impact by repairing, rehabilitating, or restoring the affected environment
4. Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.

In an EIS, mitigation measures must be considered for impacts that would not by themselves be considered significant but would contribute to lessen the environmental impact of the project overall.

6.1.1 Applicant-Proposed BMPs and Minimization Measures

The Applicant has identified BMPs to avoid and minimize the impacts of the construction and operation of the proposed Port, to meet specific regulatory requirements, or to mitigate unavoidable impacts. These are contained within the *Port Dolphin Energy LLC Deepwater Port License Application, Volume II, Appendix F,* as revised (Port Dolphin 2007c). The Applicant has committed to implementing these BMPs to comply with state and local requirements for permits, and to avoid or reduce potentially adverse environmental impacts if a license is issued for the proposed deepwater port. The Applicant would also comply with all applicable mitigation requirements for unavoidable impacts.

Water Quality BMPs

1. Trenching and burial of the gas transmission pipeline would be performed using a pipeline plow to the maximum extent practicable. The towed plow trenching and burial technology was selected primarily because it does not fluidize bottom sediments. Therefore, it causes minimal impacts from sediment resuspension in comparison to other more conventional trenching and burial technologies (e.g., clamshell dredging).
2. Minimize the duration of construction to minimize impacts on marine resources by using the most efficient and effective construction equipment and methods available.
3. The use of turbidity curtains or other methods to reduce turbidity for pipeline installation under the Skyway Bridge, in Outstanding Florida Waters, and during HDD.
4. Filtered seawater would be used for the hydrotesting. An environmentally benign dye would be added to the flooding and test water. A biocide, oxygen scavengers, and a corrosion inhibitor would be added to the water; however, the water would be treated prior to discharge.
5. Hydrostatic test water for the offshore pipe would be discharged in offshore waters

6. Fresh water for the onshore pipe would be discharged on land using industry-standard filtering procedures prior to release.
7. The gasification system on the SRVs is a closed system, requiring no intake of water for vaporizing LNG. To cool generators, 9.5 MGD of intake water would be required. Discharge would be no greater than 50 °F (10 °C) above ambient temperature.
8. Thermal discharge of SRV cooling water meets USEPA criterion of less than or equal to 1.8 °F (1 °C) above ambient at edge of 100-m mixing zone.
9. No discharges would be made from the SRVs (i.e., bilge water, sanitary wastes, grey water).
10. Desalination freshwater-generation systems would be turned off while vessels are moored; therefore no chlorine or hypersaline wastewater would be discharged.
11. On the SRVs, gutter bars shall be placed around equipment where oil leaks could occur, (e.g., mooring winches, cranes). Rain water from these utility areas shall be drained to a bilge holding tank. No rain water from the utility areas would be discharged overboard while at the buoy.
12. During the regasification operation, the SRVs would not discharge any ballast water.
13. Spill response plan and emergency response plans would be implemented.
14. Vessels would be in compliance with MARPOL Annex I and Annex IV and USCG regulations.

Marine Mammal Vessel Strike BMPs

Manatee Vessel Strike Mitigation Measures for active installation/decommissioning vessel operations:

1. Vessel operators and crews must maintain a vigilant watch for marine mammals and slow down or stop their vessels to avoid striking sighted protected species.
2. If a manatee is within 50 yards of a construction or support vessel underway, all operations would discontinue until it has left the vicinity of its own volition.
3. If a manatee is within 300 feet of an active construction or support vessel underway, it would be observed and the vessel would proceed with caution, following the guidelines below:
   - Resume vessel at slow speeds.
   - Stay on parallel course with manatee; follow behind, or next to, at an equal or lesser speed.
   - Do not cross path of manatee.
   - Do not attempt to steer or direct manatees away.
   - Do not allow the vessel to come between a mother and her calf.
4. Practical speeds would be maintained to the extent possible when applicable. Guidelines for speeds include the following:
   - No wake/idle speeds when the draft of the vessel is less than 4 feet from seafloor. All vessels would follow routes of deep water whenever possible.
   - All construction vessels transiting to and from the Port from shore would not exceed 10 knots, during regular operations.
   - Avoid sudden changes in speed and direction.

- Speeds during installation would be well under 10 knots; vessel might be stationary during certain phases of installation.
- Higher speeds would only be used if safety reasons warrant.
- Reduce vessel speed to 10 knots or less when mother/calf pairs or large assemblages of manatees are observed near an underway vessel, when safety permits.

5. Members of the vessel crew would be required to undergo training for observing marine mammals. Topics covered in the training course might include reporting procedures, collision emergency procedures, and marine mammal presence detection using a reference guide specific to GOM marine mammal species.
6. During installation and decommissioning, lookouts are required to scan for surfacing mammals and report sightings to the captain, who would notify the Environmental Coordinator.
7. Offshore construction activities would be temporarily terminated if manatees were observed in the area and there is the potential for harm of an individual. The Environmental Coordinator would be called in to determine the appropriate course of action.
8. During construction of the facility, an Environmental Coordinator would be on site and would be responsible for communicating with NOAA Fisheries Service and USFWS/FWC personnel, as appropriate.
9. If a collision seems likely, emergency collision procedures would be followed.
10. Vessel crews would be required to report sightings of any injured or dead protected species immediately, regardless of whether the injury or death is caused by their vessel. Report marine mammals to the Southeast U.S. Stranding Hotline: 877-433-8299, FWC Law Enforcement (850-488-6251), and the USFWS in Tampa, Florida (813-348-1523).

Whale Vessel Strike BMPs for Active Installation/Decommissioning Vessel Operations

1. Vessel operators and crews must maintain a vigilant watch for marine mammals and slow down or stop their vessels to avoid striking sighted protected species.
2. When whales are sighted, maintain a distance of 100 yards or greater between the whale and the vessel.
3. When small cetaceans are sighted, attempt to maintain a distance of 50 yards or greater between the animal and the vessel whenever possible.
4. When cetaceans are sighted while a vessel is underway, attempt to remain parallel to the animal's course. Avoid excessive speed or abrupt changes in direction until the cetacean has left the area.
5. Reduce vessel speed to 10 knots or less when mother/calf pairs, pods, or large assemblages of cetaceans are observed near an underway vessel, when safety permits. A single cetacean at the surface can indicate the presence of submerged animals in the vicinity of the vessel; therefore, prudent precautionary measures should always be exercised.
6. Whales can surface in unpredictable locations or approach slowly moving vessels. When an animal is sighted in the vessel's path or in close proximity to a moving vessel, reduce speed and shift the engine to neutral. Do not engage the engines until the animals are clear of the area.
7. If a whale is within 100 yards of a construction or support vessel underway, all operations would cease until it is greater than 300 feet from vessel. If the whale is within 300 feet of an active

construction or support vessel underway, it would be observed and the vessel would proceed with caution, following the guidelines below:

- Resume vessel at slow speeds.
- Stay on parallel course with whale, following behind, or next to, at an equal or lesser speed.
- Do not cross path of whale.
- Do not attempt to steer or direct whale away.
- If a whale exhibits evasive or defensive behavior, stop the vessel until the whale has left the immediate area.
- Do not allow the vessel to come between a mother and her calf.

8. Practical speeds would be maintained to the extent possible. Guidelines for speeds include the following:
   - No wake/idle speeds where the draft of the vessel provides less than a 4-foot clearance from the bottom. All vessels would follow routes of deep water whenever possible.
   - All construction vessels transiting to and from the port from shore would not exceed 10 knots, during regular operations as most collisions causing lethal or severe injuries involve vessels moving at 10 knots or faster.
   - Avoid sudden changes in speed and direction.
   - Speeds during installation would be well under 10 knots; vessel might be stationary during certain phases of installation.
   - Higher speeds would only be used if safety reasons warrant.
9. Members of the vessel crew would be required to undergo fisheries training prior to activity. Topics in the training course include reporting procedures, collision emergency procedures, and marine mammal presence detection (surfacing near wake).
10. During installation and decommissioning, lookouts are required to scan for surfacing mammals and report sightings to the captain, who would notify the Environmental Coordinator.
11. Offshore construction activities would be temporarily terminated if whales or dolphins were observed in the area and there is the potential for harm of an individual. The Environmental Coordinator would be called in to determine the appropriate course of action.
12. During construction of the facility, an Environmental Coordinator would be on site and be responsible for communicating with NOAA Fisheries Service and USFWS/FWC personnel, as appropriate.
13. If a collision seems likely, emergency collision procedures would be followed.
14. Vessel crews would be required to report sightings of any injured or dead protected species immediately, regardless of whether the injury or death is caused by your vessel. Notify the Southeast U.S. Stranding Hotline: 877-433-8299, FWC Law Enforcement (850-488-6251), and the USFWS in Tampa, Florida (813-348-1523).

Marine Mammal Acoustic Disturbance BMPs

Marine Mammal Acoustic Disturbance BMPs

1. Anchors for the unloading buoys would be driven piles. Pile-driving would be confined to an approximately 2-week period. Bubble curtains, mufflers, sound-muffling devices, and engine covers would be used where appropriate to reduce the noise associated with pile driving and vessel noise. Additionally, engines and equipment would be turned off when not in use. To minimize excessive noise, engines on all equipment and vessels would be maintained in accordance with manufacturer's recommendations.
2. All vessel crew members and contractors would be requested to "ramp-up" (also known as "soft start" or "slow build up"), which entails the gradual increase in intensity of a sound source. "Soft start" is a practiced mitigation measure used during pile driving (see recent National Environmental Policy Act documents and marine mammal take permit authorizations) (e.g., documents for download, particularly bridge construction projects that utilize pile driving, can be found at the NMFS LOA/IHA Applications for Public Review Web site: http://www.nmfs.noaa.gov/pr/permits/incidental.htm#applications) and seismic surveys (MMS 2007a, Weir and Dolman 2007, Abgrall et al. 2008). The intent of ramp-up is to either avoid or reduce the potential for instantaneous hearing damage to an animal (from the sudden initiation of an acoustic source at full power) that might be located in close proximity. Increasing sound levels are designed to warn animals of pending operations, and to allow sufficient time for those animals to leave the immediate area.

Marine Mammal Entanglement BMPs

Marine Mammal Entanglement BMPs to Prevent Entanglement in Anchor Lines or other Lines used in Project Area

1. Any lines or other equipment that have the potential to become a source of entanglement for marine mammals would only be deployed as long as necessary to complete the construction or decommissioning task and would then be removed from the site.
2. Any lines or other equipment that have the potential to become a source of entanglement for marine mammals would be kept as taut as possible to prevent entanglement; however, a certain amount of slack is necessary to account for currents, tides, and other factors.
3. In the unlikely event that entanglement appears likely, the operator would remove the source as quickly as possible or take in the slack.
4. If temporary buoys need to be placed, materials such as heavy chains or cables would be used instead of material that could enable entanglement.
5. In the unlikely event a mammal becomes entangled, vessel crews would be required to notify the FWC Law Enforcement (850-488-6251) or the Marine Mammal Hotline of NOAA Fisheries (877-433-8299). Immediately notify the Disentanglement Hotline (800-900-3622).

Marine Mammal Entanglement BMPs to Prevent Entanglement in or Ingestion of Marine Debris

1. All vessel crew members and contractors would be responsible for ensuring that no debris would inadvertently enter the water, thus reducing the chance of entanglement and eliminating pollution to marine habitats.
2. Discharge or disposal of garbage and other solid debris from vessels would be prohibited, consistent with MMS (30 CFR 250.300) and the USCG. Discharge of plastics would be strictly

prohibited and would never be authorized; this includes ashes from burned plastics. All plastics would be returned to shore and would be tracked. Marine debris training consistent with MMS NTL 2007-G03 *Marine Trash and Debris Awareness and Elimination* would be required for all personnel working on the project. No food or garbage would be discharged; all waste would be offloaded onshore for proper disposal.

3. No wildlife would be fed or attracted to the vessel and no fishing would be allowed.

4. A waste management plan would be developed and implemented as part of the port operations manual.

Sea Turtle and Smalltooth Sawfish Vessel Strike BMPs

Sea Turtle and Smalltooth Sawfish Vessel Strike BMPs for Active Installation/Decommissioning Vessel Operations:

1. All personnel associated with the Project shall be advised of the potential presence of sea turtles and smalltooth sawfish and the need to avoid collisions.
2. All vessel crew members and contractors would participate in a fisheries training for sea turtle and smalltooth sawfish presence and emergency procedures in the unlikely event a sea turtle or smalltooth sawfish is struck by a vessel.
3. All construction personnel are responsible for observing water-related activities for the presence of these species.
4. All construction personnel shall be advised that there are civil and criminal penalties for harming, harassing, or killing sea turtles or smalltooth sawfish, which are protected under the ESA.
5. If a sea turtle or smalltooth sawfish is seen within 100 yards of the active daily construction/dredging operation or vessel movement, all appropriate precautions shall be implemented to ensure its protection. These precautions shall include the following:
   - Operation of any moving equipment closer than 50 feet to a sea turtle or smalltooth sawfish shall cease.
   - Operation of any mechanical construction equipment shall cease immediately if a sea turtle or smalltooth sawfish is seen within a 50-foot radius of the equipment.
   - Activities may not resume until the protected species has departed the Project area of its own volition.
6. All vessels associated with the construction project shall operate at "no wake/idle" speeds at all times while in the construction area and while in water depths where the draft of the vessel provides less than a 4-foot clearance from the bottom. All vessels would preferentially follow deepwater routes (e.g., marked channels) whenever possible.
7. Lighting would be downshielded to prevent unnecessary upward illumination while illuminating the vessel decks only. Lights would not illuminate surrounding waters.
8. Lighting used during all operational activities would be regulated according to USCG requirements, without using excessive wattage or quality of lights.
9. Once an operational activity is completed, all lights used only for that activity would be extinguished.

10. During installation and decommissioning, lookouts are required to scan for surfacing turtles and report sightings to the captain, who would notify the Environmental Coordinator.
11. During construction of the facility, an Environmental Coordinator would be on site.
12. Any collision with or injury to a sea turtle or smalltooth sawfish would be required to be reported immediately to the NMFS's Protected Resources Division (727-824-5312), the FWC Law Enforcement (850-488-6251), and the local authorized sea turtle stranding/rescue organization.

Sea Turtle and Smalltooth Sawfish Entanglement BMPs

Sea Turtle and Smalltooth Sawfish Entanglement BMPs to Prevent Entanglement in Anchor Lines, Other Lines Used, or Siltation Barriers in Project Area

1. Siltation barriers shall be made of material in which a sea turtle or smalltooth sawfish cannot become entangled (not monofilament), be properly secured, and be regularly monitored to avoid protected species entrapment.
2. Siltation barriers may not block sea turtle or smalltooth sawfish entry to or exit from designated critical habitat without prior agreement from the NMFS's Protected Resources Division, St. Petersburg, Florida.
3. Any lines or other equipment that have the potential to become a source of entanglement for sea turtles or smalltooth sawfish would only be deployed as long as necessary to complete the task and would then be removed from the site.
4. Any lines or other equipment that have the potential to become a source of entanglement for sea turtles or smalltooth sawfish would be kept as taut as possible to prevent entanglement; however, a certain amount of slack is necessary to account for currents, tides, and other factors.
5. If entanglement appears likely, the operator would remove the source as quickly as possible or take in the slack.
6. If temporary buoys need to be placed, materials such as heavy chains or cables would be used instead of void material that could enable entanglement.
7. Lines with mandated modifications, such as knotless and nonfloating material, would be used on construction vessels.
8. Any collision with or injury to a sea turtle or smalltooth sawfish would be required to be reported immediately to the NMFS's Protected Resources Division (727-824-5312), the FWC Law Enforcement (850-488-6251), and the local authorized sea turtle or smalltooth sawfish stranding/rescue organization, as appropriate.

Sea Turtle Entanglement BMPs to Prevent Entanglement in or Ingestion of Marine Debris

1. All vessel crew members and contractors would be responsible for ensuring that no debris would inadvertently enter the water, thus reducing the chance of entanglement and eliminating pollution to marine habitats.
2. Discharge or disposal of garbage and other solid debris from vessels would be prohibited, consistent with MMS (30 CFR 250.300) and the USCG. Discharge of plastics would be strictly prohibited and would never be authorized; this includes ashes from burned plastics. All plastics would be returned to shore and would be tracked. Marine debris training consistent with MMS NTL 2007-G03 *Marine Trash and Debris Awareness and Elimination* would be required for all

personnel working on the project. No food or garbage would be discharged; all waste would be offloaded onshore for proper disposal.

3. No wildlife would be fed or attracted to the vessel and no fishing would be allowed.

4. A waste management plan would be developed and implemented as part of the port operations manual.

Pelagic Bird BMPs

Pelagic Bird Impact BMPs: The following restrictions would be mandated on all vessels, except when USCG regulations or safety precautions supersede them.

1. Lighting used during all activities would be regulated according to USCG requirements, without using excessive wattage or quantity of lights to complete the activity.
2. Lighting would be downshielded to prevent unnecessary upward illumination, while directing the light to decks as needed.
3. Lighting would be turned off when not being used.
4. Plan vessel routes to avoid sensitive receptors (e.g., bird colonies) to the extent feasible.
5. Limit the number of vessel trips by using full-capacity crew boats as much as possible.
6. If a pelagic bird is injured, immediately notify the USFWS Division of Migratory Birds, Southeast Regional Division office (404-679-7189).

Benthic Habitat Impact BMPs

1. Geohazards and benthic video survey that were conducted provided a fine-scale delineation of seafloor structure, substrate, and habitat within the proposed Port Dolphin project area.
2. The footprint of the terminals has been minimized.
3. Anchor locations were optimized to minimize impacts on benthic habitat.
4. Performed additional geophysical surveys in water depths of 45 to 65 feet to look for reef gap. Unable to locate any for 3 NM north or 3 NM south of surveyed corridor.
5. Minimize duration of construction by using BMPs for installation.
6. Identify avoidance zones of critical habitat areas for placement of installation barge anchors.
7. Midline buoys would be utilized to the extent practicable on anchor chains to reduce the amount of anchor chain sweep.
8. During installation operations, vessel sizes would be selected to provide vessels adequate to perform the work, but minimized to reduce the number and type of anchors, where possible.
9. During detailed design, an anchoring plan would be developed that would provide procedures for anchor deployment to minimize impacts on hard- and live-bottom habitat.
10. A Mitigation Plan to compensate for unavoidable impacts on hard bottom would be developed during the permitting process.

Pelagic Habitat Impact BMPs

1. The SRVs are closed systems, requiring no intake of water for heating LNG. However, a minimal amount of intake water would be required to cool generators. Discharge would be no greater than 10 °C above ambient temperature.
2. Thermal discharge of SRV cooling water meets USEPA criterion of less than or equal to 1 °C (1.8 °F) above ambient at edge of 100-m mixing zone.
3. No discharges would be made from the SRVs (i.e., bilge water, sanitary wastes, grey water).
4. Desalination freshwater-generation systems would be turned off while vessels are moored, therefore no chlorine or hypersaline wastewater would be discharged.
5. Spill response plan and emergency response plans would be implemented.
6. The SRVs would include secondary containment around hydrocarbon-containing equipment and systems.
7. Utilization of best technology available, a closed-loop system, would significantly reduce the loss of marine organisms. The innovative engineering design has resulted in operational aspects of the terminal that would provide for significant reductions of daily intake volumes compared to other conventional regasification processes presently proposed throughout the United States.
8. An intake rate of 9.5 MGD of seawater for engine-cooling purposes would substantially reduce the potential for entrainment of plankton individuals compared to open-loop vaporization systems, which can use five times more volume.
9. Limit seawater intake velocity to less than 0.15 m/s (0.5 feet/s) to ensure that older larval stages and juveniles would be able to avoid impingement or entrainment.
10. Use of pipeline plow to bury the pipeline to the extent practicable to reduce turbidity.
11. Vessels would have secondary containment around hydrocarbon-containing equipment and systems as practicable.
12. During the regasification operations, the vessel would not discharge any ballast water.
13. Spill response plan and emergency response plans would be developed and implemented, as required.
14. Vessels would be in compliance with MARPOL Annex I and Annex IV and USCG regulations.

Terrestrial Pipeline and Facilities Mitigation

1. Use of HDD method under mangroves to avoid impacts.
2. Development of contingency plan for potential loss of drilling fluids.
3. Use of Environmental Coordinator onsite during installation of pipeline.
4. Implementation of project-specific Wetland and Waterbody Construction and Mitigation Plan.
5. Restoration of wetlands after construction.
6. Utilize BMPs and FERC's Upland Erosion Control, Revegetation and Maintenance Plan.
7. Use of existing ROWs and minimize size of ROWs.
8. Use of areas at Port Manatee previously used for similar activities.
9. Regrade areas and revegetate.

Eastern Indigo Snake BMPs

- The development of an Eastern indigo snake protection/education plan for all construction personnel to follow. The plan would be provided to the USFWS for review and approval at least 30 days prior to any clearing activities. Informational signs should be posted throughout the construction site to contain the following information:
  a. Description of the Eastern indigo snake, its habits, and protection under Federal Law
  b. Instructions not to injure, harm, harass, or kill this species
  c. Directions to cease clearing activities and allow the Eastern indigo snake sufficient time to move away from the site on its own before resuming clearing
  d. Telephone numbers of pertinent agencies to be contacted if a dead Eastern indigo snake is encountered. The dead specimen should be thoroughly soaked in water, and then frozen.
- If not currently authorized through an Individual Take Statement met in association with a Biological Opinion, only an individual who has been either authorized by a section 10(a)(1)(A) permit issued by the USFWS, or designated as an agent of the State of Florida by the FWC for such activities, is permitted to come in contact with or relocate an Eastern indigo snake.
- An Eastern indigo snake monitoring report must be submitted to the appropriate Florida Field Office within 60 days of the conclusion of clearing phases. The report should be submitted whether or not Eastern indigo snakes are observed. The report should contain the following information:
  a. Any sightings of Eastern indigo snakes
  b. Other obligations required by the FWC, as stipulated in the permit.

Other obligations required by the FWC, as stipulated in the permit.

6.1.2 The Maritime Administration/USCG-Recommended Mitigation Measures

If issued, the Deepwater Port License would contain conditions requiring development and implementation of appropriate mitigation and monitoring measures. USCG would recommend the following measures for inclusion in the mitigation and monitoring plans, should a license be granted:

- Aboveground facilities adjacent to the ROW would be fenced and screened by existing and planted shrubs and trees to improve aesthetics.
- Fuel combustion sources would result in emissions of nitrous oxide (NO_x) and carbon monoxide (CO), and, to a lesser extent, emissions of volatile organic compounds (VOCs), sulfur dioxide (SO_2), and particulate matter. During the vaporization process, the boilers would be fired by natural gas only. The boilers would be equipped with low NO_x burners and selective catalytic reduction (SCR) to minimize emissions of NO_x, CO, and VOCs. Emissions of SO_2 and particulate matter from natural gas combustion would be minimal compared to the combustion of other fossil fuels because of the negligible sulfur and noncombustible content in natural gas. Potential annual emissions would be limited by a fuel use restriction.
- The power generation engines would supply electrical power for the vaporization process. Potential emissions are based on use of natural gas (greater than 99 percent) with a small amount (less than 1 percent) of diesel pilot fuel and an SCR and oxidation catalyst to control NO_x and CO/VOC emissions. SO_2 emissions would be limited by fuel use restrictions.

- Monitoring of the operation phase of the Port Dolphin Project would focus on measuring the noise source levels of the LNG carriers (LNGCs) and the regasification process and on verifying the acoustic propagation models used to predict the sound fields generated by the project. This program would be conducted during the first year of project operation.
- The Maritime Administration agrees that mitigation and monitoring of egg and fish mortality should be required to demonstrate impacts consistent with those analyzed in the EIS. Further details of this effort, including the duration of monitoring, would be developed in coordination with NOAA and USEPA as part of a detailed monitoring and mitigation plan being developed by the Maritime Administration and USCG.
- The entire pipeline corridor and stations within the proposed Terminal area would be evaluated for the presence and relative densities of lobsters prior to and post construction using video survey technologies.
- If any roadways are damaged during onshore construction activities, such as using the slick bore method for installing pipeline under roadways, then the damaged roadway would be repaired to the preconstruction state.

6.1.3 FERC Recommendations

If the FERC Commission authorizes the onshore pipeline portion of the Port Dolphin Project, the FERC staff recommends that the following measures be included as specific conditions in the Commission's Order (Order). The FERC staff believes that these measures would further mitigate the environmental impacts associated with the construction and operation of the proposed Project. Mitigation measures 1 through 9 are standard conditions typically recommended by the FERC staff for pipeline projects. FERC staff recommendations 10 through 13 are Project-specific.

1. Port Dolphin shall follow the construction procedures and mitigation measures described in its application and supplements (including responses to data requests) and as identified in the EIS, unless modified by the Order. Port Dolphin must:
    a. Request any modification to these procedures, measures, or conditions in a filing with the Secretary of the Commission (Secretary)
    b. Justify each modification relative to site-specific conditions
    c. Explain how that modification provides an equal or greater level of environmental protection than the original measure
    d. Receive approval in writing from the FERC Director of the Office of Energy Projects(OEP) before using that modification.
2. The Director of OEP has delegated authority to take whatever steps are necessary to ensure the protection of all environmental resources during construction and operation of the Project. This authority shall allow:
    a. The modification of conditions of the Order
    b. The design and implementation of any additional measures deemed necessary (including stop work authority) to ensure continued compliance with the intent of the environmental conditions, as well as the avoidance or mitigation of adverse environmental impacts resulting from project construction and operation.
3. Prior to any construction, Port Dolphin shall file an affirmative statement with the Secretary, certified by a senior company official, that all company personnel, environmental inspectors

(EIs), and contractor personnel will be informed of the EI's authority and have been or will be trained on the implementation of the environmental mitigation measures appropriate to their jobs before becoming involved with construction and restoration activities.

4. The authorized facility locations shall be as shown in the EIS and as supplemented by filed alignment sheets. **As soon as they are available, and before the start of construction**, Port Dolphin shall file with the Secretary any revised detailed survey alignment maps/sheets at a scale not smaller than 1:6,000 with station positions for all facilities approved by the Order. All requests for modifications of environmental conditions of the Order or site-specific clearances must be written and must reference locations designated on these alignment maps/sheets.

   Port Dolphin's exercise of eminent domain authority granted under Natural Gas Act (NGA) section 7(h) in any condemnation proceedings related to the Order must be consistent with these authorized facilities and locations. Port Dolphin's right of eminent domain granted under NGA section 7(h) does not authorize it to increase the size of its natural gas pipeline to accommodate future needs or to acquire a ROW for a pipeline to transport a commodity other than natural gas.

5. Port Dolphin shall file with the Secretary detailed alignment maps/sheets and aerial photographs at a scale not smaller than 1:6,000 identifying all route realignments or facility relocations, and staging areas, pipe storage yards, and other areas that would be used or disturbed and have not been previously identified in filings with the Secretary. Approval for each of these areas must be explicitly requested in writing. For each area, the request must include a description of the existing land use/cover type, and documentation of landowner approval, whether any cultural resources or federally listed threatened or endangered species would be affected, and whether any other environmentally sensitive areas are within or abutting the area. All areas shall be clearly identified on the maps, sheets, and aerial photographs. Each area must be approved in writing by the Director of OEP **before construction in or near that area**.

   This requirement does not apply to extra workspace allowed by the *Upland Erosion Control, Revegetation, and Maintenance Plan,* minor field realignments per landowner needs, and requirements which do not affect other landowners or sensitive environmental areas such as wetlands. Examples of alterations requiring approval include all route realignments and facility location changes resulting from:

   a. Implementation of cultural resources mitigation measures

   b. Implementation of endangered, threatened, or special concern species mitigation measures

   c. Recommendations by state regulatory authorities

   d. Agreements with individual landowners that affect other landowners or could affect sensitive environmental areas.

6. **Within 60 days of the acceptance of this certificate and before the start of construction**, Port Dolphin shall file an initial Implementation Plan with the Secretary for review and written approval by the Director of OEP describing how Port Dolphin will implement the mitigation measures required by the Order. Port Dolphin must file revisions to the plan as schedules change. The plan shall identify:

   a. How Port Dolphin will implement the construction procedures and mitigation measures described in its application and supplements (including responses to data requests), those identified in the EIS, and those required by the Order

   b. How Port Dolphin will incorporate these requirements into the contract bid documents, construction contracts (especially penalty clauses and specifications), and construction drawings so that the mitigation required at each site is clear to onsite construction and inspection personnel

c. The number of EIs assigned per spread, and how the company will ensure that sufficient personnel are available to implement the environmental mitigation

d. Company personnel, including EIs and contractors, who will receive copies of the appropriate material

e. The training and instructions Port Dolphin will give to all personnel involved with construction and restoration (initial and refresher training as the project progresses and personnel change), with the opportunity for OEP staff to participate in the training sessions

f. The company personnel (if known) and specific portion of Port Dolphin's organization having responsibility for compliance

g. The procedures (including use of contract penalties) Port Dolphin will follow if noncompliance occurs

h. For each discrete facility, a Gantt or PERT chart (or similar project-scheduling diagram), and dates for:

i. the completion of all required surveys and reports

ii. the mitigation training of onsite personnel

iii. the start of construction

iv. the start and completion of restoration.

7. Port Dolphin shall employ at least one EI per construction spread. The EI shall be:

a. Responsible for monitoring and ensuring compliance with all mitigation measures required by the Order and other grants, permits, certificates, or other authorizing documents

b. Responsible for evaluating the construction contractor's implementation of the environmental mitigation measures required in the contract (see condition 5 above) and any other authorizing document

c. Empowered to order correction of acts that violate the environmental conditions of the Order, and any other authorizing document

d. A full-time position, separate from all other activity inspectors

e. Responsible for documenting compliance with the environmental conditions of the Order, as well as any environmental conditions/permit requirements imposed by other Federal, state, or local agencies

f. Responsible for maintaining status reports.

8. Port Dolphin shall file updated status reports with the Secretary, prepared by the EI on a biweekly basis until all construction and restoration activities are complete. On request, these status reports will also be provided to other Federal and state agencies with permitting responsibilities. Status reports shall include:

a. The current construction status of the project, work planned for the following reporting period, and any schedule changes for stream crossings or work in other environmentally sensitive areas

b. A listing of all problems encountered and each instance of noncompliance observed by the EIs during the reporting period (both for the conditions imposed by the Commission and any environmental conditions/permit requirements imposed by other Federal, state, or local agencies)

c. Corrective actions implemented in response to all instances of noncompliance, and their cost

d. The effectiveness of all corrective actions implemented

e. A description of any landowner/resident complaints which might relate to compliance with the requirements of the Order, and the measures taken to satisfy their concerns

f. Copies of any correspondence received by Port Dolphin from other Federal, state, or local permitting agencies concerning instances of noncompliance.

9. Port Dolphin must receive written authorization from the Director of OEP **before commencing service of the project**. Such authorization will only be granted following a determination that rehabilitation and restoration of the ROW and other areas affected by the project are proceeding satisfactorily.

10. Port Dolphin shall file any proposed changes or project-specific revisions to the FERC Plan and Procedures. This information must be included with Port Dolphin's comments on the draft EIS or in a separate document submitted at the same time. Port Dolphin shall clearly identify any items that differ from the requirements of the FERC Plan and Procedures and explain how such Project-specific measures would result in an equal or greater protection of resources. Any outstanding information (e.g., from pending surveys or ongoing agency consultation) must be identified, along with an estimate of when such will be completed.

11. Port Dolphin shall not begin construction of the onshore portion of the Project until it has filed documentation that all Section 7 consultations with the USFWS regarding the onshore portion of the project has been completed and Port Dolphin has received written notification from the Director of OEP that construction or use of mitigation may begin.

12. Prior to the start of construction, Port Dolphin shall file for each HDD location the following: (a) the estimated number of days of drilling required for each location, and whether drilling would be done 24 hours per day; and (b) a description of any noise mitigation which would be implemented during drilling activity to reduce noise impacts at the noise sensitive areas below 55 dBA L_{dn}, or 10 dBA over background if ambient levels are above 55 dBA L_{dn}.

13. Port Dolphin shall defer construction and use of the onshore facilities and staging, storage, and temporary work areas until Port Dolphin consults the Florida State Historic Preservation Office (SHPO) regarding the need for survey of any newly identified pullouts, staging areas, extra work spaces, the concrete coating batch plant and storage area, and pipe and contractor yards; and files the SHPO's comments, any required survey report(s), and the SHPO's comments on the reports. All material filed with the Commission containing location, character, and ownership information about cultural resources must have the cover and any relevant pages therein clearly labeled in bold lettering: **"CONTAINS PRIVILEGED INFORMATION--DO NOT RELEASE."**

6.1.4 NOAA/NMFS Recommendations

In a scoping letter dated August 9, 2007, NMFS expressed concerns that the entrainment of marine organisms could affect the sustainability of marine and estuarine fisheries (see **Appendix C**). NMFS recommended that mitigative measures be developed and proposed to ensure that unavoided entrainment impacts are fully offset. The mitigation plan should be linked to a plan for adaptive management of the deepwater Port to identify and require operational or mechanical modifications to minimize adverse fishery impacts.

The NOAA/NMFS Southeast Region Habitat Conservation Division has developed the *Southeast Regional LNG Monitoring Plan Considerations* (Plan Considerations) (see **Appendix C**) for LNG terminal construction and operation in the GOM. Although the Plan Considerations were developed for open-loop regasification systems, two of the considerations (Questions 6 and 7 are represented as A and B) are applicable to the proposed Project.

A. LNG facilities must transport the regasified product to market through pipelines. These pipelines begin at the Terminal and can tie-in with other natural gas pipelines located either offshore or onshore. Often, these pipelines are proposed to be considered on productive water bottoms or through wetlands, both of which could be designated as EFH supportive of marine fishery resources. If a pipeline impacts EFH, the NMFS recommends the habitat be restored after the pipeline has been constructed. Alternatively, NMFS might recommend a different pipeline route that would avoid or minimize impacts on EFH.

   Monitoring of the pipeline ROW is necessary to document pre-construction conditions as well as the level of successful restoration and the need for remedial actions. The following constitutes typical monitoring recommendations associated with the installation of pipelines in areas classified as EFH.

   1. The licensee should conduct a pre-construction survey of the pipeline ROW and all work areas to document pre-Project conditions. The survey should include a Geographic Information System (GIS) analysis using recent aerial photographs of the Project area with the pipeline ROW superimposed on the photograph and identify all habitat types using Cowardin codes (Cowardin et al. 1979) or other accepted measures. The survey also should identify elevations of all wetland areas crossed and include a description of major wetland vegetative communities. Where shell reefs could be impacted, the survey should document the geographic extent and productivity of those shell reefs.
   2. Ground photographs of those portions of the pipeline ROW which cross marsh should be taken prior to construction and immediately after construction. The photographs should be taken at 500-foot intervals from the center of the ROW with two photographs being taken at each location, one in each direction. Global Positioning System (GPS) should be used during photography such that pre-and post-construction could be taken from the same locations.
   3. Following one growing season after construction, the licensee should undertake a post-construction survey similar to that taken prior to construction. The intent of the post-construction survey is to identify areas where pre-construction contours were not successfully restored or where vegetative or shell reef communities did not become reestablished.
   4. All monitoring information should be provided to the NMFS within 3 months of its development.

B. Reporting the Monitoring Result

   1. Monitoring methodologies, sample locations, monitoring results and analysis, and any resulting recommendations for change of facility operations or monitoring protocols are to be prepared and submitted to the Federal licensing agency and the NMFS annually.
   2. Annual reports are to be submitted by March 30 and would encompass the previous calendar year (or portion of a year if monitoring was not conducted for an entire 12-month period).

In a letter dated May 29, 2008, the Southeast Regional Office requested that the measures such as press in piles or pile sleeves be considered to reduce the noise impacts associated with pile driving. Additionally, NMFS recommends the Applicant utilize the study of David Mann at the University of South Florida to do the following:

1. Monitor noise levels as part of the ESA consultation with NMFS to address uncertainties in the noise estimates
2. Monitor the effectiveness of any noise-reduction methodologies proposed.

During the Section 7 Endangered Species Act consultation process, NMFS submitted the following BMPs or harm avoidance measures for protected species to the USCG and MARAD. The following BMPs were considered for their effectiveness at reducing the potential for adverse effects on protected species (threatened and endangered species, and marine mammals). These measures are required to be implemented by Port Dolphin to avoid harm to ESA-listed species, as well as marine mammals protected under the MMPA, associated with the construction, operation, and decommissioning of the Port Dolphin Deepwater Port.

A. Pile-Driving Conditions

The following measures shall be required during any pile-driving activity associated with Port Dolphin.

1. All project personnel and contractor personnel shall be advised that there are civil and criminal penalties for harming or harassing protected species. Informational materials regarding protected species identification shall be provided to project personnel.
2. For impact hammers, the power of the hammer shall be reduced to minimum energy levels required to drive a pile; thus, reducing the amount of noise produced in the marine environment. Additional measures shall be considered, when feasible, such as bubble curtains, Micarta© pile caps, and pile-driving sleeves.
3. A 250-m zone of influence (ZOI) shall be established around a pile to be monitored (a 200-m radius to the 160-dB isopleths and an additional 50-m watch zone). The Environmental Coordinator (EC) or at least one person designated as a Protected Species Observer (PSO) by the EC shall monitor the 250-m ZOI to prevent or minimize potential adverse impacts on protected species.
4. Each PSO used shall be instructed in surveying for protected species, data recording, and be familiar with species that might occur in the area. A viewing platform, such as the highest point on a barge that has an unobstructed view in all directions, should be used to conduct effective observations. Each PSO shall be provided with the equipment necessary to conduct effective observations (e.g., a two-way radio dedicated to protected species communication, ear protection, polarized sunglasses, binoculars, and any necessary data-recording equipment that might be required).
5. The 250-m ZOI around a pile shall be observed for protected species prior to beginning any pile driving. PSOs to protected species observations shall be used to visually monitor the impact zone for at least 45 minutes prior to beginning all pile-driving activities (each time a hammer is started).
6. Each time a pile driving hammer is started, "dry firing" or "ramping up" of the hammer shall be conducted for at least 15 minutes to allow animals the opportunity to leave the area. Dry firing of a pile-driving hammer is a method of raising and dropping the hammer with no compression of the pistons, producing a lower-intensity sound than the full power of the hammer. Ramping up involves slowly increasing the power of the hammer and noise produced over the ramp-up period (and bubble curtains turned on if used).
7. The 45-minute observation period may occur during dry firing and ramping up of the pile-driving hammer (i.e., observations may begin 30 minutes prior to dry firing or ramp-up). Pile driving shall be stopped if any protected species are sighted within the 250-m impact zone, or a

protected species is observed moving toward the ZOI. Pile driving shall not restart until the animal is confirmed to be outside of the impact zone. If at any time a protected species is observed in the safety zone during dry firing or ramp-up, the hammer shall be shut down until the animal has left the safety zone of its own volition; ramp-up procedures shall then be repeated.

8. Pile driving is expected to last at least 2 weeks. For pile-driving activities, the designated PSO shall intermittently scan the ZOI to watch for animals in the area (and to ensure bubble curtains are functioning properly if they are used). Any time an animal is observed in the impact zone during pile driving, all activities shall stop and the animal continually observed until it has left the area of its own volition.

9. Pile driving may continue into nighttime hours only if ramp-up/dry-firing protocols and visual clearing of the impact are conducted during daylight hours and bubble curtains are utilized.

10. Records shall be maintained of all protected species sightings in the area, including date and time, weather conditions, species identification, approximate distance from the pile, direction and heading in relation to the pile driving, and behavioral observations. When animals are observed in the impact zone, additional information and corrective actions taken such as a shutdown of the pile driver, duration of the shutdown, behavior of the animal, and time spent in the safety zone will be recorded. The PSOs shall also identify and record large schools of fish, marine mammals, *Sargassum*, jellyfish aggregations, or other indicators of biologically productive areas. Data shall be recorded on the types of piles driven (material construction, diameter and length of pile, wall thickness), the type and power of the hammer used, the number of cold starts, strikes per minute, and the duration of the pile-driving activities.

11. If a take of a listed species occurs, reinitiation of consultation is required. If a take of a listed species occurs from pile-driving activities, a report of the incident must be submitted by email to NMFS' Protected Resources Division at takereport.nmfsser@noaa.gov.

    Please report all other dead or injured protected species to your local stranding network contacts. A list of sea turtle stranding responders is available at http://www.sefsc.noaa.gov/seaturtleSTSSN.jsp. A list of marine mammal stranding network responders for each state is available at http://www.nmfs.noaa.gov/pr/health/networks.htm or sightings can be reported to the marine mammal stranding hotline at 877-433-8299.

    All other dead or injured protected species incidents shall be reported to NMFS' Southeast Regional Office by telephone at 727-824-5312, or by fax at 727-824-5309.

B. Noise-Monitoring Study

Port Dolphin shall monitor noise levels during construction and operation of the LNG terminal to address uncertainties in the estimated noise levels, document propagation characteristics, and verify the impact zones estimated in the EIS. A noise-monitoring plan shall be submitted for review to NMFS, USCG, and MARAD for review prior to the start of pile-driving activities. A noise-monitoring report shall be submitted to NMFS, USCG, and MARAD detailing methods, noise levels measured during construction and operation of the terminal, verification of the noise levels predicted from construction and operation activities, and effectiveness of the noise-reduction methodologies utilized during construction. NMFS is available to assist with the development of the noise-monitoring plan and data collection protocols.

C. Construction Conditions

1. During construction of the facility, the EC must be on site.

2. Port Dolphin shall instruct all personnel associated with the project of the potential presence of protected species. Personnel associated with the project shall undergo a briefing of the potential presence of protected species in the project area and harm avoidance and any other mitigation requirements. All construction personnel are responsible for observing water-related activities for the presence of these species.
3. Personnel shall be informed that there are civil and criminal penalties for harming, harassing, or killing sea turtles and smalltooth sawfish protected under the ESA. The responsible party shall be held accountable for any protected species harmed, harassed, or killed as a result of construction activities.
4. During construction, lookouts are required to scan for protected species and report sightings to the EC.
5. If a protected species is seen within 100 yards of marine construction activities, all appropriate precautions shall be implemented to ensure its protection. These precautions shall include cessation of operation of any moving equipment within 100 yards of a protected species. Activities may not resume until the animal has departed the project area of its own volition.
6. In order to avoid causing injury or disturbance to protected species during activities associated with construction of the Port Dolphin, construction and support vessels shall follow the NMFS Vessel Strike Avoidance Measures and Reporting for Mariners (see below) during construction activities and when in transit between the terminal location and shore.
7. Use of HDD shall be used under mangroves to avoid impacts.
8. All vessel crew members and contractors shall participate in a fisheries training for protected species presence and emergency procedures in the unlikely event a protected species is struck by a vessel.
9. All construction personnel are responsible for observing water-related activities for the presence of protected species.
10. All vessels associated with the construction project shall operate at "no wake/idle" speeds at all times while in the construction area and while in water depths where the draft of the vessel provides less than a 4-foot clearance from the bottom. All vessels would preferentially follow deepwater routes (e.g., marked channels) whenever possible.
11. Lighting will be downshielded to prevent unnecessary upward illumination, while only illuminating the vessel decks. Lights will not illuminate surrounding waters. Lighting used during all operational activities would be regulated according to USCG requirements, without using excessive wattage or quantity of lights. Once an operational activity is completed, all lights used only for that activity would be extinguished.
12. If a dead or injured protected species is observed and is unrelated to the project, it will be reported, as requested, to the local stranding network contacts. The appropriate contact will be selected from either the current list of sea turtle stranding responders available at http://www.sefsc.noaa.gov/seaturtleSTSSN.jsp or the list of marine mammal stranding network responders available at http://www.nmfs.noaa.gov/pr/health/networks.htm. All other observed dead or injured protected species must be reported to the NMFS Southeast Regional Office by telephone at 727-824-5312 or by fax at 727-824-5309, or by email at takereport.nmfsser@noaa.gov if the death or injury was the result of Port Dolphin activities.

D. Vessel Strike Avoidance Measures and Reporting for Mariners

The National Marine Fisheries Service (NMFS) has determined that collisions with vessels can injure or kill protected species (e.g., endangered and threatened species, and marine mammals). The following standard measures should be implemented to reduce to discountable levels the risk associated with vessel strikes or disturbance of these protected species. NMFS should be contacted to identify any additional conservation and recovery issues of concern, and to assist in the development of measures that might be necessary.

Protected Species Identification Training. Vessel crews should use an Atlantic and Gulf of Mexico reference guide that helps identify protected species that might be encountered in U.S. waters of the Atlantic Ocean, including the Caribbean Sea, and Gulf of Mexico. Additional training should be provided regarding information and resources available regarding Federal laws and regulations for protected species, ship strike information, critical habitat, migratory routes and seasonal abundance, and recent sightings of protected species.

Vessel Strike Avoidance. In order to avoid causing injury or death to marine mammals and sea turtles the following measures should be taken when consistent with safe navigation:

1. Vessel operators and crews shall maintain a vigilant watch for marine mammals and sea turtles to avoid striking sighted protected species.
2. When whales are sighted, maintain a distance of 100 yards or greater between the whale and the vessel.
3. When sea turtles or small cetaceans are sighted, attempt to maintain a distance of 50 yards or greater between the animal and the vessel whenever possible.
4. When small cetaceans are sighted while a vessel is underway (e.g., bow-riding), attempt to remain parallel to the animal's course. Avoid excessive speed or abrupt changes in direction until the cetacean has left the area.
5. Reduce vessel speed to 10 knots or less when mother/calf pairs, groups, or large assemblages of cetaceans are observed near an underway vessel, when safety permits. A single cetacean at the surface could indicate the presence of submerged animals in the vicinity; therefore, prudent precautionary measures should always be exercised. The vessel shall attempt to route around the animals, maintaining a minimum distance of 100 yards whenever possible.
6. Whales can surface in unpredictable locations or approach slowly moving vessels. When an animal is sighted in the vessel's path or in close proximity to a moving vessel and when safety permits, reduce speed and shift the engine to neutral. Do not engage the engines until the animals are clear of the area.

E. Additional Requirements for the North Atlantic Right Whale

1. If a sighted whale is believed to be a North Atlantic right whale, Federal regulation requires a minimum distance of 500 yards be maintained from the animal (50 CFR 224.103 (c)).
2. Vessels entering North Atlantic right whale critical habitat are required to report into the Mandatory Ship Reporting System.
3. Mariners shall check with various communication media for general information regarding avoiding ship strikes and specific information regarding North Atlantic right whale sighting locations. These include NOAA weather radio, U.S. Coast Guard NAVTEX broadcasts, and Notices to Mariners. Commercial mariners calling on United States ports should view the most

recent version of the NOAA/USCG produced training CD titled "A Prudent Mariner's Guide to Right Whale Protection" (contact the NMFS Southeast Region, Protected Resources Division for more information regarding the CD).

4. Injured, dead, or entangled right whales should be immediately reported to the U.S. Coast Guard via VHF Channel 16.

F. Injured or Dead Protected Species Reporting

Vessel crews shall report sightings of any injured or dead protected species immediately, regardless of whether the injury or death is caused by your vessel.

Report marine mammals to the Southeast U.S. Stranding Hotline: 877-433-8299

Report sea turtles to the NMFS Southeast Regional Office: 727-824-5312

If the injury or death of a marine mammal was caused by a collision with your vessel, responsible parties shall remain available to assist the respective salvage and stranding network as needed. NMFS' Southeast Regional Office shall be immediately notified of the strike by email (takereport.nmfsser@noaa.gov) using the attached vessel strike reporting form.

For additional information, please contact the Protected Resources Division at:

NOAA Fisheries Service
Southeast Regional Office
263 13th Avenue South
St. Petersburg, FL 33701-5505
Tel: 727-824-5312
http://sero.nmfs.noaa.gov

G. Line and Cable Conditions

The following BMPs will be required to prevent entanglement in any lines or cables used, or siltation barriers used in any construction area to avoid the potential for entanglement of protected species.

1. Siltation barriers shall not be made of any materials in which a protected species can become entangled (e.g., monofilament), shall be properly secured, and shall be regularly monitored to avoid protected species entrapment.
2. Siltation barriers may not block protected species entry or exit points from habitat without prior agreement from NMFS' Protected Resources Division, St. Petersburg, Florida.
3. Any lines or other equipment that have the potential to become a source of entanglement for sea turtles or smalltooth sawfish shall only be deployed as long as necessary to complete the task and then shall be removed from the site.
4. Any lines or other equipment that have the potential to become a source of entanglement for protected species shall be kept as taut as possible to prevent entanglement; however, a certain amount of slack is necessary to account for currents, tides, and other factors.
5. If entanglement appears likely, the operator shall remove the source as quickly as possible or take in the slack.
6. If temporary buoys need to be placed, materials such as heavy chains or cables shall be used instead of void material that could enable entanglement.

7. Lines with mandated modifications, such as knotless and nonfloating material, shall be used on construction vessels.
8. Any collision with or injury to a protected species must be reported immediately to NMFS' Protected Resources Division (727-824-5312), FWC Law Enforcement (850-488-6251), and the local authorized sea turtle or marine mammal stranding/rescue organization, as appropriate.

H. Marine Debris Reduction and Elimination Conditions

1. Marine debris training consistent with MMS NTL 2007-G03 Marine Trash and Debris Awareness and Elimination (http://www.gomr.mms.gov/homepg/regulate/regs/ntls/2007NTLs/07-g03.pdf) is required for all personnel working on the project.
2. All vessel crew members and contractors are responsible for ensuring that no debris inadvertently enters the water, thus reducing the chances of entanglement and eliminating pollution to marine habitats.
3. Discharge or disposal of garbage and other solid debris from vessels shall be prohibited, consistent with MMS (30 CFR 250.300) and the USCG. Discharge of plastics shall be strictly prohibited and shall never be authorized; this includes ashes from burned plastics. All plastics shall be returned to shore and shall be tracked. No food or garbage shall be discharged; all waste shall be offloaded onshore for proper disposal.
4. No wildlife shall be fed or purposely attracted to the vessel and no fishing is allowed.
5. A waste management plan shall be developed and implemented as part of the port operations manual.

I. Water Quality Conditions

1. Trenching and burial of the gas transmission pipeline shall be performed using a pipeline plow, to the maximum extent practicable. The towed plow trenching and burial technology was selected primarily because it does not fluidize bottom sediments. Therefore, it causes minimal impacts from sediment resuspension in comparison to other more conventional trenching and burial technologies (e.g., clamshell dredging).
2. The duration of construction shall be minimized to minimize impacts on marine resources by using the most efficient and effective construction equipment and methods available.
3. Turbidity curtains or other methods to reduce turbidity shall be used for pipeline installation under the Skyway Bridge, in Outstanding Florida Waters, and during HDD.
4. Filtered seawater shall be used for the hydrotesting. An environmentally benign dye would be added to the flooding and test water. A biocide, oxygen scavengers, and a corrosion inhibitor would be added to the water; however, the water would be treated prior to discharge.
5. Hydrostatic test water for the offshore pipe will be discharged in offshore waters.
6. Fresh water for the onshore pipe will be discharged on land using industry-standard filtering procedures prior to release.
7. The gasification system on the SRVs is a closed system, requiring no intake of water for vaporizing LNG. To cool generators, 9.5 MGD of intake water will be required. Discharge will be no greater than 50 °F (10 °C) above ambient temperature.
8. Thermal discharge of SRV cooling water shall meet USEPA's criterion of less than or equal to 1.8 °F (1 °C) above ambient at the edge of the 100-m mixing zone.

9. No discharges shall be made from the SRVs (i.e., bilge water, sanitary wastes, grey water).
10. Desalination freshwater-generation systems shall be turned off while vessels are moored; therefore, no chlorine or hypersaline wastewater would be discharged.
11. On the SRVs, gutter bars shall be placed around equipment where oil leaks could occur, (e.g., mooring winches, cranes). Rain water from these utility areas shall be drained to a bilge holding tank. No rain water from the utility areas shall be discharged overboard while at the buoy.
12. During the regasification operation, the SRVs shall not discharge any ballast water.
13. Spill response plan and emergency response plans shall be implemented.
14. Vessels shall be in compliance with MARPOL Annex I, Annex IV, and USCG regulations.

6.1.5 USFWS Recommendations

1. The service recommends that a light management plan be implemented during the construction phase of the Port Dolphin LLC liquefied natural gas deepwater port. The service requests to review this plan prior to the commencement of this project.
2. The development of an Eastern indigo snake protection/education plan for all construction personnel to follow. The plan would be provided to the USFWS for review and approval at least 30 days prior to any clearing activities. Informational signs should be posted throughout the construction site to contain the following information:
   - Description of the Eastern indigo snake, its habits, and protection under Federal Law
   - Instructions not to injure, harm, harass, or kill this species
   - Directions to cease clearing activities and allow the Eastern indigo snake sufficient time to move away from the site on its own before resuming clearing
   - Telephone numbers of pertinent agencies to be contacted if a dead Eastern indigo snake is encountered. The dead specimen should be thoroughly soaked in water, and then frozen.
3. If not currently authorized through an Individual Take Statement met in association with a Biological Opinion, only an individual who has been either authorized by a section 10(a)(1)(A) permit issued by the USFWS, or designated as an agent of the State of Florida by the FWC for such activities, is permitted to come in contact with or relocate an Eastern indigo snake.
4. An Eastern indigo snake monitoring report must be submitted to the appropriate Florida Field Office within 60 days of the conclusion of clearing phases. The report should be submitted whether or not Eastern indigo snakes are observed. The report should contain the following information:
   - Any sightings of Eastern indigo snakes
   - Other obligations required by the FWC, as stipulated in the permit.
5. The Service recommends the Applicant use as a minimum the *Standard Manatee Conditions for in-Water Work (2005 revision)*.

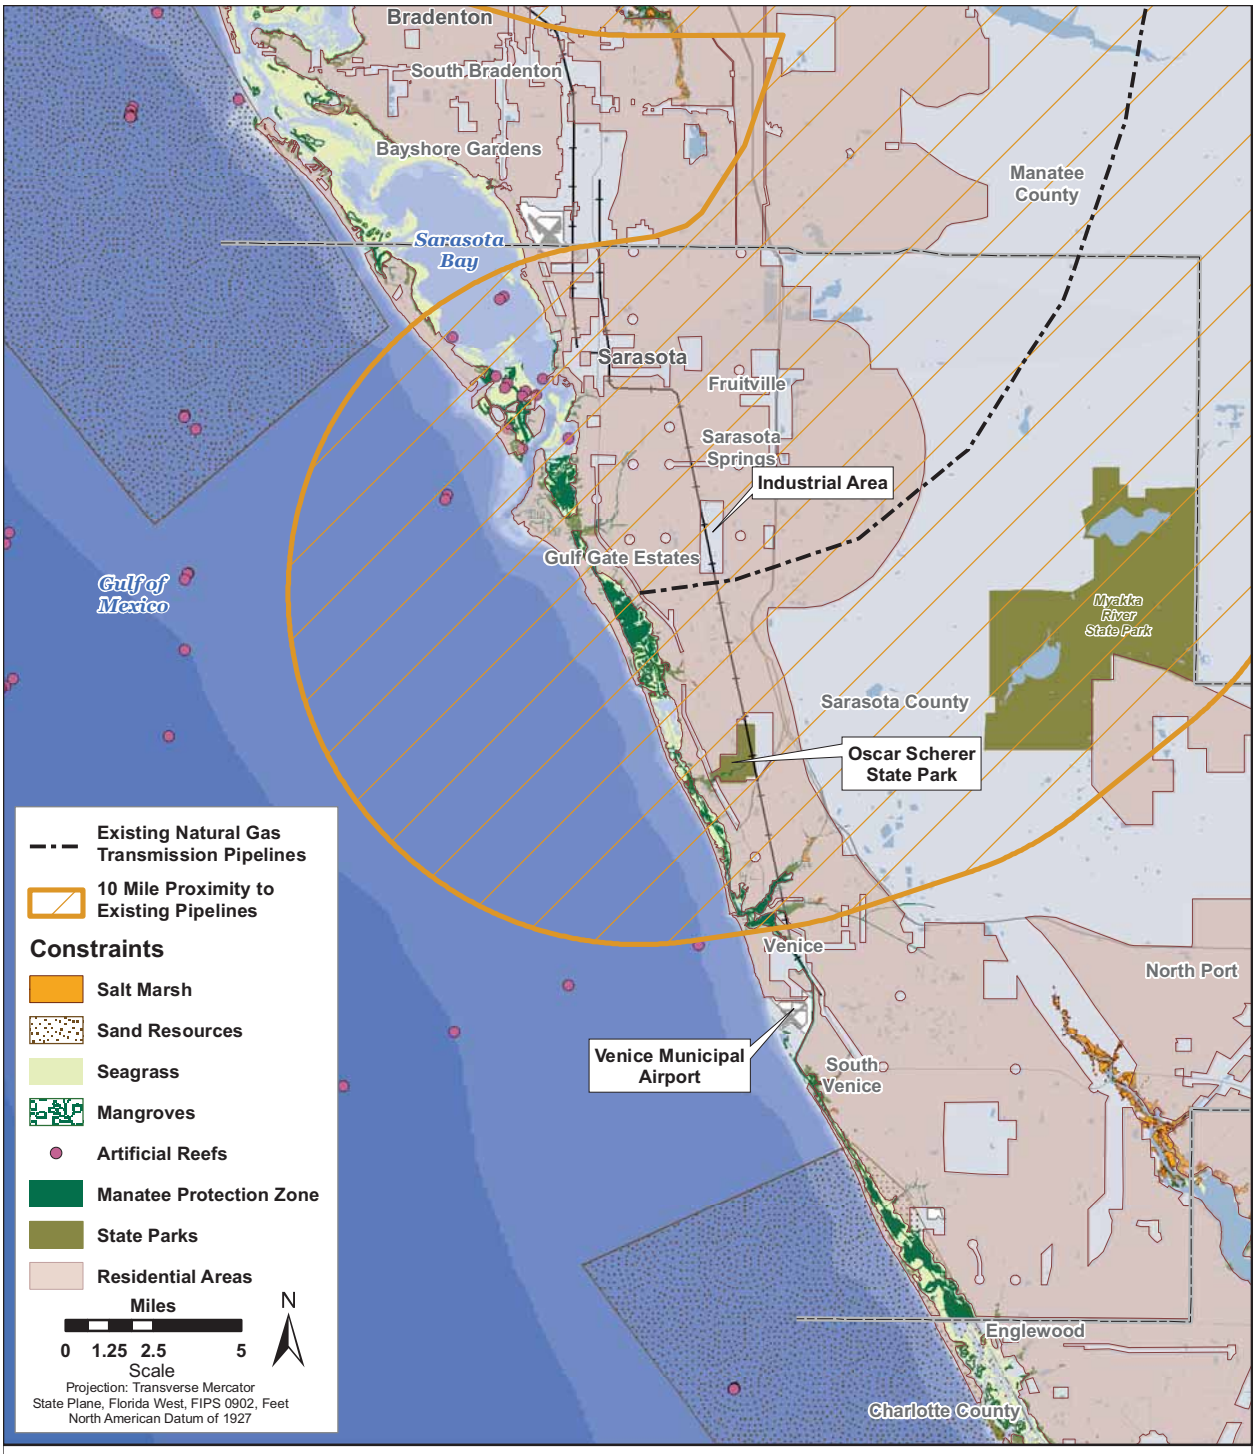
Appendix F1
Detailed Criteria Maps for Landfall Locations

Selection of Location for Onshore Pipeline Transition And Construction Support Area

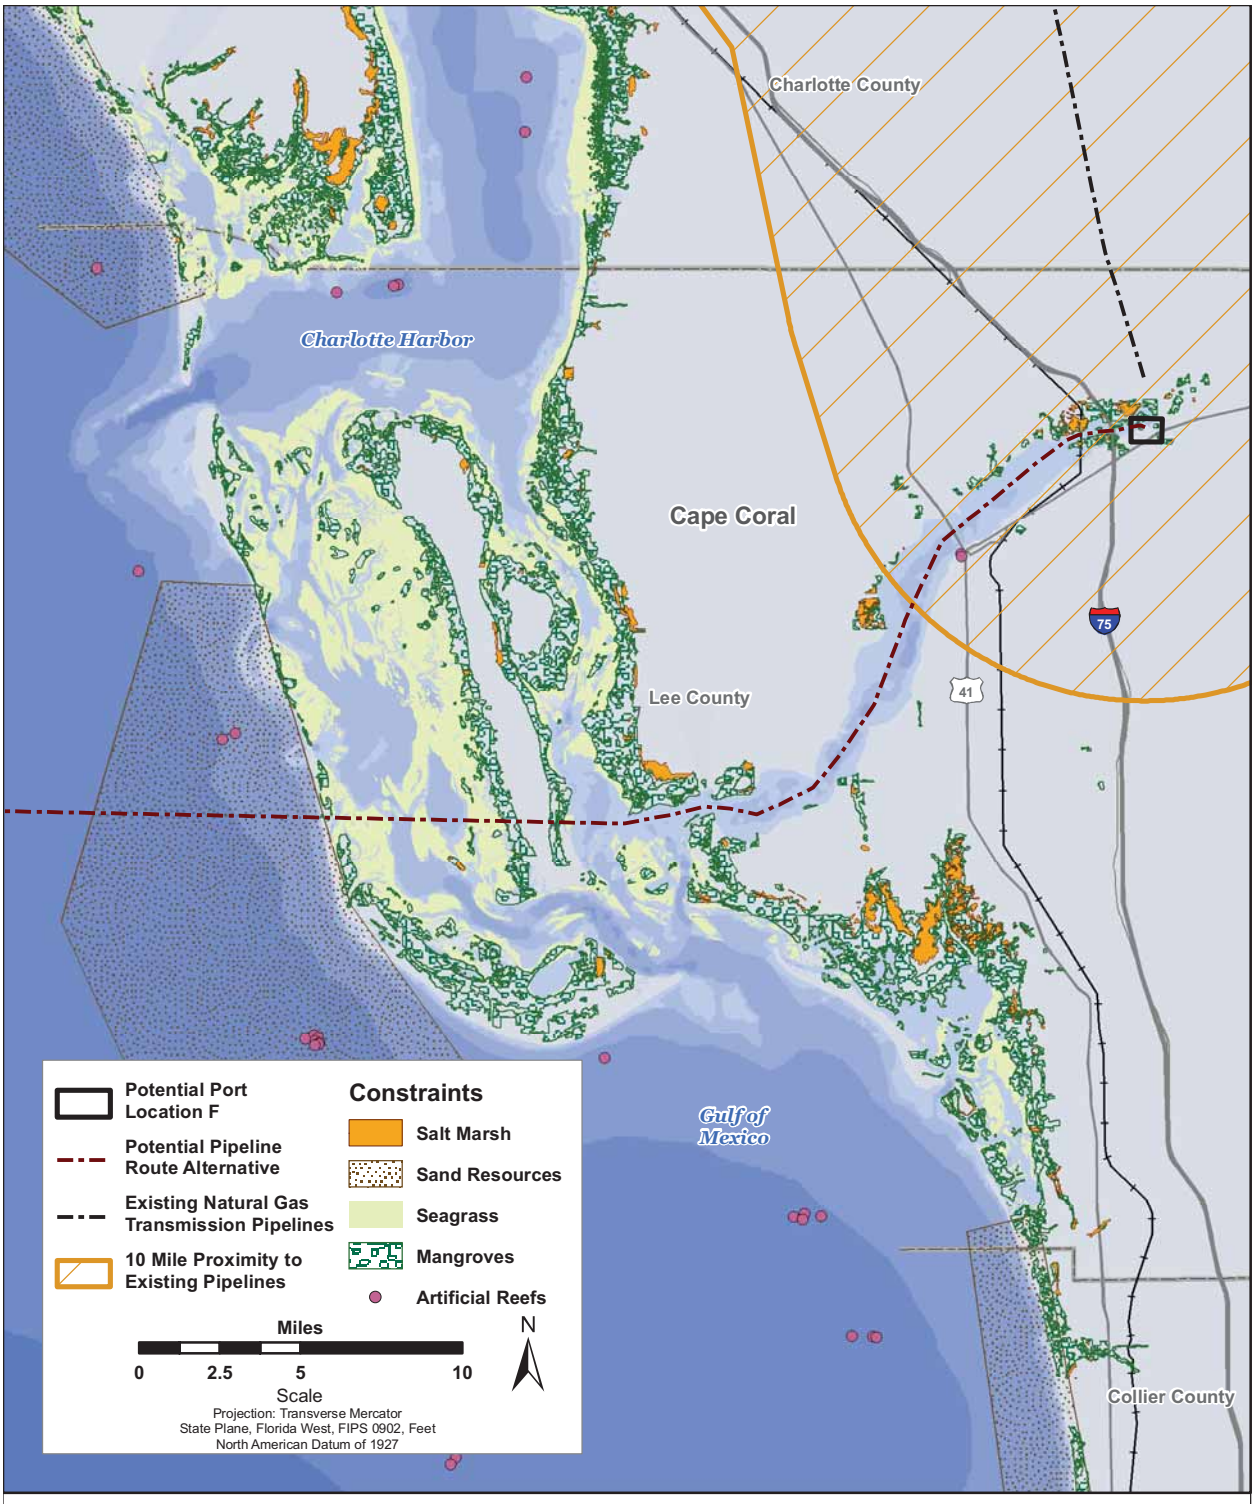
As described in **Section 2.1.4** of this FEIS, a number of factors were considered in the siting analysis for the onshore location of the LNG port. Phase I screening identified five areas for more detailed evaluation. In the Phase 2 screening, three of these areas were eliminated as discussed in **Section 2.1.4**. As stated in **Section 2.1.4**, the Sarasota area was eliminated because of the proximity of highly developed residential areas along the coastline. There were no industrial areas along the coast that would be able to support a potential LNG port. A barrier island and environmental constraints, including several sand resource areas, also would have made it difficult to build and support a pipeline port. There was one nonresidential area close to the coast. However, it was not suitable for construction because it is a State Recreational Area, and as such, not acceptable for construction. The remaining two areas, Tampa Bay and Fort Myers, were further evaluated to identify acceptable locations that would support construction of the pipeline and interconnection with at least one interstate pipeline system. This included the transition from offshore to a suitable onshore location.



Using the USGS Land Use data, industrial areas located within the two areas were selected for further site screening. These selected areas were confirmed with aerial photography as potential locations for bringing the pipeline ashore and providing pipeline construction support areas. There were six areas identified as potential port locations, five potential locations in the Tampa Bay area and one location in Fort Myers.

The selection criteria for Phase II include avoiding coastal environmental resources to the maximum degree possible and identifying appropriate land use. The environmental constraints including, aquatic preserves, mangroves, manatee protected areas, seagrasses, and salt marshes were collected and overlaid in the potential port locations. This mapping helped to identify potential areas and eliminated unsuitable areas based on the provided criterion.

The Sarasota area, as shown in **Figure F-1**, is densely developed with residential properties for at least 8 km (5 mi) from the coast, making it unsuitable for pipeline construction. Coastal resources also include seagrass beds, turtle habitat, mangrove resources, and protected waters. The most suitable area is south of the FGT pipeline. This area has nonresidential property closer to shore, but that property is a State Recreational Area and was therefore, determined not suitable for pipeline construction (see **Figure F-1**).



The potential onshore location in Fort Myers that could provide a landing point for the offshore to onshore pipeline would be 1.5 miles away from the existing interstate pipeline. However, the onshore site and interconnection location are located inland within the Caloosahatchee River. This would require a long pipeline through barrier islands and through inland waters over twenty miles to open water. (See **Figure F-2**) Therefore, the Ft. Myers area was eliminated from further consideration.

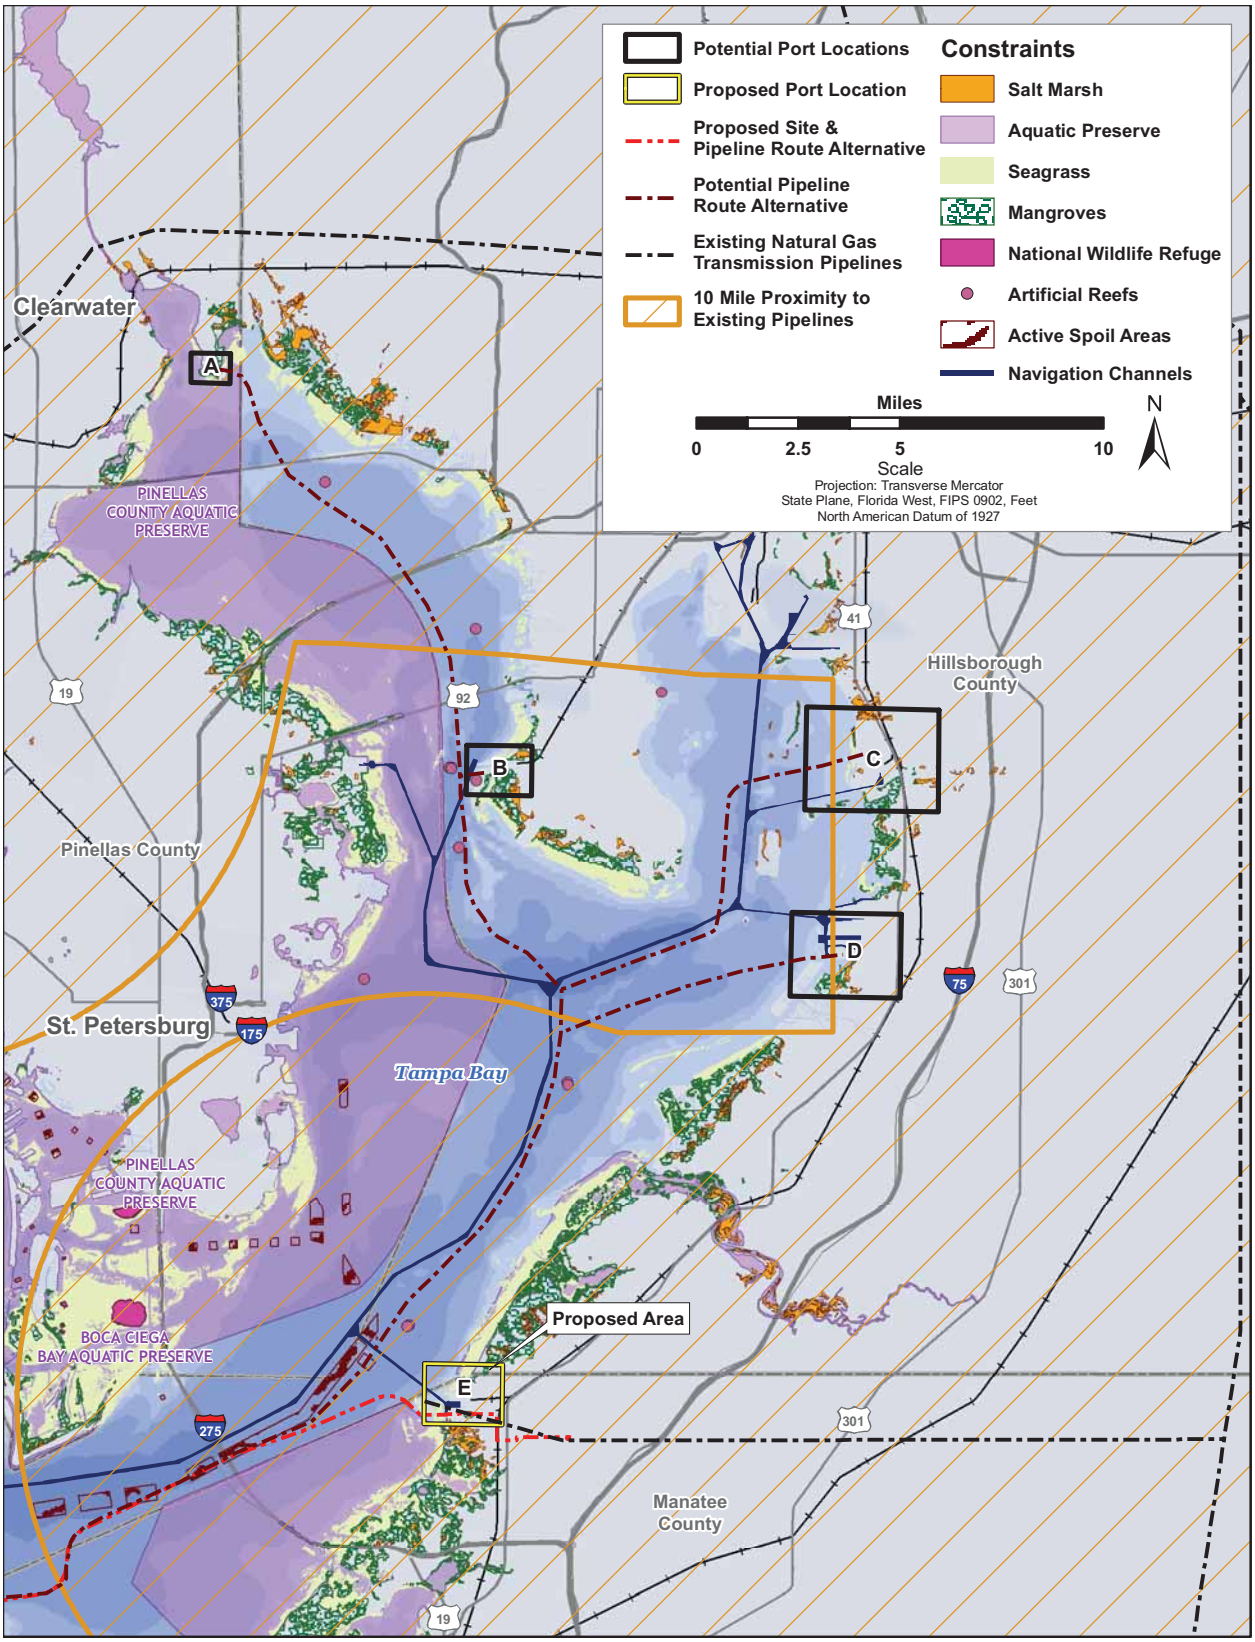
Several potential locations were identified in Tampa Bay that appeared to be suitable sites for bringing the pipeline ashore and supporting pipeline construction. **Figure F-3** shows the locations of each of these. Details of each potential site are shown on **Figures F-4** through **F-8**. Each of these figures includes a description of the screening process for the potential site depicted.

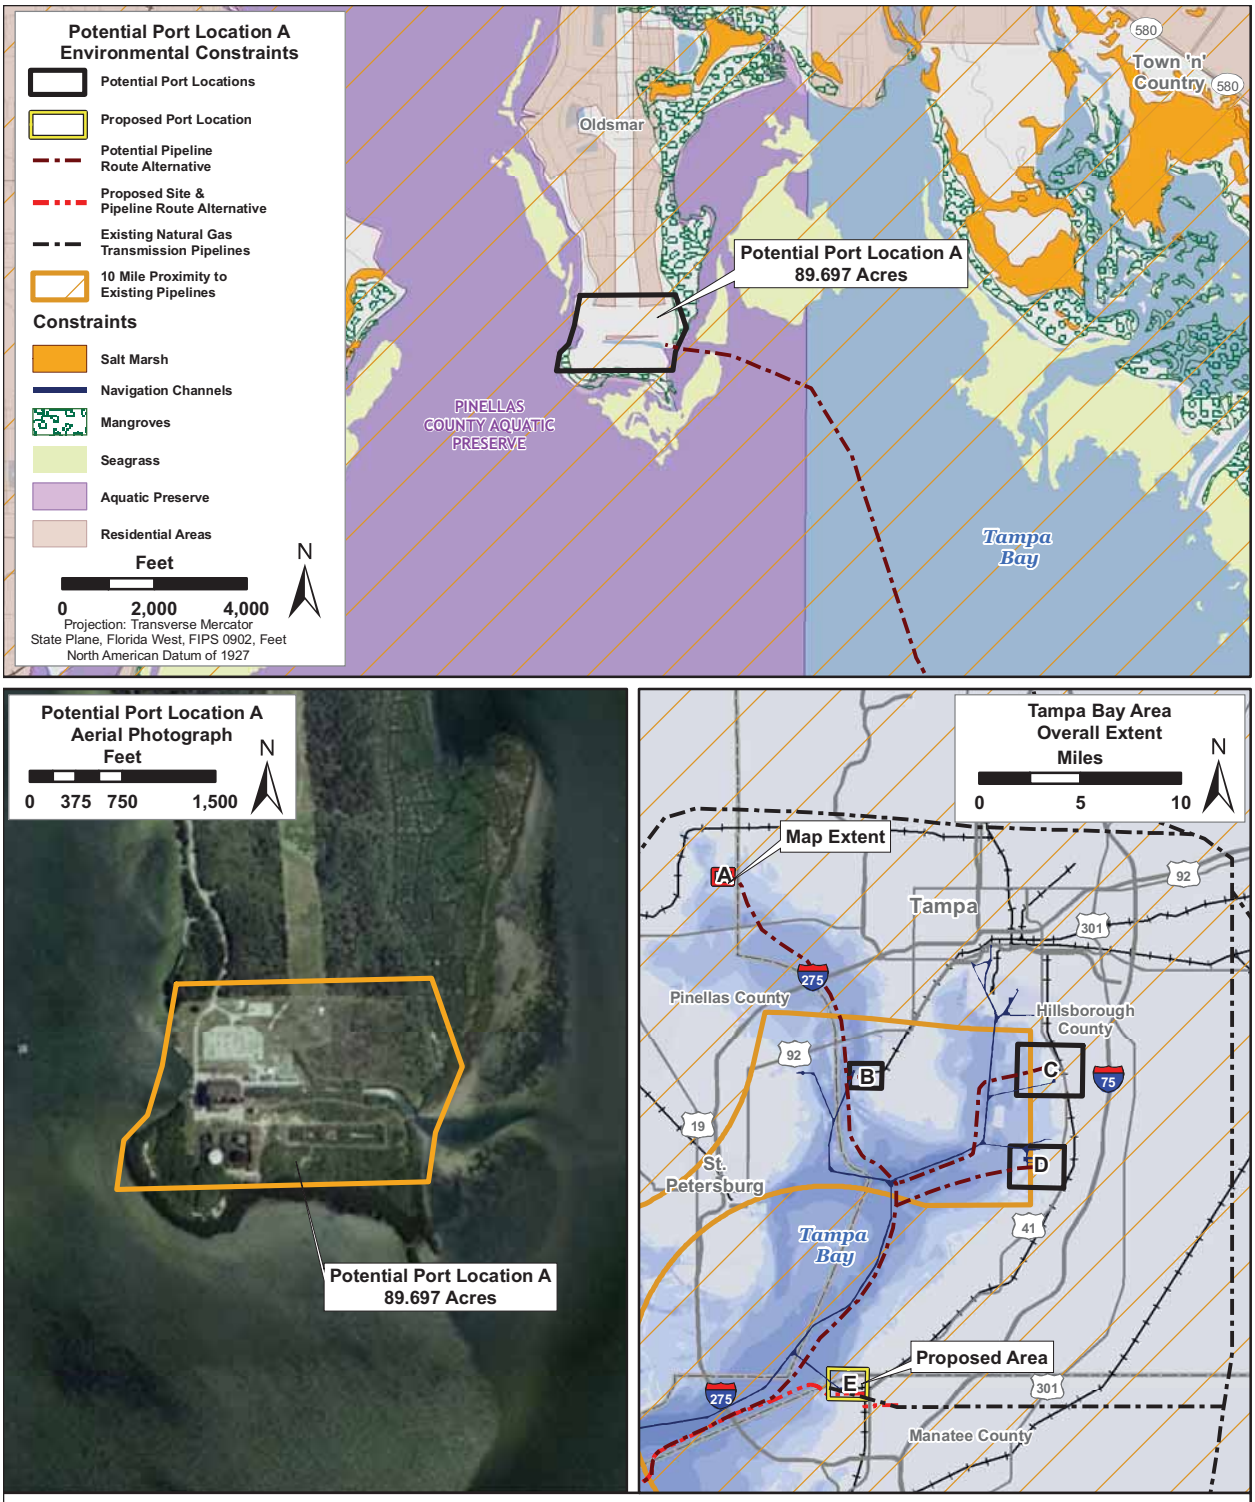
South of Tampa Bay in the Sarasota area, the coastal area is densely developed with residential properties for at least 8 km (5 mi) from the coast, making it unsuitable for pipeline construction. Coastal resources also include seagrass beds, turtle habitat, mangrove resources, and protected waters. There is one industrial area adjacent to the interstate pipeline. However, the area is over 4 miles from the coast. This distance is greater than available directional drilling techniques are able to span. The area between the coast and the industrial area are densely developed with residential properties, so there would be no appropriate location for staging a directional drill under the coastal resources. One area south of the FGT pipeline has nonresidential property closer to shore, but that property is a State Recreational Area and therefore not suitable for pipeline construction.

Figure F-1. Area showing potential landfall site for pipeline around Sarasota, Florida

The potential onshore location in Fort Myers would provide an interconnection point to the existing onshore pipeline and would be 1.5 miles away from the existing interstate pipeline. However, onshore site and interconnection location are located inland within the Caloosahatchee River. This would require a long pipeline through barrier islands and through inland waters over twenty miles to open water. Therefore, the Ft. Myers area was eliminated from further consideration.

Figure F-2. Area showing potential landfall site for pipeline around Fort Meyers, Florida





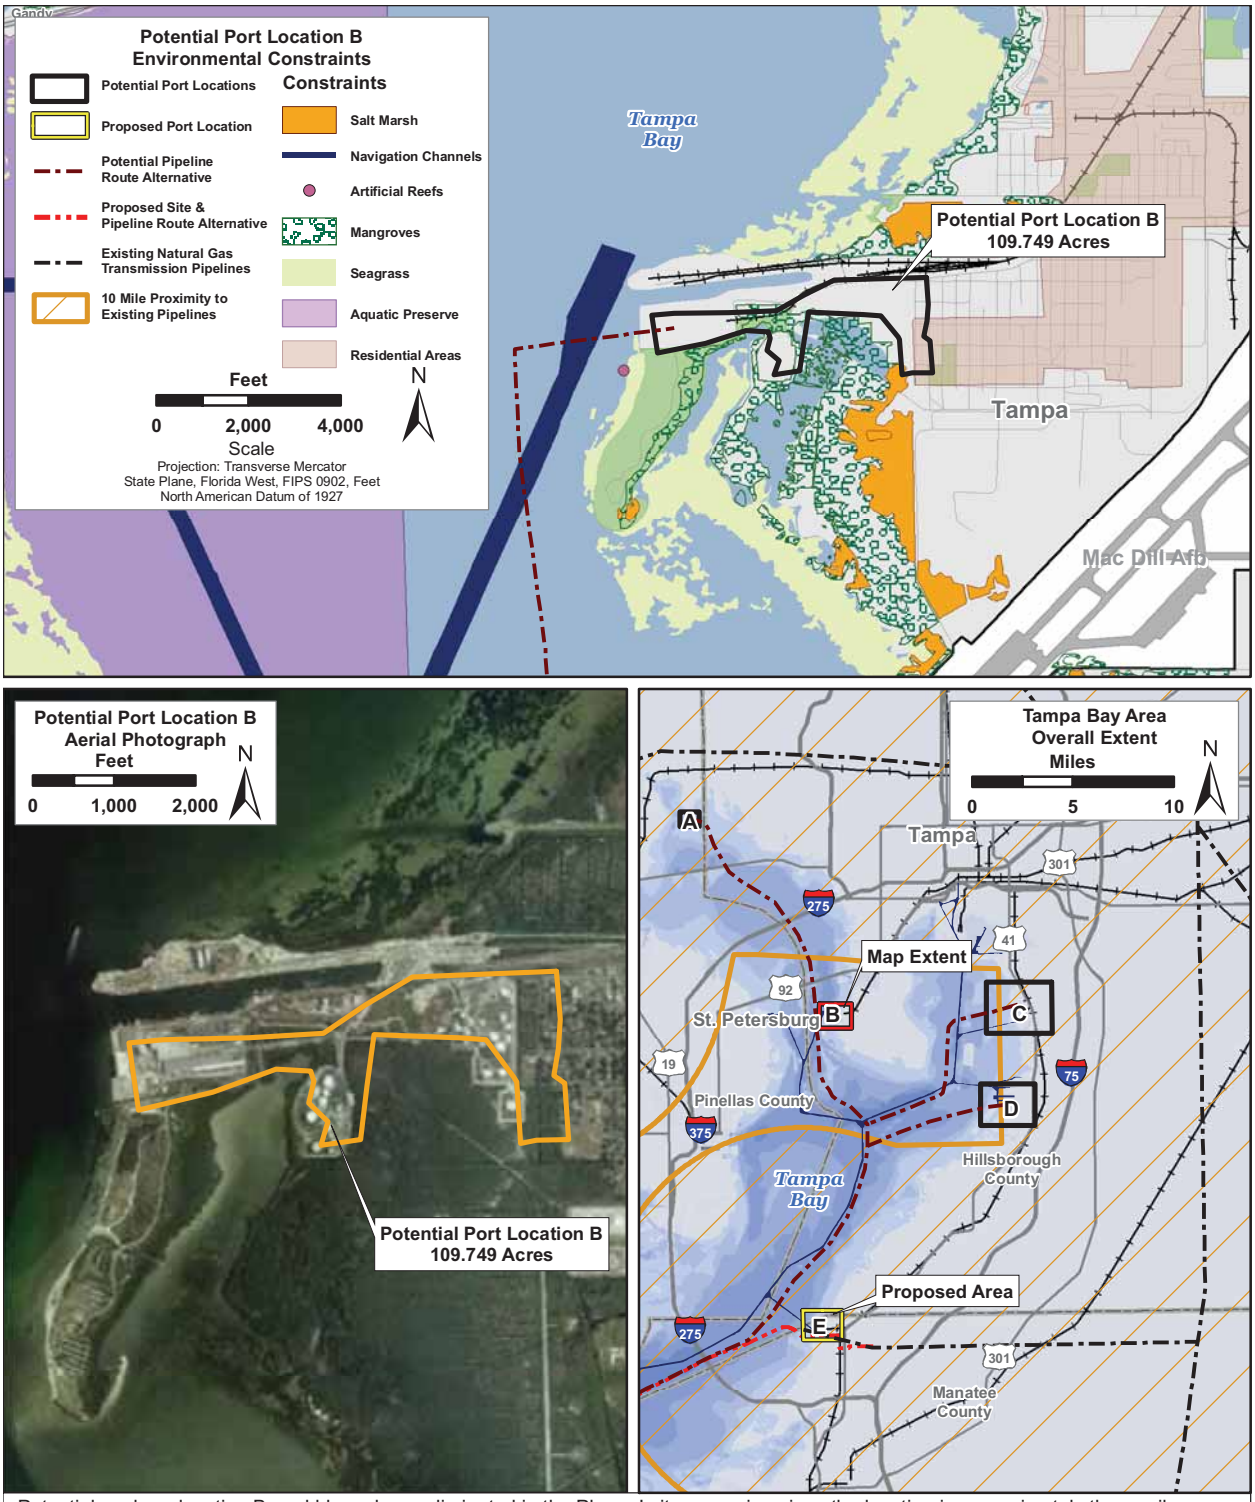


Figure F-3. Area showing potential landfall sites for pipeline around Tampa Bay, Florida

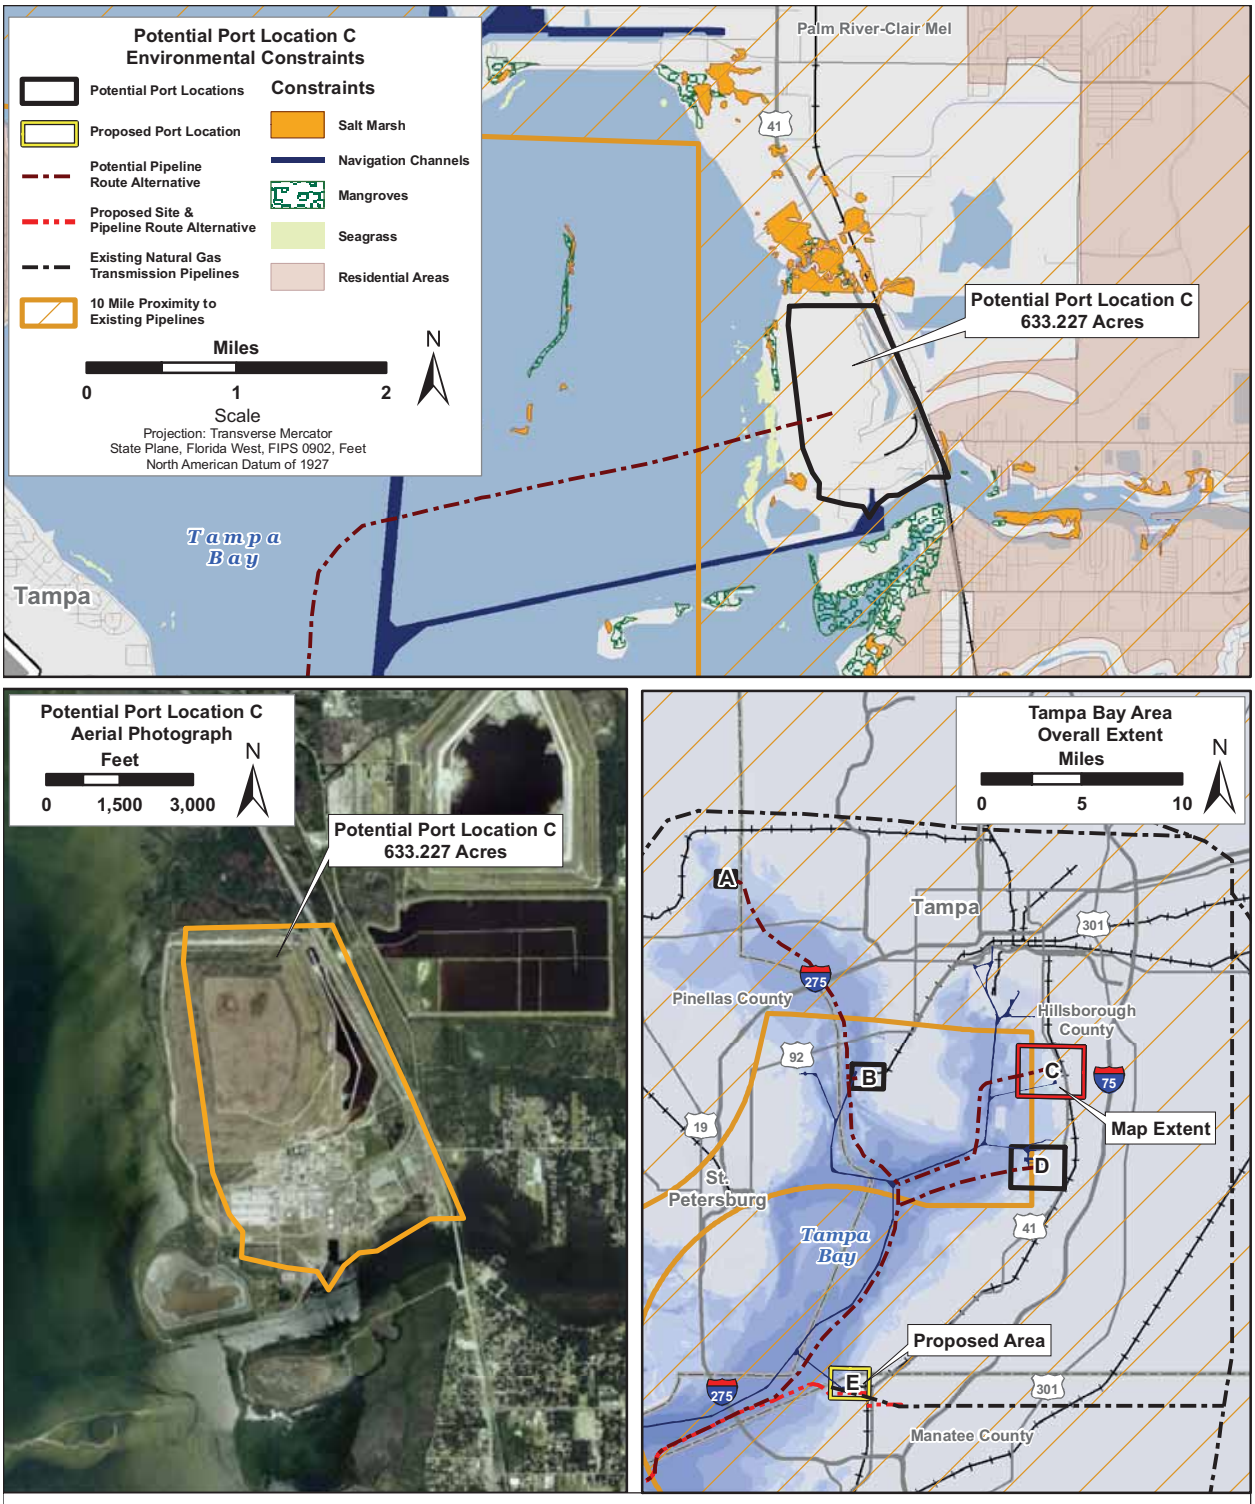
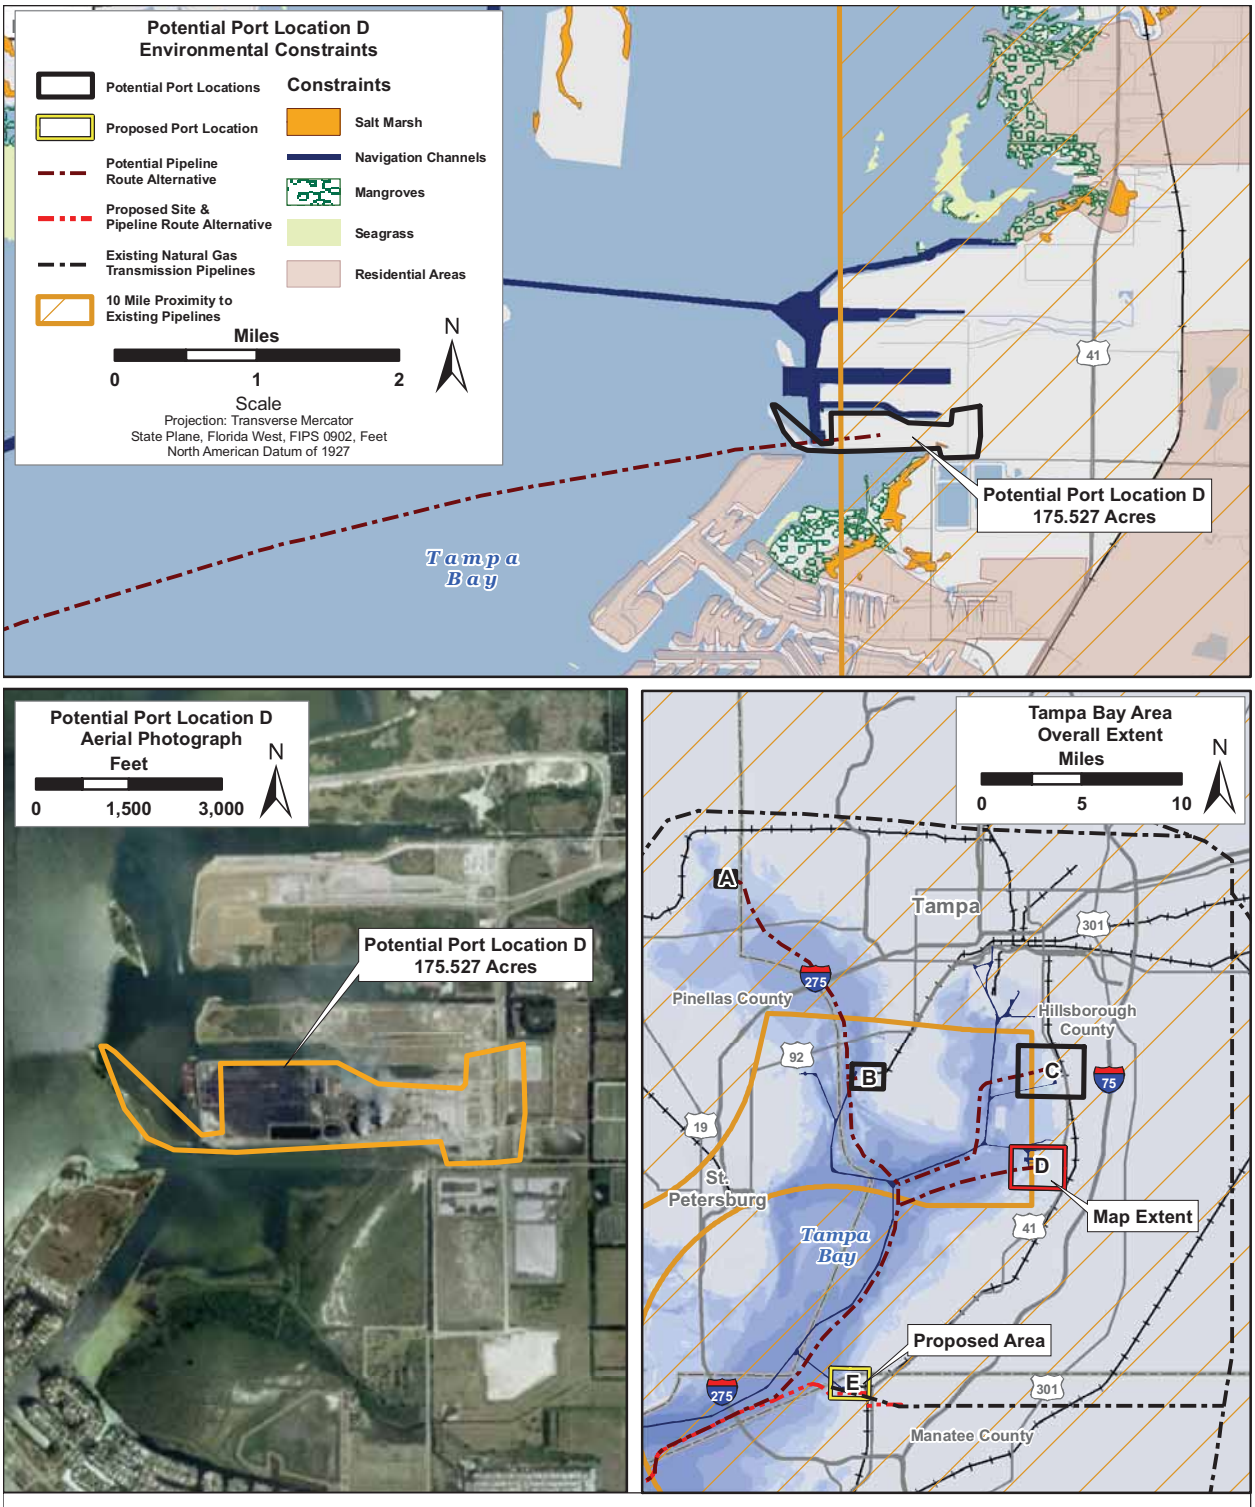


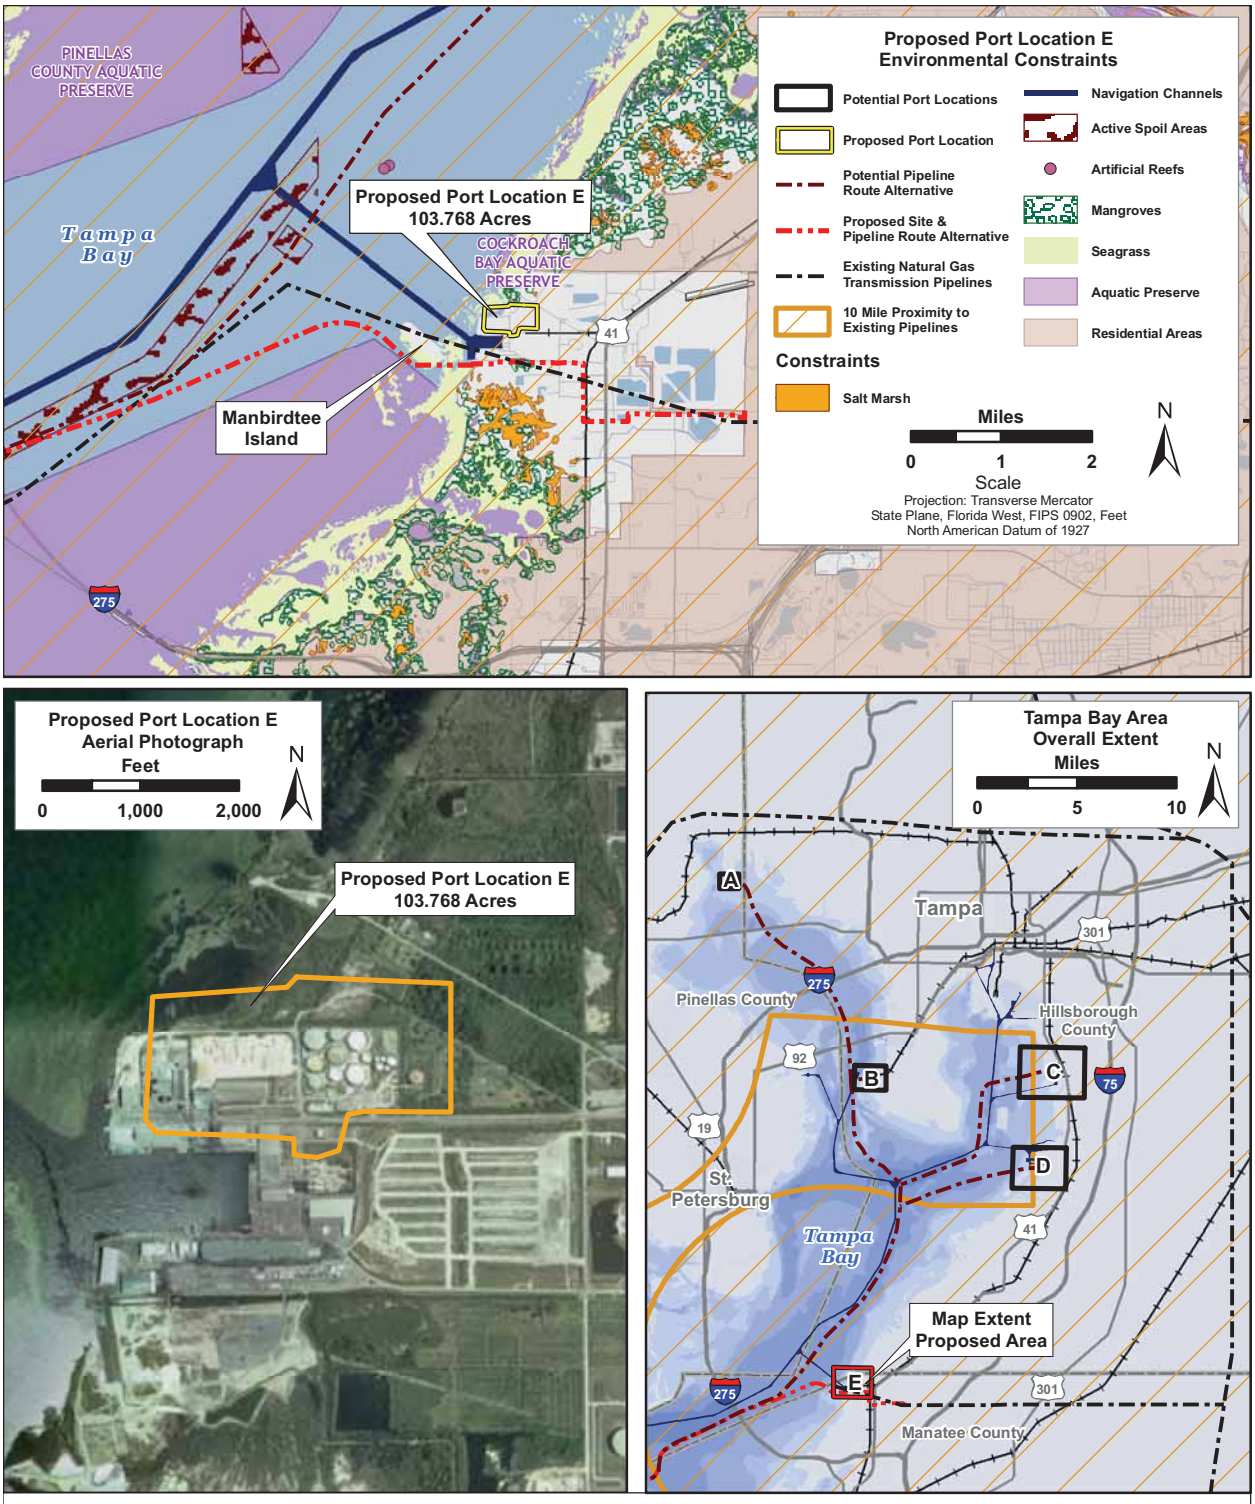
The potential onshore location A was the northernmost location considered. The site is located 3.2 miles south of an existing onshore interstate pipeline. However, its location would have required at least 33 miles of pipeline construction through Tampa Bay. The route would have crossed through several navigation channels which are routinely dredged for channel maintenance. There also are several environmental constraints such as seagrasses, mangroves, and aquatic preserves that would have increased environmental impacts or made construction more difficult to complete.

Figure F-4. Location A: Potential landfall site for pipeline in Tampa Bay, Florida



Potential onshore location B could have been eliminated in the Phase I site screening since the location is approximately three miles outside the original ten mile corridor for the existing interstate pipeline. However it was considered in this phase of the site screening because of its proximity to the coast and suitability of land use designation. Location B is approximately one mile from MacDill AFB in Tampa and 12.8 miles south of an existing interstate pipeline. Environmental constraints are not as severe as location A, but other environmental factors included mangroves, seagrasses, and artificial reefs. Selection of this location would require at least twenty miles of pipeline construction in Tampa Bay that crisscross navigation channels. Therefore, Site B was eliminated from further selection.

Figure F-5. Location B: Potential landfall site for pipeline in Tampa Bay, Florida

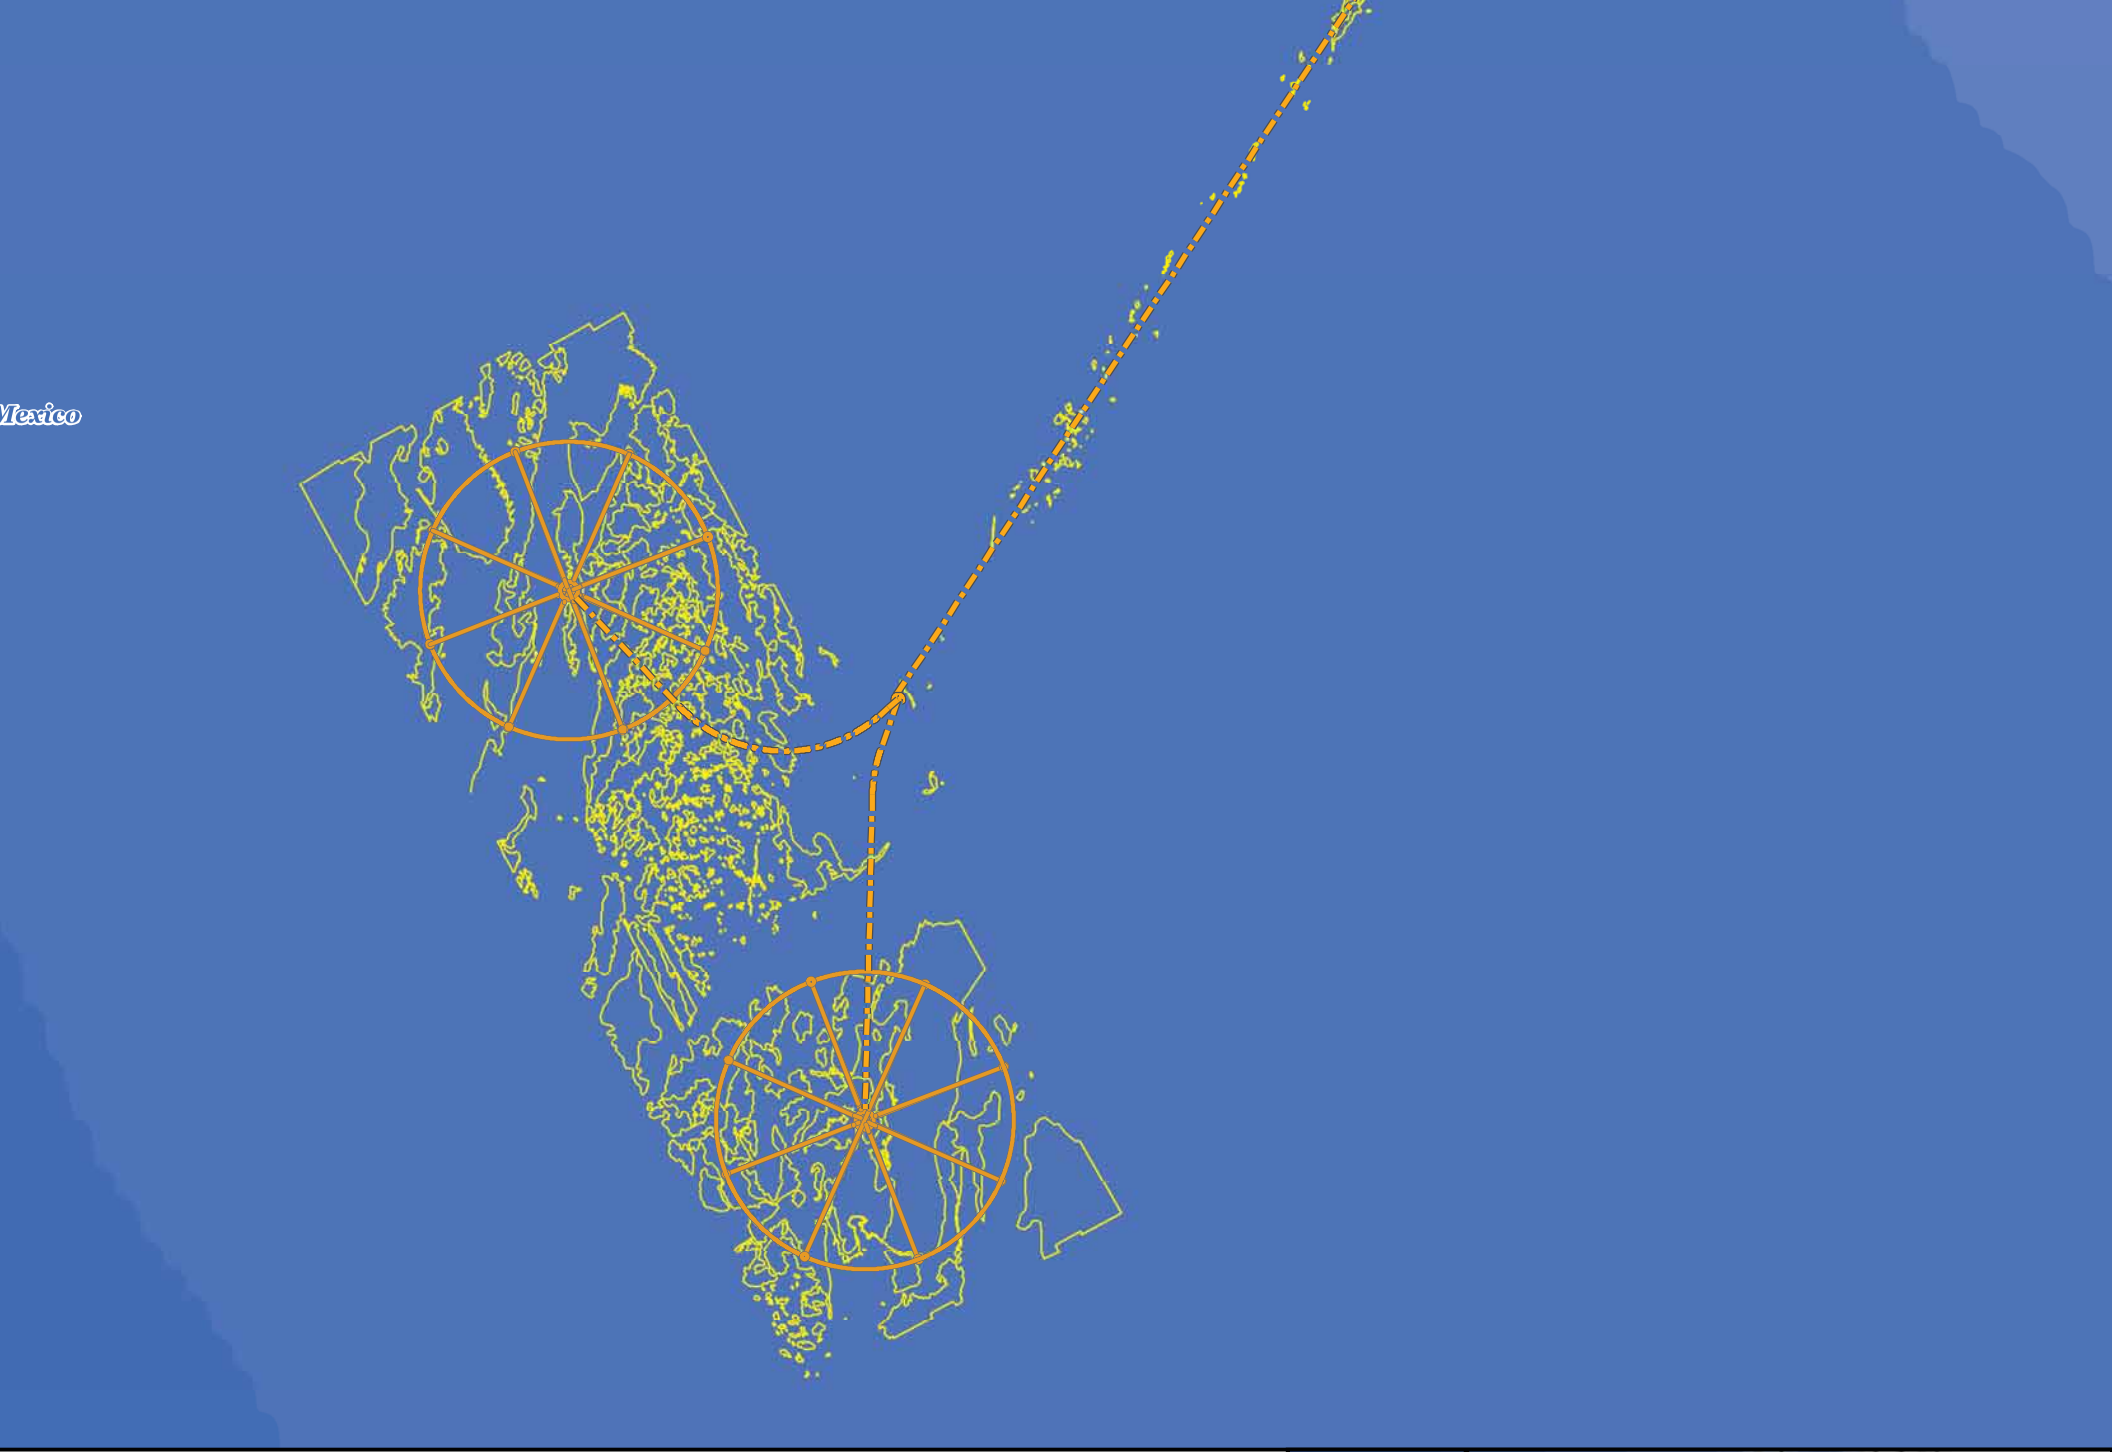


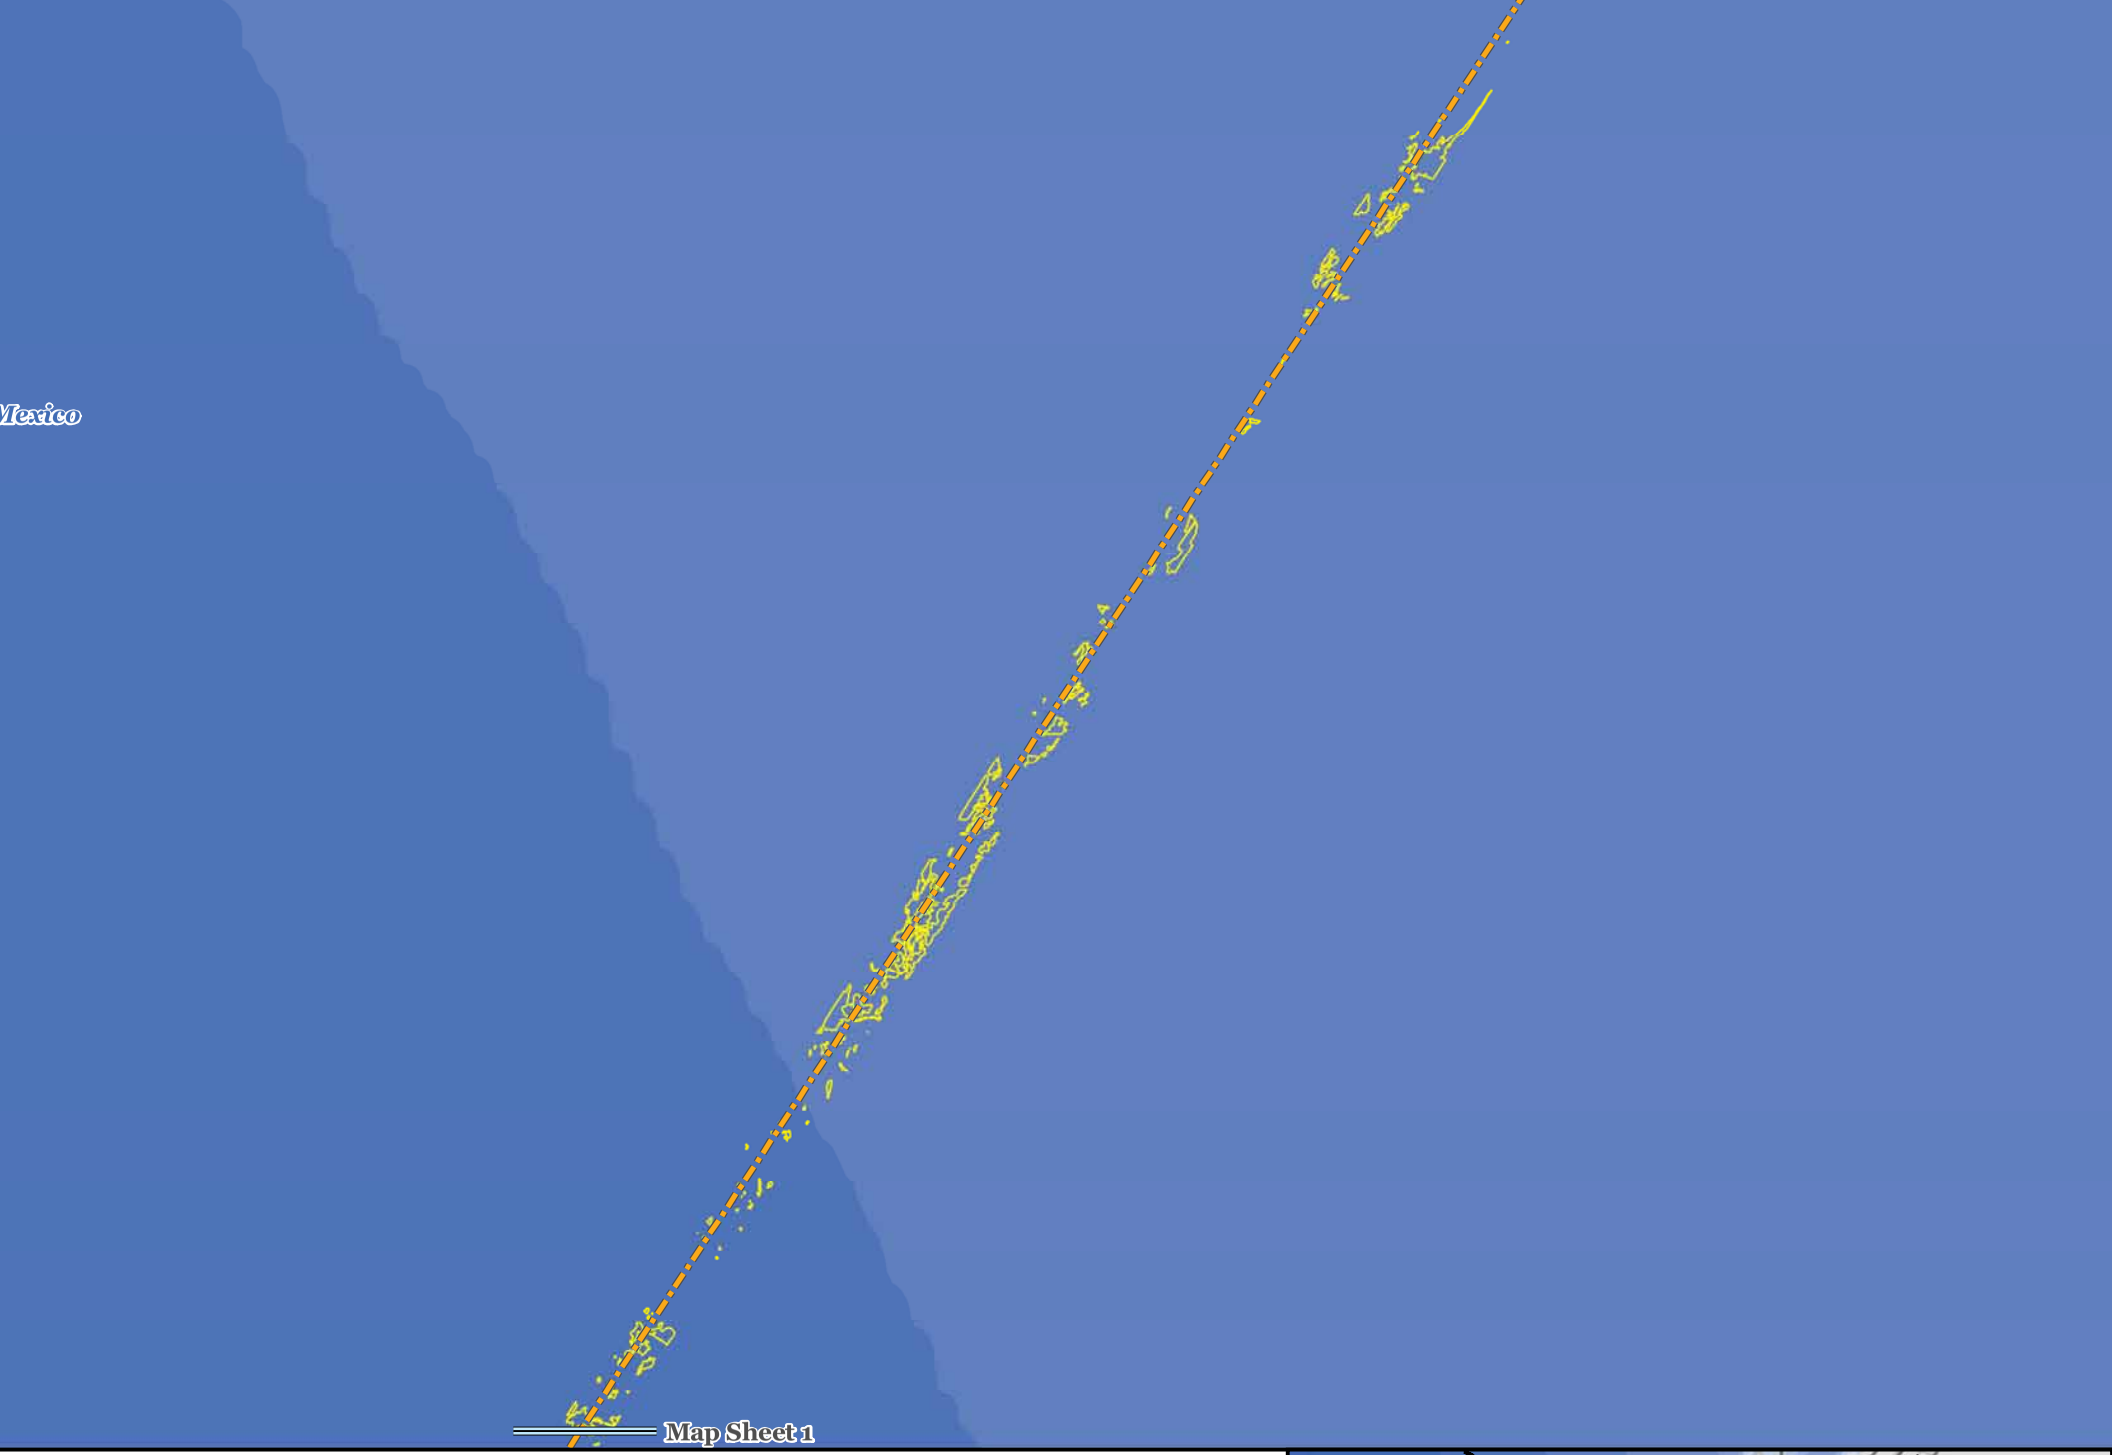
Potential onshore location C is on the eastern side of Tampa Bay. The nearest interconnection point to an existing onshore pipeline is 8.5 miles to the east. Environmental constraints are minimal in this location. There are seagrasses and mangroves nearby, but they are not disturbed due to channel dredging. However, the site is located over 22 miles from the entrance to Tampa Bay, requiring the constructed pipeline to cross navigation channels which are routinely dredged.

Figure F-6. Location C: Potential landfall site for pipeline in Tampa Bay, Florida

The next site considered was potential port location D. It is located on the eastern side of Tampa Bay and is four miles south of location C. The nearest interconnection point to an existing onshore pipeline is 9.2 miles to the east. Environmental constraints are almost nonexistent except for salt marshes and mangroves to the south of the site that could be avoided. This site is 21 miles away from the mouth of Tampa Bay, and like the previous potential sites, this requires multiple crossings of navigation channels.

Figure F-7. Location D: Potential landfall site for pipeline in Tampa Bay, Florida





Potential port location E exhibits benefits that surpass the other potential locations. This site is located eight miles from the mouth of Tampa Bay. The environmental constraints consist mainly of an area of seagrass between Manbirdtee Island and landfall. The primary advantage of this site is the proximity to the existing interstate pipeline, which is approximately four miles from the proposed port location. This site was the most advantageous potential site because environmental impacts could be minimized and no navigational channels have to be crossed.

Figure F-8. Location E: Potential landfall site for pipeline in Tampa Bay, Florida

1. Overview

The purpose of this document is to present the criteria that engineering-environmental Management, Inc. (e^2M) used to develop a study area for the Port Dolphin LLC Deepwater Port Environmental Impact Statement (EIS) and present the data used for the ichthyoplankton impact assessment. The methodology to evaluate impacts of seawater intakes associated with deepwater ports in the Gulf of Mexico was developed previously for the Gulf Landing Deepwater Port License Application EIS (USCG and MARAD 2004a) and was used to evaluate the impacts of the seawater intake alternatives associated with the proposed Port Dolphin Deepwater Port.

The following evaluation provides an overall description of abundance and density within the project area and assesses potential impacts based on calculated age-1 equivalents and equivalent yields for six finfish species. Based on the species represented in the Southeast Area Monitoring and Assessment Program (SEAMAP) data and other considerations, such as the availability of data to construct life histories and whether or not a species had Essential Fish Habitat (EFH) in the area, four species were selected to represent broad categories of the species represented in the data when the methodology was developed. The four finfish species that were selected are red drum (*Sciaenops ocellatus*), red snapper (*Lutjanus campechanus*), and bay anchovy (*Anchoa* spp.). These species were selected to represent a commercially and recreationally important species with significant impacts from over fishing and extensive restrictions on landings through a Federal Fishery Management Plan (FMP) (red drum), another important commercial and recreational species that is managed under a Federal FMP (red snapper), and an important prey species with some commercial importance (bay anchovy). Typically Gulf menhaden are assessed; however, a quantitative assessment of Gulf menhaden were omitted from this assessment because of data limitations, described in **Section 4**.

Based on discussions with the National Marine Fishery Service (NMFS) and the Florida Fish and Wildlife Commission (FFWC), three additional species were identified for analysis. Gag grouper (*Myctoperca microlepis*) was selected as a commercially and recreationally important species in the project area that is managed under a Federal FMP. Sheepshead (*Archosargus probatocephalus*) was selected as a species of concern to Florida that is not managed under a Federal FMP. Spanish sardine (*Sardinella aurita*) was selected as a forage fish common to the west coast of Florida that is also commercially fished. Other species might have EFH in the project area or occur in the project area, but these representative species were selected (in cooperation with NMFS) based on economic and ecological importance, availability of life history data, and the similarity to other population types. It is assumed that impacts on other species in the Project area would be similar to impacts on these representative species.

THIS PAGE INTENTIONALLY LEFT BLANK

2. Study Area

To maximize the number of samples from habitat similar to that of the proposed Port Dolphin Deepwater Port, e²M chose the study area based on depth and location (see **Figure 2-1**).

The proposed location of the Port Dolphin Deepwater Port is approximately 27.41 degrees (°) latitude and -83.20° longitude. The study area for this analysis incorporates depths greater than 65 feet, and encompasses 6,938 square miles around the proposed location with corners positioned as follows (see **Figure 2-1**):

- Northwest corner: 28.167° latitude/-84.019° longitude
- Northeast corner: 28.169° latitude/-83.245° longitude
- Southwest corner: 26.661° latitude/-84.019° longitude
- Southeast corner: 26.661° latitude/-83.552° longitude.

The proposed location is west of Tampa Bay and centered on the proposed Port Dolphin Deepwater Port. To capture all the SEAMAP sample locations within the designated study area, e²M queried the "statcard" table for samples classified as follows: "SLATDEC" (decimal latitude) greater than or equal to "26.595" and less than or equal to "28.225"; "SLONDEC" (decimal longitude) greater than or equal to "-84.015" and less than or equal to "-82.385"; and "ST_DEPTH" (sample depth) greater than or equal to "10.83" (note that this variable is reported in fathoms, so that a depth of greater than or equal to 65 feet was queried).

Between 1984 and 2002, 143 samples were taken in the study area, and eggs and larvae were collected in all 143 samples. There were no trips reported with egg samples in 1995. There were no trips with larval samples in 2000. A summary of the trips that caught eggs and larvae is presented in **Table 2-1**. These samples will be referred to as the Port Dolphin samples throughout the remainder of the document.

Sampling trips occurred from May to November (excluding July); the frequency of samples that caught larvae and eggs is presented in **Figure 2-2**. Because the trips occurred from May through November, the density estimates (i.e., average, upper, and lower estimates of larvae per 1 million gallons) are initially considered estimates for that 7-month period. The 7-month density estimates for the species of concern were used to derive yearly entrainment estimates, as described in the Gulf Landing EIS (USCG and MARAD 2004b) and below.

Estimates of the average density of eggs and larvae in 1 million gallons of seawater are presented in **Table 2-2**. Samples from within the study area indicate that an average of 3,398 eggs and 12,084 larvae occur per 1 million gallons of seawater in the area of the proposed Port Dolphin Deepwater Port.

Formulas designed within Microsoft Excel were used to calculate descriptive statistics for larval and egg densities per 1 million gallons of seawater. **Table 2-3** shows these statistics. The formula confidence limit equals the mean, plus or minus, the "t value" multiplied by the standard error. The "t value" is dependent on the degrees of freedom (n-1) and the desired confidence limits (95 percent in this case), and can be found in any standard t-distribution table.

The descriptive statistics were used to judge the normality of the data distribution and to estimate larval and egg densities in the study area. Based on the large values of kurtosis (flatness) and skewness, the distribution of the data was determined not to be a normal distribution. However, a non-normal distribution was expected, based on the inherent patchy distribution associated with ichthyoplankton.

Figure 2-2. Frequency of Egg and Larval Samples within the Study Area by Month

Table 2-2. Estimate of Egg and Larval Abundance at the Proposed Site for the Port Dolphin Deepwater Port, Based on Port Dolphin Samples

Life Stage	Number of Samples	Number of Eggs or Larvae/1 million gallons of Seawater	
		Mean	Standard Error
Egg	143	3,398	486
Larvae	143	12,084	1,028

Source: e2M

Based on the measures of central tendency, median, mode, mean, and skewness, it was determined that the best values to use as estimates for the larval and egg density in the study area were the standard mean and the upper and lower 95 percent confidence limits.

The mean densities of eggs and larvae within the study were previously adjusted because of the potential for undersampling by bongo nets used to collect the ichthyoplankton data for the SEAMAP survey. These bongo nets have a mesh size of 0.333 millimeters (mm). A comparison of ichthyoplankton samples taken with 0.333- and 0.202-mm mesh nets indicates that the smallest red drum larvae sampled were 5 to 8 times more numerous when collected with the finer mesh net. These results are expected to be applicable to larvae of other species (Thompson 2004). Additionally, in order to account for the patchiness and variability of the ichthyoplankton data (described above), 95 percent confidence limits were constructed around the adjusted mean.

Table 2-3. Descriptive Statistics for Egg and Larval Samples within the Study Area, Based on SEAMAP Data

Statistics	Eggs/1 million gallons	Larvae/1 million gallons
Mean	3,398.50	12,084.52
Standard Error	486.21	1,028.41
Median	1,947	8,896
Mode	0	11,929.74545
Standard Deviation	5,814.18	12,298.04
Sample Variance	33,804,719	151,241,832
Kurtosis	50.13	15.25
Skewness	5.85	3.35
Range	56,846	88,197
Minimum	0	0
Maximum	56,846	88,197
Sum	485,985.51	1,728,086.8
Count	143	143
Confidence Limit (95%)	4,359.64	14,117.5

3. Species of Concern

The larvae in the Port Dolphin Deepwater Port samples represent 217 taxa (i.e., larvae identified to the lowest taxon possible). These taxa are presented in **Table 3-1**. The 10 most abundant taxa, in order of decreasing abundance, are gobies (Family Gobiidae), Spanish sardine (*Sardinella aurita*), round scad (*Decapterus punctatus*), Atlantic thread herring (*Opisthonema oglinum*), lizardfish (Family Synodontidae), scorpionfish (Family Scorpaenidae), unidentified fish, cusk eels (Family Ophidiidae), codfish (*Bregmaceros sp.*), and perches (Order Perciformes).

Ms. Patience Whitten consulted NMFS and FFWC via email to determine if the study area chosen was sufficient and if any additional species of concern need to be addressed (Whitten 2007)**.**

Table 3-1. Density of Larvae (Number of Larvae Per 1 Million Gallons) by Taxon in the Samples Within the Study Area Surrounding the Proposed Port Dolphin Deepwater Port

Source: SEAMAP Data

4. Evaluation of Potential Impacts of the Proposed Port Dolphin Deepwater Port

To evaluate the impacts of the seawater intake of the Port Dolphin Deepwater Port on fisheries resources and EFH, e^2M used the ichthyoplankton assessment model developed for the Gulf Landing EIS (USCG and MARAD 2004a) to estimate density of larvae and eggs for each species of concern that could be entrained by the Proposed Port Dolphin Deepwater Port and to estimate potential impacts on fish stocks by calculating the age-1 (one-year-old) equivalents and equivalent yield for the potentially entrained fish.

e^2M assumed that 100 percent of larvae and eggs in 1 million gallons of seawater taken in by Port Dolphin would be entrained. We also assumed a mortality rate of 100 percent. It is unlikely that 100 percent would be entrained; however, because only the larvae and eggs that come into contact with the intake screen would be entrained.

Because SEAMAP data are collected with oblique tows throughout the water column, the true distribution and entrainment of larvae and eggs are unknown. We have found no studies that would allow a reliable estimate of whether or how much this would reduce impingement or entrainment. Therefore, we allowed no exclusion credits for screen mesh size, intake depth, or intake velocity, but the entrainment rates are expected to be reduced based on the proposed locations of the intake screens.

Table 4-1 summarizes adjustments that we used to compensate for data limitations. In order to address variability and uncertainty, we performed a sensitivity analysis to examine potential ranges of age-1 and equivalent yield estimates.

Table 4-1. Summary of Data Limitations, Corresponding Assumptions, and Data Adjustments

Data Limitation	Assumption or Data Adjustment
Low number of samples based on frequency of sampling and distance between sampling station.	Sample size was increased by increasing the study area to habitat representative of the study area based on depth and distance from shore.
No data on distribution of ichthyoplankton throughout the water column.	Assumed a homogenous distribution of ichthyoplankton throughout the water column.
Efficiency of sampling equipment—because of mesh size and regurgitation from net not all eggs and larvae are sampled.	Density of ichthyoplankton in samples is multiplied by three.
Samples only occur from May through November (excluding July).	Data are adjusted for seasonality by weighting it using values in literature.
Invertebrate data are not included.	The Project will not be located within brown or white shrimp EFH.
Eggs are not identified.	(1) Eggs were analyzed separately using four life history tables. (2) There were 24.2% fewer eggs than larvae for key species.
Not all larvae can be identified to species level.	Unidentified larvae within taxon for key species were weighted by proportion of key species for that taxon and added to the number of larvae of key species.
Data are highly variable.	Used 95% confidence limits of ichthyoplankton densities.

Additionally, Gulf menhaden were not represented in the SEAMAP data because this species spawns from October through March, a time when the SEAMAP data were not consistently collected. It is likely that Gulf menhaden would be entrained by seawater intake associated with the Deepwater Port. Egg and larval entrainment is likely to be less than entrainment of Spanish sardines. Data collected by Houde (1979) indicate that *Brevoortia* spp. (the genus that includes Gulf menhaden) occurred at depths of less than 30 meters and that *Brevoortia* spp. were less common than any of the other clupeids (e.g., Spanish sardines); suggesting that concentrations of menhaden are relatively low in the eastern Gulf of Mexico.

4.1 Calculation of Larval Entrainment Estimation

Calculating annual larval entrainment involves the following steps, which are described in greater detail in the revised Appendix G of the Gulf Landing EIS (USCG and MARAD 2004a).

1. An adjustment for larvae that were not identified to species but were identified to Order, Family, Subfamily, or Genus and are associated with a species of concern. Note that this adjustment assumed that the larvae under the taxa Perciformes were Lutjanidae, Sciaenidae, Serranidae, and Sparidae and larvae under the taxa Clupeiformes were Engraulidae and Clupeidae.
2. A seasonal adjustment using data from Ditty 1986 because the SEAMAP data were only collected from June through November. The entrainment estimates larval abundance of SEAMAP data was considered the larval abundance for the 213 days from June through November. The monthly larval abundance presented from Ditty 1986 was used to develop a weighting factor for the June through November and December through May time periods. A ratio of the average abundance in these two time periods was used as a weighting factor. Larval abundance data were not available for red snapper, grouper, sheepshead, and Spanish sardines in Ditty 1986. For these species, the average for each time period was based on presence and absence for each time period.
3. An adjustment for the number of larvae entrained each day based on the volume of seawater intake.
4. An adjustment for the number of larvae entrained annually, based on the 213 days in the 7-month period of May through November and the 152 days in the 5-month period of December through April.
5. An adjustment for net extrusion and sampling inefficiency by multiplying by three.

Table 4-2 summarizes the mean, upper, and lower larval entrainment estimates for the species of concern.

Table 4-2. Summary of Average Larval Entrainment Estimates

Species of Concern	Lower Estimate	Average	Upper Estimate
Red Drum	454	4,384	10,281
Red Snapper	51,857	97,516	145,291
Bay Anchovy	154,724	358,388	566,099
Gag Grouper	62,552	169,073	276,046
Sheepshead	2,258,554	3,631,060	5,002,810
Spanish Sardines	14,892,446	42,000,246	78,762,655

4.2 Calculation of Egg Entrainment Estimates

Egg entrainment estimates for a particular target species are calculated by taking the proportion of total eggs to total larvae in the entire data set and applying that proportion to the entrainment estimate for each species, after all adjustments are made.

In the case of the Port Dolphin samples, the average total number of eggs in the entire data set is 0.297 of the average total number of larvae in the entire data set. Based on this proportion, the larval entrainment estimate for each key species is multiplied by 0.28 to estimate the number of potentially entrained eggs of the target species. **Table 4-3** presents the mean, lower, and upper annual entrainment estimates for eggs in the Port Dolphin samples.

Table 4-3. Summary of Average Egg Entrainment Estimates

Species of Concern	Lower Estimate	Average	Upper Estimate
Red Drum	127	1,228	2,879
Red Snapper	14,520	27,304	40,682
Bay Anchovy	43,323	100,349	158,508
Gag Grouper	17,515	47,340	77,293
Sheepshead	632,395	1,016,697	1,400,787
Spanish Sardines	4,169,884	11,760,069	22,053,543

4.3 Life History Values

The evaluation uses age-specific mortality to compare the estimated total number of eggs and larvae that could be entrained in the proposed warming system to the number that would have been expected to survive to age-1 or that would have been caught in a commercial or recreational fishery (equivalent yield). Life history values that are used for age-specific mortality include stage duration (e.g., it takes 1-2 days for an egg to hatch) and daily instantaneous mortality rates. These two values are multiplied to determine an age- or stage-specific mortality rate. In some cases, if an age-specific mortality rate was not available, a mortality rate, or a range of mortality rates, for comparable species was multiplied by the stage duration for the species in question. **Tables 4-4** through **4-9** present the available life history data for the species of concern.

4.4 Age-1 Equivalent Yield Calculations

The equivalent adult forward projection approach was used to estimate age-1 equivalent losses (EPRI 2004). Of the total estimated number of eggs and larvae entrained, age-1 equivalents represent the number of individuals of each species that would have been expected to survive to age-1 (1 year) had they not been entrained. The calculation of the age-1 equivalents is described in detail in revised Appendix G of the Gulf Landing EIS (USCG and MARAD 2004a). The entrainment estimates and critical life history values were used to estimate age-1 equivalents for red drum, red snapper, bay anchovy, Spanish sardines, gag grouper, and sheepshead in **Tables 4-10** through **4-15**.

Table 4-4. Critical Values of the Red Drum Life History Table

Stage	Daily Instantaneous Mortality (Z)			Resource Information	Stage Duration (Days)			Reference
	Base	High	Low		Base	High	Low	
Egg	0.4984	0.4984	0.4984	Mortality rate of 0.4984 was for Atlantic croaker (Diamond et al. 1999). Red drum hatch rate was 94–99 percent at 22–23C, egg size was 0.95 mm, and newly hatched fish were 1.74 mm TL (Holt et al. 1981a); 24-h lab mortality for red drum ranged from 2–35 percent (Holt et al. 1981b).	1	1	1	Reported as 28–29 hrs at 22–23C (Holt et al. 1981a); 18 and 25 hours (Davis 1990)
Larvae	0.25	0.33	0.17	Comyns (1997) reported a best mortality estimate of 0.33 (SE=0.04) for the early part of this life stage; this value is derived from a composite estimate of 0.27 corrected for net extrusion. The base estimate of 0.25 uses 0.33 for the first 10 d of the stage and 0.17 (Comyn's lowest mortality recorded in his Table 3.1) for the second 10 d. The high mortality estimate uses 0.33 for the entire stage; the low estimate uses 0.17 for the entire stage.	20	20	20	Reported as 20 d if settlement occurs at 8 mm SL (Rooker et al. 1999, Stunz et al. 2002). Herzka et al. (2002) found peak settlement at 6–8 mm SL. In the lab, 13-d old larvae ranged from 4.3–6.3 mm SL (Holt et al. 1981b)
Juvenile 1	0.1365	0.139	0.134	Midpoint of 0.134-0.139 (Rooker et al. 1999)	12	20	12	Rooker et al. (1999) indicate that this mortality applies to a 12-d period, but Fig. 6 in their paper extends to 40-d old fish.
Juvenile 2	0.0054	0.00609	0.0047	Mean of reported conditional daily mortalities for 20 years and 9 estuaries (Scharf 2000). High and low values are upper and lower 95 percent confidence levels.	166	162	166	Remainder age 0 year split with the juvenile 3 stage
Juvenile 3	0.0018	0.0018	0.0009	Porch (2000) estimated a mortality of 0.6 for entire post settlement period (332 days). Low mortality estimate assumes that most of this mortality occurs in juvenile 2 stage.	166	162	166	Remainder age 0 year split with the juvenile 2 stage

Table 4-5. Critical Values of the Red Snapper Life History Table

Stage	Daily Instantaneous Mortality (Z)			Resource Information	Stage Duration (Days)			Reference
	Base	High	Low		Base	High	Low	
Egg	0.4984	0.4984	0.4984	Mortality rate of 0.4984 was for Atlantic croaker (Diamond et al. 1999).	1	1	1	Rabalais et al. 1980
Larvae	0.205	0.255	0.155	Comyns reported a range in mortalities from 0.19-0.29 for vermillion snapper ranging in age from 4-16 days (Comyns et al. 2003); A used the midpoint of 0.24 for these larvae. Mortality for day 17 to settlement (28 days) should be lower and was estimated (Minello 2004).	28	30	26	Larval settlement of red snapper at 17.4 mm SL (26 d) (Szledmeyer and Conti 1999) and 16–19 mm SL; 27–30 d (Rooker et al. 2004). Vermillion snapper are gone from plankton at 5–6 mm SL (Comyns et al. 2003)
Juvenile 1	0.1	0.12	0.045	Daily mortality from day 47 to 57 was 0.129 but estimates varied among habitats from 0.045 to 0.120 (Rooker et al. 2004).	24	10	31	Rooker cites that the dominant size class is between 31 and 54 d, but he reports that the M for early post-settlement is for 47–57 days (a 10-day period). When added to larval duration the base estimate is the midpoint of 47–57, the high estimate accounts for his 10- day duration and the fact that the dominant size class was between 31 and 54, the low estimate accounts for the high end of his range (Rooker et al. 2004) extends only to day 57.
Juvenile 2	0.00160	0.00154	0.00163	Age 0+ M=0.5/stage duration (SEDAR 7 2004)	312	324	307	365 minus the sum of the other stage durations.

Table 4-6. Critical Values of the Bay Anchovy Life History Table

Stage	Daily Instantaneous Mortality (Z)			Resource Information	Stage Duration (Days)			Reference
	Base	High	Low		Base	High	Low	
Egg	1.044	1.94	0.69	Base (EPRI 2004, PSEG 1999). High (CEFAS Lowestoft 2000). Low (Houde 1987).	1	1	1	(Robinette 1983, Houde 1987)
Larvae	2.059	0.231	0.184	For the base life history table, it assumes 2 days yolk sac larvae stage duration at M=0.4915 (midpoint of 0.783 and 0.2) and 32 days at M=0.188 (midpoint of 0.196 and 0.18) for post yolk sac larvae (EPRI 2004 and Houde 1987). For the low natural mortality life history table it assumes 0.625 days for yolk sac larvae at M=0.2 and 30 days for post yolk sac larvae at M=0.18 (Houde 1987). High natural mortality life history table assumes at total of 2 days at M=0.783 and for yolk sac larvae and 32 days at 0.196 for post yolk sac larvae.	34	34	30.63	For the base life history table, it assumes 2 days yolk sac larvae stage duration at M=0.4915 (midpoint of 0.783 and 0.2) and 32 days at M=0.188 (midpoint of 0.196 and 0.18) for post yolk sac larvae (EPRI 2004 and Houde 1987). For the low natural mortality life history table it assumes 0.625 days for yolk sac larvae at M=0.2 and 30 days for post yolk sac larvae at M=0.18 (Houde 1987). High natural mortality life history table assumes at total of 2 days at M=0.783 and for yolk sac larvae and 32 days at 0.196 for post yolk sac larvae.
Juvenile	0.004	0.01	0.004	Base and low life history table adapted from EPRI (2004) and PSEG (1999). High life history table from Houde (1987).	330	330	333.4	365 days minus the sum of the other early life history durations.

Table 4-7. Critical Values of the Gag Grouper Life History Table

Stage	Daily Instantaneous Mortality (Z)			Resource Information	Stage Duration (Days)			Reference
	Base	High	Low		Base	High	Low	
Egg	1.31	2.70	0.64	Egg mortality based on temperatures of 21 °C (base), 25 °C (high), and 17 °C (low) (Pepin 1991).	2.182	3.242	1.468	Egg mortality based on temperatures of 21 °C (base), 17 °C (high), and 25 °C (low) (Pepin 1991).
Larvae	0.11	0.13	0.09	Larval mortality based apparent mortality per mm for lengths 2.6 to 8.5 mm for Serranidae (Houde 1979, p. 265).	45	50	40	Larval stage duration is based on the midpoint of 40-50 (Hill 2004).
Juvenile	0.00295	0.0032	0.0027	Range of juvenile mortality 0.0027 – 0.0032(SEDAR 10 2006).	317.82	311.76	323.53	365 days minus the sum of the egg and larval stage durations.

Table 4-8. Critical Vales of the Sheepshead Life History Table

Stage	Daily Instantaneous Mortality (Z)			Resource Information	Stage Duration (Days)			Reference
	Base	High	Low		Base	High	Low	
Egg	1.6197	2.053	1.3772	Total mortality of 2.3 (USEPA 2002) divided by stage duration.	1.42	1.67	1.12	Low is from Tucker and Kennedy (2008). High is from Fishbase (2005). Base is the midpoint.
Larvae	0.2111	0.246	0.1848	Total mortality of 7.39 (USEPA 2002) divided by stage duration.	35	40	30	Sheepshead larval stage duration (Hill 2005).
Juvenile	0.0058	0.005	0.0059	Total mortality of 1.91 (USEPA 2002) divided by stage duration.	328.6	323.3	333.9	365 days minus the sum of the egg and larval stage durations.

Table 4-9. Critical Vales of the Spanish Sardines Life History Table

Stage	Daily Instantaneous Mortality (Z)			Reference	Stage Duration (Days)			Reference
	Base	High	Low		Base	High	Low	
Egg	3.716	5.5480255	1.8841	The high and low are based on equation 9 (M=0.030e^0.18T) in Pepin (1991). Assumed a high temperature of 29 °C and a low temperature of 23 °C, based on Ditty et al. (1994).	1.3	1.6	1	Midpoint of 24 hours at 29 °C and 38 hours at 23 °C (Ditty et al. 1994)
Larvae	0.45	0.54	0.36	The base is based on Houde and Zastrow (1993). The high and low are plus and minus 20% of the base.	34.8	41.4	28.1	Base is based on midpoint of 28.1 and 41.4 days. High is 41.4 days [based on assumed growth rate of 0.8 mm per day (Ditty et al. 1994), hatching at 3.7 mm and transformation at 36.8 mm (Johnson and Vaught 1986)]. Low is 28.1 days [based on assumed growth rate of 0.8 mm per day, hatching at 3 mm and transformation at 25 mm] .
Juvenile 1	0.02	0.0218395	0.0159	Base is based on stage mortality of 6.53 for scaled sardines (USEPA 2002). The high and low are plus and minus 20% of the base.	328.9	322	335.9	365 days minus the sum of the other early life history durations.

4.5 Equivalent Yield Calculations

The equivalent yield model calculates an estimated recreational or commercial fish yield (harvest) in pounds that might be lost due to entrainment in the Port Dolphin Deepwater Port (EPRI 2004). The calculation adjusts the estimated larval impacts of the deepwater port forward in time to resemble a fishery yield or harvest. The equivalent yield estimate is used as a base for reasonable comparison to other fisheries to help assess potential stress on the population. Equivalent yield is not intended to predict direct losses to fish landings or harvest. For example, an equivalent yield that represents 2 percent of some fishing harvest is equivalent to an additional 2 percent fishing stress on the population when compared to that harvest, not a 2 percent loss to that harvest. Equivalent yield is calculated using the age-equivalent equation, Baranov's catch equation, age-specific natural and fishing mortality, and weight (EPRI 2004). The calculation of the equivalent yield is described in detail in revised Appendix G of the Gulf Landing EIS (USCG and MARAD 2004a). **Tables 4-16** through **4-20** present the age-specific mortality and weight used to calculate equivalent yield for red drum, red snapper, gag grouper, and sheepshead. Because bay anchovy is a forage fish, there is no equivalent yield analysis for bay anchovies. Rather, the biomass of the bay anchovies potentially entrained by the proposed Port Dolphin Deepwater Port was estimated by multiplying the age-1 equivalents by the average weight of an anchovy. The results can be compared to an estimate of biomass of bay anchovies in the Gulf of Mexico and Northeast Gulf of Mexico. **Tables 4-21** through **4-25** present the results of the equivalent yield analysis for red drum.

Table 4-16. Critical Values Used in the Red Drum Equivalent Yield Life History Table

Age	Natural Mortality	Fishing Mortality	Midpoint Weight at Death (lbs)

Table 4-20. Critical Values Used in the Spanish Sardines Equivalent Yield Life History Table

Age	Natural Mortality[a]	Fishing Mortality[b]	Mid-Point Weight at Death (lbs)[c]
1	0.78315	0.00726	0.032725
2	0.78315	0.00726	0.067804
3	0.78315	0.00726	0.099578
4	0.78315	0.00726	0.123926

Notes:

[a] Based on mid-point of 0.5769 and 0.9894 in Johnson and Vaught (1986).

[b] Based on mid-point of 1.5 and 3.8 in Johnson and Vaught (1986). It was assumed these values were a daily fishing mortality rate.

[c] Based on the average weight for male and females at ages 1.5, 2.5, 3.5, and 4.5, based on Grall (1984) growth equations in Johnson and Vaught (1986) and FWRI (2006).

Table 4-21. Equivalent Yield Estimate for Red Drum Using the Base Life History Table and the Average Entrainment Estimate

Life History Stage of Age	Natural Mortality per Stage or Age (M)	Fishing Mortality per Stage or Age (F)	Total Mortality Per Stage	Number Potentially Entrained at Stage or Age	Age-1 Equivalents	Weight of an Individual Fish at Midpoint of Death	Number That Would Have Been Lost to Fishing	Number That Would Have Been Lost to Natural Causes	Number That Would Have Remained in the Population at End of Year	Total Number	Weight of Fish That Would Have Been Lost to Fishing	Weight of Fish That Would have Been lost to Natural Causes	Weight of Fish that Would have Remained in Population

4.6 Sensitivity Analysis

In addition to estimating age-1 equivalents and equivalent yield using the base life history table and average entrainment estimates, three variations of the life history tables were used to examine the sensitivity of age-1 equivalents and equivalent yield related to changes in natural mortality and entrainment estimates. **Tables 4-26** through **4-31** present the results of the sensitivity analyses for age-1 equivalents and equivalent yield potentially entrained for the proposed Port Dolphin Deepwater Port.

Table 4-26. Sensitivity Analysis for Age-1 Equivalent Losses of Red Drum and Corresponding Projected Losses to the Fishery

Estimate	Likelihood	Number of Age-1 Fish Lost	Equivalent Yield Loss to Fishery (pounds)	Percent of 1990–2006 Gulf Harvest	Percent of 1990–2006 NE Gulf Harvest	Percent of 1990–2006 Florida West Coast Harvest
Base Life History Table and Average Entrainment Estimate	Average	4	14	0.00%	0.00%	0.00%
Low Larval Mortality and Average Entrainment Estimate	Likely	18	66	0.00%	0.00%	0.01%
High Larval Mortality and Average Entrainment Estimate	Likely	1	3	0.00%	0.00%	0.00%
Base Life History Table and Upper 95 Percent Confidence Limits	Likely	3	11	0.00%	0.00%	0.00%
Base Life History Table and Lower 95 Percent Confidence Limits	Likely	0	1	0.00%	0.00%	0.00%
Extreme High Estimate Using Low Natural Mortality and Upper 95 Percent Confidence Limits	Unlikely	58	207	0.00%	0.01%	0.02%
Extreme Low Estimate Using High Natural Mortality and Lower 95 Percent Confidence Limits	Unlikely	0	0	0.00%	0.00%	0.00%

Note: Fishery Losses Are Compared with the 1990–2006 Harvest in the Gulf of Mexico (10,530,135 pounds), Northeast Gulf of Mexico (Mississippi, Alabama, West Coast of Florida) (2,281,436 pounds), and the West Coast of Florida (1,296,070 pounds)

Table 4-27. Sensitivity Analysis for Age-1 Equivalent Losses of Red Snapper and Corresponding Projected Losses to the Fishery

Estimate	Likelihood	Number of Age-1 Fish Lost	Equivalent Yield Loss to Fishery (pounds)	Percent of 1990–2006 Gulf Harvest	Percent of 1990–2006 NE Gulf Harvest	Percent of 1990–2006 Florida West Coast Harvest

Extreme High Estimate Using Low Natural Mortality and Upper 95 Percent Confidence Limits	Unlikely	32	2	0.000%	0.000%	0.000%
Extreme Low Estimate Using High Natural Mortality and Lower 95 Percent Confidence Limits	Unlikely	0	0	0.000%	0.000%	0.000%

Note: Fishery Losses Are Compared with the 1990–2006 Harvest in the Gulf of Mexico, Northeast Gulf of Mexico, and the West Coast of Florida. Landings of Spanish sardines only occur on the West coast of Florida; therefore this value is the same (1,433,773 pounds) for all three sets of landings.

4.6.1 Variability in Recruitment

Variability in recruitment is demonstrated in the low and high ranges of mortality rates and stage durations in the sensitivity analysis. The first variation on the life history tables uses the average entrainment estimate with high and low natural mortality values (scenarios accepted by NMFS as likely).

Relatively few measurements are available for mortality and growth in the early life history stages of fishes (Houde 1987). Available data, however, indicate that these rates can be highly variable. Larval mortality is thought to vary in relation to water temperature, food availability, and predation. Mortality of early life history is also difficult to measure. To capture this variability and uncertainty, age-1 equivalents were calculated using life history values based on the literature. Literature values for upper and lower larval instantaneous natural mortality rates were used to calculate estimates of high and low age-1 equivalents and equivalent yield. **Tables 4-32** through **4-53** present those results.

Although multiple life stages are used in calculating age-1 equivalents and equivalent yield, and there are multiple opportunities to compound the range of impacts using low and high mortality estimates for each life stage, only larval mortality was changed. Larval mortality is one of the most difficult to measure, and it is one of the life stages with the most variable mortality.

4.6.2 Variability in Ichthyoplankton Densities

Distribution of ichthyoplankton varies both temporally and spatially and often occurs in patches. Ichthyoplankton densities can also be variable. The distribution and abundance of fish eggs and larvae depend on spawning behavior of adults, hydrographic structure and transport on a variety of scales (e.g., vertical stratification and coastal currents), duration of the pelagic period, and behavior of larvae (e.g., vertical migration). The use of 95 percent confidence levels in the sensitivity analysis helps to capture this variability.

Variability in ichthyoplankton densities is demonstrated by the upper and lower confidence limits calculated for each species of concern. These values were used as low and high entrainment to calculate age-1 equivalent estimates and equivalent yield estimates (scenarios that NMFS accepts as likely). Those results are presented in **Tables 4-54** through **4-75**.

4.6.3 Compounded Variability and Uncertainty

The third variation used the low natural mortality estimates and stage durations for each early life history stage with the upper 95 percent confidence limit entrainment estimate to yield the highest possible age-1 and equivalent yield estimates, and the high natural mortality estimates and stage durations for each life history stage with the lower 95 percent confidence limit entrainment estimate to yield the lowest age-1 and equivalent yield estimates (scenarios that NMFS considers unlikely). **Tables 4-76** through **4-97** present the results of these estimates.

These estimates use the most extreme values at each life stage. Although each estimated value can be supported by scientific literature and expert opinion, it is difficult to determine the probability of all of the conditions aligning that would be required to produce the worst-case (highest) or best-case (lowest) impact numbers. It is extremely unlikely that all of these factors would align in a single year, and it is even more unlikely that they would persist for the 30-year projected lifetime of the proposed project. Over the years, it is more likely that the natural variability of conditions would tend toward the mean.

PORT DOLPHIN ESSENTIAL FISH HABITAT ASSESSMENT

TABLE OF CONTENTS

1. ESSENTIAL FISH HABITAT ASSESSMENT 1-1

1.1 Impacts on Commercial and Recreational Fisheries 1-5
1.2 Measures to Avoid, Minimize, and Mitigate Potential Impacts 1-8
1.2.1 Seafloor Disturbance 1-8
1.2.2 Turbidity 1-9
1.2.3 Hydrostatic Testing 1-9
1.2.4 Seawater Intake 1-9
1.2.5 Vessel Discharges 1-10
1.2.6 Hydrocarbon and LNG Spills 1-10
1.2.7 Marine Debris 1-10

2. REFERENCES CITED 2-1

TABLES

1-1. Fish/Invertebrate Species, Life Stages, and EFH Categories in the Project Area 1-2
1-2. Summary of the Proposed Action Impacts on EFH 1-6

THIS PAGE INTENTIONALLY LEFT BLANK

1. Essential Fish Habitat Assessment

This essential fish habitat (EFH) assessment has been prepared for the Port Dolphin Deepwater Port License Application Environmental Impact Statement (EIS). The EIS includes the components required for an EFH assessment. The U.S. Coast Guard (USCG) and the Maritime Administration request for EFH consultation, and the National Oceanic and Atmospheric Administration's National Marine Fisheries Service's (NMFS) response appear in **Appendix C of the Port Dolphin EIS**. The following are the required components of this EFH consultation and the sections of the EIS containing the EFH discussions and other related material:

- A description of the Proposed Action is in **Section 2 of the EIS**.
- A description of fisheries resources and EFH within the project area is in **Section 3.2.8.3 and 3.2.9 of the EIS** and **Table 1-1** of this assessment.
- Analyses of the effects, including cumulative effects, of the Proposed Action on fisheries resources and EFH are presented throughout **Sections 4.2.1.6, 4.2.1.11, 4.2.1.12, 4.2.1.13, 4.2.2.3, and 6.3.2**; and **Appendix G of the EIS**.
- The USCG's and Maritime Administration's assessment and conclusion of the effects of the action on EFH are included at the end of each impact discussion outlined in **Sections 4.2.1.13**; and summarized in **Table 1-2** of this assessment.

Federally managed species that are managed by and have been identified by NMFS as having EFH in the proposed Port area are pink shrimp, stone crab, spiny lobster, red drum, red grouper, black grouper, gag grouper, goliath grouper, misty grouper, Nassau grouper, snowy grouper, Warsaw grouper, yellowedge grouper, yellowfin grouper, red hind, rock hind, schoolmaster, red snapper, Vermilion snapper, gray snapper, yellowtail snapper, lane snapper, blackfin snapper, Cubera snapper, dog snapper, mutton snapper, hogfish, greater amberjack, lesser amberjack, almaco jack, banded rudderfish, gray triggerfish, king mackerel, Spanish mackerel, cobia, and coral (Croom 2007). Habitat types that currently exist in the proposed project area include the water column, three types of hard/live bottom habitat, soft substrate/sediments, seagrass, and wetlands. The impacts on each habitat type are quantified in **Table 4.2-13 of the EIS** for offshore, coastal, and nearshore habitats, and **Table 4.2-27 of the EIS** for wetlands. A summary of potential EFH impacts from the proposed Port is presented in **Table 1-2** of this assessment.

Short- and long-term minor to moderate adverse effects on EFH would result from the Proposed Action. Based on the mitigation measures proposed below, impacts on EFH and commercial fisheries could range from minor to moderate throughout the life of the Proposed Action. All impacts on the water column, unvegetated sediments, hard bottom, and wetlands are expected to be localized.

As a condition of the deepwater port license (if issued), Port Dolphin Energy LLC would be required to develop and implement a *Prevention, Monitoring, and Mitigation Plan* (the plan) to assess, minimize, and mitigate impacts on marine fisheries species (including ichthyoplankton) associated with the seawater intake and impacts on hard bottom. The plan would require that the impacts of Port Dolphin be reassessed at least once every 3 years. If impacts are higher than the base-case impacts (estimated impacts based on the average entrainment estimate and base life history table) for red drum, red snapper, anchovies, Spanish sardines, and Gulf menhaden, as stated in the Final EIS, the Applicant shall develop and implement a plan to mitigate these additional impacts. Mitigation efforts would also extend to other marine fisheries species when, in the judgment of the Maritime Administrator and after consultation with NMFS, the monitoring program has identified major adverse impacts. Based on the analyses in

Table 1-1. Fish/Invertebrate Species, Life Stages, and EFH Categories in the Project Area

Species	Life Stage	System[1]	EFH
Pink shrimp[2]	Eggs	M	Sand/shell bottom
	Larvae	M	Planktonic, sand/shell bottom, submerged aquatic vegetation (SAV)
	Juvenile	E	Sand/shell substrate
	Adults	M	Sand/shell substrate
Stone crab	Eggs	E/M	<18 m to the North & <27 m to the South of Cape Sable; Soft/shell/hard bottoms, SAV, oyster reefs
	Larvae	E/M	18 m to the north & <27 m to the South of Cape Sable; Planktonic
	Juvenile	E/M	<18 m to the north & <27 m to the South of Cape Sable; Sand/shell/hard bottoms, SAV
	Adults	M	<18 m N & <27 m S of Cape Sable; Sand/shell/hard bottoms, SAV, reefs
Spiny lobster	Eggs	M	9-18 m to the North of Naples, <27 m S of Cape Sable; reefs
	Larvae	M	9-18 m to the North of Naples, <27 m S of Cape Sable; planktonic, SAV
	Juvenile	M	9-18 m to the North of Naples, <27 m S of Cape Sable; SAV hard bottoms, reefs
	Adults	M	9-18 m to the North of Naples, <27 m S of Cape Sable; SAV hard bottoms reefs
Red drum	Eggs	M	Planktonic
	Larvae/postlarvae	E	Planktonic, SAV, sand/shell/soft bottom, emergent marsh
	Juvenile	M/E	<5 m; SAV, sand/shell/soft/hard bottom, emergent marsh
	Adults	M/E	9-18 m S of Cape Sable and N of Naples (other areas 1-46 m); SAV pelagic, sand/shell/soft/hard bottom, emergent marsh
Red grouper	Eggs	M	20-100 m; planktonic
	Larvae	M	20-100 m; planktonic
	Juvenile	M/E	<50 m; hard bottoms, SAV, reefs
	Adults	M	3-190 m; reefs, hard bottoms
Black grouper	Eggs	M	18-28 m; planktonic
	Larvae	M	10-150 m; planktonic
	Juvenile	M/E	SAV, hard bottom, reefs
	Adults	E/M	10-150 m; hard bottoms, mangrove, reefs
Gag grouper	Eggs	M	50-120 m; planktonic
	Larvae	M	50-120 m; planktonic
	Juvenile	M/E	<50m; SAV, reefs, hard bottom
	Adults	M	20-100 m; hard bottom, reefs

Species	Life Stage	System[1]	EFH
Goliath grouper	Eggs	M	36-46 M; planktonic
	Larvae	M	36-46 M; planktonic
	Postlarvae/juvenile	M/E	<3 m; mangrove, SAV, hard bottom, reefs
Nassau grouper	Eggs	M	Planktonic
	Larvae	M	2-50 m; planktonic
	Juvenile	M	SAV, reefs
Snowy grouper	Eggs	M	30-183 m; planktonic
	Larvae	M	30-183 m; planktonic
	Juvenile	M	17-60 m; reefs
Warsaw grouper	Eggs	M	40-183 m; planktonic
	Larvae	M	40-183 m; planktonic
	Juvenile	M	20-30 m; reefs
Yellowedge grouper	Eggs	M	35-183 m; planktonic
	Larvae	M	35-183 m; planktonic
	Juvenile	M	35-183 m; hard bottom
	Adults	M	35-183 m; reefs bottom
Yellowfin grouper	Eggs	M	2-183 m; planktonic
	Larvae	M	2-183 m; planktonic
	Juvenile	M/E	2-4 m; SAV, hard bottom
Yellowmouth grouper	Eggs	M	20-183 m; planktonic
	Larvae	M	20-183 m; planktonic
	Juvenile	M/E	18-24 m; mangroves, reefs
Red hind	Eggs	M	18-110 m; planktonic
	Larvae	M	18-110 m; planktonic
	Postlarvae/juvenile	M	2-110 m; reefs
	Juvenile	M	18-24 m; reefs, hard/sand/shell bottom
Rock hind	Eggs	M	2-100 m; planktonic
	Larvae	M	2-100 m; planktonic
	Juvenile	M	2-110 m; reefs
Schoolmaster	Eggs	M	<90 m; planktonic
	Larvae	M	<90 m; planktonic
	Juvenile	M/E	<90 m; SAV, mangrove, emergent Marsh, reefs, hard bottom
Red snapper	Eggs	M	18-37 m; planktonic
	Larvae	M	18-37 m; planktonic
	Juvenile	M	17-183 m; hard/soft/sand/shell bottom
	Adults	M	7-146 m; reefs, hard/sand/shell bottoms
Vermillion snapper	Eggs	M	<183 m; planktonic
	Juvenile	M	<183 m; reefs, hard bottom
	Adult	M	<183 m; reefs, hard bottom

Species	Life Stage	System[1]	EFH
Gray snapper	Eggs	M	<180 m; planktonic, reefs
	Larvae	M/E	<180 m; planktonic, reefs
	Postlarvae/juvenile	E/M	<180 m; SAV, mangrove, emergent marsh
	Adults	E/M	<180 m; mangrove, emergent marsh, reefs, sand/shell/soft/hard bottoms
Yellowtail snapper	Eggs	M	1-183 m; planktonic
	Juvenile	M/E	1-183 m; SAV, mangrove, soft bottom, reefs
	Adults	M	1-183 m; reefs, hard bottom, shoals/banks
Lane snapper	Eggs	M	4-132 m; planktonic
	Larvae	M/E	4-132 m; reefs, SAV
	Juvenile	E/M	<20 m; SAV, mangrove, reefs, sand/shell/soft bottom
	Adults	M	4-132 m; reefs, sand/shell bottom, shoals/banks, shelf edge
Blackfin snapper	Eggs	M	40-183 m; planktonic
	Juvenile	M	12-40 m; hard bottom
Cubera snapper	Eggs	M	10-85m; planktonic
	Juvenile	M/E	<85 m; SAV, mangrove, emergent marsh
Dog snapper	Eggs	M	Planktonic
	Larvae	M	Planktonic
	Juvenile	M/E	SAV, mangrove, emergent marsh
Mutton snapper	Eggs	M	Reefs
	Larvae	M	Reefs
	Juvenile	M/E	Reefs, mangrove, SAV, emergent marsh
	Adult	E/M	Reefs, SAV, shoals/banks, shelf edge 25-95 m spawning
Hogfish	Juvenile	M/E	3-30 m; SAV
Dwarf sand perch	Juvenile	M	Hard bottom
Greater amberjack	Eggs	M	1-183 m; planktonic
	Larvae	M	1-183 m; planktonic
	Juvenile	M	1-183 m; drift algae (Sargassum)
	Adults	M	1-183 m; pelagic, reefs
Lesser amberjack	Eggs	M	Planktonic
	Larvae	M	Planktonic
	Juvenile	M	55-130 m; drift algae (Sargassum)
Almaco jack	Eggs	M	15-160 m; planktonic
	juvenile	M	15-160 m; drift algae (Sargassum)
Banded rudderfish	Eggs	M	Planktonic
	Larvae	M	10-130 m; planktonic
	Juvenile	M	10-130 m; drift algae (Sargassum)

Species	Life Stage	System[1]	EFH
Gray triggerfish	Eggs	M	10-100 m; reefs
	Larvae	M	Drift algae (Sargassum)
	Postlarvae/juvenile	M	10-100 m; drift algae (Sargassum), mangroves, reefs
King mackerel	Adults	M	35-180 m; pelagic
Spanish Mackerel	Adults	E/M	<75 m; pelagic
Cobin	Adults	M	<70 m; pelagic
Coral	All stages	M	Plankton, reefs

Source: Croom 2008

Notes:

1. E=Estuarine, M=Marine, m=meters
2. Shrimp EFH is generally less than 64 meters, but varies in some part of Ecoregion 1; refer to the 2005 fishery management plan and final environmental impact statement.

Appendix G of the EIS, potential impacts could range from minor to moderate in any given year. However, based on the proposed monitoring and mitigation plan, no long-term effects on stock size are expected.

The proposed onshore pipeline would cross wetlands and waterbodies, and would have 1.19 acres of permanent impacts and 10.71 acres of temporary impacts on wetlands (see **Section 4.2.2.2 of the EIS**). The Federal Energy Regulatory Commission (FERC) would require the Applicant to develop and implement a project-specific *Wetland and Waterbody Construction and Mitigation Procedures* document in consultation with all appropriate agencies. Therefore impacts on wetlands would be mitigated. The construction would comply with all state and Federal permit conditions. Final mitigation plans will be coordinated by the U.S. Army Corps of Engineers (USACE) with state resource agencies during the Section 404 water quality permitting process, and will become a condition of the Record of Decision (ROD), and the FERC certificate, if the license is issued.

1.1 Impacts on Commercial and Recreational Fisheries

Potential impacts on commercial and recreational fisheries resources were examined in **Section 4.9**. Long-term minor effects on commercial and recreational fisheries could result from entrainment of fish eggs and larvae in the seawater intake. These effects were analyzed using annual equivalent yield estimates (see **Appendix G in the EIS**). Annual equivalent yield estimates consider mortality beyond age 1 to the point that they would have entered the fishery to provide an estimated loss of biomass as compared to the loss related to commercial and recreational fishing activities. Annual equivalent yield estimates could be used to make reasonable comparisons among fisheries to assess potential stresses on a population.

Impacts on fisheries associated with vaporization alternatives are estimated using annual equivalent yield estimates for red drum, red snapper, bay anchovies, and Spanish sardines. The annual equivalent yield estimates represent biomass losses to the population and are compared to 1990-2006 average landings (commercial and recreational) in the entire Gulf of Mexico (GOM), the Northeast GOM (Mississippi, Alabama, and west coast of Florida), and on the west coast of Florida. These impacts are discussed in **Section 4.2.1.11 and 4.2.1.12 of the EIS**.

Table 1-2. Summary of the Proposed Action Impacts on EFH

Proposed Action Component/ Impact	EFH Type				
	Water Column	Soft Bottom	Hard/Live Bottom	Seagrass	Wetlands
Placement of STL Buoy System	▪ Temporary increase in turbidity, minor	▪ Displacement of sediments, not significant ▪ Secondary impact on prey species, negligible	▪ Long-term minor to moderate adverse impacts	▪ Long-term minor impacts on paddlegrass (would be mitigated)	▪ No expected impact
Pipeline Installation	▪ Temporary increase in turbidity, negligible	▪ Displacement of sediments, not significant ▪ Secondary impact on prey species, negligible	▪ Long-term minor to moderate adverse impacts	▪ Long-term minor impacts on paddlegrass (would be mitigated)	▪ Long-term and short-term impacts, mitigated under FERC and USACE permits
LNG Vaporization-Intake	▪ Impingement/entrainment, short-term minor impact could be minor to moderate, long-term impact expected to be minor	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact
LNG Vaporization-Discharge	▪ 18 ºF (10 ºC) increase in water temperature in the immediate vicinity of the Port, 1.8 ºF (1 ºC) within 100 m, minor	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact
Routine Discharges	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact
Vessel and Aircraft Noise	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact
STL Buoy Lighting	▪ Might attract ichthyoplankton, negligible	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact

Proposed Action Component/ Impact	EFH Type				
	Water Column	**Soft Bottom**	**Hard/Live Bottom**	**Seagrass**	**Wetlands**
Increased Vessel Traffic	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact
Marine Debris	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact	▪ No expected impact
Presence of Terminal and Pipeline	▪ Long-term minor adverse impacts from resuspended sediments ▪ Proposed safety zone would provide refuge from fishing, beneficial impact	▪ Long-term minor adverse impact from anchor sweep ▪ Proposed safety zone would provide refuge from fishing, beneficial impact	▪ Long-term minor moderate adverse impacts, natural hard/live bottoms would be replaced by buoy anchors and concrete mattresses	▪ No expected impact	▪ No expected impact
Accidental Release	▪ Minor release – no expected impact ▪ Unlikely, catastrophic release – Freezing of tissue, localized significant, short-term impact	▪ Minor release – no expected impact ▪ Unlikely, catastrophic release – no expected impact	▪ Minor release – no expected impact ▪ Unlikely, catastrophic release – no expected impact	▪ Minor release – no expected impact ▪ Unlikely, catastrophic release – no expected impact	▪ No expected impact
Decommissioning	▪ Explosives would not be used, impacts would be similar to construction	▪ Explosives would not be used, impacts would be similar to construction	▪ Explosives would not be used, short-term impacts would be similar to construction, additional long-term impacts on hard bottom would not occur	▪ Explosives would not be used, impacts would be similar to construction	▪ No expected impact

The potential impacts, based on age-1 equivalents, recruitment equivalents, and equivalent yield must be considered in light of the uncertainty and limitations inherent in their development and, therefore, could be higher and lower. The analyses found that entrainment of eggs and larvae would be small, and the impact has been characterized as minor to moderate, reflecting the uncertainty inherent in the model and underlying data. However, many fisheries resources (including invertebrates) are currently stressed from historic overharvest and other factors. In this context, any additional stress to the affected populations could be considered significant, and could result in further reductions in limits to commercial and recreational harvest. To meet established goals for fisheries stock, Port Dolphin Energy LLC would be required to develop and implement a *Prevention, Monitoring and Mitigation Plan* to assess, minimize, and mitigate impacts on marine fisheries species (including ichthyoplankton) associated with the operation of the seawater intake. As a result of these proposed mitigation measures, adverse effects over the life of the Proposed Action on EFH and commercial and recreational fish stocks are expected to range from negligible to moderate for any one stock in a given year.

1.2 Measures to Avoid, Minimize, and Mitigate Potential Impacts

To avoid and minimize the impacts of the Proposed Action on EFH and commercial and recreational fish stocks, The Applicant has proposed BMPs to reduce the impacts associated with the following:

1.2.1 Seafloor Disturbance

1. Geohazards and benthic video survey that are conducted providing a fine-scale delineation of seafloor structure, substrate, and habitat within the proposed Port Dolphin Project area.
2. The footprint of the terminals would be minimized.
3. Anchor locations would be optimized to minimize impacts on benthic habitat.
4. Additional geophysical surveys in water depths of 45 to 65 feet will be performed to look for reef gap. Unable to locate any for 3 NM north or 3 NM south of surveyed corridor.
5. Minimize duration of construction by using BMPs for installation.
6. Identify avoidance zones of critical habitat areas for placement of installation barge anchors.
7. Midline buoys would be utilized to the extent practicable on anchor chains to reduce the amount of anchor chain sweep.
8. During installation operations, vessel sizes would be selected to provide vessels adequate to perform the work, but minimized to reduce the number and type of anchors, where possible.
9. During detailed design, an anchoring plan would be developed that would provide procedures for anchor deployment to minimize impacts on hard- and live-bottom habitat.
10. A seagrass survey would be conducted prior to construction to determine the current status and location of seagrass both in deeper waters and in the area of HDD exit location.
11. A Mitigation Plan to compensate for unavoidable impacts on seagrasses and live- and hard-bottom habitats would be developed during the permitting process.

Proper design and implementation of BMPs and mitigation would minimize impacts on EFH from seafloor disturbance from the construction of the pipeline.

1.2.2 Turbidity

1. Trenching and burial of the gas transmission pipeline would be performed using a pipeline plow to the maximum extent practicable. The towed plow trenching and burial technology was selected primarily because it does not fluidize bottom sediments. Therefore, it causes minimal impacts from sediment resuspension in comparison to other more conventional trenching and burial technologies (e.g., clamshell dredging).
2. Minimize the duration of construction to minimize impacts on marine resources by using the most efficient and effective construction equipment and methods available.
3. The use of turbidity curtains when installation is performed by clamshell dredge under the Skyway Bridge and during HDD.
4. The use of turbidity curtains or other mitigation methods as practicable in OFW.
5. Apply for temporary variance for turbidity.

The first four of these measures are expected to be effective in reducing the magnitude and extent of impacts resulting from sediment suspension during pipeline construction, and therefore, the impact of turbidity on fish, shellfish, and EFH. However, the performance of the measures should be monitored during construction to verify their effectiveness. Application for variance from turbidity standards would not be effective in reducing adverse impacts, and could in fact result in an increase in adverse impacts.

1.2.3 Hydrostatic Testing

1. Filtered seawater would be used for the hydrotesting. An environmentally benign dye, Hydro Hib P and Hydro Tag Green Flourescent Dye, would be added to the flooding and test water.
2. Hydrostatic test water for the offshore pipe would be discharged in state waters; however, some of the intake would occur in Federal waters.
3. Fresh water for the onshore pipe would be discharged on land using industry standard filtering procedures prior to release.

These BMPs would be expected to be effective in reducing the magnitude and extent of impacts of hydrostatic testing on fish, shellfish, and EFH. However, the performance of the measures should be monitored during construction to verify their effectiveness.

1.2.4 Seawater Intake

1. The SRVs are closed systems, requiring no intake of water for heating LNG. However, a minimal amount of intake water would be required to cool generators. Discharge would be no greater than 10 °C above ambient temperature.
2. Thermal discharge of SRV cooling water meets USEPA criterion of less than or equal to 1.8 °F (1 °C) above ambient at edge of 100-m mixing zone.
3. Utilization of Best Technology Available (BTA), a closed-loop system, would significantly reduce the loss of marine organisms. The innovative engineering design has resulted in operational aspects of the terminal that would provide for significant reductions of daily intake volumes compared to other conventional regasification processes presently proposed throughout the United States.

4. An intake rate of 11.83 MGD of seawater for engine-cooling and ballast water for each SRV would substantially reduce the potential for entrainment of plankton individuals compared to open-loop vaporization systems, which can use five times more volume.
5. Limit seawater intake velocity to less than 0.15 m/s (0.5 feet/s) to ensure that older larval stages and juveniles would be able to avoid impingement or entrainment.

The use of a closed-loop system, as stated in BMPs 1, 3, and 4, would result in a reduction in entrainment of planktonic fish and shellfish, compared to an open-loop system. BMPs 2 and 5 would likely have no impact on plankton.

1.2.5 Vessel Discharges

1. No discharges would be made from the SRVs (i.e., bilge water, sanitary wastes, grey water).
2. Desalination freshwater-generation systems would be turned off while vessels are moored, therefore no chlorine or hypersaline wastewater would be discharged.
3. During the regasification operations, the vessel would not discharge any ballast water.

These BMPs would avoid the impact of routine vessel discharges on fish, shellfish, and EFH.

1.2.6 Hydrocarbon and LNG Spills

1. Spill response plan and emergency response plans would be implemented.
2. The SRVs would include secondary containment around hydrocarbon-containing equipment and systems.
3. Vessels would have secondary containment around hydrocarbon-containing equipment and systems as practicable.

These BMPs would both help to avoid and reduce the impacts of hydrocarbon and LNG spills, which would reduce potential impacts on fish, shellfish, and EFH.

1.2.7 Marine Debris

1. Vessels would be in compliance with MARPOL Annex I and Annex IV and USCG regulations.

Additionally, the following mitigation would be incorporated into the design and operation of the proposed Port and would be expected as a condition of the license, should it be issued:

1. If the proposed monitoring plan indicated that the effects were substantially larger than estimated, the system could be modified over time to reduce adverse effects.
2. The appropriate resource agencies would work directly with Port Dolphin Energy LLC to develop site-specific construction and wetlands mitigation. The construction plan would include best management practices for reducing impacts on wetlands and waterbodies. Site locations and construction techniques would comply with ongoing Coastal Wetlands Planning, Protection and Restoration Act (CWPPRA) projects and USACE activities in the area. Port Dolphin LLC would also be required to mitigate for the temporary loss of forested and non-forested wetlands during construction and the permanent conversion of wetlands for the operation of the proposed onshore pipelines.

3. As a condition of the license (if issued), Port Dolphin Energy LLC will be required to develop and implement a *Prevention, Monitoring, and Mitigation Plan* to assess, minimize, and mitigate impacts on marine fisheries species (including ichthyoplankton) associated with the operation of the cooling and ballast seawater intake. The plan would be developed in consultation with NMFS and other cooperating agencies, as appropriate, and subject to approval by the Maritime Administrator. The plan shall include the following:

   a) A monitoring plan that establishes baseline information on fish eggs and larvae in the area in and around the proposed Port site. This plan will specify techniques and frequencies of sampling and the type(s) of analysis and, at MARAD's request, will be reviewed for scientific adequacy and completeness by the National Research Council. A qualified third party, approved by the Maritime Administrator, will manage and implement this plan. This information will be furnished on a quarterly basis to the Maritime Administrator and NMFS.

   b) A monitoring plan to assess impacts of the proposed deepwater port on fish eggs and larvae in and around the deepwater port. This plan will focus on impacts on gag grouper, sheepshead, red drum, red snapper, bay anchovies, Spanish sardines, and Gulf menhaden identified from the baseline information gathered prior to installation. At the Maritime Administrator's request, the plan will be reviewed for scientific adequacy and completeness by the National Research Council. A qualified third party approved by the Maritime Administrator will manage and implement this plan. This plan will also be consistent with the monitoring plans for other offshore LNG facilities. This information will be reported on a quarterly basis to the Maritime Administrator and NMFS. This plan will commence upon operation of Port Dolphin. The plan will be part of the USCG-approved operations plan.

   c) The temperature increase in discharged water shall be monitored and maintained at 1 degree Celsius (°C) (1.8 degrees Fahrenheit [°F]) at a radial distance of 100 meters from the outfall.

   d) No biocide treatment would be used while the SRV is moored on the submerged turret loading (STL) buoy. If a sodium hypochlorite generator is available for use on the SRV, it would be turned off while the SRV is moored on the STL buoy.

   e) The Applicant shall pursue and implement practical and reasonable ways to minimize water use and ichthyoplankton entrainment. The Applicant will provide an annual report to the Maritime Administrator outlining the previous year's change(s) to design or operations and the results.

   f) It is recognized that the Proposed Action will have beneficial environmental and commercial impacts, such as providing a diverse and reliable source of clean-burning natural gas (displacement of oil and coal). Upon commencement of the operations at Port Dolphin, the Applicant shall develop and implement a mitigation program designed to offset the base-case impacts (estimated impacts based on the average entrainment estimate and base life history table) of the facility on gag grouper, sheepshead, red drum, red snapper, bay anchovy, Spanish sardines, and Gulf menhaden (as indicator species), as stated in the Final EIS. The program is subject to approval by the Maritime Administrator, in consultation with NMFS. These efforts shall be reasonable, timely, and practical, and designed to specifically counter the base-case impacts associated with the operation of the proposed Port.

   g) After an undetermined amount of time of operation (to be agreed on by NMFS and the Maritime Administrator and not to exceed 3 years), the licensee shall provide to the Maritime Administrator, NMFS, and other cooperating agencies a detailed report of the impact of the vaporization system on marine fisheries species (including ichthyoplankton), relative to the baseline information gathered prior to installation of the deepwater port. If, at that time, the impacts of the deepwater port on gag grouper, sheepshead, red drum, red snapper, bay

anchovy, Spanish sardines, and Gulf menhaden exceed the base-case impacts as stated in the Final EIS, the Applicant shall develop and implement a plan to mitigate these additional impacts. Mitigation efforts would also extend to other marine fisheries species when, in the judgment of the Maritime Administrator and after consultation with NMFS, the monitoring program has identified major adverse impacts. The mitigation efforts shall be reasonable, timely, and practical, and designed to specifically counter the impacts associated with the operation of the proposed Port. Depending upon the impacts, mitigation measures could include changes to the operation of the facility, aquaculture projects, wetland restoration or other habitat projects, additional artificial reefs projects, modification of the warming water inlet exclusion devices, research, and education programs.

4. To minimize potential fisheries impacts associated with the decommissioning of the proposed Port facilities, it would be possible to leave some of the facilities' underwater structure in place to function as an artificial reef (GMFMC 1998). All decommissioning activities would be conducted in accordance with approved plans required by the licensing authority, and in compliance with all applicable and appropriate regulations and guidelines in place at the time of decommissioning.

Appendix I
Unanticipated Discoveries Plan for Cultural Artifacts and Human Remains

Onshore Unanticipated Discovery Plan – Cultural Resources
Port Dolphin LLC
Deepwater Port and Proposed 36-Inch Gas Pipeline
St. Petersburg Area Block 545 to Tampa Bay, Florida

Cultural resources surveys employ a sampling strategy that leaves open the possibility of unidentified deposits. Even at sites that have been previously identified and assessed, there is a potential for the discovery of additional archaeological components, features, or human remains that may require investigation and assessment. Therefore, a procedure has been developed for the treatment of any unexpected discoveries that may occur during construction.

The following applicable federal laws and state of Florida statutes concern cultural resources:

- Florida Historical Resources Act (Chapter 267, F.S., rev. 2004)
- Emergency Archaeological Properties Acquisition Act of 1988 (Chapter 253.027, Florida Statutes)
- Offenses Concerning Dead Bodies and Graves (Chapter 872, Florida Statutes)
- Native American Graves Protection and Repatriation Act of 1990 (NAGPRA)
- National Historic Preservation Act of 1966, as amended (NHPA)

All project inspectors have the responsibility to monitor development and post development procedures for the inadvertent discovery of cultural resources. Under 36 CFR 800 of the NHPA, if during any of these phases, evidence of prehistoric or historic cultural remains is encountered, all activity in that area will cease immediately to preclude any further contact or damage to the resource. Reasonable efforts will be made to avoid or minimize impacts to the cultural resources. Port Dolphin LLC will contact the FERC and the Florida Division of Historic Preservation (FDHR).

Port Dolphin LLC will contract an archaeologist meeting the Secretary of the Interior's professional qualifications and standards to survey the findings and provide a report to the appropriate agencies describing the type of resource discovered, its location, size and any information concerning the resource's significance. If the resource is determined to be ineligible for inclusion in the National Register of Historic Places, Port Dolphin LLC will proceed with the project only after written notification of compliance from FDHR. If the site is determined eligible for inclusion in the National Register of Historic Places, additional work may include formulation and execution of a data recovery plan in consultation with the FERC and FDHR.

Human Remains

If human remains are discovered during site development, all work in the near vicinity of the human remains will cease immediately and efforts will be made to avoid and protect the remains from additional impact. When human remains are encountered, federal or state guidelines will be followed based upon the nature of the project, including those contained in the Native American Graves Protection and Repatriation Act of 1990 and Chapter 872.05, Florida Statutes. Regardless of which law takes precedence, consultation with FERC or the SHPO (or in the case of Ch. 872, F.S., the State Archaeologist). Every effort will be made to identify and notify next of kin, closest lineal descendant, or, for Native American remains, the Native American tribes who may be culturally affiliated with the remains, and to determine appropriate treatment and disposition of the remains. If the human remains are found to be non-Native American or less than 75 years old, then the County Medical Examiner and local law enforcement agencies will be notified.

Pursuant to any request from the FERC, the SHPO, or the State Archaeologist, a qualified professional archaeologist will be retained to investigate the reported discovery and to inventory and evaluate alternate work areas or routes that will avoid any further effects to the human remains. A plan for the avoidance of any further impact to the human remains or mitigate excavation, reinterment, or a combination of these treatments, will be developed in consultation with FERC, the State Archaeologist, the SHPO, and the next of kin, closest lineal descendents, or, if applicable, appropriate Native American tribes. All parties will be expected to respond with advice and guidance in an efficient time frame.

If Traditional Cultural Properties (TCPs) are identified during site development, consultation with representatives of the affected Native American tribe, the FERC, and the SHPO to develop procedures for the appropriate treatment of such properties will be initiated.

Offshore Unanticipated Discovery Plan – Cultural Resources
Port Dolphin LLC
Deepwater Port and Proposed 36-Inch Gas Pipeline
St. Petersburg Area Block 545 to Tampa Bay, Florida

Port Dolphin Energy LLC (Applicant) has undertaken a systematic review of the high resolution geophysical data for the proposed project area to minimize the discovery of cultural resources, either in the form of historic shipwrecks or high probability areas for prehistoric archaeological sites, that follows the guidelines posted in U.S. Department of the Interior Minerals Management Service (USDI MMS) Gulf of Mexico OCS Region NTL 2006-G07 and standards for cultural resources in the state of Florida. This assessment has been prepared because the proposed Port Dolphin deepwater port and pipeline are within portions of St. Petersburg blocks of the Outer Continental Shelf and Florida State Waters that have been designated as having a high potential for archaeological resources as described in the USDI MMS Gulf of Mexico OCS Region NTL 20065-G07. The following applicable statutes of the state of Florida concern Cultural resources:

- Chapter 267 F.S., Florida Historical Resources Act
- Emergency Archaeological Properties Acquisition Act of 1988 (Chapter 253.027, Florida Statutes)
- Offenses Concerning Dead Bodies and Graves (Chapter 872, Florida Statutes)
- Performance Standards for Submerged Remote Sensing Surveys (May 17, 2001) issued by the Florida Department of State, Division of Historical Resources

The cultural resources assessment of these areas of potential effect did find evidence for potential historic and prehistoric cultural resources in the remote sensing data. These included one unidentified side scan sonar contact associated with three unidentified magnetic anomalies that could represent possibly significant historic cultural resources. An avoidance zone of 500 feet around these features has been recommended.

However, it is possible that small features representing high probability areas for prehistoric archaeological sites and historic shipwreck materials may not be detected by the geophysical instruments or may not be detected during interpretation of the data sets. Prehistoric archaeological sites have been discovered in nearshore Florida State and OCS waters previously (Goggin 1964; Ruppe 1980; Stright 1987; Dunbar, Webb, and Faught 1989; Anuskiewicz 1988; Dunbar, Webb, Faught, Anuskiewicz and Stright 1989; Murphy 1990; Milanich 1994:23). Recently, historic period cultural resources have been discovered offshore during the process of post development inspections, rather than during the predevelopment phases in areas not determined to have a high potential for archaeological resources (Irion, 2001; Church, Landry, Warren and Smith, 2003). In order to be in full compliance with all Federal and Florida State regulations regarding the protection of cultural resources, this unanticipated discovery plan has been prepared.

Port Dolphin LLC is fully aware that the USDI MMS has posted guidelines for the conduct of investigations at the USDI MMS Internet website at ***http://www.gomr.mms.gov/homepg/regulate/environ/archaeological/evaluation.html*** and that failure to comply with the USDI MMS regulations with respect to archaeological resources can result in civil penalties under 0 CFR 250.1404. In addition, Section 110(k) of the National Historic Preservation Act (16 U.S.C. 470h-2[k]) prohibits a Federal agency from granting a loan, loan guarantee, permit, license, or other assistance to an applicant who, with the

intent to avoid a historic property to which the grant would relate, or having legal power to prevent it, has allowed such adverse effect to occur, unless the agency, after consultation with the Advisory Council for Historic Preservation, determines that circumstances justify granting such assistance despite the adverse effect created or permitted by the applicant (see 36 CFR 800.9[c][1]).

All project inspectors have the responsibility to monitor development and post development procedures for the inadvertent discovery of cultural resources. If during any of these phases, evidence of prehistoric or historic cultural remains is encountered, all activity in that area will cease immediately to preclude any further contact or damage to the resource (36 CFR 800.11[b][3]). An avoidance zone of at least 1,000 feet (305 meters) for further work in that area will be established. If the cultural resource is discovered during the course of an investigation by a remotely operated vehicle (ROV), the USDI MMS has posted guidelines for the conduct of ROV investigations at the following web site ***http://www.gomr.mms.gov/homepg/regulate/environ/archaeological/ROV_2005_1.pdf.*** All ROV operators will be provided with these guidelines and will be required to comply with them. At no time will the ROV operators be permitted to disturb or pick up any artifacts, features, or components of the site.

If a discovery is made in Federal waters, the project inspector within 48 hours of the discovery will contact the Regional Supervisor, Leasing and Environment, and the archaeologists at the USDI MMS in New Orleans, as well as the U.S. Coast Guard (USCG), to notify them of the presence of such a cultural resource. If a discovery is made in Florida state waters, within the same period of time the project inspector will contact the State Historic Preservation Officer of Florida. After the initial consultation with the appropriate agencies, Port Dolphin LLC will contract an approved professional archaeologist to survey the findings and provide an immediate report to the appropriate agencies describing the type of resource discovered and its location and size. Such findings may include the following:

- Anomalous and distinct mounds of lithic material, which could represent ballast material from a shipwreck
- Intact articulated wooden ship timbers or sections of iron, steel, or metal clad hulls
- Substantial cargo remains, which may be scattered or closely grouped, that may include armaments, ammunitions, wooden crates and barrels, ceramics, glass, and other cultural materials, some of which may be heavily concreted and not readily identifiable
- A widely scattered debris field comprised of ship's rigging and other structural components, as well as cargo
- Anomalous mounds of mollusk shell that may include prehistoric lithic or worked shell material
- Human skeletal remains

A mitigation plan conducted under the direction of a professional archaeologist and using such equipment and techniques deemed necessary will be developed with the appropriate agencies to ascertain the eligibility of the resource for inclusion in the National Register of Historic Places. If the resource is determined to be ineligible for inclusion in the National Register of Historic Places, Port Dolphin LLC will proceed with the project only after written notification of compliance from the USDI MMS and the USCG or the Florida State Historic Preservation Officer. If the site is determined eligible for inclusion in the National Register of Historic Places, additional work that may include formal data recovery and the preparation of a determination of performed as required and approved by the appropriate agencies. Further work at the location of the discovery will be suspended until clearance to proceed is granted by the USDI MMS and the USCG or the Florida State Historic Preservation Officer.

Executive Summary

A. Background

On March 29, 2007, the U.S. Coast Guard (USCG) and U.S. Maritime Administration (MARAD) received an application from Port Dolphin Energy, LLC, for all Federal authorizations required for a license to own, construct and operate a Deepwater Port (DWP) offshore of Tampa Bay, Florida. This document is a stand-alone technical report on the potential risks to the public from the proposed Port Dolphin project based on a large-scale release of Liquefied Natural Gas (LNG). The primary objective of this Independent Risk Assessment (IRA) is to assess impacts to humans and property not associated with the DWP from an event(s) that compromises LNG containment.

The unloading portion of the proposed Port Dolphin DWP, would be located in federal waters approximately 28 miles (45 kilometers) offshore of the Tampa Bay area of Florida in St. Petersburg (lease blocks PB 545 and PB 589). The DWP would consist of two buoys 2.7 nm (3.1 miles) apart, the northernmost buoy would be 9.55 nm (11 miles) south of the vessel safety fairway and the southernmost buoy would be 12.3 nm (14.1 miles) from the vessel safety fairway. The project location is shown below in Figure A .The water depth in this region is approximately 100 feet (30 meters). From this DWP location, a transmission pipeline approximately 42.1 miles (68 kilometers total) in length will be run to onshore interconnection facilities in Manatee County, Florida.

Port Dolphin[1] will be capable of mooring Shuttle and Re-gasification Vessels (SRVs), and is intended to provide a diverse source of natural gas delivery. The SRVs are vessels designed to carry liquefied natural gas and also to re-gasify the natural gas prior to off-loading for transport via pipeline to shore. These vessels will have a capacity range of 145,000 cubic meters (m^3) to 217,000 m^3 of LNG, transported and stored at a temperature of -261º F. The SRVs themselves are almost entirely fueled by natural gas.

Initially, it is expected that the average daily throughput of natural gas from the port will be approximately 400 million standard cubic feet per day (mmscfd). Port Dolphin would eventually be capable of achieving an average throughput of 800 million standard cubic feet per day (mmscfd) and a peak capacity of approximately 1,200 million mmscfd. Natural gas would be sent out by means of a 16-inch flexible riser from each buoy to two 36-inch subsea flowlines through a piggable-Y to a 36-inch gas transmission line. The gas transmission line would transport natural gas to onshore facilities inland in Manatee County, Florida. From there, the natural gas would be available to serve residential, commercial, industrial, and electrical generation customers primarily in Florida and the Southeastern United States.

[1] Information taken from the Port Dolphin LLC – Deepwater Port License Application – Volume 1 – Pages 2-3.

Figure A: Project Location

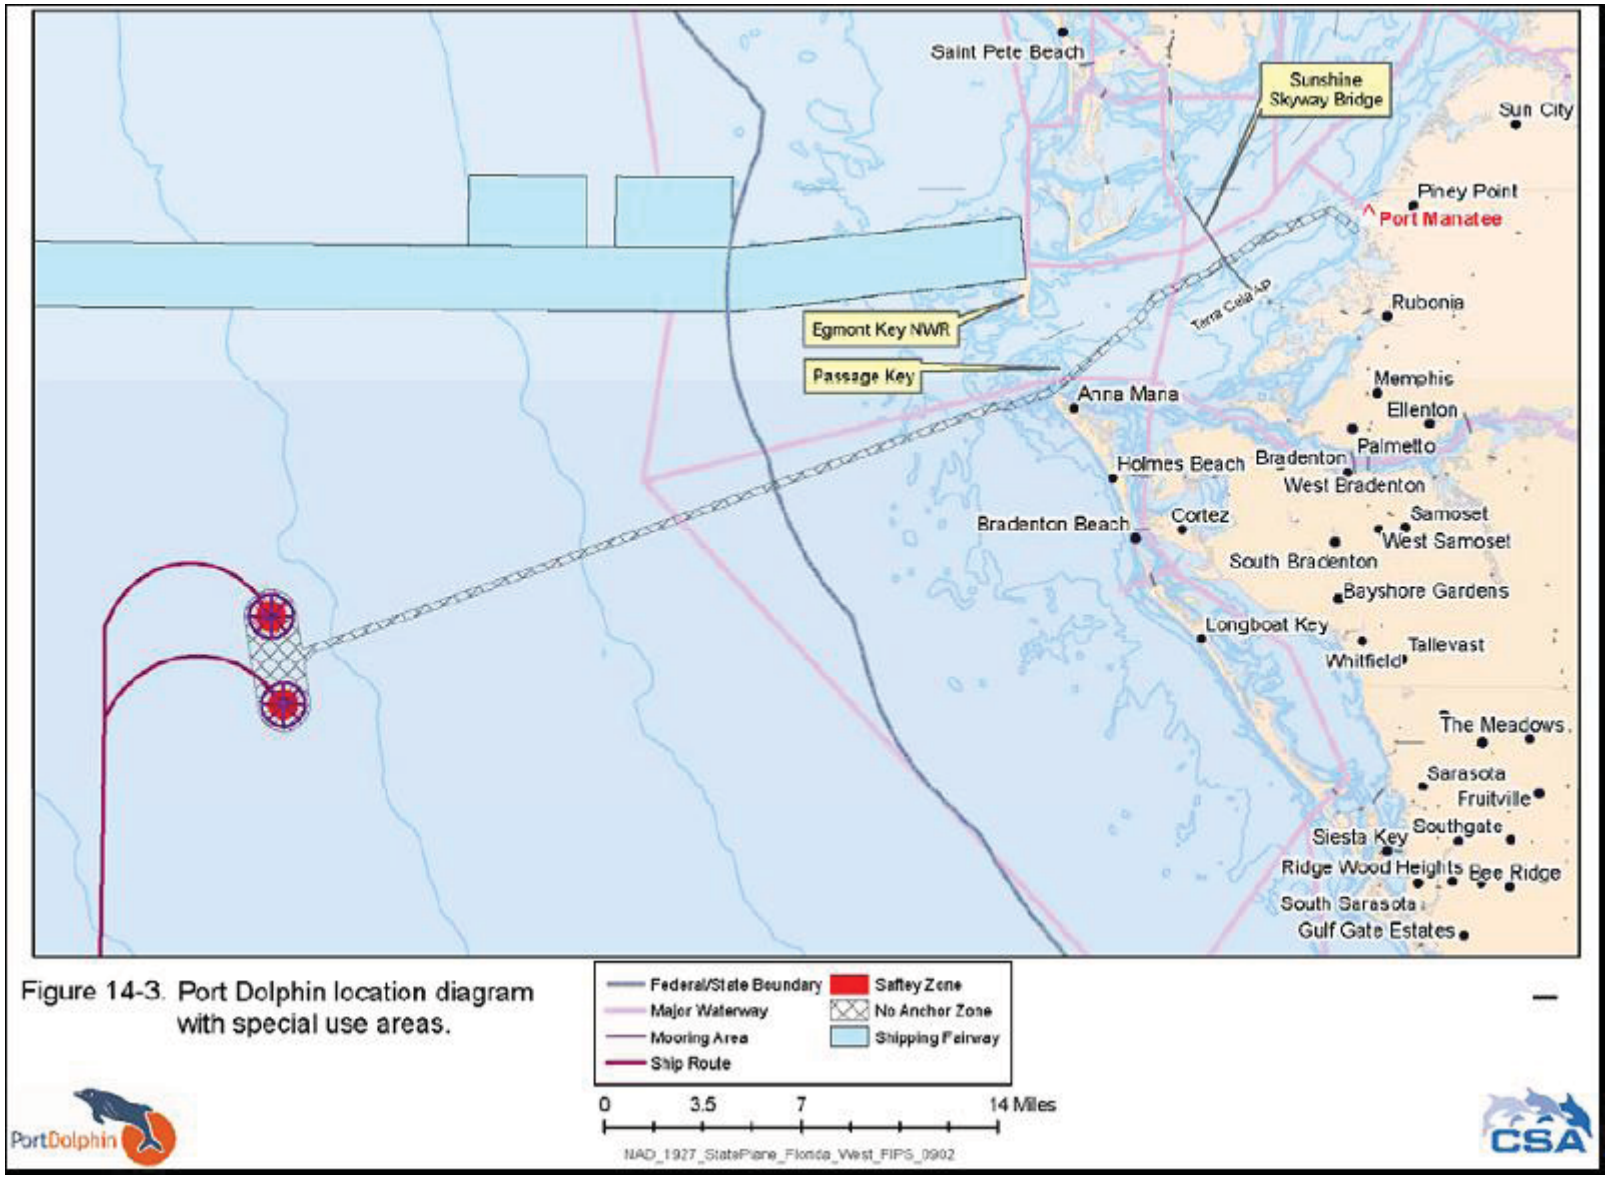

Figure 14-3. Port Dolphin location diagram with special use areas.

B. Study Process

The deepwater port (DWP) license application review process includes an analysis of the proposed project's impacts on public safety. As part of this analysis, a project's specific risk assessment is comprised of two parts:

- Phase I is an independent risk assessment (IRA) that evaluates potential maximum hazards of Liquefied Natural Gas (LNG) releases from credible scenarios (identification of the bounding or worst-credible consequences), and is an input to the Environmental Impact Statement (EIS) process.
- Phase II is a risk assessment (RA) that examines the range of scenarios that could result in an LNG release and evaluates proposed strategies to reduce the risk, providing input to Operations/Security (OPS/SEC) manuals required by 46 CFR 150.10 and potentially incorporating safety and security measures into the Secretary of Transportation's Record of Decision (ROD).

This report is limited to the Phase I IRA and involved six steps.

Table A: IRA Process

Step	Description
1. DWP Area Characterization	The DWP application was reviewed and additional data was gathered and analyzed about the port environment.
2. HAZID	Input was received from various stakeholders and the applicants to identify accidental and intentional scenarios.
3. Scenario Development	The HAZID scenarios were further analyzed to determine credible and bounding scenarios.
4. Vessel Collision and Frequency Analysis	The type of vessel and frequency of collisions was analyzed.
5. Consequence Analysis	The impacts of the bounding cases were analyzed using Computational Fluid Dynamics (CFD) modeling.
6. Results and Conclusions	The analysis results were assessed and are presented in this report.

The conclusions of this IRA are presented as the hazard zones for thermal radiation and flammable vapor cloud dispersion for the accidental and intentional release scenarios evaluated. The hazard zones have been presented as graphical overlays on the nautical charts for the proposed Port Dolphin DWP project location. The results of the study are presented without passing judgment on the merits of the applicant's proposed project.

While the study evaluated the potential impacts to the public and surrounding infrastructure, it did not attempt to predict the number of estimated fatalities or injuries from these events. Also, the study was done without considering any mitigation measures that could be implemented to reduce the risk of accidental or intentional release of LNG from this proposed project. These considerations may be subject to further review outside of the scope of this study.

C. Results

C.1 Scenarios Selected

The scope of the HAZID (Step 3, Table A) was the identification of "credible" scenarios for accidental and intentional events involving all parts of the proposed project under the jurisdiction of the USCG. Credible scenarios as defined in the HAZID process do not necessarily represent scenarios that are high risk – credible scenarios are the possible intentional and accidental scenarios identified through a multidisciplinary team evaluation of the project. The scenarios are identified regardless of likelihood and are used in the Phase I IRA for bounding the consequences of concern.

Scenarios derived in Steps 1-3 of the IRA process are shown in Table B. Based on information provided by the applicant, both membrane and Moss-style SRVs may call on the Port Dolphin DWP. Therefore, LNG release scenarios have been developed for both SRV types.

The intentional acts (Scenarios 1-3 and 5-7) were evaluated in cooperation with Sandia National Laboratories (Sandia). The most significant of these acts was evaluated although it was considered unlikely to occur due to the multiple countermeasures required by the Maritime Transportation Security Act (MTSA) and specific operational plans of the USCG and the applicants. The mitigation for specific acts of terrorism, such as hijacking or attacks by explosive weapons, will be addressed by the USCG and the applicants as required by Title 33, Chapter I, Part 150 Deepwater Ports: Operations, Subpart A, General, Sec. 150.15, Operations Manual.

Table B: Release Scenario Summary

Scenario	Description	Event Type
Membrane-Type Carrier - 217,000m^3		
1	One- 16 m^2 hole (single cargo tank release)	Intentional
2	Two – 12 m^2 holes (two cargo tank release)	Intentional
3	Three – 12 m^2 holes (three cargo tank release)	Intentional (Cascading Damage)
4	One – 17 m^2 hole	Vessel Collision
Moss-Type Carrier – 215,000 m^3		
5	One – 16 m^2 hole (single cargo tank release)	Intentional
6	Two – 12 m^2 holes (two cargo tank release	Intentional
7	Three – 12 m^2 holes (three cargo tank release)	Intentional (Cascading Damage)
8	One – 22 m^2 hole	Vessel Collision

As detailed in Table A, Scenarios 3 and 7 are intentional scenarios that lead to cascading damage and the release of three LNG cargo tanks. Since a sustained fire is required for cascading damage immediate ignition is assumed for these scenarios, resulting in only the potential for a pool fire, or thermal radiation hazard. Due to the assumed immediate ignition basis for these two scenarios, flammable vapor dispersion is not a credible outcome and the distance to LFL is not evaluated.

Since the purpose of the IRA is to identify and review the bounding scenarios, a series of screening analyses were conducted to identify the SRV type with the largest potential consequences. Based on

these results, the Moss-type SRV was identified as having the greatest potential consequences. Compared to the membrane SRV, the Moss SRV has a greater liquid head and liquid volume above the waterline, and results in a greater release rate and greater amount of LNG released for similar breach sizes.

Therefore, Scenario 6 and Scenario 7 are the bounding intentional scenarios and Scenario 8 is the bounding vessel collision scenario under consideration in the Port Dolphin IRA. For the intentional releases, Scenario 7 is the bounding thermal radiation hazard and Scenario 6 is the bounding flammable vapor dispersion hazard. The intentional scenarios have different bounding scenarios since Scenario 7 is limited to thermal radiation hazards of a pool fire as a result of immediate ignition and cascading damage.

C.2 Consequence Modeling Results

Thermal radiation hazard distances from a pool fire were estimated to two different thermal heat flux levels:

- 37.5 kW/m^2: Damage to process equipment and storage tanks[2] for unprotected exposures based on an average 10-minute exposure duration, as well immediate fatalities
- 5 kW/m^2: Permissible level for emergency operations lasting several minutes with appropriate clothing based on an average 10-minute exposure duration[3] and onset of second degree burns based on an average 40-second exposed duration[4]

The maximum thermal radiation hazard distances predicted for the intentional and vessel collision scenarios are listed in Table C. In this IRA, it is assumed that all spills originate at the SRV, with all hazard distances measured from the center of the LNG pool.

The flammable vapor dispersion hazard distance is determined as the maximum downwind distance to the Lower Flammability Limit (LFL). The flammable vapor cloud dispersion simulations were performed using Fluent, a commercial CFD code. Fluent was validated for this study by its favorable comparison with experimental LNG vapor dispersion data from the Burro tests (Appendix A). Given the right environmental conditions, the maximum distances could occur in any direction from the LNG release source. Therefore, for the purposes of this analysis, distances to the LFL are represented as a circle surrounding the SRV. All distances in Table C are measured from the center of the pool, which is the source of the LNG release (the SRV itself).

Table C: Summary Risk Analysis Consequences for Bounding Scenarios

Result	Scenario 6 (Intentional)	Scenario 7 (Intentional)	Scenario 8 (Collision)
Breach Size, m^2	12	12	22
Number of Tanks	2	3	1
Total Capacity of Impacted Tank(s), m^3	108,724	163,086	54,362
Release Quantity, m^3	96,660	144,990	48,330
Pool Fire Maximum Distance to Endpoint (meters)			
Pool Diameter (immediate ignition)	1,060	1,260	840
Thermal Radiation Endpoint > 37.5kW/m^2	1,710	1,990	1,390
Thermal Radiation Endpoint > 5 kW/m^2	3,960	4,680	3,140
Flammable Vapor Cloud Dispersion (No Ignition)			
Distance to LFL, m	6,095	***Immediate Ignition No Vapor Cloud Hazard***	4,980
Time for Maximum Distance, min	30		26
Cloud Peak Elevation, m	112		110

The pool fire, thermal radiation results for Scenarios 7 and 8 are shown in Figure B and Figure C, respectively. These scenarios represent the bounding thermal radiation hazards for the intentional and vessel collision scenarios. In Figures B and C, the consequence is shown as the radial distance centered at the North or South buoy to the two thermal radiation hazard endpoints. These figures illustrate that neither a release of LNG from an intentional event (Scenario 7) nor from a vessel collision (Scenario 8) at either the North or South buoy would impact activities at the other buoy location from a sustained fire. For Scenario 7, the 5 kW/m^2 zone extends to within about 500 m of the adjacent project buoy, but the impacts to another SRV (if at the DWP) are expected to be less than the impacts defined by this hazard zone. Additionally, the thermal radiation zones from these scenarios do not impact the vessel safety fairway or the nearest landmass. However, since the thermal radiation zones extend farther than the expected Safety Zone and the area to be avoided (ATBA) there is a potential for a release and sustained fire at the DWP to impact private or commercial marine traffic in the vicinity of the DWP.

Figure D compares the flammable vapor dispersion results for Scenarios 6 and 8, represented as the distance to the LFL. As compared to the pool fire consequence, where the thermal radiation hazard extends radially from the pool fire center, the flammable vapor dispersion hazard will extend as a cloud dispersing in the downwind direction. However, the flammable vapor dispersion hazard (distance to LFL) is illustrated as a circle (Figure D), since the cloud could disperse in any of 360 degrees, depending on the wind direction at the time of release.

As illustrated in Figure D, the intentional scenario (Scenario 6) results in the greatest distance to LFL, and an incident at either buoy could potentially impact the other buoy location. As shown in Table C, the time to reach LFL is 30 minutes for Scenario 6 and 26 minutes for Scenario 8. Assuming the wind direction was toward a second SRV at the adjacent buoy, the other SRV has an emergency buoy disconnect that can shutdown re-gasification and disconnect the SRV in 15 minutes. The wind rose data for the DWP illustrates that if an unignited release were to occur at the North buoy, there is a 5.1% probability that the wind would be blowing toward the South buoy. Similarly, if the release were to occur at the South buoy, there is a 6.3% probability that the wind would be blowing toward the

North buoy. The predominant wind direction at the DWP is not toward either buoy, but from the east, and out to sea.

Neither the vessel safety fairway nor the shoreline would be impacted from a vapor cloud release at either buoy location, but the potential to impact private or commercial marine traffic in the vicinity of the DWP does exist due to the extent of the hazard distance.

Figure B: Scenario 7 – Thermal Radiation Hazard Zone

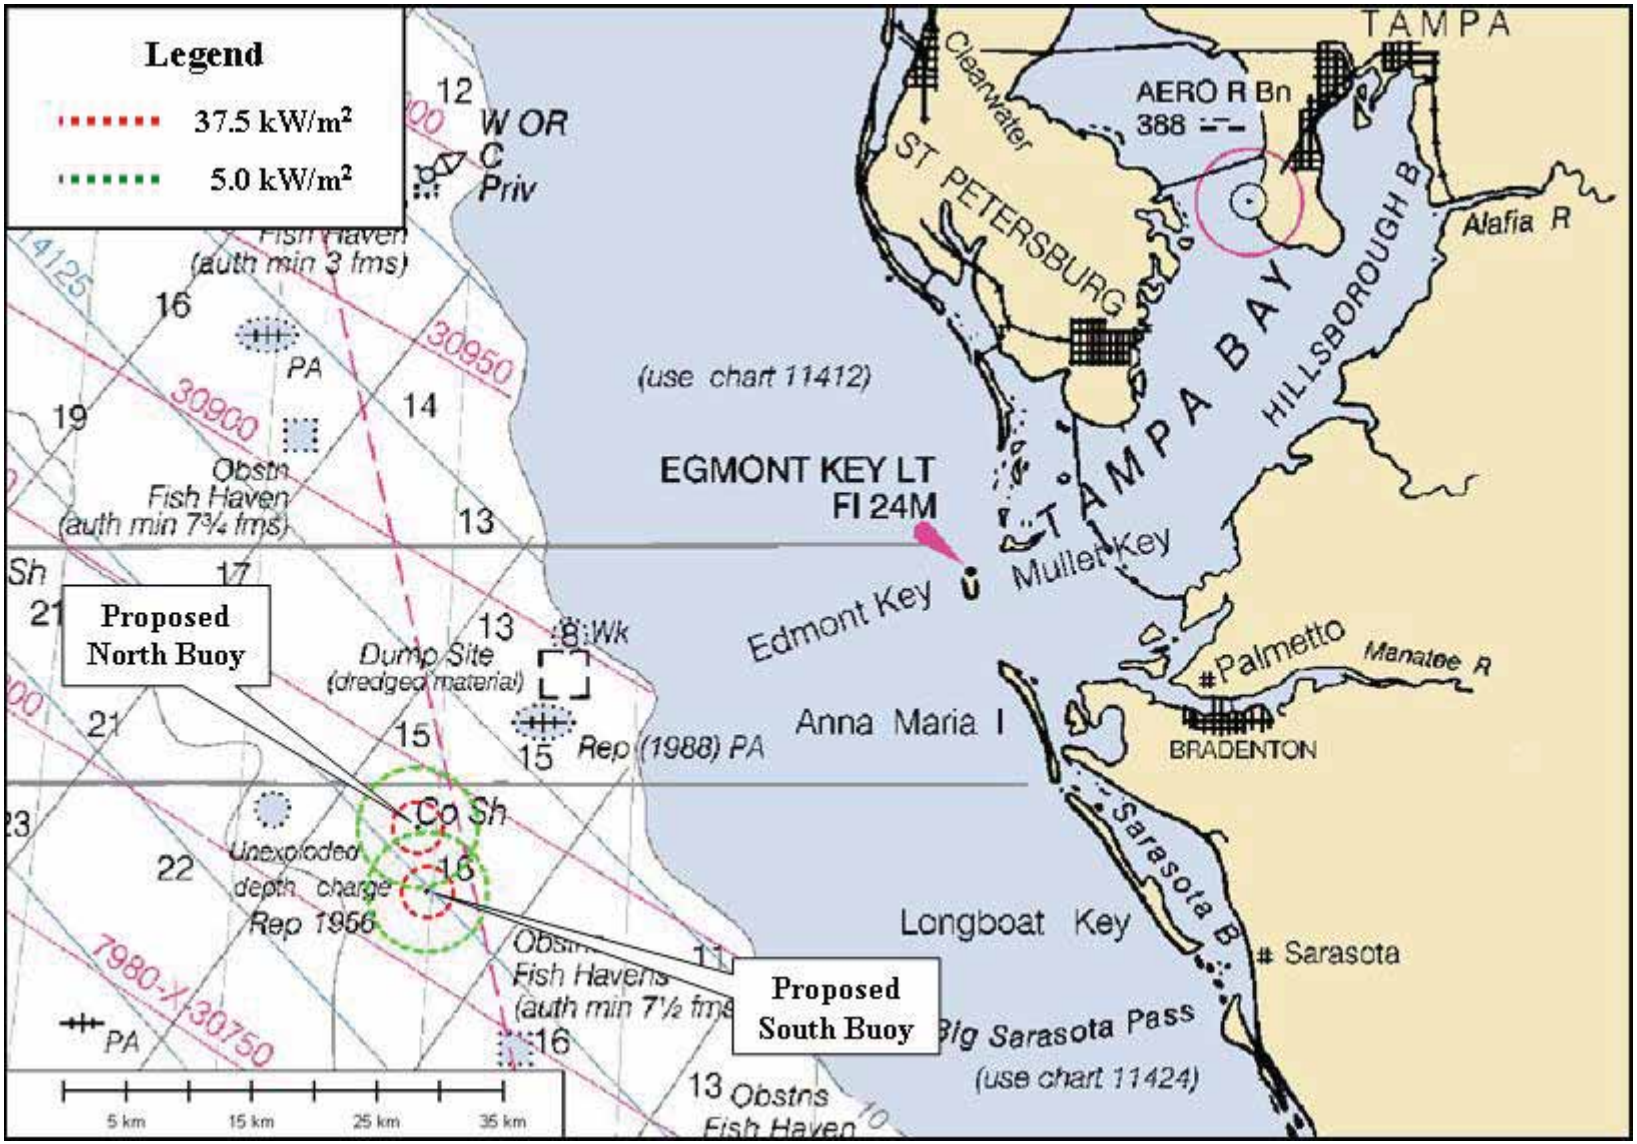

Figure C: Scenario 8 – Thermal Radiation Hazard Zone

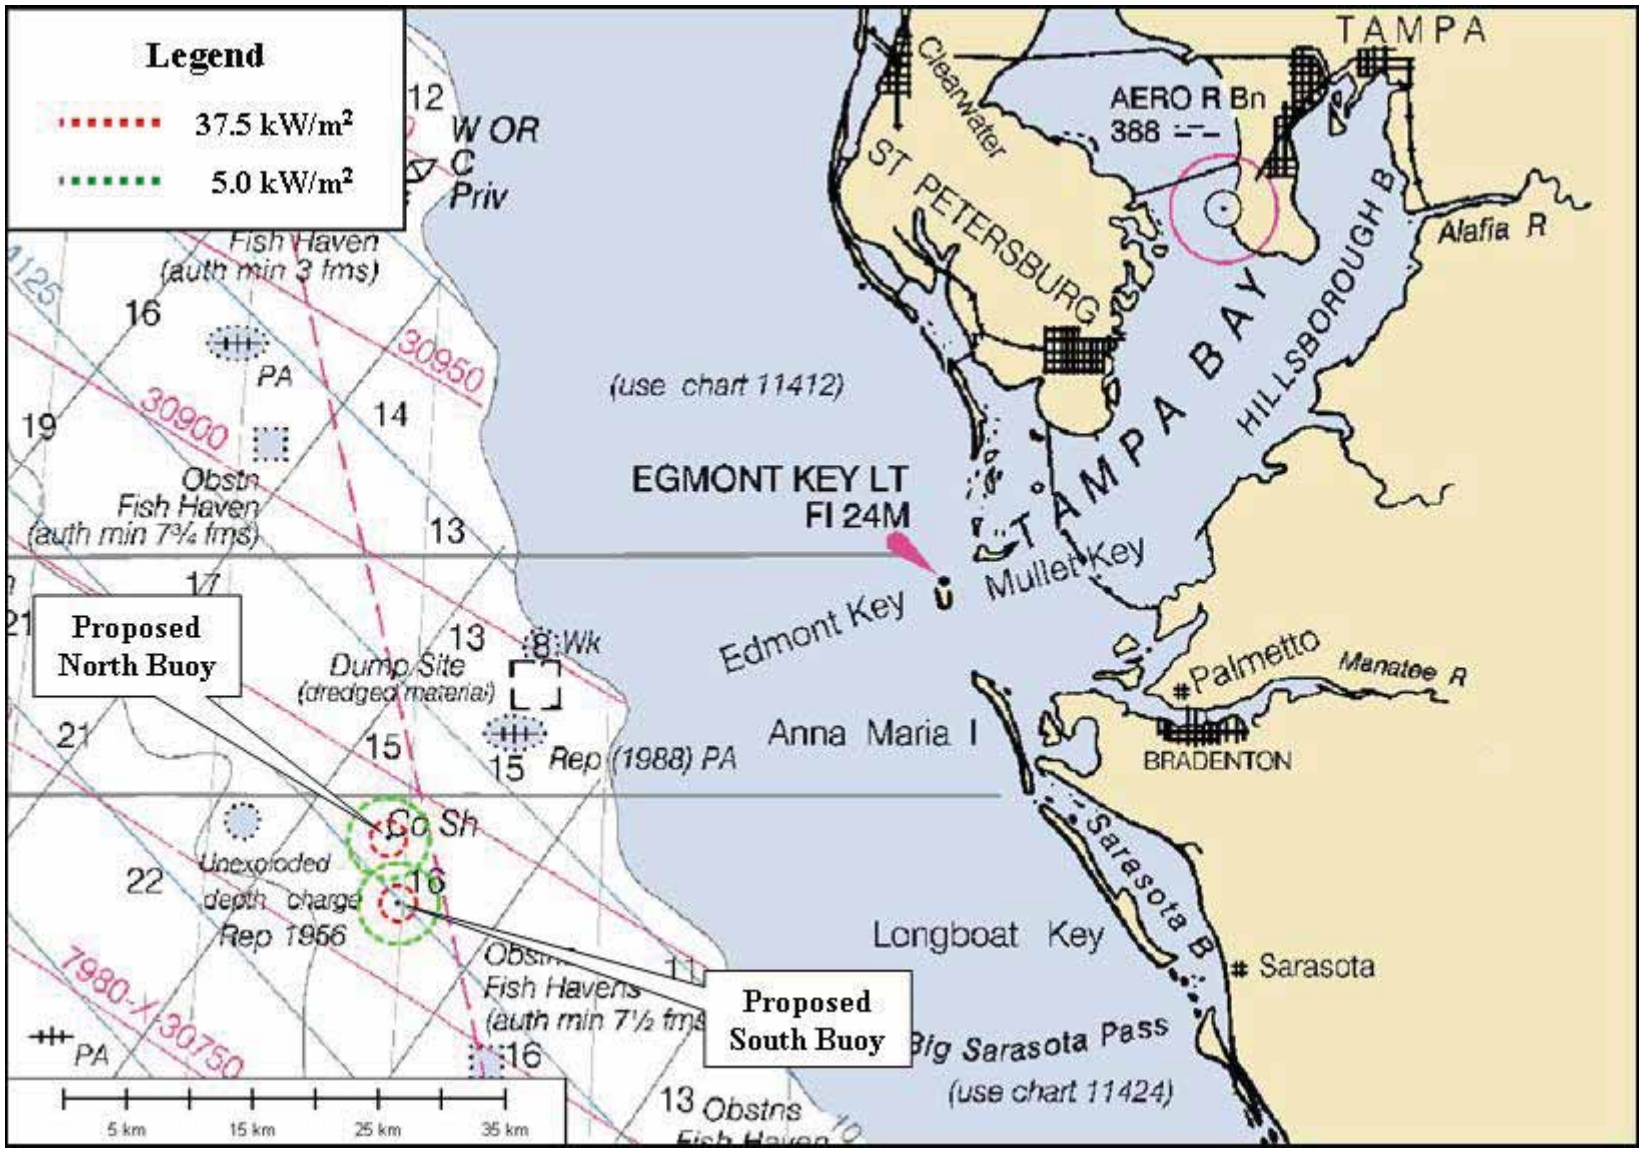

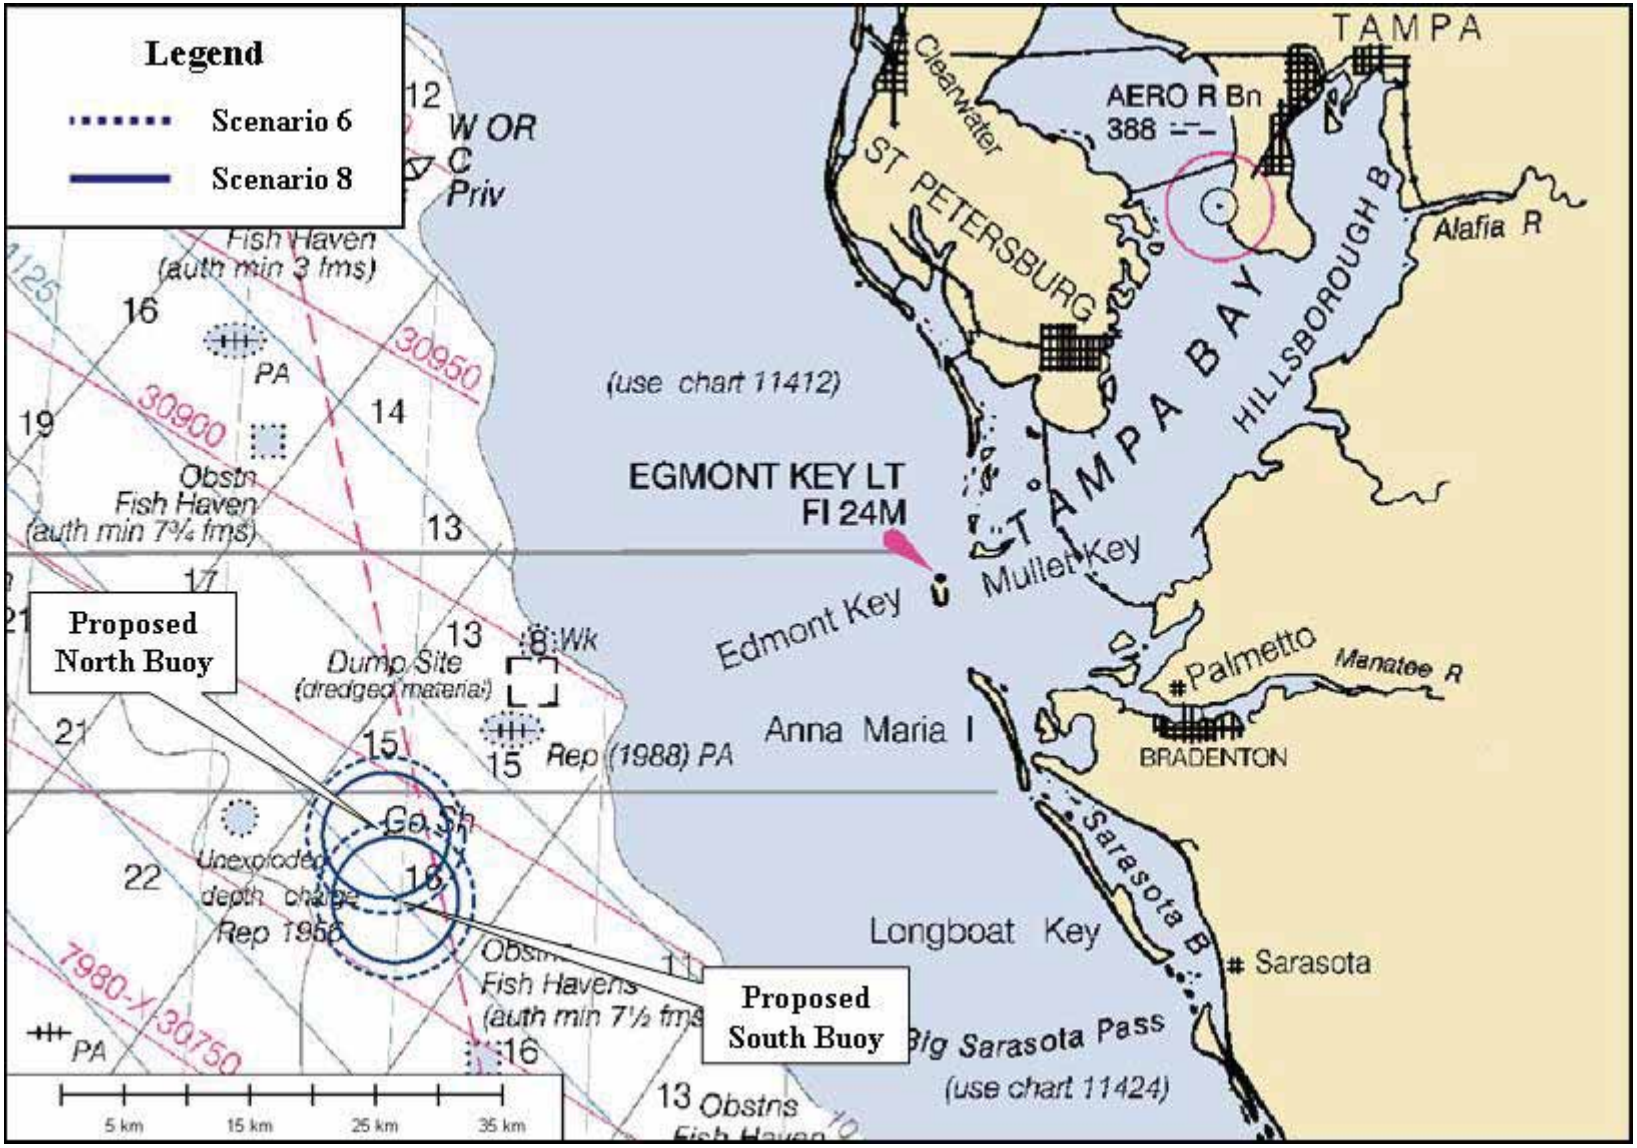

Figure D: Scenario 6 and 8 – Comparative Distance to LFL

C.3 Frequency of Events

The total frequency of a collision with an SRV at the DWP was calculated for two vessel types: 1) vessels in the established Port of Tampa Vessel Safety Fairway, and 2) vessels randomly passing the DWP location. This calculation utilized vessel traffic from the Automatic Identification System (AIS) dataset provided for this project by the USCG R&D Center, and only included those vessels with the potential to breach the inner hull of the SRV (resulting in a release of LNG from containment) in a collision.

Due to the distance from the safety fairway to the DWP (11 miles to the North buoy) the likelihood of a powered and drifting collision in this defined route and the SRV was very unlikely. In addition to vessels in the defined fairway, vessels of sufficient displacement and speed were identified that passed near the DWP. Using the collision frequency calculation for randomly distributed vessels, a collision frequency of 1.4×10^{-4} collisions per year was calculated. This vessel collision frequency can also be presented as one collision that could result in an inner hull breach of the SRV every 7,100 years.

The collision frequency for the proposed DWP considering both vessels in the safety fairway and randomly distributed around the DWP is shown in Table D.

Table D: Frequency of Vessel Collisions for Proposed DWP

LOCATION	FREQUENCY OF VESSEL COLLISION (PER YEAR BASIS)	FREQUENCY OF VESSEL COLLISION (YEARS PER COLLISION BASIS)
SRV at Port Dolphin DWP	1.4×10^{-4}	1 collision every 7,100 years

1.0 Project Overview

The Deepwater Port Act[5] authorized the Secretary of Transportation to issue licenses for the ownership, construction and operation of deepwater ports,[6] including liquefied natural gas facilities. The Secretary has delegated authority for processing license applications to the U.S. Coast Guard (USCG) and the U.S. Maritime Administration (MARAD).

To enable a more efficient application review process, the USCG established procedures for license applicants to hire third-party consultants, under direction of the Coast Guard, to conduct statutorily required analyses (e.g., Environmental Impact Statements (EISs) and Independent Risk Assessments (IRAs)).[7]

1.1 Introduction

On March 29, 2007, the USCG and MARAD received an application from Port Dolphin Energy, LLC, for all Federal authorizations required for a license to own, construct, and operate a deepwater port (DWP). USCG deemed the application complete subsequent to a review as required by the Deepwater Port Act.

This IRA is being submitted by AcuTech Consulting Group (AcuTech) to the USCG for the proposed Port Dolphin, Liquefied Natural Gas (LNG) DWP. This IRA provides the necessary data for the public safety section of the EIS being developed for the Project. AcuTech is the lead contractor for the IRA, responsible for the development of a stand-alone technical report on the potential risks to the public from potential large-scale release(s) of LNG or natural gas. Under contract to AcuTech, Exponent Inc. (Exponent) conducted the modeling for liquid spills, fire, and vapor dispersion for the LNG release scenarios defined in the IRA. This included three-dimensional computational fluid dynamic (CFD) for the flammable dispersion consequences.

The objective of this risk assessment is to assess the maximum impacts to the public and property not associated with the DWP from an event that compromises LNG containment, resulting in a release to the environment.

AcuTech is a global company providing consulting, training, and technologies to the public and private sectors to identify, evaluate, and manage risks in order to continually improve safety, security, health, environmental, and operational performance. AcuTech has expertise in LNG operations, security, process safety, offshore hazardous materials installation operations, risk assessment, fire protection, and homeland security for critical infrastructure.

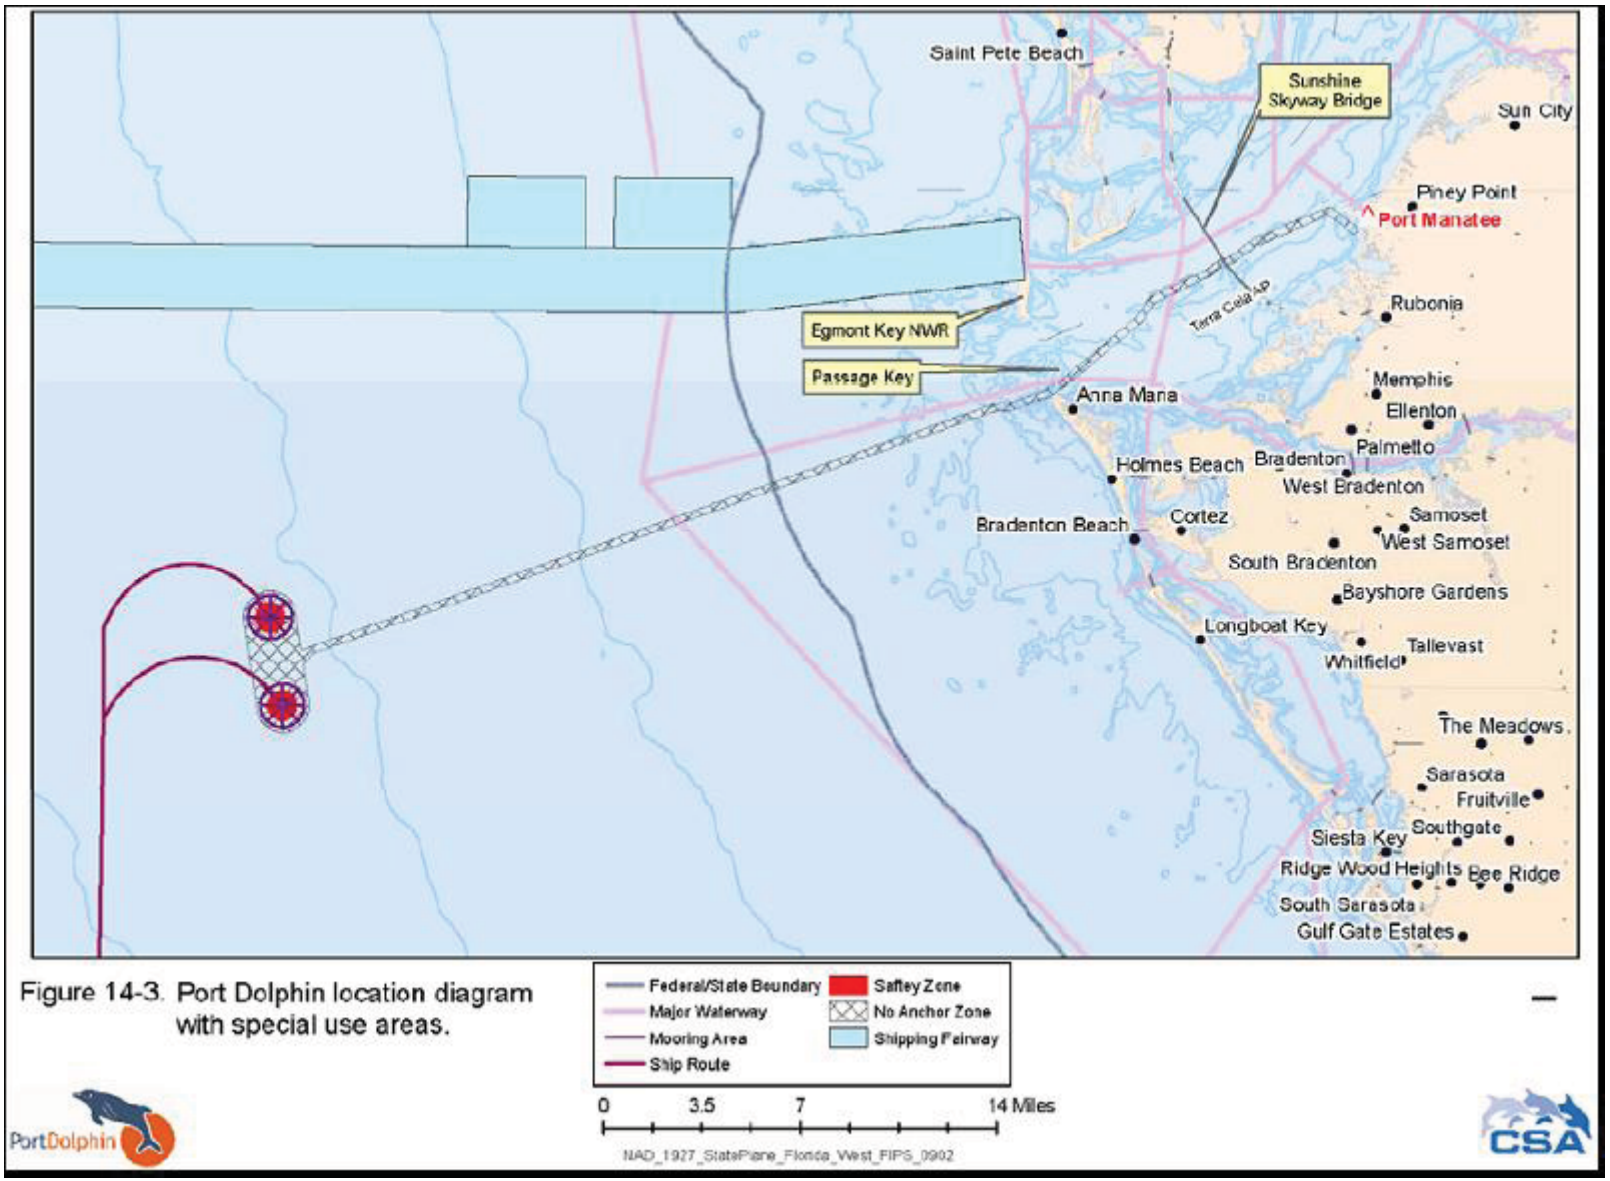
[5] Deepwater Port Act (DWPA) of 1974 as amended by the Maritime Transportation Security Act of 2002 (MTSA); 33 United States Code 1501, *et seq*.
[6] The term "deepwater port" refers to any fixed or floating manmade structures other than a vessel, or any group of such structures, located beyond the territorial sea and of the coast if the United States, and intended for the loading or unloading and further handling of oil for transportation, except as excluded in 33 U.S.C. 1522.
[7] US Coast Guard, "Deepwater Port Third Party Handbook" (Washington, DC: US Department of Homeland Security, February 27, 2004), Section 4.0.

Exponent Inc. is an engineering and scientific consulting firm that provides solutions to complex technical problems. Their multidisciplinary team of scientists, physicians, engineers, and regulatory consultants performs in-depth research and analysis in more than 70 technical disciplines. Exponent is a recognized leader in the use of CFD models for LNG hazard estimation.

Port Dolphin Energy, LLC has filed for all Federal authorizations required for a license to own, construct, and operate a Deepwater Port (DWP) offshore of Tampa Bay, Florida

1.2 The Independent Risk Assessment (IRA)

The purpose of this work is to develop a stand-alone technical report on the potential risks to the public from the proposed Port Dolphin DWP based on a large scale release of LNG. The objective of this IRA is to assess impacts to humans and property not associated with the DWP from an event(s) that compromises LNG containment, resulting in a release to the environment. Therefore the scope of the IRA does not include the natural gas sub-sea pipeline or any additional onshore gas pipeline or facilities.



The assessment is not a full probabilistic risk assessment which estimates the cumulative frequency of all expected losses over the life of the DWP facilities, but instead is a deterministic study of the most significant credible loss scenarios that represent the maximum expected impacts from accidental and intentional scenarios developed and defined as part of the IRA. As such, the study provides representative scenarios for consideration and derives the most significant consequences (defined as the bounding intentional and accidental scenarios) for presentation of the maximum expected impacts to public safety.

The USCG Office of Operating and Environmental Standards, Deepwater Ports Standards Division (CG-5225) directed the scope, content, and quality of the report. The applicant, Port Dolphin LLC, had no technical direction of the work done under this contract, and was not able to review the work product before its release to the public. The applicant did, however present an overview of the Port Dolphin project to the IRA team as part of the Hazard Identification (HAZID), and answered additional question as requested.

1.3 Proposed Port Dolphin Deepwater Port

Port Dolphin Energy and its partners are proposing to construct, own, and operate a DWP offshore of Tampa Bay, Florida. The unloading portion of the proposed DWP, would be located in federal waters approximately 28 miles (45 kilometers) offshore of the Tampa Bay area of Florida in St. Petersburg (lease blocks PB 545 and PB 589). The location of the offshore components of the project is illustrated in Figure 1-1.

Figure 1-1: Port Dolphin Proposed Project Location

The DWP would consist of two buoys 2.7 nm (3.1 miles) apart and 9.55 nm (11 miles) and 12.3 nm (14.1 miles) south of the vessel safety fairway. The water depth in this region is approximately 100 feet (30 meters). From the project site, a transmission pipeline approximately 42.1 miles (68 kilometers total) in length will be run to shore, with interconnection facilities to the natural gas distribution network in Manatee County, Florida. The coordinates of the proposed North and South buoys of the DWP are detailed in Table 1-1.

Table 1-1: Unloading Buoy Coordinates

Buoy	Latitude	Longitude
North	27° 25' 12.14" N	83° 11'50.11" W
South	27° 22' 28.73" N	83° 11' 22.49" W

Initially, it is expected that the average daily throughput of natural gas from the port will be approximately 400 million standard cubic feet per day (mmscfd). Port Dolphin would eventually be capable of achieving an average throughput of 800 million standard cubic feet per day (mmscfd) and a peak capacity of approximately 1,200 million mmscfd. Natural gas would be sent out by means of a 16-inch flexible riser from each buoy to two 36-inch subsea flowlines through a piggable-Y to a 36-inch gas transmission line. The gas transmission line would transport natural gas to onshore facilities inland in Manatee County, Florida. From there, the natural gas would be available to serve residential, commercial, industrial, and electrical generation customers primarily in Florida and the Southeastern United States.

As part of the DWP, Port Dolphin would be capable of mooring Shuttle and Re-gasification Vessels (SRVs), as depicted in Figure 1-2. The SRVs are designed to carry liquefied natural gas and also to re-gasify the natural gas prior to off-loading for transport to shore.[8] These vessels would have a capacity range of 145,000 cubic meters (m^3) to 217,000 m^3 of LNG, transported and stored at a temperature of -261º F (-162 º C). The maximum SRV dimensions and capacities are the focus of the IRA since the larger SRV designs can carry a greater quantity of LNG, and thus have greater potential consequences if there were an accidental or intentional a release of LNG as part of this project.

[8] Information taken from the Port Dolphin LLC – Deepwater Port License Application – Volume 1 – Pages 2-3.

Figure 1-2: Shuttle and Re-gasification Vessel (SRV) Illustration

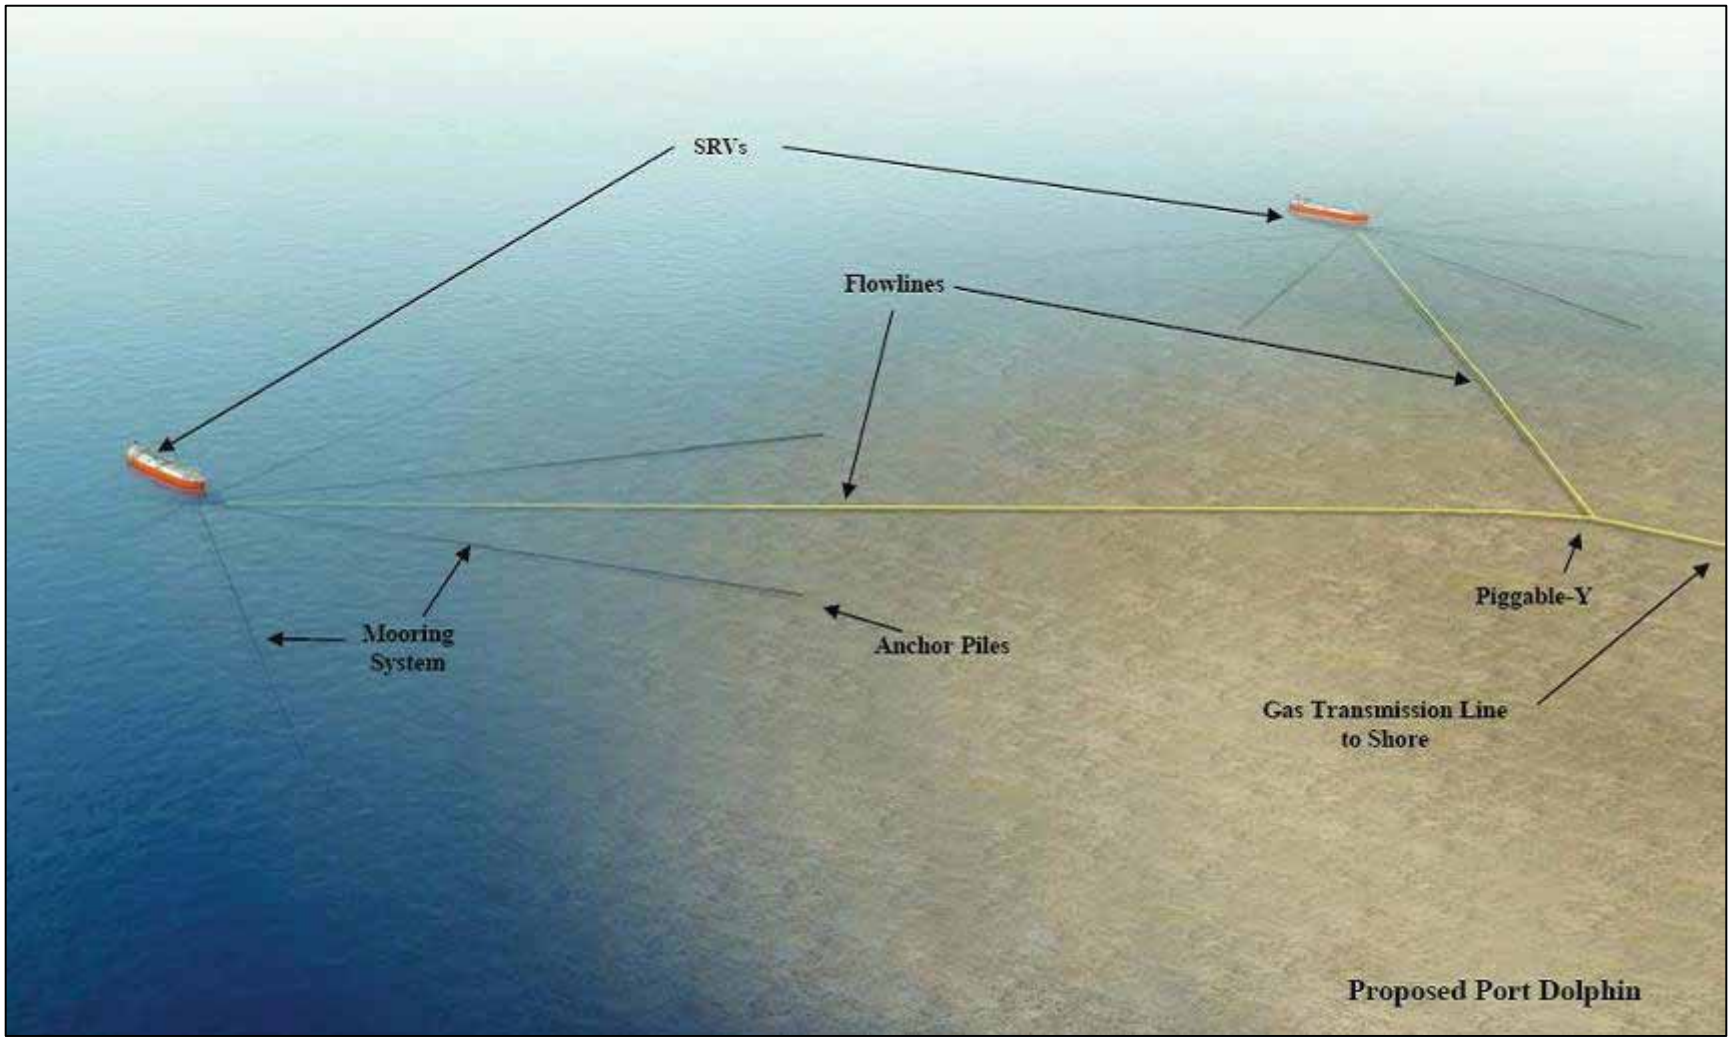


Figure 1-3 illustrates that the Port Dolphin project will be capable of mooring up to two SRVs simultaneously for uninterrupted off-loading and transmission of natural gas to onshore interconnection stations for delivery to customers in Florida and elsewhere in the Southeastern United States.

In addition to the SRVs, project vessels that are included as part of the Port Dolphin project will include:

- Support Vessel
- Crew Boat

The specifics of the SRVs and the additional project vessels are discussed in detail as part of Section 3.

Figure 1-3: DWP Illustration

2.0 Risk Assessment Methodology

2.1 Study Basis

In order to provide useful quantitative data regarding the potential safety and security impacts of the Port Dolphin LLC proposed DWP project, this assessment:

- Evaluates the potential risks utilizing appropriate site-specific data and credible scenarios to address public safety issues associated with the storage, handling, and re-gasification of LNG at the proposed the DWP.
- Is transparent and available for review to the greatest extent possible by the public and government agencies, subject to limitations imposed by security requirements.
- Establishes an independent and project-specific analysis, in lieu of extrapolation or regression of past studies or calculations.
- Follows the guidance for accidental and intentional LNG spills on water in the Department of (DOE) reports[9] (*Guidance on Risk Analysis and Safety Implications of a Large Liquefied Natural Gas (LNG) Spill Over Water*, 2004 and *Breach and Safety Analysis of Spills Over Water from Large Liquefied Natural Gas Carriers*, 2008) conducted by Sandia National Laboratories (Sandia).

This IRA relied on input and guidance from experts at Sandia, the USCG, and local stakeholders in the development of the intentional and accidental scenarios considered.

2.2 Bounding Scenarios and Credibility

To maintain objectivity and practicality which properly addresses the public's concerns, the following are the bounds of the assessment's scope:

- The assessment is a systems level risk assessment that considers operations related to the transfer, storage, and re-gasification at the DWP.
- The full range of hazards was evaluated as part of an initial HAZard IDdentification (HAZID).
- The assessment analyzed a defined subset of the HAZID cases to bracket the credible range of potential accidental and intentional LNG release scenarios.

Credible scenarios developed in the HAZID process include all possible intentional and accidental scenarios identified through a multidisciplinary team evaluation of the project. The scenarios are defined regardless of likelihood or consequence and are examined in the IRA to identify the one which will produce the bounding consequences of concern.

[9] SAND2004-6258 and SAND2008-3153

2.3 Significance Criteria and Assumptions

The risk assessment compares the results to the significance criteria and assumptions prescribed by the USCG in the Statement of Work and include SAND2008-3153 baseline criteria. Thermal radiation hazard distances from a pool fire were estimated to two different thermal heat flux levels:

- 37.5 kW/m^2: Damage to process equipment and storage tanks,[10] for unprotected exposures based on an average 10-minute exposure duration, as well immediate fatalities
- 5 kW/m^2: Permissible level for emergency operations lasting several minutes with appropriate clothing based on an average 10-minute exposed duration[11] and onset of second degree burns based on an average 40 second exposed duration[12]

The pool fire calculations report the maximum distance to each of these thermal radiation endpoints, estimated respectively from the center of the pool fire.

In addition to the thermal radiation hazards from pool fires, the vapor dispersion from an unignited cloud evolving from an LNG release is reported as the distance to the lower flammability limit (LFL) endpoint, which is 5% by volume for methane.

These modeling endpoints were considered from spills emanating from a pool assumed to be initiated from either accidental or intentional release scenarios at the DWP location itself. While the hazard zones would also apply to the LNG regasification vessels in transit to the DWP, the figures in this report depict a pool that is centered at the North or South buoy with the release originating at the LNG carrier. The significance criteria are limited specifically to acute and fatal effects to the public (either in nearby waters or on shore). Scenarios involving long-range transport to or from the source of the LNG were not included as they are outside the jurisdiction of the USCG.

2.4 Study Approach

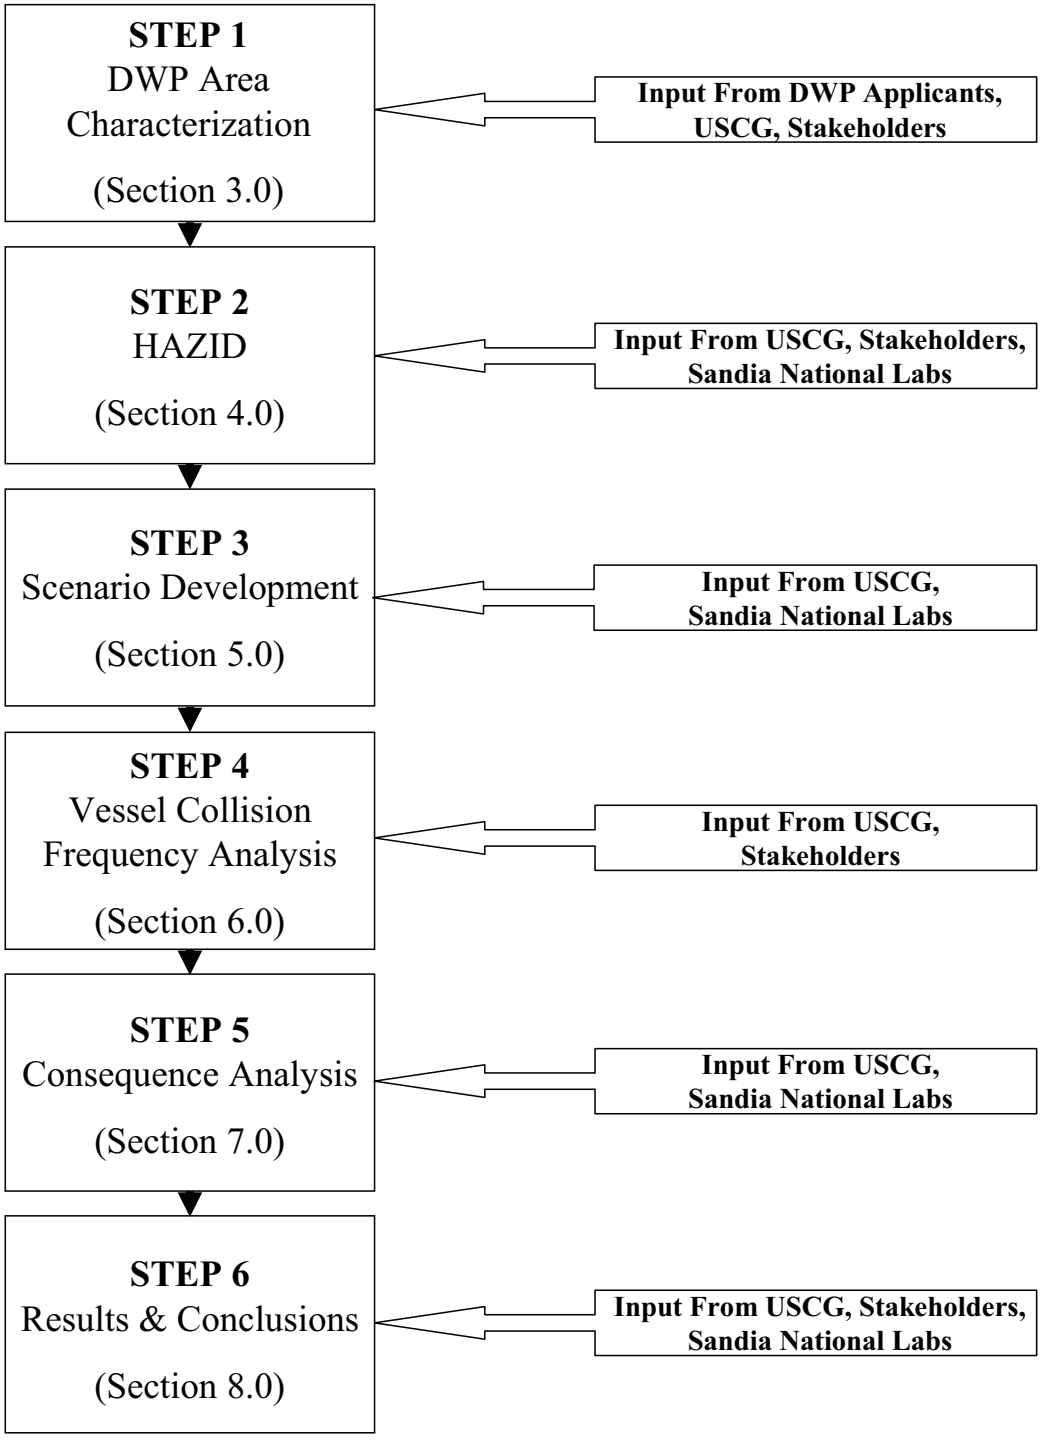

Figure 2-1 illustrates the risk assessment approach that was used to complete the analysis of this LNG DWP project. The approach was comprised of 6 steps, and included:

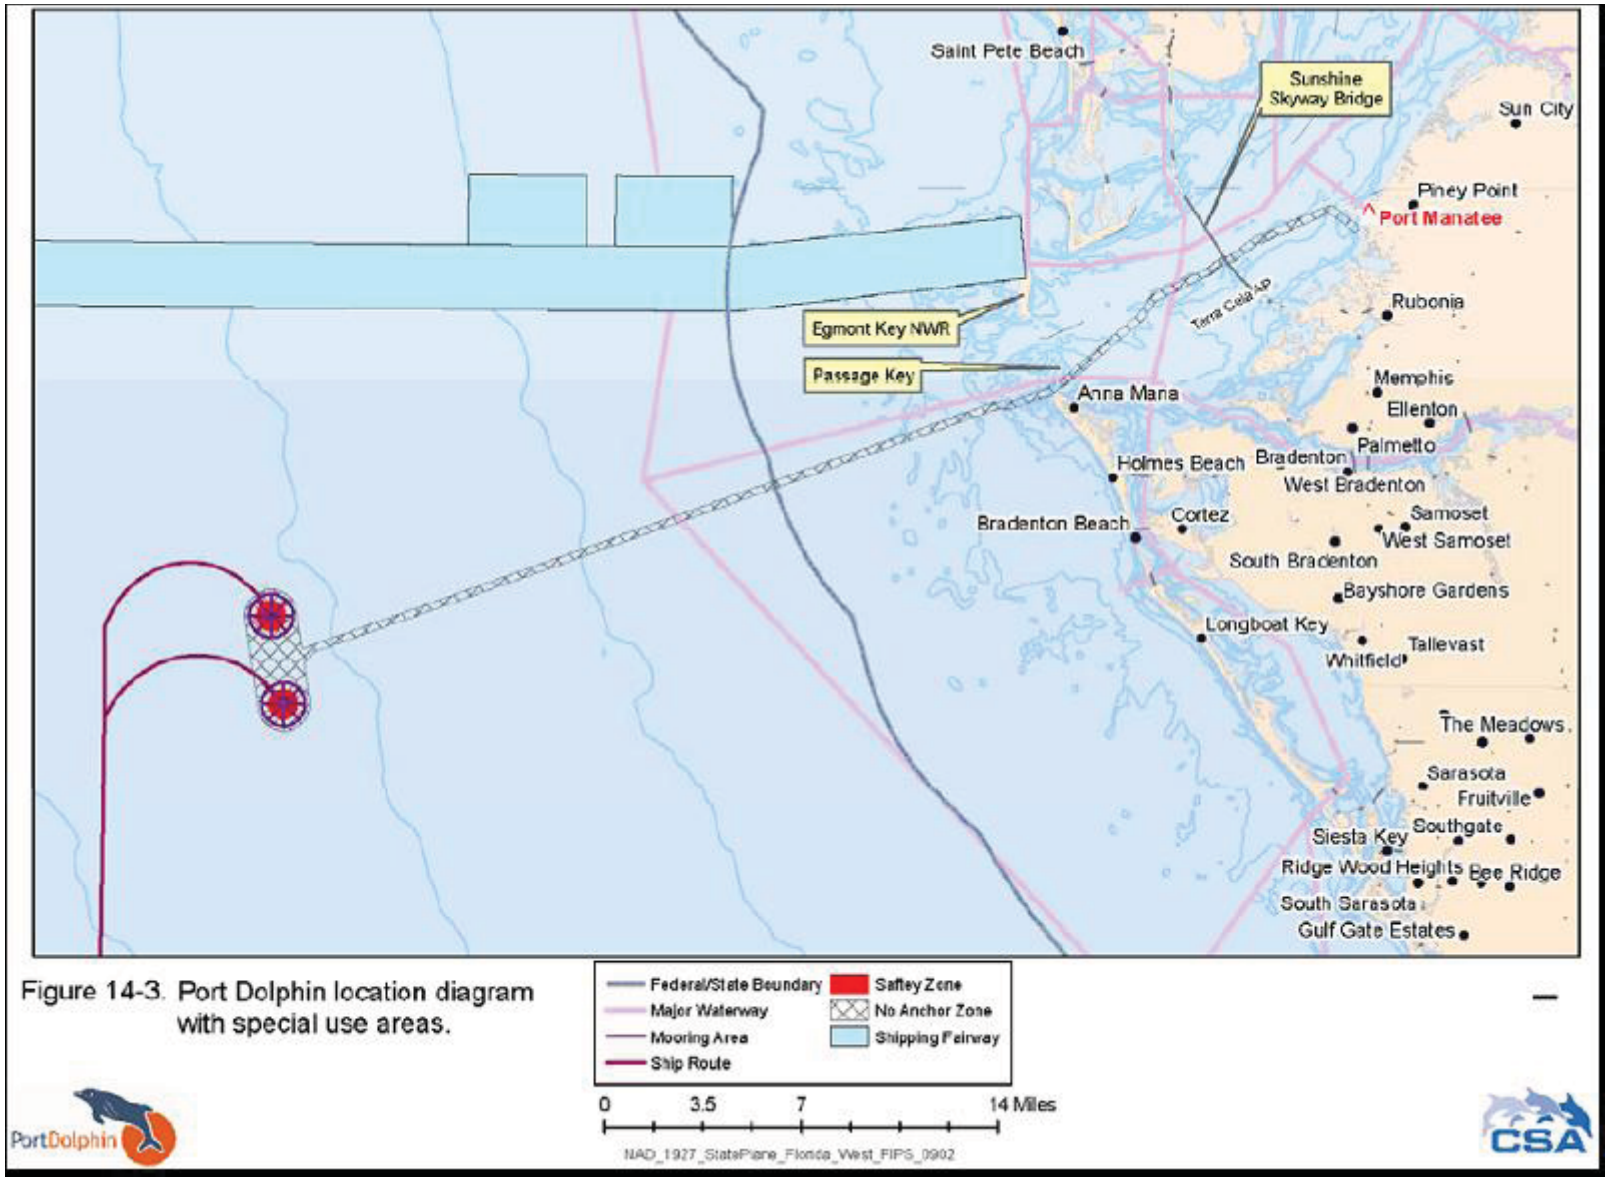
- **Step 1 – DWP Area Characterization**: Section 3 discusses the input data that was collected and reviewed for the risk assessment. The data included a description of the LNG DWP project, specifics on the design of the DWP location, expected size of the SRVs, operating conditions of the offloading, storage and re-gasification operation, and information on the marine traffic in the area of the proposed DWP location.

[10] Barry, Thomas, *Risk-Informed Performance-based Industrial Fire Protection* (Knoxville, TN: Tennessee Valley Publishing, 2002).
[11] Ibid.
[12] Federal Emergency Management Agency, *Handbook of Chemical Hazard Analysis Procedures*, (Washington, DC: FEMA, 1989).

- **Step 2 - HAZID**: The HAZard IDentification (HAZID) is a structured evaluation exercise that was used to identify accidental and intentional releases scenarios for this LNG DWP project. As discussed in Section 4, AcuTech facilitated a team consisting of representatives from USCG, Sandia National Laboratories, and State / Local stakeholders as well as other project stakeholders to identify initiating accidental and intentional events and a qualitative estimate of the potential consequences.
- **Step 3 – Scenario Development**: The development of the list of accidental and intentional scenarios evaluated in this risk assessment is discussed in Section 5. The final list of scenarios was determined by grouping similar cases from the HAZID, as well as screening out cases based on likelihood of occurrence and/or resulting consequence level, to identify the bounding accidental and intentional release scenarios for this project. Step 3 also includes a discussion of the development of the accidental and intentional release sizes. The intentional release sizes were selected based on guidance provided in SAND2008-3153 and guidance provided by Sandia specific to this project.
- **Step 4 – Vessel Frequency Collision Analysis**: Section 6 details the marine vessel traffic analysis and overall statistical likelihood of the occurrence of a vessel collision or allision with an SRV located at the DWP buoy locations.
- **Step 5 – Consequence Analysis**: Section 7 details the assumptions and consequence models that were used to evaluate the release scenarios defined in Step 3. This includes: LNG spill rate, pool evaporation, vapor dispersion, and thermal radiation models that were used in the analysis. A series of screening calculations were performed during this analysis to aid in evaluating the effects of certain parameters on the thermal radiation and vapor dispersion hazard distances. The screening calculations were performed using DEGADIS and a solid flame model, respectively, for the vapor cloud dispersion and the thermal radiation analysis. These models were used solely to identify those parameters that may be likely to have a significant effect on the outcome (or resulting consequence distances) of the release scenarios being evaluated in this risk assessment. Additional Computational Fluid Dynamics (CFD) was used for the actual consequence modeling for vapor dispersion in this risk assessment.
- **Step 6 – Results & Conclusions**: Section 8 combines the inputs and results of the supporting sections to evaluate the risk of this DWP project. This final step includes a discussion of the potential impacts to the public from the LNG DWP project based on the distances to the thermal radiation and flammable vapor dispersion endpoints for the accidental and intentional release scenarios modeled in the risk assessment.

Figure 2-1: DWP IRA Process



3.0 Deepwater Port Area Characterization

This section provides information to characterize and describe the proposed project area off the coast of Tampa, FL. Information in this section is derived from the applicant's materials. Most of the information is summarized from Port Dolphin's DWP license application (Volumes I and II General (Public)).

3.1 Proposed Port Dolphin DWP

The proposed DWP location and pipeline corridor shown in Figure 3-1 is in an area south of the Port of Tampa Safety Fairway that includes the Egmont Channel that runs into Tampa Bay. The pipeline route will provide a direct route to the mouth of the bay. The northernmost buoy location is 9.55 nm (11 miles) from the southernmost edge of the safety fairway; the southernmost buoy is 12.3 nm (14.1 miles) from the southernmost edge of the safety fairway. The pipeline corridor is 42.1 miles to the landing location at Port Manatee. This corridor was sited to avoid mapped wrecks, underwater obstructions, artificial reefs, ocean dredge material disposal sites, and fish havens. Additionally, to avoid impacts to Egmont Key, a National Wildlife Refuge and Florida state park, the pipeline corridor traverses south of Passage Key, another National Wildlife Refuge, to the north of Anna Maria.

Figure 3-1: Project Site Location

3.1.1 Shuttle and Regasification Vessels

Port Dolphin would be capable of mooring Shuttle and Re-gasification Vessels (SRVs). The SRVs are designed to carry liquefied natural gas and also to re-gasify the natural gas prior to off-loading for transport to shore.[13] These vessels would have a capacity range of 145,000 cubic meters (m^3) to 217,000 m^3 of LNG, transported and stored at a temperature of -261º F (-162 º C). Table 3-1 describes the approximate dimensions and capacities of the proposed SRVs that are expected to call on this DWP and, as shown, the SRVs may be of either membrane or Moss design. The maximum carrier dimensions and capacities are the focus of the IRA since the larger SRV designs can carry a greater quantity of LNG, and thus have greater potential consequences if there were an accidental or intentional a release of LNG as part of this project.

Table 3-1: Approximate Dimensions and Capacities of SRVs

Item	Description
SRV 217,000 m^3 SRV with Membrane Tanks	
Hull Type	Double bottom/Double hull
Total LNG Capacity	217,300 m^3
Number and Type of Cargo Tanks	5 Membrane-style tanks
Length Overall	315 m (1,035 ft)
Moulded Breadth	50 m (164 ft)
Design Draft	12 m (19.5 ft)
Laden Displacement (estimated)	143,500 tonnes
Vessel Speed (calm weather)	19.5 Knots (kts)
SRV 215,000 m^3 SRV with Moss Tanks	
Hull Type	Double bottom/Double hull
Total LNG Capacity	217,446 m^3
Number and Type of Cargo Tanks	4 Spherical (Moss)
Length Overall	315 m (1,035 ft)
Moulded Breadth	56 m (184 ft)
Design Draft	12 m (19.5 ft)
Laden Displacement (estimated)	152,000 tonnes
Vessel Speed (calm weather)	19.5 Knots (kts)

The SRVs would be equipped to transport, store, and vaporize liquefied natural gas, as well as meter natural gas exported to shore. The SRVs will be designed with insulated storage tanks for the liquefied natural gas located within its hull. Each tank would be equipped with an in-tank pump to circulate and transfer LNG to the vaporization facilities located on the deck of the SRVs. The vaporization system would have a closed-loop cycle utilizing glycol/water brine as the re-circulating heating medium. This re-circulating medium would heat the liquefied natural gas and the medium itself would be warmed using steam from the SRVs natural gas boilers.

[13] Information taken from the Port Dolphin LLC – Deepwater Port License Application – Volume 1 – Pages 2-3.

3.1.2 SRV Offloading Operation

An SRV would typically moor at the deepwater port for between four and eight days, depending on vessel size and natural gas send-out rate. The two separate buoys would allow natural gas to be delivered in a continuous flow, without interruption, by scheduling an overlap between arriving and departing SRVs. It is anticipated that the DWP would host 50-70 vessels per year (25-35 at each buoy location).

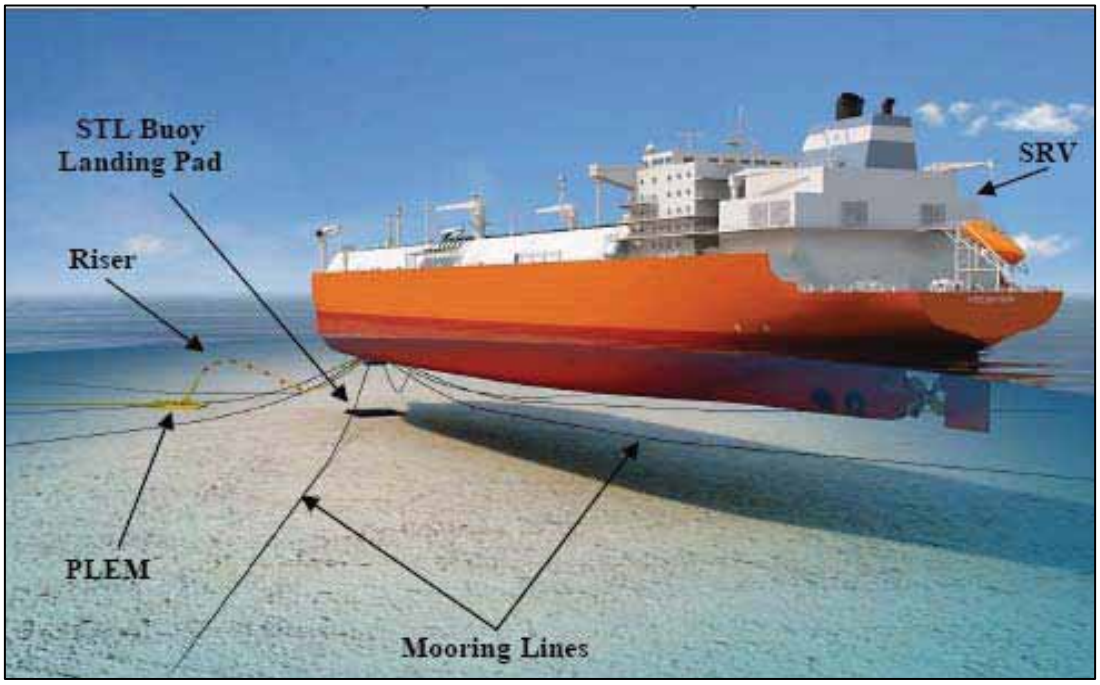
The unloading buoy technology and associated equipment proposed for Port Dolphin is similar to that used in the Gulf Gateway deepwater port and the Northeast Gateway and that which is planned for Neptune and Calypso LNG DWP projects.[14] The technology has also been successfully used in the offloading of oil at several locations overseas including the North Sea.

Each unloading buoy would have eight mooring lines consisting of wire rope and chain. The mooring lines would connect each unloading buoy to eight anchor points most likely consisting of driven piles on the seabed. The unloading buoy is designed by Advanced Production and Loading (APL), and is also commonly known as a Submerged Turret Loading (STL) buoy. See Figure 3-2 for an illustration of the STL system.

When not connected to an SRV, the unloading buoy would be submerged 60-70 feet (18-21 meters) below the sea surface. In this position, the buoy would be held in position by the mooring lines and would be resting on the STL buoy landing pad. A marker buoy and retrieval line would be used to locate and recover the buoy as the SRV arrives at the deepwater port. The unloading buoy would be retrieved from its submerged position by means of a winch and recovery line. It would be hoisted up through a moon-pool in the forward part of the SRV where it would be located in a receiving cone within the hull trunk as shown in Figure 3-3. After the buoy is locked in position, unloading of re-gasified natural gas would begin. The gas would be unloaded through the flexible riser into the pipeline end manifold (PLEM) for transportation to shore via the new subsea pipeline.

[14] Summary information on these other project is available on the MARAD website at http://www.marad.dot.gov/DWP/LNG/deepwater_ports/index.asp

Figure 3-2: DWP – STL Illustration



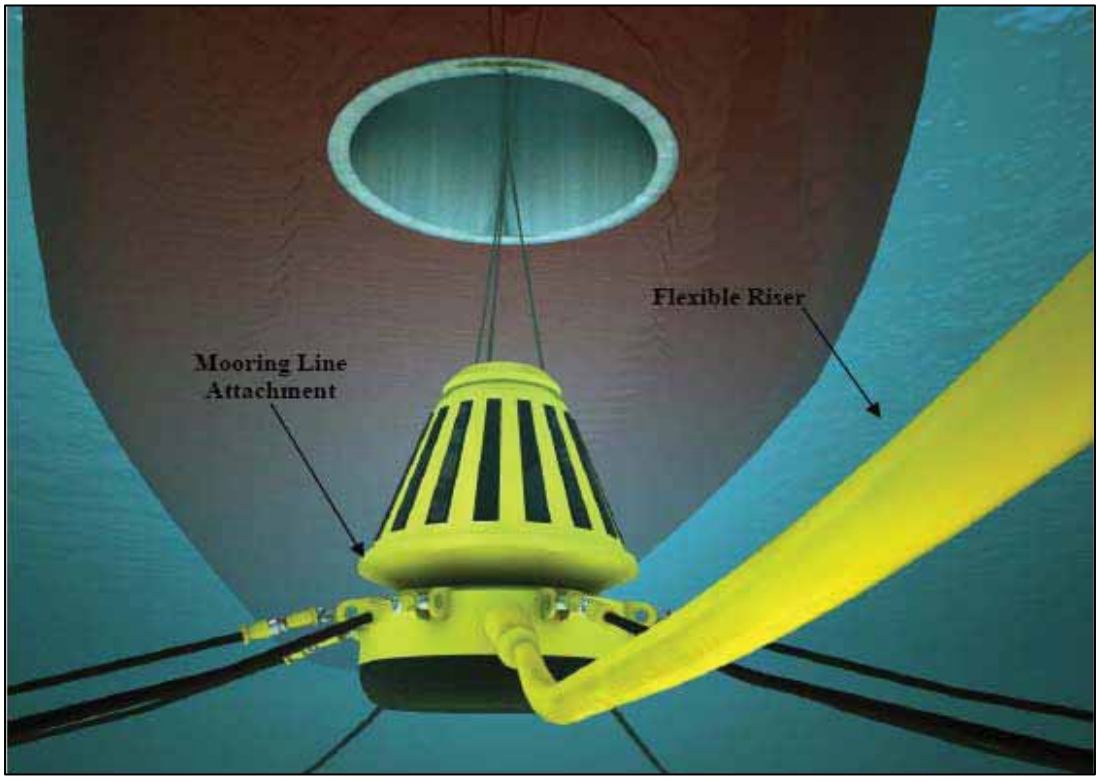


Figure 3-3: Moon Pool – STL Illustration

3.1.3 Additional Project Vessels

Port Dolphin will utilize a support vessel for logistics and delivery of consumables, stores and supplies; to assist in security surveillance of areas around the SRVs and unloading buoys; to provide Class 1 fire fighting capability; to assist in inspection/maintenance of DWP components; to assist in case of emergency evacuation of personnel; and to assist in traffic control and monitoring of the Safety Zone. This vessel is described by the applicant as having a length overall of 130 feet (40 m), a beam of 45 feet (14 m), a draft of 19 feet (6 m), an approximate speed of 8 knots (kts) and a crew of 2 to 3.

Port Dolphin will also utilize a crew boat for transportation of USCG inspectors or other authorities; to conduct transportation missions for up to 12 personnel; to assist in security surveillance of areas around the SRVs and unloading buoys; to assist in case of emergency evacuation of personnel; and to be able to conduct other emergency response missions upon request of the USCG. This vessel is described by the applicant as having a length overall of 75.5 feet (23 m), breadth (extreme) of 19 feet (6 m); and a maximum speed of 22-33 kts.

3.2 Local Population and the Economy

The following subsections highlight demographic and economic indicators for Manatee and Hillsborough Counties as well as information specific to Port Manatee, onshore areas which are closest to the proposed offshore portions of Port Dolphin.

Manatee County is in central Florida along Tampa Bay in the Gulf of Mexico. It covers a total of 741 square miles and has a population density of 356.3 persons per square mile (Census 2000). The most current estimated countywide population of Manatee County is 308,325 people (University of Florida, Bureau of Economic and Business Research 2006). The most populated city in Manatee County is Bradenton, but 74.1% of the countywide population lives in the unincorporated portion of the county. Between 1990 and 2000, Manatee County as a whole had a growth rate of 24.7%, which was slightly greater than the statewide growth rate of 23.5% in those 10 years. According to the Bureau of Economic and Business Research (BEBR) (2004), Manatee County's population is projected to grow steadily and reach an estimated 453,900 by 2030.

Hillsborough County is located in Central Florida along the Gulf of Mexico's coast in Tampa Bay and is part of the Tampa-St. Pete Clearwater Metropolitan Statistical Area. It covers a total of 1,051 square miles with a population density of 950.6 persons per square mile. The most current estimated countywide population of Hillsborough County is 1,164,425 people (University of Florida, Bureau of Economic and Business Research 2006). The most populated city in Hillsborough County is Tampa, but 66.8% of the countywide population lives in the unincorporated portion of the county. Between 1990 and 2000, Hillsborough County had a growth rate of 19.8%, which is slightly less than the statewide average of 23.5% for the same time period. According to BEBR (2004), Hillsborough County's population is projected to grow steadily and reach an estimated 1,653,800 by the year 2030.

3.2.1 Industrial Ports and Shipping

Port Manatee is the closest U.S. deepwater seaport to the Panama Canal and among Florida's largest deepwater ports. It is Fresh Del Monte Produce's second largest U.S. port facility and is the southeast's leading forestry product import facility. Port Manatee has approximately 84 full-time employees and supports an estimated 1,100 on-port employees.[15] A recent economic impact analysis of the port supported by Port Manatee states that the total annual economic impact to the county from the port was $2.3 billion.[16]

The major shipping lane, Egmont Channel, enters Tampa Bay from the eastern Gulf of Mexico and is dredged and maintained out to 6 miles west to a water depth of 43 feet (13 meters). Ships carrying products such as petroleum, coal, lumber, plywood, drywall, liquid and dry bulk, fruits, cement, fertilizer, liquefied sulfur, steel, anhydrous ammonia, citrus concentrate, containerized cargo, and aggregates such as limestone and granite pass in and out of Tampa Bay. Over 3,800 vessels pass through the facilities in the Port of Tampa annually, handling nearly 40 percent of the of the state's total tonnage.

3.2.2 Existing Activities Near the Proposed Project Area

The marine region offshore southwest Florida and within Tampa Bay is an important economic and recreational area that supports maritime transportation and other commercial industries such as commercial fishing and cruise ships. There are also several conservation areas within the larger eastern Gulf of Mexico. Recreational activities such as sailing, fishing, boating, and diving on natural and artificial reefs is another common use within the offshore region.

3.2.3 Commercial Fishing

Commercial fishing is an important industry within the Tampa Bay region, with 2,677 "commercial" vessels[17,18] registered in the counties of Hillsborough, Manatee, and Pinellas. The combined data sets (landings, effort, permits, and licenses) indicate that key fisheries exist for shelf and inshore Tampa Bay waters of the region. For shelf waters of the project area, the key fisheries in order of importance are reef fishes, pink shrimp, coastal pelagic fishes, and stone crab. Reef fishing for red grouper, gag and scamp, generally occurs in water depths ranging from 66 to 394 feet (20 to 120 meters). Pink shrimp are caught in shelf waters using bottom trawls. Primary water depths for pink shrimp are 66 to 197 feet (20 to 60 meters). The Sanibel shrimp grounds (west of Ft. Myers) and the Tortugas grounds (north of Dry Tortugas) are the primary pink shrimping areas in the region. Trawling can only take place on level sandy bottoms as hard bottom or other obstructions will snag and damage nets. Many members of the shrimp fleet are nomadic and only appear during peak seasons then move on to other ports.

---

[15] Port of Manatee website, "Port Facts," accessed February 29, 2008. www.portmanatee.com

[16] Economic Impact Analysis of Port Manatee, Economics Research Associates, Table II-1 April 2003

[17] Florida Department of Highway Safety and Motor Vehicles. Alphabetical Vessel Statistics by County, 2007. http://www.flhsmv.gov/dmv/vslfacts.html#2b

[18] A "commercial vessel" is defined in these statistics as "any vessel primarily engaged in the taking or landing of saltwater fish or saltwater products, freshwater fish or freshwater products from within and without the waters of this state for sale either to the consumer, retail dealer or wholesale dealer; or any vessel engaged in any activity wherein a fee is paid by the user, either directly or indirectly, to the owner, operator or custodian of the vessel."

Tampa is one of the primary ports for shrimpers in the eastern Gulf of Mexico. Coastal pelagic species are caught by gillnetting or purse netting. Both of these activities are banned from state waters and can only occur in federal waters. Pompano, Spanish mackerel, and sharks are the main targets of gillnet fisheries in the region. Spanish sardine, thread herring, and ladyfish are the quarry of purse net fisheries. In the inshore waters of Tampa Bay, the primary fisheries are striped mullet, bait shrimp, and blue crab. Blue crabs are harvested with bottom tending traps throughout the bay.

3.2.4 Recreational Fishing

Recreational and charter boat fishing are important as well. Data presented by the applicant in Volume II, Section 6 of the application materials were obtained from the Marine Recreational Fisheries Statistical Survey (MRFSS) website (NOAA Fisheries 2006) and include estimated numbers of fish caught and trips made by recreational anglers fishing from shore, private/rental boats, and charter boats (data on the types of vessels engaged in recreational fishing is not available). Table 3-2details the average number of recreational trips made including inland areas, ocean waters less than or equal to 10 miles (16 kilometers) from shore, and ocean waters greater than 10 miles (16 kilometers) from shore.

Table 3-2: Average Number of Recreational Trips (2001 - 2005)

Area	Private/Rental	Shore	Charter
Inland	4,442,220	3,590,683	112,782
Ocean <=10 miles	3,121,339	2,935,211	161,100
Ocean >10 miles	1,164,752	--	304,629

Source: NOAA Fisheries and Marine Recreational Fisheries Statistical Survey (MRFSS) 2006.

The following paragraphs focus only on the trips made by recreational anglers greater than 10 miles from shore as that is the area closest to the proposed DWP site.

Species ranking highest in estimated total catches for charter vessels operating in oceanic waters greater than 10 miles (16 kilometers) from shore off west Florida during 1995 to 2005 included red snapper, *Mycteroperca* (e.g., gag and scamp) groupers, *Epinephelus* (e.g., red grouper, snowy grouper, goliath grouper) groupers, white grunt, vermilion snapper, triggerfishes/filefishes, and yellowtail snapper, and all reef species. Species most commonly caught by private/rental vessels in ocean waters greater than 10 miles (16 kilometers) offshore of west Florida were *Mycteroperca* groupers, *Epinephelus* groupers, black sea bass, herrings, pinfishes, and white grunt.

Charter vessels accounted for the fewest average trips per year; however, charter vessels spend most of their time in waters greater than 10 miles (16 kilometers) from shore.

Although the MRFSS data represented the entire coast of west Florida and not the specific project area, it appears that most of the general patterns and trends in the data should broadly reflect the situation in the project area. General patterns that emerged from the applicant's

analysis of the west Florida shelf as a whole noted that offshore fishers target reef fish and, to a lesser extent, coastal pelagic species. Species caught by charter vessels were mostly reef fish (snappers and groupers). Charter vessels contributed fewer overall trips as most trips went greater than 10 miles (16 kilometers) offshore; the private/rental vessels accounted for many more trips, but fished mostly in inland or coastal waters. Most trips were made by anglers fishing from shore either inland or along the Gulf beaches.

3.2.5 Recreational Boating and Water-Based Tourism

Recreational activities near the project area are primarily water-based, consisting of pleasure boating, surfing, diving, fishing, sailing, beach-going, dolphin-watching, and windsurfing. Other tourism-related activities include gambling cruises, dinner cruises, sight seeing, nature-viewing, picnicking and camping on islands, and parasailing.

Over 123,000 vessels were registered in Manatee, Hillsborough, and Pinellas counties in 2005, departing from private docks, boat ramps, and the many marinas throughout the region. Year-round favorable weather conditions allow for boaters to participate in various activities throughout the year with no strong seasonal fluctuations. Most recreational boating is focused around fishing, cruising, and nature viewing. Vessel types include various sized power boats, sailboats, kayaks, and fishing boats. Frequent destinations within the Tampa Bay region are Egmont Key, Terra Ceia Bay, and the Sunshine Skyway Bridge. Boaters' use patterns within the bay, and offshore center around the intended activity; diving trips tend to travel farther into the Gulf of Mexico to reach their destination whereas nature viewers remain closer to islands and the coastal area.

A large tourism-based economy supports a charter boat industry. Within the Tampa Bay region, numerous charter companies and private captains offer individual or group experiences in fishing, diving and snorkeling, cruising, gambling, dolphin-watching, harbor touring, kayaking, nature-viewing, and birdwatching. Chartered trips typically last from half a day up to one week and are offered year round. Of the 123,673 registered vessels in the region, 2,865 are considered commercial and include charter vessels and commercial fishing vessels. As noted previously, charter vessels engaged in fishing are the charter vessels most likely to travel greater than 10 miles from shore.

The Port of Tampa is currently the largest cruise ship port among Florida ports with over 770,000 cruise ship embarkments and disembarkments were reported in fiscal year 2004-2005.

3.3 Marine Traffic Management

Marine traffic in Tampa Bay is governed by several mechanisms. A safety fairway has been established in which no artificial island or fixed structure, whether temporary or permanent, is permitted. This vessel safety fairway is depicted on the project location chart (Figure 3-1) as the light blue rectangular area north of the proposed project site. As noted above, the northernmost buoy planned for the Port Dolphin project is 9.5 nm from the edge of the safety fairway. The USCG has recently begun activation of a Vessel Traffic Service for Tampa Bay which is

intended for the waters east of the Sunshine Skyway Bridge. Port Dolphin vessels and buoys are located far west of this area in deep water.

Once the SRV is moored at the buoy, 33 CFR 150 allows for the establishment of safety zones, no anchoring areas (NAA), and areas to be avoided (ATBA).

3.3.1 Safety Zone

Pursuant to the regulations of the DWPA, USCG is authorized to establish a safety zone, whether a vessel is present or not, to promote the safety of life and property on the facilities, their appurtenances and attending vessels, and the adjacent waters within the safety zone. The safety zone extends 500 meters in all directions around the vessel from the stern of the vessel as the vessel weathervanes on the STL, approximately 850 m from the center of each buoy. All unauthorized vessels would be prohibited from anchoring or transiting the proposed safety zone.

3.3.2 No Anchoring Area (NAA)

The extent of the NAA is proposed to avoid entanglement by any vessel's anchors and the mooring lines and anchors for the STL buoys and the pipeline. The NAA for the buoy site is proposed to be an area defined by the outer bounds of each STL buoy anchor system, with a radius of 4,925 ft (1500 m). Additionally, an area between the buoys extending 4,925 ft (1500 m) to both sides of a straight line between the buoys would be part of the NAA.

3.3.3 Area to Be Avoided (ATBA)

The ATBA proposed by the Applicant is to have the same shape as for the NAA for the buoy site. This ATBA would help to ensure that other vessels do not interfere with the DWP operations, including maneuvering of LNG carriers and support vessels. The actual size of the ATBA would be determined through advice and consent of the USCG Navigation and Standards Branch with input from the Captain of the Port. Upon its approval from IMO, the ATBA would appear on subsequent editions of nautical charts. The ATBA is recommendatory and is meant to discourage vessel traffic in the area. Vessels entering the ATBA are advised to maintain a speed of 10 kts or less.

3.4 Marine Traffic Data

The following issues related to marine traffic in the project area were considered and examined in this risk assessment as they constitute a possible impact to the public in or near the project area:

- Potential increased vessel traffic (traffic associated with the proposed DWP in the area surrounding the Port of Tampa)
- Potential impact of safety zones and areas to be avoided by vessel traffic around the Port Dolphin DWP
- Potential interference with use and access to current fishing areas and other mariners and vessels transiting areas around the DWP

- Potential for collision between ships entering or departing Port of Tampa with the SRVs calling at the proposed DWP location

3.4.1 Commercial Shipping Traffic

There is currently very little precise data regarding vessel traffic within the area where the proposed Port Dolphin project is planned partly due to the substantial distance offshore. The USCG has only recently begun collecting such data.

Automatic Identification System (AIS) data was obtained by the USCG R&D Center for vessel movements in and out of the Port of Tampa, and vessels transiting near the Port Dolphin proposed project location. This data confirms that the majority of vessel traffic bound for the Port of Tampa area stays within the safety fairway, north of the proposed DWP. The types of vessel identified in the AIS dataset included:

- Passenger Vessels
- Cargo Ships
- Tankers
- Fishing, Towing, Dredging, Military and Sailing Vessels
- Pilot Boats, Tugs and Port Tenders
- Other Vessels (including unknown)

AIS data was only available from August to December 2007, but has been extrapolated to an annual number of 2,543 vessel movements for these vessel types. Due to a lack of data, the extrapolation does not account for seasonal or any other variations in traffic. The extrapolated movements for each vessel type are detailed in Table 3-3.

Table 3-3: Annual Shipping Movements – 2007 AIS Data

VESSEL TYPE	NUMBER OF VESSEL MOVEMENTS (EXTRAPOLATED)
Passenger	65
Cargo	895
Tanker	379
Fishing, Towing, Dredging, Military and Sailing	430
Pilot Boats, Tugs and Port Tenders	395
Other Vessels (including unknown)	379
TOTAL	**2,543**

In addition to vessel types and counts, the AIS data also included:

- Displacement
- Speed
- Kinetic Energy

This AIS data set was used to determine the bounding vessel collision breach size for the SRV and was used as input to the vessel collision frequency analysis. In these analyses, the number of vessels has been limited to those with sufficient size (displacement) and speed to potentially breach the inner hull of a SRV in a vessel collision, resulting in a release of LNG.

Table 3-4 details the range of displacement, average speed, and absorbed energy for the subset of vessels identified from the AIS data with the potential to breach the inner hull of a SRV.

Table 3-4: Vessel Type Impact Energy

Vessel Type	Displacement (tonnes)	Average Cruising Speed (knots)	Kinetic Energy (N-m)
Passenger	4,000 – 55,400	19	$2.1 \times 10^8 – 3.5 \times 10^9$
Cargo	3,300– 128,000	23	$2.5 \times 10^8 – 9.8 \times 10^9$
Tanker	8,400 – 200,000	21	$5.4 \times 10^8 – 1.3 \times 10^{10}$

In addition to the extrapolated AIS dataset that does not account for seasonal or any other variations in traffic, some of the vessel records in this dataset had reported speeds that were not representative of a typical cruising speed in the area where the DWP is to be located. Therefore, an average vessel speed was estimated for each of the vessel types using the AIS records where a typical cruising speed was reported. The average vessel speed for each vessel type is shown in Table 3-4.

This vessel data has been applied in the breach size calculations in this Section 5, as well as the vessel collision frequency analysis in Section 6.

4.0 Hazard Identification (HAZID) Study

The HAZID was a comprehensive review of the applicant's proposed DWP operation, including operation of the Shuttle & Regasification Vessels (SRV) and offloading at the buoys. The purpose of the HAZID is to develop and review credible accidental and intentional events (scenarios) that could potentially impact the public, and that will be analyzed throughout the IRA process. The list of accidental and intentional scenarios considered in this IRA is detailed in Section 5.

The HAZID workshop was conducted on August 1 - 2, 2007, at the U.S. Coast Guard Sector, St. Petersburg, Prevention Office in Tampa, FL. The meeting was facilitated by AcuTech, and the HAZID team included representatives from USCG Sector, USCG CG-5225, Sandia National Laboratories, and representatives from Port of Tampa area stakeholders groups and agencies listed in Table 4-1.

The first day of the HAZID workshop included the applicant's overview presentation of the proposed Port Dolphin project to the HAZID team, allowing for questions to familiarize the group with the DWP project. This presentation from Port Dolphin LLC included an overall project familiarization including the re-gasification and transfer process, ship traffic data, meteorological conditions, and information on the SRVs. Following the presentation, the applicant was excused and the HAZID team utilized the remaining time to evaluate the potential events for the DWP operation.

4.1 HAZID Process

The HAZID process was intended to identify the worst credible accidental and intentional scenarios for the Port Dolphin DWP project that could lead to impacts on the public. Therefore, the emphasis of the HAZID was on the identification of events that could lead to a release of LNG and potentially impact populations including those onshore, and on private or commercial ships (those not associated with the project) in the vicinity.

Credible scenarios as defined in the HAZID process do not necessarily represent scenarios that are high risk – credible scenarios are the possible intentional and accidental scenarios identified through a multidisciplinary team evaluation of the project. The scenarios are identified regardless of likelihood for bounding or establishing the worst credible consequences of concern.

As a minimum baseline, the following scenarios were discussed and evaluated to determine their suitability for further analysis:

- Marine collision and/or allision that results in penetration of LNG cargo containment
- Major accidental LNG spills or cargo piping ruptures
- Spills in confined space
- Major cascading events leading to compromise of LNG cargo containment

The IRA focused solely on the specific maximum potential impacts to the public associated with offshore storage and regasification of LNG at the proposed DWP; therefore, processes beyond the Pipeline End Manifold (PLEM) and pipeline failures were not considered as part of the HAZID.

4.2 HAZID Scope

The Port Dolphin HAZID Workshop participants analyzed the following operational segments:

- SRV in Transit to DWP
- DWP
    - Mooring System
    - One and Two SRVs at DWP
- Transfer System
- Re-gasification Skids on SRV
- STL Buoy System
    - Flexible Riser to PLEM
    - PLEM
    - PLEM to pipeline

5.0 Scenario Development

Following the HAZID, the identified scenarios were further reviewed and a subset was selected for further development in the risk assessment. A copy of the HAZID results was submitted to the USCG, but is not appended here as it contains information pertaining to intentional acts, which has a homeland security concern. While the full set of details from the HAZID is not presented, the key findings have been carried through this section.

A subset, as opposed to a full range of accidental and intentional scenarios, was analyzed in this risk assessment since the purpose of this analysis is to identify the results of the bounding credible worst-case release scenarios. The process that the USCG requires for the evaluation of a LNG DWP project application is comprised of two phases: Phase I, which is the IRA, evaluates the worst credible accidental and intentional scenarios; Phase II evaluates the full range of all possible releases to develop the safety and security strategy for the security and operations manuals. This section discusses all of the scenarios identified during the HAZID process and presents information and analysis used to screen-out cases which were deemed not to be the bounding cases.

In addition to discussing the method that was used to select the final accidental and intentional release scenarios, this section also details the resulting consequences that were modeled (i.e., breach sizes). For the release scenarios included in the risk assessment, this is defined as an expected breach size in the inner hull of a SRV, a release from process equipment, or any other locations or scenario where LNG could be potentially released.

Section 7 details the analysis of the consequences and the resulting thermal radiation hazard distances and flammable vapor cloud dispersion results from the intentional and accidental scenarios.

5.1 Accidental Scenario Development

The HAZID identified eleven potential accidental release scenarios that have the potential to result in a release of LNG. These accidental scenarios included:

- Scenario 1 – Vessel Collision / Allision
- Scenario 2 - Shipboard Mechanical System Failure
- Scenario 3 - Fire
- Scenario 4 - LNG Release at Process Equipment
- Scenario 5 - Severe Weather
- Scenario 6 -Structural Failure of LNG SRV
- Scenario 7 - Grounding
- Scenario 8 - Natural Phenomena
- Scenario 9 -Mooring System Failure

- Scenario 10 - Dropped Objects
- Scenario 11 - Aviation Accident

The accidental scenarios were discussed and reviewed with the HAZID participants and evaluated based on scenario significance. Based on that review, Scenario 1 – Vessel Collision / Allision was identified as the scenario with the greatest potential of significant LNG release.

5.1.1 Marine Release

During the past 45 years, there have been approximately 100,000 LNG carrier voyages,[19] covering more than 235 million miles.[20] There is no report of any accident involving a LNG carrier underway that has resulted in an unintentional release of LNG cargo. This covers export locations (e.g., Alaska, Algeria, Trinidad, Indonesia) and various import locations (e.g., Boston, Lake Charles, Savannah, and several locations in Japan and Korea). Many of these locations are in ports and environments more busy and complex than that of the proposed Port Dolphin DWP and present greater potential for collisions, allisions, and groundings than this location. It would be inaccurate to state that there have been no marine mishaps involving LNG carriers. Over the life of the industry, sixteen cargo transfer incidents worldwide have resulted in limited LNG spills with some damage, but no cargo fires have occurred.[21] In addition to these cargo transfer incidents, there have been collisions, groundings, loss of vessel propulsion, cargo tank leaks, vent riser fires, insulation fires, and other miscellaneous incidents involving LNG carriers, but none of these incidents have resulted in a release of LNG to the environment.

The maritime scenarios identified in the HAZID include collision/allision, mechanical failure, groundings, and other accidental and intentional acts. Even though historically there are no reported marine accidents that have resulted in a breach of containment, the vessel speeds and sizes that traverse the open waters and the vessel safety fairway near the Port Dolphin DWP location have the potential to significantly damage an SRV, if a collision were to occur.

The expected breach size on the inner hull of an SRV from a vessel collision scenario is presented in Section 5.3. Marine collision is also presented in Section 6 as part of the collision analysis to determine the frequency of a vessel collision with the SRV that could result in a breach of containment and loss of LNG to the environment.

The buoys for the Port Dolphin DWP project are located more than 28 miles away from any landmass or shallow water, reducing the chance of a grounding event. Therefore, the

[19] A "voyage" is defined as both the loaded and unloaded LNG carrier movement between the loading port and discharge port.
[20] Data compiled from SIGGTO 1976-2000 and International Group of Liquefied Natural Gas Importers, *The LNG Industry* (Clichy, France: International Group of Liquefied Natural Gas Importers, 2002-2006).
[21] USCG DWP Standards Division maintains LNG accident/incident data. This data will be included as an Appendix to the DEIS/FEIS.

grounding of an SRV in transit to and from the buoy has not been evaluated as a bounding scenario and screened-out for further consideration.

5.1.2 Process Release

In addition to the release of LNG associated with a possible collision/allision, several other types of scenarios are possible with the LNG carriers associated with the Port Dolphin project. Since an SRV has significant top-side processing equipment for the re-gasification of LNG and the distribution of natural gas to the subsea pipeline, there is a potential for process-related releases. These scenarios involve equipment failures, human errors, or external events (weather-related events are addressed separately) that can result in a release of LNG or natural gas leading to fires, explosions, or other serious shipboard events. Similar consequences could also be initiated intentionally via onboard sabotage.

The Applicant proposes that all project elements will integrate safety systems and equipment during all phases of the project. These systems and equipment include: hazard detection, emergency shutdown, spill containment, fire protection, flooding control, crew escape and safety shelters, and all other safe guarding systems as may be required by federal and international regulations and standards.

The Applicant states that the integrity of the re-gasification equipment, LNG storage, STL buoys, and pipeline systems will be assured through a formal and documented set of operational procedures, inspections, personnel training, as well as a quality assurance audit and maintenance program. All vessels, pumps, storage tanks, instruments, piping and environmental control equipment are to be inspected and maintained to high standards which will be specified in the final design of the Port Dolphin systems and equipment. All maintenance operations will be performed under strict guidelines designed to minimize risk of releases and to ensure the safety of people and systems.

In addition to the inherent designs and high standards for operational practice, the public, contractors, Port Dolphin personnel, the SRVs and the DWP offshore and onshore systems will be protected by comprehensive emergency shutdown systems. Emergency shutdown comprises multiple levels of action from an individual piece of equipment, to shutdown of a system or multiple systems in an area, to an overall facility or project shutdown. The Applicant states that these shutdown systems will be high-integrity, proven technology, and will be redundant systems that can initiate a range of shutdown actions depending upon the cause and nature of the event(s) that produced the emergency condition.

The applicant further states that the safe transfer of natural gas from the SRV will be ensured by a series of sensors that provide feedback to the operator panel and that can automatically shutdown gas transfer. Additionally, there are a series of emergency shutdown valves that will also interrupt gas transfer in the event of an unsafe condition along with emergency buoy disconnect procedures for interrupting gas flow as well.

These systems and associated procedures are summarized below and comprise the principal means for dealing with the unsafe discharge of natural gas.

There are three shutdown levels governing the transfer of natural gas from the SRV to the STL Buoy:

- Automatic Shutdown (ASD)
- Emergency Shutdown (ESD)
- Emergency Buoy Disconnect (EBD)

The safety related equipment and functions associated with these shutdown levels are described as follows.

Emergency Shutdown (ESD)

ESD is controlled by automatic or manually activated systems:

- Automatic shutdown through the fire and gas detection or other systems on the SRV requiring a total shutdown of gas export
- Manual shutdown through ESD buttons positioned at strategic locations

Automatic or manual operation activates closed all of the three ESD valves (ESDV) which are located:

- ESDV1 – ESD valve mounted on main deck upstream of the STL Buoy system
- ESDV2 -- ESD valve mounted in the STL Buoy
- ESDV3 – ESD valve mounted subsea in the PLEM

The ESD valves are operated by spring return, hydraulically powered actuators with a fail-safe spring return to the closed position. The hydraulic power for operation of the valves is supplied from the STL valve control system. The signal for indicating the open or closed position of the valves will be sent to the vessel control system.

Emergency Buoy Disconnect (EBD)

EBD can only be activated manually through the EBD button located on the STL operator panel on the SRVs navigation bridge. EBD involves a shutdown of the gas export operation followed by an automatic disconnection of the STL Buoy. The EBD is initiated through push-button activation in two steps. Step one disconnects the STL gas transfer system while step two releases the STL Buoy. Total time required for the vessel to complete an emergency STL buoy disconnect operation is estimated to be approximately 15 minutes.

Regulatory Vessel Design Requirements[22]

The SRVs are designed to be built to comply with the following rules, regulations, and requirements:

- Maritime regulations of the registered country
- International Convention for the Safety of Life at Sea (SOLAS), 1974 with Protocol of 1978, and the amendments up to 2003
- International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (IGC Code)
- International Convention on Load Lines, 1966 with the Protocol of 1988
- International Convention for Preventing Collisions at Sea, 1972 including amendments of 1981, 1987, 1989 and 1993
- International Tele-Communications Union (ITU) Radio Regulations, 1982
- International Convention for the Prevention of Pollution from Ships (MARPOL), 1973 (Annexes I, IV, V and VI (Regulation 12,13, 14 and 16)) with Protocol of 1978 and up to the latest amendments
- MEPC 53/24/Add.2 Proposed Amendments to the Revised MARPOL Annex I
- (Addition of new regulation 13A on oil fuel tank protection) International Convention on Tonnage Measurement of Ships, 1969
- International Labour Conference concerning Crew Accommodation On Board Ship, Convention No. 92 and 133 (except swimming pool)
- ILO Codes of Practice, Safety and Health in Dock Work
- International Electro-Technical Commission (IEC) Publication No. 60092 and International Electro-Technical Commission (IEC) Publication No. 60533 "Electrical and Electronic Installations in Ships-Electromagnetic Compatibility"
- Suez Canal Navigation Regulations and Tonnage Measurement of Ships
- International Convention on Standards of Training, Certification and Watchkeeping (STCW), 1993 and later amendments
- IMO Resolution A.468 (XII) "Code on Noise Levels On Board Ships", 1981
- IMO Resolution MSC137 (76) "Standards for Ship Maneuverability"
- IMO Resolution A.330 (IX) "Amendment to the Recommendation on Safe Access to and Working in Large Tanks to Include Large Water Ballast Tanks"
- IMO Resolution A601(15) Provision and Display of Maneuvering Information On Board Ships
- IMO Publication No. 978 - Performance Standard for Navigational Equipment
- U.S. Coast Guard's Regulations for Foreign Flag Vessels Operating in Navigable Waters of the United States (except Alaskan waters, without Certificate or Inspection)
- 33 CFR Part 155: Oil Pollution Prevention Regulations for Vessels
- 33 CFR Part 156: Oil and Hazardous Material Transfer Operations
- 33 CFR Part 159: Marine Sanitation Devices
- 33 CFR Part 164: Navigation Safety Regulation

[22] Port Dolphin DWP Application – Volume II, Section 11, Pgs 8-10

In addition, the SRVs may be subject to the following recommendations and guidelines, as applicable:

- ISO 6954-2000: "Mechanical Vibration - Guideline for the Measurement, Reporting and Evaluation of Vibration with Regard to Habitability on Passenger and merchant ships"
- ISO 8309-1991: Refrigeration Light Hydrocarbon Fluids. Measurements of Liquid Levels in Tanks Containing Liquefied Gases Electric Capacitance Gauges
- U.S. Department of Labor Safety and Health Regulations for Longshoring
- Oil Companies International Marine Forum (OCIMF) “Recommendations on
- Equipment for the Towing of Disabled Tankers,” 1981
- OCIMF “Mooring Equipment Guidelines,” 1997
- OCIMF “Ship to Ship Transfer Guide (Liquefied Gases),” 1995
- OCIMF “Recommendations for Manifolds for Refrigerated Liquefied Natural Gas Carriers (LNG),” 1994
- Society of International Gas Tanker and Terminal Operators (SIGTTO) “Recommendations and Guidelines for Linked Ship/Shore Emergency Shutdown of Liquefied Gas Cargo Transfer,” 1997
- SIGTTO “Recommendations for the Installation of Cargo Strainers on LNG Carriers,” 1992
- International Chamber of Shipping (ICS) Guide to Helicopter / Ship Operations
- International Electro-Technical Commission (IEC) Publication 92
- ISO 4406: Hydraulic System Flushing
- VDI 2056 Criteria for Assessment of Mechanical Vibrations in Machines
- IMO Resolution A343(ix) Recommendation on Method of Measuring Noise Levels at Listening Posts
- ISO 8501-1, 1988 (Preparation of Steel Substrates before Application of Paints etc)

The Applicant will be required to comply with applicable codes and standards for the SRV safety systems and equipment onboard the vessel. These systems and equipment include: detection, emergency shutdown, spill containment, fire protection, flooding control, crew escape and safety shelters, and all other such equipment as required by applicable federal and international regulations and standards.

Like all LNG carriers, the SRVs (membrane and Moss design) will be double-hulled, with the interspaces continuously monitored for leaks. The ships will have cargo surveillance and electronic guidance equipment to ensure the integrity of the LNG cargo.

The SRVs will be designed and built under the survey of a selected Recognized Classification Society’s (RCS) Rules and IMO Regulations in force at the date of the design contract signing, with the objective of obtaining an IMO Certificate of Fitness.

SRVs are designed to carry cryogenic gases and follow stringent International Maritime Organization (IMO) regulations that govern their construction and operation. IMO is an independent organization that provides specific rules for the construction standards for LNG carriers, including safety equipment, marine pollution prevention, operational procedures, and crew training. The IMO conventions, codes, and resolutions that Port Dolphin will follow address the minimum acceptable requirements for such a vessel according to International and U.S. Regulations.

International Labor Organization (ILO)

- ILO Conventions Concerning Crew Accommodation on Board Ships (No. 92&133)

- IMO Resolution A751 (18) "Interim Standards for Ship Maneuverability"

Compliance with these regulations minimizes the likelihood of an accidental LNG release at the proposed DWP project. Additionally, these safety features would also mitigate any release, regardless of cause. The safety features of the SRV for this project are summarized below:

- **Double-Hull Construction**. The IMO/IGC requires LNG carriers to be constructed with an outer and inner hull to provide protection against collisions or groundings and resultant cargo loss. These hulls would be separated from each other by structural members and separated from the cargo by the membrane system. Thus, a collision, grounding, or other impact would need to penetrate up to four layers to result in cargo spillage.

- **Separation of Cargo Holds and Piping Systems**. The IGC requires the structural separation of cargo holds from other spaces as well as separation of cargo piping from other piping systems. This helps keep cargo leaks away from potential ignition sources and keeps cargo from inadvertently being pumped through the wrong pipes.

- **Accessibility for Inspection Access**. The IGC requires that a tank be constructed so that at least one side is visible and accessible to inspectors. This allows proper periodic inspection of the tank for integrity and signs of corrosion or stress.

- **Leak Detectors in Hold Spaces**. The IGC requires that gas detectors and low temperature sensors be placed in a cargo hold in order to detect cargo leakage. An alarm sounds if either is detected and appropriate precautions and mitigation repairs can be made.

- **Tank Requirements for Cargo Containment**. The IGC requires that a tank be constructed with materials that can withstand the temperatures involved so as to properly contain the cargo and have adequate relief valve systems to avoid over pressurization.

- **Structural Analysis**. The IGC requires structural analysis of the cargo containment system and specifies individual tank stress limitations.

- **Secondary Containment and Thermal Management**. The IGC requires partial secondary containment to contain leaks and prevent contact of cryogenic liquid with the inner hull. This prevents thermal stress. In addition, insulation in conjunction with a primary and backup heating system must be installed that would keep the cargo from exceeding the thermal limitations of the material selected for the inner hull if the leak prevention system should fail.

- **Tank Construction and Testing Requirements**. The IGC addresses standards for workmanship, quality, and testing of tanks under construction. Before cargo is pumped aboard, each tank on the LNG carriers would have had its welds nondestructively tested and a pressure test would have been performed to ensure integrity.

- **Isolation, Construction and Testing Requirements for Piping and Pressure Vessels**. The IGC specifies piping thickness, leak testing, pressure testing, isolation requirements, welding requirements, and many other aspects of pressure vessel and piping design and construction. This ensures the integrity of these systems before any cargo is brought aboard.

- **Emergency Shutdown Valves and Shutdown Systems**. The IGC requires remote-control shutdown systems for shutting down cargo and vapor transfer in an emergency. This system must have the ability to be activated from at least two locations on board the LNG carrier and would also be automatically activated in the event of a cargo fire.

- **Pressure Venting Systems**. The IGC specifies that appropriate venting of the cargo be installed to keep the cargo under the design pressure of the tank and keep relief valves from needing to operate

- **Vacuum Protection Systems**. The IGC requires the installation of relief valves that would prevent under-pressurization of cargo tanks in the event that cargo was pumped out without adequately providing for vapor return. The LNG carrier would have sufficient vapor return capacity to keep the pressures at appropriate levels; however, this system would prevent under-pressurization if this system should fail to be actuated or fail to work properly.

- **Fire Protection Systems**. The IGC requires that LNG carriers have a saltwater fire-main system for fighting fires throughout the ship and fixed dry chemical and carbon dioxide systems for cargo areas and compressor rooms, respectively.

- **Water-spray System.** The IGC requires that ships carrying flammable or toxic products or both install a water-spray system for cooling, fire prevention and crew protection to cover exposed cargo tank domes and any exposed parts of cargo

tanks; exposed on-deck storage vessels for flammable or toxic products; cargo liquid and vapor discharge and loading manifolds and other areas where control valves are situated; boundaries of superstructures and deckhouses that are normally manned, and other high fire risk items and cargo control rooms.

- **Cargo Tank Instrumentation**. The IGC requires that each cargo tank be outfitted with an integrated instrumentation/alarm system that notifies the crew of possible leaks via gas detection and temperature sensors and tank liquid levels, temperatures, and pressures. These systems, as well as the pressure relief systems mentioned above, provide a many-layered protection against cargo release either through equipment malfunction or human error.

- **Additional Gas Detection Systems**. The IGC requires gas detection systems and alarms in spaces where cargo is located, including compressor spaces, spaces where fuel gas is located, and other spaces likely to contain gasified cargo. Venting systems for certain spaces and portable gas detectors are also required.

- **Automatic Safety Shutdown Systems**. The IGC requires that cargo loading areas and docks be equipped with LNG vapor and fire detection systems that automatically shut down the transfer systems in the event of a leak or fire. Personnel on the loading dock or the LNG carrier can also manually operate these shutdowns.

The technical requirements for vessels to carry LNG in U.S. waters are set forth in 46 CFR 154. The requirements delineated in 46 CFR 154 are similar, but not identical, to those of the IMO IGC Code for new built LNG carriers.

In addition to carrying a valid IMO Certificate of Fitness, and complying with the specific U.S. requirements for LNG carriers, foreign-registered LNG carriers operating in U.S. waters must also comply with the following U.S. regulations:

- Pollution prevention regulations (33 CFR Parts 151, 155-157 and 159)
- Navigation safety regulations (33 CFR Part 164)
- Repair regulations (46 CFR Part 35.01-1)

Foreign registered tank vessels must further comply with:

- Cargo venting and handling system requirements (46 CFR Part 35.30 and 35.35)
- Inert gas systems (46 CFR Part 32.53)
- Fire fighting foam systems (46 CFR Part 34-05-5(a)(2))
- Vapor control systems (46 CFR Part 39)

The process-related scenarios identified in the HAZID have not been further analyzed in this study. These scenarios were determined to have smaller potential release sizes (potential breach size, inventory available for release, and duration of release) and a lower potential to escalate (due to the safety and emergency shutdown systems) as compared to other accidental

and intentional scenarios for which a detailed examination of the consequences has been performed. The lower likelihood for catastrophic accidental events is based on the codes, regulations, requirements, and additional spill controls to which Port Dolphin has committed for the LNG carriers, the safety record of the LNG industry (both onshore and transportation), and the associated safety features onboard an SRV. Therefore, while process releases are credible scenarios, they do not represent the bounding consequence for the range of accidental scenarios identified in the HAZID and have not been included in the IRA as a worst case consequence.

5.1.3 Weather-Related Release

Scenario 5 from the HAZID included severe weather at any point along the SRV transit and at the DWP. Due to the relatively predictable and mild climate in and around the Port of Tampa, combined with the robust ship and equipment design, procedures to predict adverse weather conditions, and the ability to disconnect from the buoy should severe weather develop suddenly during transfer operations,[23] significant damage to an SRV or the DWP due to severe weather is considered unlikely.

5.1.3.1 Weather of Tampa Bay Area

The weather in the Tampa Bay area is relatively predictable and mild. The prevailing winds in the region come from the east. Wind speed is less than 15.0 knots (7.74 meters/second [m/s]) approximately 80 percent of the year. The 100-year meteorological conditions include a significant wave height of 8.8 meters and a surface current of 1.7 m/sec. Table 5-1 details the metocean data at the Port Dolphin buoy locations. The Applicant states that the 100-year storm conditions are the maximum permissible operating limits for connecting to the buoy, for safe discharge of natural gas, and for safe disconnection from the STL Buoy.[24]

Table 5-1: Metocean Data for the Port Dolphin DWP

Parameter	Units	Value
100 Year Significant Wave Height	m	8.8
100 Year Wind Speed (one hour; 10 m elevation)	m/sec	38.1
100 Year Surface Current	cm/sec	173
Surface Seawater Temperature (min)	ºC	16.1
Surface Seawater Temperature (max)	ºC	32.5
Air Temperature (min)	ºC	7.4
Air Temperature (max)	ºC	32.6

[23] Port Dolphin Application, Vol. III, Sec. 9 (Draft Operations Manual)(Confidential).
[24] Port Dolphin Application, Vol. III, Sec. 11 (Metocean Data)(Confidential).

5.1.3.2 Hurricanes

It is noteworthy that Florida is among the wettest states in the U.S., with the Tampa area receiving an average annual rainfall of 48 inches. The rainy season runs from May or early June through October or November. In addition, the Tampa area can be affected by tropical systems such as depressions, storms, and hurricanes. Tropical systems affecting Florida develop in the Gulf of Mexico, the Caribbean Sea, or the Southern Atlantic Ocean. A hurricane begins as a tropical depression, an organized system of clouds and thunderstorms with a defined surface circulation and maximum sustained winds of less than 38 miles per hour. If conditions are favorable for development, the depression progresses into a tropical storm and finally, a hurricane.

A tropical storm becomes a hurricane when winds reach 74 miles per hour. The official hurricane season for the Atlantic Basin is from June 1 to November 30, with the weeks centered on mid-September having the highest frequency of storm occurrence. Based on hindcast data reported by the Applicant, there were 302 storms that attained tropical storm strength during the time period January 1, 1990 to January 1, 2000. The maximum permissible sea state for safe discharge of gas from the SRV is the 100-year extra-tropical storm (100-year non-hurricane condition), as detailed in the operating limits (Section 5.1.3.4). The Applicant states that through weather forecasts and observation of actual conditions, the initiation of disconnect procedures will occur well prior to reaching the operating limits, with the intent of allowing sufficient time for the SRV to avoid weather.[25]

5.1.3.3 Seismic Activity[26]

Florida is considered an area of low earthquake hazards. Only a few confirmable earthquakes, none of which were damaging, have been documented. Between 1780 and 1996, over 30 reports of earthquakes were documented. The Florida Platform is a seismically stable area, which shows only a handful of earthquakes that occurred during the period from 1990 to 2001. Of the reported events, most can be attributed to non-seismic phenomena or to events that occurred outside the state. Although the west coast of Florida is not a seismically active area, earthquakes and tremors have occurred there. There is a relatively low probability of earthquakes in the central West Florida Shelf. Faults associated with either gravity slumping or seismic activity can affect pipelines, but these types of shallow faults are not common within near-shore areas of the central West Florida Shelf.

5.1.3.4 Port Dolphin Operation Limits

The Port Dolphin project must plan the optimal routing for bad weather avoidance for the SRV delivering cargo to the DWP and the optimal weather conditions at the DWP for the unloading, vaporizing, and send out operations which may be dependent on relative humidity and temperature. Final project designs will take into account these considerations coupled with detailed metocean data and will be incorporated into the acceptance criteria in the operating manuals for both.

[25] Port Dolphin Application, Vol. III, Section 9-Draft Operations Manual (Confidential).
[26] Port Dolphin Application, Vol. II, Section 7 (Public).

The design of the STL buoy compartment and buoy mooring systems allows the SRV to connect in conditions of significant wave height of up to 11.5 ft (3.5 m), wind speed (1 hr mean) of 29.0 knots (15 m/s) and current speed of 3.0 knots (1.5 m/s) The STL and offloading system and SRV will be designed with the ability to operate in 100-year return environmental conditions where the significant wave height will be up to 20.3 ft (6.2 m), wind of 38.9 knots (20.0 m/s) and current of 3.0 knots (1.5 m/s).

If any of the identified limits are, or are expected to be exceeded, connection to the buoy will not be commenced or an SRV on the buoy may stop regasification and disconnect from the buoy and leave the area. The SRV Master will also continuously evaluate the conditions even when lower than the stated limits, and may impose stricter limits. The direction of final approach (last 3 nautical miles) to the unloading buoy will depend primarily on wind and current direction. Speed limits will be in force during operation of the SRVs.

Based on the meteorological data and the design specifications of the SRV and DWP equipment, it is unlikely that severe weather would cause a significant adverse consequence leading to a release of LNG or a public impact. Therefore, the severe weather scenario is not addressed in the risk analysis, as recommended by the HAZID team.

5.1.4 Aircraft Collision Release

Scenario 11 from the HAZID considered a large commercial jet, a smaller private jet, or a helicopter colliding with the SRV at any point in transit or at the DWP. Since the likelihood of such an accident with an aircraft not associated with the Port Dolphin project is remote, these types of aircraft scenarios have been screened out for further consideration.

5.2 Intentional Release Scenarios

As part of the HAZID, a thorough review of potential intentional attack scenarios against the SRV and DWP were developed. These included scenarios required by the USCG to be considered for development of a security vulnerability assessment and facility security plan under the Maritime Transportation Security Act (MTSA) such as standoff attack, ramming, hijacking, and other methods. Describing the weapons, tactics, and potential consequences in detail is not suitable for a public document; therefore, this combination of information is excluded from this report.

Since the probability of intentional attacks cannot be accurately determined based on historical data, the frequency of occurrence of these acts was not calculated. Therefore, the selection of intentional scenarios for analysis was based solely on events that were deemed to be credible and that bound the potential consequences of an LNG release.

For transparency in this IRA, the consequences of intentional releases are estimated to understand the potential impacts to public health and safety. Therefore, working directly with Sandia and the USCG, release scenarios have been defined for this risk assessment

without associating the weapons or tactics. The intentional acts were evaluated in cooperation with Sandia and the most significant of the credible threats identified were analyzed. The likelihood of these events will vary depending on the success of the multiple countermeasures required by the international and federal regulations, as well as the operational security plans developed by the USCG and Port Dolphin.

5.2.1 Intentional Scenario Breach Sizes

In preparing SAND2008-3153, Sandia met with intelligence agencies and other federal agencies to discuss potential threats against maritime shipping based on the possible capabilities and past actions of politically active groups. From these external and internal discussions with Sandia explosives and threat experts, a set of site-specific threat scenarios was developed to consider against the proposed Port Dolphin operations. As discussed previously, the threat scenarios developed are documented in a separate classified report.

Using this set of credible threat scenarios, Sandia performed a series of scoping calculations to estimate the possible breach sizes for a standard membrane-type LNG carrier for this range of threat scenarios. These calculations were conducted using shock physics-based computer models that can calculate the impact of an explosion or an attack with an explosive weapon on a structure, such as a LNG carrier. In SAND2008-3153, Sandia suggested that for the larger 215,000 – 265,000 m^3 LNG carriers where there might be less surveillance or control in an offshore environment, the breach sizes for a range of credible intentional events might vary from 5-12 m^2, with an expected nominal intentional breach size of 12 m^2. Additionally, given that the potential for multiple threats and possible escalating damage to additional tanks from fires or from cryogenic damage from the spilled LNG, Sandia suggested that as many as three LNG tanks may be compromised from a single intentional event.

While these results provide an understanding of the possible range of breach sizes from potential intentional threats, the guidance in SAND2008-3153 suggests that the threat, breach, spill, and hazard analyses should be conducted on a site-specific basis. Therefore, Sandia worked with AcuTech and the USCG to conduct a threat assessment and breach evaluation for specific, credible intentional threat scenarios for the Port Dolphin DWP project. Sandia considered site-specific factors such as ship size and design, LNG volumes, port location, vessel operations, and traffic control and vessel protection to estimate the credible threats and the associated range of possible breach sizes to consider for fire and vapor dispersion hazard distance calculations.

Based on the assessment of these factors for the Port Dolphin DWP location, a range of credible breach sizes was developed for what was considered to be credible threats for this DWP location. While the methodology and breach size results for specific threats are classified, the maximum breach size results estimated for the SRV for this project are summarized below.

While the SRVs are moored at the Port Dolphin DWP, there is less traffic control, surveillance, and escorts, but the vessels are more difficult to access due to their distance offshore. Taking this into consideration, Sandia recommended the intentional breach sizes

for membrane SRVs detailed in Table 5-2 and for Moss-style SRVs detailed in Table 5-3 be used in calculating LNG spill rates, spill volumes, and associated spill hazards for this project: Since there could be two SRVs at the Port Dolphin DWP to provide an uninterrupted flow of natural gas to the pipeline, the impacts of a breach of containment of one SRV on a SRV at the other buoy location was considered. Also considered was the possibility of a simultaneous attack against two SRVs while at the DWP.

Insulation proposed for the SRVs could potentially degrade in a fire. While the degradation will be most pronounced at the top of the cargo tanks where there is less shielding of the insulation, the potential of fire damage to additional cargo tanks and cascading spills should be considered. This scenario is represented by Scenarios 3 and 7 and addresses the insulation degradation cascading damage issues. Since the basis for these scenarios is a sustained fire degrading the insulation, immediate ignition is assumed for an intentional act that results in the breach of up to three cargo tanks. Therefore, the consequences for Scenario 3 and Scenario 7 are limited to thermal radiation from a resulting pool fire, and the distance to LFL is not evaluated. Specifically, there is no flammable vapor dispersion hazard since the release of LNG is assumed to burn immediately following release.

Table 5-2: Intentional Scenario Summary

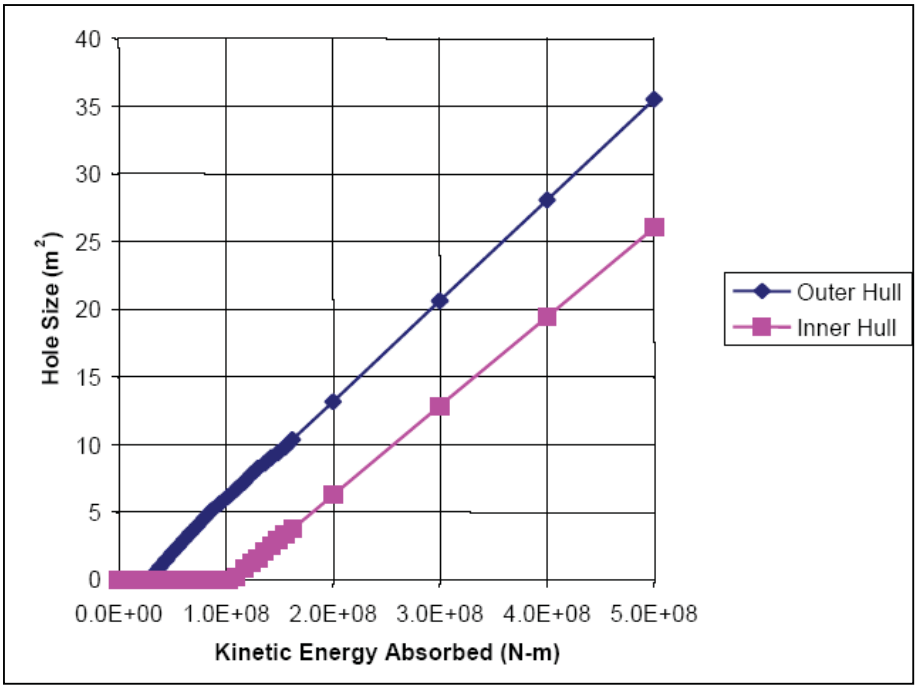
Scenario	Description	Event Type
Membrane-Type Carrier - 217,000m^3		
1	One - 16m^2 hole (single cargo tank release)	Intentional
2	Two - 12m^2 holes (two cargo tank release)	Intentional
3	Three - 12m^2 holes (three cargo tank release)	Intentional (Cascading Damage)
Moss-Type Carrier – 215,000 m^3		
5	One - 16m^2 hole (single cargo tank release)	Intentional
6	Two - 12m^2 holes (two cargo tank release)	Intentional
7	Three - 12m^2 holes (three cargo tank release)	Intentional (Cascading Damage)

5.3 Vessel Collision Scenario Breach Sizes

The severity of a breach from a LNGC following a collision with another vessel depends on the location of impact, vessel design, relative vessel speeds, collision alignment, and mitigation or prevention systems in place to limit the potential damage. For the Port Dolphin DWP, the applicant is proposing both membrane- and Moss-type carriers. Therefore, both SRV design options have been examined in this section of the IRA to determine the breach size that will be applied in the consequence analysis for the vessel collision scenario. The

calculations for a membrane-type LNGC are presented in Section 5.3.1, Section 5.3.2 presents the moss-type LNGC calculations.

As detailed in this section, a collision with a membrane-type SRV will result in a 17 m^2 breach in the inner hull, and the Moss-type SRV results in a 22 m^2 breach. Section 7.7 provides an analysis of tank size, type, and breach area on the LNG hazards from an SRV. From this analysis, the bounding hazard distances from a vessel collision with the SRV are from the Moss-type LNGC, therefore the Moss-type SRV with a 22 m^2 breach has been evaluated as part of the consequence analysis and presented in the results of the IRA.



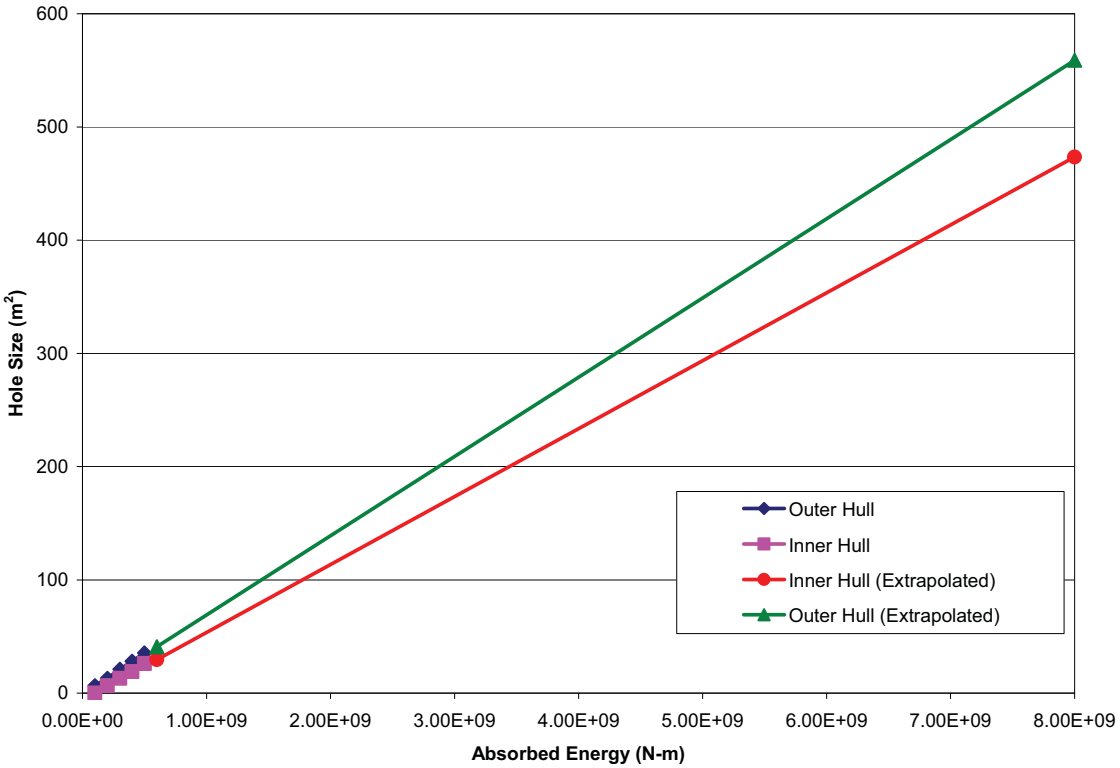
5.3.1 Calculations for Determining Breach Size for a Membrane-Style Cargo Tank

Published work is not available that relates damage to LNGCs (in the form of an inner hull breach size) to striking vessel type, speed, and energy. SAND2004-6258 includes finite element modeling of collisions for a series of double hulled oil tankers, similar in overall size, mass, and design to a membrane-type LNGC.[27] The results of this analysis are a set of curves to estimate the breach size on the outer and inner hull of a membrane-type LNG carrier as a function of the energy of the collision. This relationship, replicated from the Sandia Report, is shown in Figure 5-1.

While membrane-type LNG carriers and crude oil tankers differ, the nature of the double hull vessels are closer in design and response than traditional single hull tankers, where most of the empirical collision data has been obtained. Therefore, the recommendations in SAND2004-6258 were used to assess the expected inner hull breach size for a membrane-type LNGC following a collision with a passing vessel.

[27] SAND2004-6258 Appendix B

Figure 5-1: Double Hull Tanker Hole Size vs. Kinetic Energy (SAND2004-6258)



The methodology for calculating the size of an inner hull breach in a membrane-type LNGC (from a vessel-to-vessel collision) was developed with input from the USCG and Sandia, and includes the following steps:

- Calculate the kinetic energy of the vessels with the potential to collide with the LNG carriers for this project. The range of potential vessels is based on the AIS data from the USCG R&D Center, and the kinetic energy is calculated for each striking vessel based on the specific displacement and speed of each vessel.
- Calculate the absorbed energy of the SRV based on the kinetic energy of the striking vessel.
- Calculate the final breach size that will be applied in the vessel collision consequence modeling.

Based on discussions with Sandia and the USCG, it was determined that the empirical equations used for ship collisions can be represented as a linear relationship between breach size and absorbed energy. The curves presented in Figure 5-2 were extrapolated by AcuTech (from the data in SAND2004-6258) to determine the breach sizes for collisions with a membrane-type SRV.

Figure 5-2: Extrapolated Breach Size vs. Absorbed Energy Curve

(Membrane-type LNGC)

AIS data was collected for the area surrounding the proposed DWP project. From the AIS data analysis, there are three vessel types of sufficient size (displacement) and speed that have the potential to breach the outer and inner hull of a SRV in a collision. These vessel types include:

- Passenger
- Cargo
- Tanker

The following is the approach applied for determining the kinetic energy of the striking vessel and the absorbed energy of the SRV. These calculations were reviewed with USCG and Sandia as part of the IRA.

- M = mass of striking vessel
    - Displacement and speed from USCG R&D Center AIS data
        - Displacement = 1.026x C_b×Length(m) ×Breadth(m) ×Draft(m)
            - C_b = Block coefficient. The following were applied:
                - 0.85 for tankers

  - 0.68 for passenger vessels
  - 0.61 for cargo vessels
  - 0.75 for all other vessel types
- m = mass of struck vessel
  - Port Dolphin membrane-style SRV displacement:
    - Length = 315 meters
    - Breadth = 50 meters
    - Draft = 12 meters
    - Laden displacement (estimated) = 143,500 tonnes

- D = ratio of entrained water moving with the striking vessel (values of 0.05-0.1 are typically used)
  - The mass of the water that is moving along with the striking ship, either by being pushed in front of the vessel or by being dragged along due to friction over the length of the hull. The upper end of the range, specifically a value of 0.1, has been applied in these calculations.
- d = ratio of added mass for water resistance (0.4 is frequently used)
  - The resistive mass that acts on the struck vessel. Minorsky[28] recommended 0.4 times the mass of the struck vessel, and that ratio has been widely used.
- V = initial velocity of striking vessel (meters per second)
  - Assume struck vessel is initially at rest
- U = final velocity of both ships (meters per second)
  - Perfectly plastic collision
- E1 = initial kinetic energy (N-m)
  - $E1=0.5*(M+DM)*V^2$
- E2 = final kinetic energy
- H1 = initial momentum
  - $H1=(M+DM)*V$
- H2 = final momentum
  - $H2=(M+DM+m+dm)*U$

- Conservation of momentum gives H1=H2 which results in:
- $U=[(M+DM)/(M+DM+m+dm)]*V$
- $E2=0.5*(M+DM+m+dm)*U^2$
- $=0.5*(M+DM+m+dm)*[(M+DM)/(M+DM+m+dm)]^2*V^2$
- $=[(M+DM)/(M+DM+m+dm)]*E1$

- Absorbed energy = E1-E2
- $\{1-[(M+DM)/(M+DM+m+dm)]\}*E1$

[28] V.V. Minorsky, "An Analysis of Ship Collisions with Reference to Protection of Nuclear Power Plants", Journal of Ship Research, Vol. 3, No. 1 (1959), pp. 1-4.

In these calculations, only the three vessel types (passenger, cargo, and tanker), and only those vessels within this subset with the appropriate combination of displacement and speed have been included in the estimation of the resultant collision breach size of a membrane-type SRV. Therefore, any vessels from the AIS dataset passing the DWP location with an absorbed energy of less than 1.0×10^8 N-m are not included, as these would not result in a calculated inner hull breach[29]. This minimum absorbed energy for inner hull damage is illustrated in Figure 5-1.

Table 5-3: Estimated Vessel Collision Parameters (Membrane SRV)

Parameter	Vessel Type		
	Passenger	**Cargo**	**Tanker**
Number of Vessels (per year)	51	798	368
Maximum Absorbed Energy (N-m)	2.76×10^9	5.79×10^9	6.13×10^9
90^{th} Percentile Absorbed Energy (N-m)	2.46×10^9	2.89×10^9	2.91×10^9
Extrapolated Hole (m^2)	141	167	168
Breach Size (m^2)	14.1	16.7	16.8

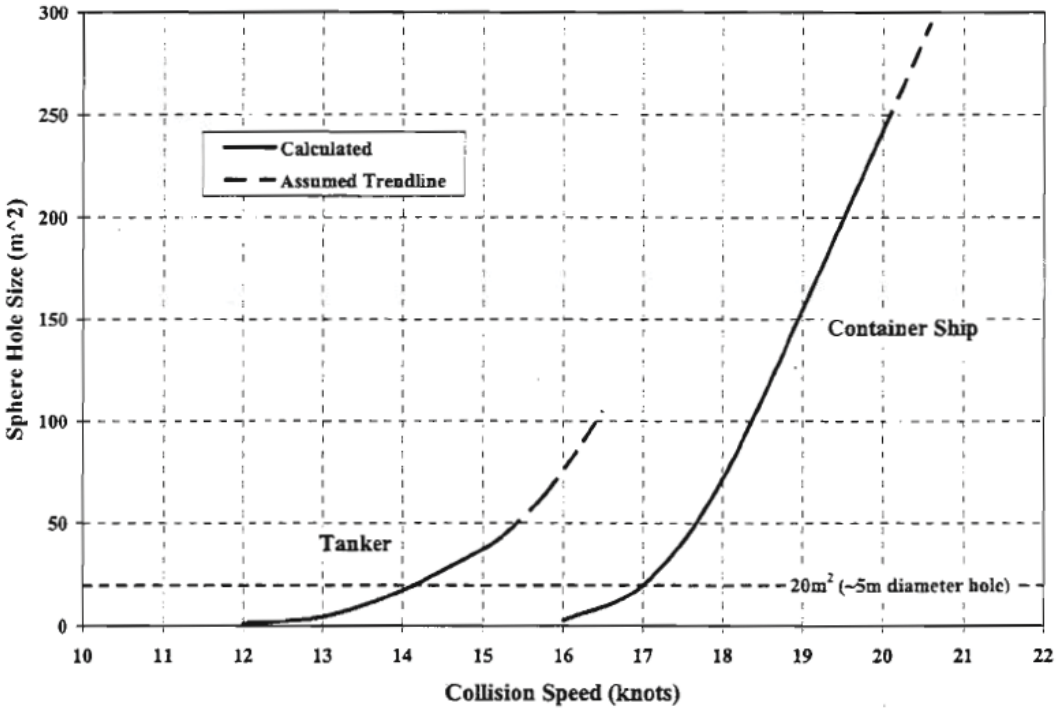
Table 5-3 details the vessel collision parameters for vessels surrounding the DWP and shows that a collision with a cargo vessel or tanker results in a breach size of 17 m^2, the largest breach size for a collision with a membrane-type SRV. The calculated breach size is based on the following:

- 90^{th} percentile absorbed energy: While the maximum absorbed energy can be calculated, it is only representative of the worst-case or a single and specific vessel transiting near the DWP location. The 90^{th} percentile absorbed energy is a more representative upper bound, eliminating outliers in the upper end of the AIS dataset.
- Extrapolated hole size: Table 5-1 shows that 90^{th} percentile absorbed energy for a tanker collision with the membrane-style SRV is 2.91×10^9 N-m. This value along with the data in Figure 5-2 is used to determine the extrapolated hole size of 168 m^2.
- Breach size: The work of Ammerman[30] has been used to support reducing the predicted extrapolated breach size resulting from an accidental collision with LNGCs[31]. Ammerman's work was originally commissioned to provide a comparative analysis of oil outflow from breached cargo tanks among double hull crude oil carriers. The hypothesis that Ammerman's work supports is that the

[29] It is possible that there may be two SRVs at the Port Dolphin DWP simultaneously to ensure constant natural gas supply. These LNG vessels do not have sufficient kinetic energy at their approach speed within the safety zone to result in an inner hull breach if a collision between two LNG project vessels were to occur. Therefore, the SRVs have been screened out from further consideration in these calculations.
[30] Ammerman, D.,"Marine Safety Systems, Control Ballast Tanker Interactive CD," SAND2002-3188P, (Albuquerque, NM: Sandia National Laboratories, 2002).
[31] SAND2004-6258.

striking ship remains lodged in the structure of the damaged vessel thus reducing the outflow of cargo. This reduction in extrapolated breach size (a value of 90%) was informally derived from a survey of worldwide tanker collision events. A reduction of the breach size by 90% plugging of the breach by the striking vessel was applied in this analysis to derive the final breach size of 16.8 m^2 for consequence modeling. This approach is consistent with Ammerman's double-hull tanker study.

Based on this analysis, the consequences of a vessel collision with a membrane-type SRV (Scenario 4) will be a 17 m^2 hole in the inner hull of a single cargo tank.



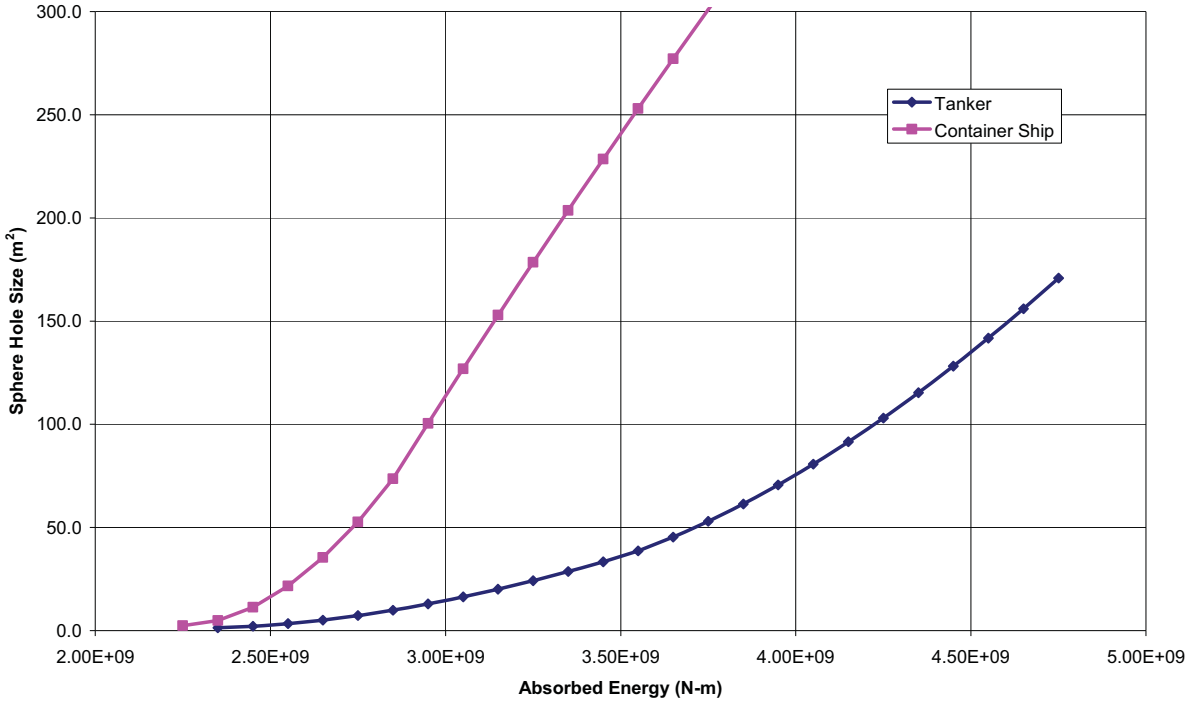
5.3.2 Calculations for Determining Breach Size for a Moss-Style Cargo Tank

The Port Dolphin project may use SRVs of similar size but with different cargo tank configurations. Section 5.3.1 details the calculation for developing an inner hull breach size for a SRV with membrane-type cargo tanks. This section presents the technical basis and calculations for the collision breach size for a Moss-type SRV for the Port Dolphin project.

In the absence of published, peer-reviewed work regarding the effects of collisions with double-hulled LNG carriers with Moss-type cargo tanks, calculations to determine the breach size for a Moss-type SRV are based on the work completed for the Cabrillo DWP IRA. The Cabrillo Port IRA included structural finite element method (FEM) analysis that was used to generate a set of hole size versus collision speed curves for a 190,000 tonnes Moss-type Floating Storage and Regasification Unit (FSRU). These curves are illustrated in Figure 5-3. As shown, the Cabrillo Port analysis considered two vessel types:

- Container Ship
- Oil Tanker

Figure 5-3: FSRU Sphere Hole Size vs. Collision Speed (Cabrillo Port) (Moss-type LNGC)



While the FEM analysis developed for Cabrillo Port provides a detailed analysis of the response of a Moss spherical tank in a collision, the limitation is that the curves developed are for only two specific ship sizes, one container ship and one tanker. Therefore, the direct application of the Cabrillo Port curves for the proposed Port Dolphin DWP does not enable the use of site specific data that has been collected and developed for the IRA. Specifically, this data includes the SRV displacement and the range of vessel type, size, and speed near the proposed DWP location.

Since the FRSU evaluated in Cabrillo Port and the Moss-type SRV proposed for Port Dolphin are different sizes, and the non-project vessels passing near these DWPs have different sizes and speeds, the curves developed for Cabrillo Port are further evolved in this IRA so that the estimated breach size of the inner hull of a Moss-type LNGC is based on the absorbed energy of the collision. Additionally, even though the Moss-type LNGCs from Cabrillo Port and Port Dolphin are of the larger (greater than 200,000 m^3) class, the displacements are different. This results in different absorbed energies in a collision with similar sized vessels. Therefore, what has been developed as part of the Port Dolphin IRA is a new set of hole size versus absorbed energy curves for Moss-type LNGCs. These curves, shown in Figure 5-4 are:

- Based on the FEM analysis of Moss-type LNG carriers from Cabrillo Port.
- Take into account the need for site specifc data on vessel type, size, and speed surrounging the DWP .

- Take into account the need or additional project specific information of the size of the LNGC, and the resuling absorbed energy of collision.

Figure 5-4: Moss-type LNGC Hole Size vs. Absorbed Energy

The methodology for calculating the size of an inner hull breach in a Moss-type LNGC (from a vessel-to-vessel collision) at the Port Dolphin DWP was developed for tankers and container ships using the data in Figure 5-4 and the AIS data provided by the USCG R&D Center for this proposed location. The final calculated breach size for Moss-type LNGCs includes:

1. Calculate the impact kinetic energy of the vessels surrounding the proposed DWP location. The range of potential vessels is based on the AIS data from the USCG R&D Center, and the kinetic energy is calculated for each vessel based on the specific displacement, vessel type, and speed.
2. Calculate the absorbed energy of the Moss LNGC based on the kinetic energy of the striking vessel. Displacement of the Moss LNGC provided by Port Dolphin is 152,000 tonnes.
3. Calculate the final breach size that will be applied in the vessel collision consequence modeling using Figure 5-4 (hole size vs. absorbed energy) and the assumption of 90% plugging.

In these calculations, only those vessels with the appropriate combination of displacement and speed to result in an inner hull breach of the Moss-type LNGC have

been included in the estimation of the resultant collision breach size. Therefore, any vessels from the AIS dataset passing the DWP location with an absorbed energy of less than 2.25×10^9 N-m are not included, as these would not result in a calculated inner hull breach. This minimum absorbed energy for inner hull damage is illustrated in Figure 5-4. Table 5-4 details the vessel collision parameters for vessels surrounding the Port Dolphin DWP and shows that a container ship collision with the Moss-style SRV results in an estimated breach size of 22 m^2. This is the maximum hole size created by either a tanker or container ship with the Moss-type LNGC.

Table 5-4:Vessel Summary Surrounding Port Dolphin DWP

Parameter	Vessel Type	
	Tanker	Container
Number of Vessels (per year)	216	216
Maximum Absorbed Energy (N-m)	5.79×10^9	6.13×10^9
90^{th} Percentile Absorbed Energy (N-m)	3.21×10^9	3.39×10^9
Extrapolated Hole (m^2)	27	216
Breach Size (m^2)	2.7	21.6

The calculated breach size is based on the following:

- 90^{th} percentile energy: While the maximum absorbed energy can be calculated, it is only representative of the worst-case, or a single and specific vessel transiting near the DWP location. The 90^{th} percentile absorbed energy is a more representative upper bound, eliminating outliers in the upper end of the AIS dataset.
- Extrapolated hole size: Table 5-4 illustrates that 90^{th} percentile absorbed energy for a container ship collision with the Moss-type SRV is 3.39×10^9 N-m. This absorbed energy along with the data in Figure 5-4 is used to determine the extrapolated hole size of 216 m^2 for the Moss-style SRV.
- Breach size: The work of Ammerman[32] has been used to support reducing the predicted extrapolated hole size resulting from a collision with a LNGC[33]. Ammerman's work was originally commissioned to provide a comparative analysis of oil outflow from breached cargo tanks among double hull crude oil carriers. The hypothesis that Ammerman's work supports is that the striking ship remains lodged in the structure of the damaged vessel thus reducing the outflow of cargo. This reduction in extrapolated hole size (a value of 90%) was informally derived from a survey of worldwide tanker collision events. A reduction of the breach size by 90% to account for the plugging by the striking vessel was applied in this analysis to derive the final breach size of 22 m^2 for consequence modeling. This approach is consistent with Ammerman's double-hull tanker study.

[32] Ammerman, D., "Marine Safety Systems, Control Ballast Tanker Interactive CD," SAND2002-3188P, Sandia National Laboratories, Albuquerque, NM, 2002.
[33] SAND2004-6258.

Based on this analysis, the consequences of a vessel collision with a Moss-type SRV (Scenario 4) will be a 22 m^2 hole in the inner hull of a single cargo tank.

6.0 Vessel Collision Frequency Analysis

This section focuses on the frequency of collisions between ships and between ships and a fixed object. A ship striking a fixed object is formally referred to as an allision. Although SRVs moored at the DWP buoys can weathervane with the wind and current, they are not underway while unloading at a DWP. Nevertheless, for the purposes of this analysis, a ship striking a moored SRV will be referred to as a collision.

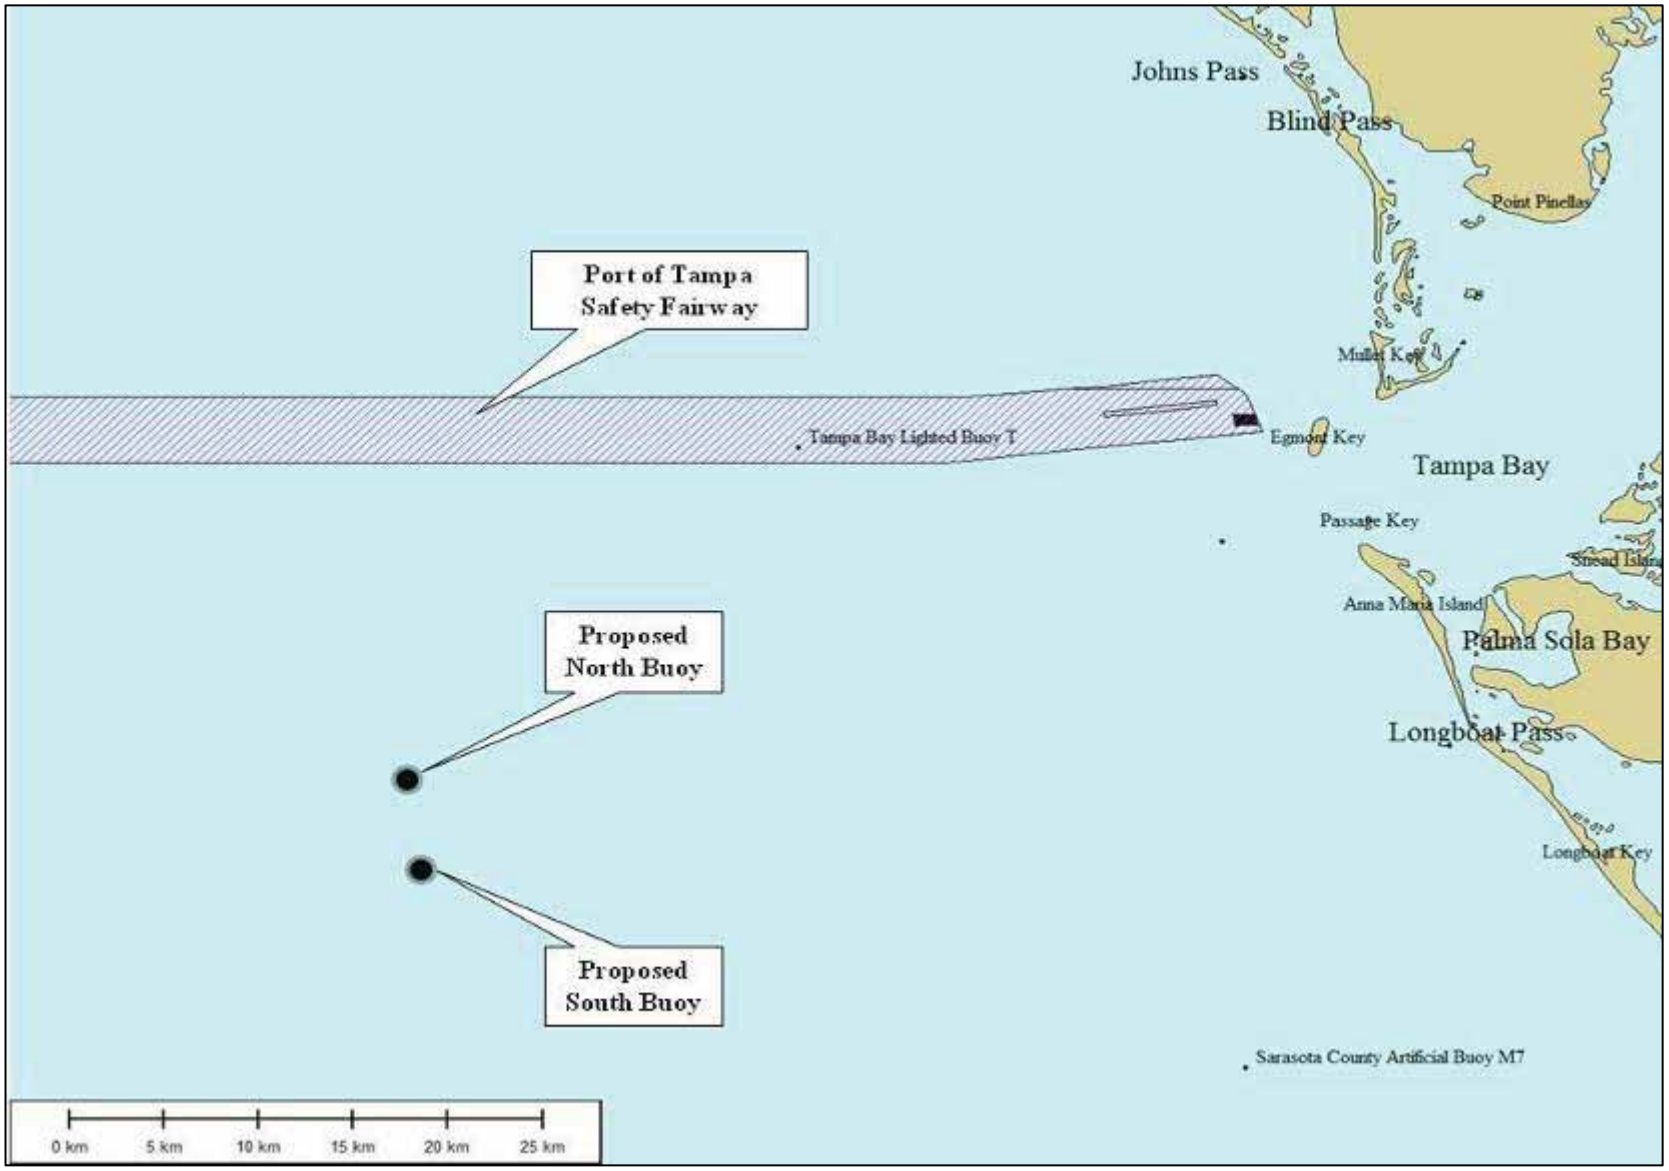
A powered collision for the Port Dolphin project may involve:

- Collisions between an SRV and ships transiting near the proposed DWP (typical maritime traffic off the coast of Tampa) and under way.

A drifting collision may involve any of the following:

- Collisions between an SRV and ships transiting near the proposed DWP (typical maritime traffic off the coast of Tampa) that loses steerage.

Passing vessel collisions for the Port Dolphin project can be divided into two categories. The first category is for vessels transiting in defined routes, represented by vessels that use the Port of Tampa Vessel Safety Fairway. The second category is for randomly distributed vessels near the DWP.



As discussed in Section 5, both drifting collisions and groundings were screened-out for further analysis by the HAZID team due to the distance of the DWP from the safety fairway. The North Buoy is 11 miles (9.55 nm) from the safety fairway and the South Buoy is 14.1 miles (12.3 nm) from the safety fairway. Additionally, the DWP is located 28.1 miles (24.3 nm) from shore making an accidental grounding scenario very unlikely. Even though these scenarios were screened out qualitatively in the HAZID, this section presents the collision frequency analysis methodology and applies the site-specific maritime characteristics to confirm or deny the remote likelihood of a vessel collision at this DWP location for ships in the safety fairway.

The AIS dataset for this project indicates that there are vessels that pass the proposed DWP location, but do not use a defined route (a formal or informal shipping or transit lane). Additionally, the data indicates that some of these vessels do have sufficient displacement and speed to result in an inner hull breach of the SRV in a collision. Therefore, the frequency of these vessels colliding with an SRV at the DWP has been evaluated as part of this analysis.

6.1 Vessel Traffic - Port of Tampa Safety Fairway

Automatic Identification System (AIS) data was obtained for this analysis from the USCG R&D Center. The use of the vessel safety fairway by the majority of the large vessels in the area was confirmed by a review of this limited AIS data. This vessel safety fairway is presented in Figure 6-1: Port Dolphin Buoy Locations and Safety Fairway.

Figure 6-1: Port Dolphin Buoy Locations and Safety Fairway

Section 5 presents the SRV inner hull damage calculations for vessel collisions. As detailed in this section, only vessels with the combination of displacement and speed that can result in an absorbed collision energy with the SRV of 1.0×10^8 N-m or greater have the potential to breach the inner hull of the SRV. This level of absorbed energy is the minimum required to breach the hull of a membrane-style SRV. As discussed in Section 5.3, the minimum absorbed energy to breach the inner hull of the Moss-style SRV is higher, 3.0×10^9 N-m. Since there are two different SRV-types that could be used for the Port Dolphin project, the minimum absorbed energy, consistent with the membrane SRV, is used in the collision analysis. Therefore, to be conservative, only vessels that can result in an absorbed collision energy greater than or equal to 1.0×10^8 N-m have been included in the analysis. The remaining vessels[34] are assumed to be incapable of causing an inner hull breach of the SRV, and a collision with these vessels is assumed not to result in a release of LNG.

The AIS data that was collected for the Port Dolphin project area included not only all vessel traffic, but also data to identify vessels with sufficient displacement, speed, and kinetic energy to breach the inner hull of a SRV. Using this data and the traffic located in the vessel safety fairway, there are 316 annual vessel movements in the safety fairway to the north of the Port Dolphin DWP. All of these 316 vessel movements have the potential to breach the inner hull of the SRV at cruising speed.

6.1.1 Powered Collisions

The frequency of powered collisions is given as follows. This model was developed by DNV and has been used for ship collision analyses for DWP application IRAs over the past four years.[35] .

$$F_{power} = N \times P_{coll} \times P_2 \times P_3$$

Where:
F_{power} = Frequency of powered collision, per year
N = Number of transits in safety fairway or other route, per year
P_{coll} = Probability of collision
P_2 = Probability of steering system failure when on collision course = 2.0×10^{-4}
P_3 = Probability of failure to recover from collision course given a warning from moored SRV = 0.67

The selection of the probability distribution function (P_{coll}) depends on the route followed by the vessels transiting past the SRV. Because the safety fairway is located 11 miles from the North buoy, the vessels in the safety fairway can be represented as a skewed normal distribution between the fairway and the DWP.

[34] In the future, it is possible that there may be up to two SRVs at the Port Dolphin DWP simultaneously to ensure constant natural gas supply. These LNG vessels do not have sufficient absorbed energy at their approach speed within the safety zone to result in an inner hull breach if a collision between two LNG project vessels were to occur. Therefore, the SRVs have been screened out from further consideration in these calculations.

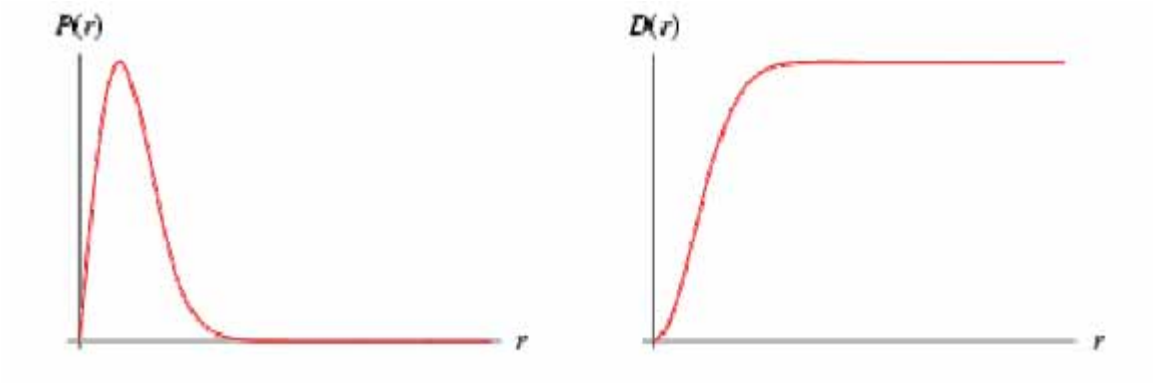
[35] Det Norske Veritas (DNV), *Concept Safety Assessment of LNG Floating, Storage & Re-gasification Unit (FSRU)*. Final Report, March 14, 2003, Project No. 230-11749.

There are many skewed continuous distribution functions that can be used to model the vessel routes. After reviewing these, the Rayleigh distribution function was selected for its simplicity. It is defined with only one parameter, namely the mode, *b*. For application to vessels in the safety fairway, a value of *b* of 0.5 nm was selected, and is consistent with an assumption that vessels could deviate up to one-half mile to pass other vessels, or that the vessels may drift within the safety fairway since it is not a defined traffic separation scheme (TSS).

The Rayleigh probability density function is P(r):

$$P(r) = \frac{r}{b^2} \exp\left[-0.5 \left(\frac{r}{b} \right)^2 \right]$$

The cumulative distribution function is D(r):



$$D(r) = 1 - \exp\left[-0.5 \left(\frac{r}{b} \right)^2 \right]$$

Where:

- D(r) = Cumulative distribution function
- r = Distance from the DWP buoys to marine traffic track or lane (when measuring distances to the safety fairway, the southern edge of the fairway was used)
- b = Mode value of distribution = 0.5 nm

The form of the Rayleigh distribution function is shown in Figure 6-2.

Figure 6-2: Rayleigh Probability Density and Cumulative Distribution Functions

To determine the probability that a SRV will be within the distance defined by the mode of the distribution (i.e., 0.5 nm), the value of D(r) must be calculated for two distances: the distance from the moored SRV to the safety fairway or track plus half the length of the SRV, and the distance from the moored SRV to the safety fairway or track minus half the length of the SRV. Therefore, the two distances are:

$r_1 = r + 0.5(\text{length of SRV})$

$r_2 = r - 0.5(\text{length of SRV})$

The length of the SRV is 315 m (same for both membrane and Moss-style SRVs). Once $D(r_1)$ and $D(r_2)$ are determined, the probability of collision is the difference between these two values:

$P_{coll} = D(r_1) – D(r_2)$

Table 6-1 shows a summary of the P_{coll} calculations for the DWP location with respect to the Port of Tampa Safety Fairway. As shown, due to the distance of the safety fairway from the DWP, the calculated frequency of a powered collision from this group of vessels is zero, Table 6-2. This resultant frequency of zero is a direct result of the 11 mile separation between the safety fairway and the DWP.

Table 6-1: Summary of Calculated P_{coll} Values[36]

DESCRIPTION OF DWP BUOY & TRAFFIC LOCATION	DISTANCE FROM DWP BUOY TO SAFETY FAIRWAY/ROUTE, r (nm)	r_1 (nm)	r_2 (nm)	$D(r_1)$	$D(r_2)$	P_{COLL}
North Buoy to Fairway	9.55	9.635043	9.464957	1	1	0
South Buoy to Fairway	12.3	12.38504	12.21496	1	1	0

Table 6-2: Summary of Frequencies of Powered Collisions

DESCRIPTION OF DWP BUOY & TRAFFIC LOCATION	N	P_{COLL}	P_2	P_3	F_{POWER}
North Buoy to Fairway	316	0	2.00×10^{-4}	0.67	0
South Buoy to Fairway	316	0	2.00×10^{-4}	0.67	0

6.1.2 Drifting Collisions

Drifting collisions are possible at the proposed DWP location if a vessel in the safety fairway loses propulsion and the wind and current cause the damaged vessel to collide at low speed with a moored SRV. As with powered collisions, the only vessels of concern are those with the requisite mass at the assumed drifting speed that have enough kinetic energy to possibly breach the inner hull of a SRV. The drifting speed of a vessel is dependent on the vessel type/size and the wind speed.[37] As discussed in Section 7.4.6, the prevailing wind speed at the DWP is 10 m/s (19.4 kts). This wind speed translates into a Beaufort Wind Strength of 6[38], and for the larger passenger, cargo and tankers operating near the DWP, a drifting speed of 1.7 kts is applied for this analysis. Using the displacement data from the AIS and a speed of 1.7 kts, there are no vessels surrounding the Port Dolphin area of operation that have the potential to breach the inner hull of a SRV in a drifting collision. Specifically, there is no vessel of sufficient displacement drifting at a speed of 1.7 kts that would result in an absorbed energy of 1.0×10^8 N-m or greater. This includes another SRV related to the Port Dolphin Project which would approach the DWP at a speed of less than 3 kts.

Based on these results the frequency of a drifting collision between a vessel in the safety fairway and an SRV at the DWP is not considered.

[36] Based on the calculations performed for the Table 6-1 values, it is clear that for any value of r that is greater than 4.0 nm, the values of $D(r_1)$ and $D(r_2)$ become so small ($< 1 \text{ X } 10^{-12}$) that the value of P_{coll} approaches zero. Therefore, for any combination of vessels either in the vessel safety fairway or at a distance of more than 4.0 nm, the probability of collision is calculated as zero.

[37] Centre for Marine and Petroleum Technology (CMPT), "A Guide to Quantitative Risk Assessment for Offshore Installations," 1999.

[38] http://www.spc.noaa.gov/faq/tornado/beaufort.html

6.1.3 Randomly Distributed Vessels

The underlying technical basis for the collision frequency for randomly distributed vessels was published by DNV (2003).[39]

As discussed, the AIS dataset for this project shows vessel traffic near the proposed DWP with no defined routes. Additionally, there is a subset of these randomly distributed vessels that have sufficient displacement and cruising speed to result in an inner hull breach of the SRV in a collision.

In this analysis, the vessel traffic with a collision absorbed energy potential of 1.0×10^8 N-m or greater is defined in terms of a density (i.e., the number of vessels per square nautical mile). The collision frequency model for random vessel motion is outlined below.

$$F_{random} = N \times P_1 \times P_2 \times P_3$$

Where:
$N = \rho \times \pi \times R^2$ = the number of vessels within a circle with radius R
ρ = density of vessels (vessels/m^2)
$R = 365 \times 24 \times 3600 \times V$ = the distance traveled in one year
V = vessel speed (m/s)
$P_1 = D/(\pi \times R)$ = the mean geometric collision probability
D = collision diameter of the SRV (m)
P_2 = probability of loss of control onboard the ship
P_3 = probability of failure of warning or diverting a ship on collision course

For this calculation, the values for P_2 and P_3 are the same as for the powered vessel collision calculation, Section 6.1. Specifically:

- $P_2 = 2.0 \times 10^{-4}$
- $P_3 = 0.67$

From the AIS dataset, it can be assumed that vessels with sufficient displacement to breach the inner hull of the SRV could be passenger vessels, cargo vessels, or tankers. From Table 3-3 the minimum cruising speed for these vessel types, at this distance from shore, would be approximately 20 kts (10.3 m/s). In addition, the mean width (or beam) of these vessels, from the AIS dataset, is approximately 26 meters.

Evaluating the vessel traffic around the DWP, approximately 120 vessels (with the potential to breach the inner hull of the SRV in a collision) pass within an area of 5 nm radius of the project buoys in a given year. Based on this annual number of vessels, speed of the vessels, and the area around the DWP, the density of vessels around the DWP is estimated to be 0.004 in an area of 5 nm radius around the DWP, at any given time.

[39]DNV Project No. 230-11749, 2003.

Since these vessels can approach the DWP from any direction, the collision diameter (D) of the SRV is equal to the average apparent width of the SRV.

$$D = (\text{Length} + \text{Beam}) \times 2 / \pi$$

Given an SRV length of 315 meters and a beam of 56 meters, D is calculated to be 236.2 meters.

Using the collision frequency calculation above, and the listed assumptions, the collision frequency for vessels randomly passing the DWP is calculated to be 1.4×10^{-4} collisions per year (one collision that could result in an inner hull breach of the SRV every 7,143 years). It should be noted that this frequency does not take into account any safety and security zones and or ATBA that may be established as part of the DWP. In addition to collision detection and avoidance systems that may be placed on both the SRV and the potential colliding vessel, the actual likelihood of a vessel collision with an SRV at the DWP by a passing vessel would be expected to be much lower than calculated.

6.2 Final DWP Collision Frequencies

The final frequencies for collisions between various deep draft vessels transiting the Tampa Bay area and SRVs moored at the Port Dolphin DWP locations are shown below.

The total frequency of a collision with an SRV at the DWP was calculated for two vessel types: 1) vessels in the established Port of Tampa Vessel Safety Fairway; and 2) vessels randomly passing the DWP location. This calculation utilized vessel traffic from the AIS dataset for this project and only included those vessels with the potential to breach the inner hull of the SRV in a collision.

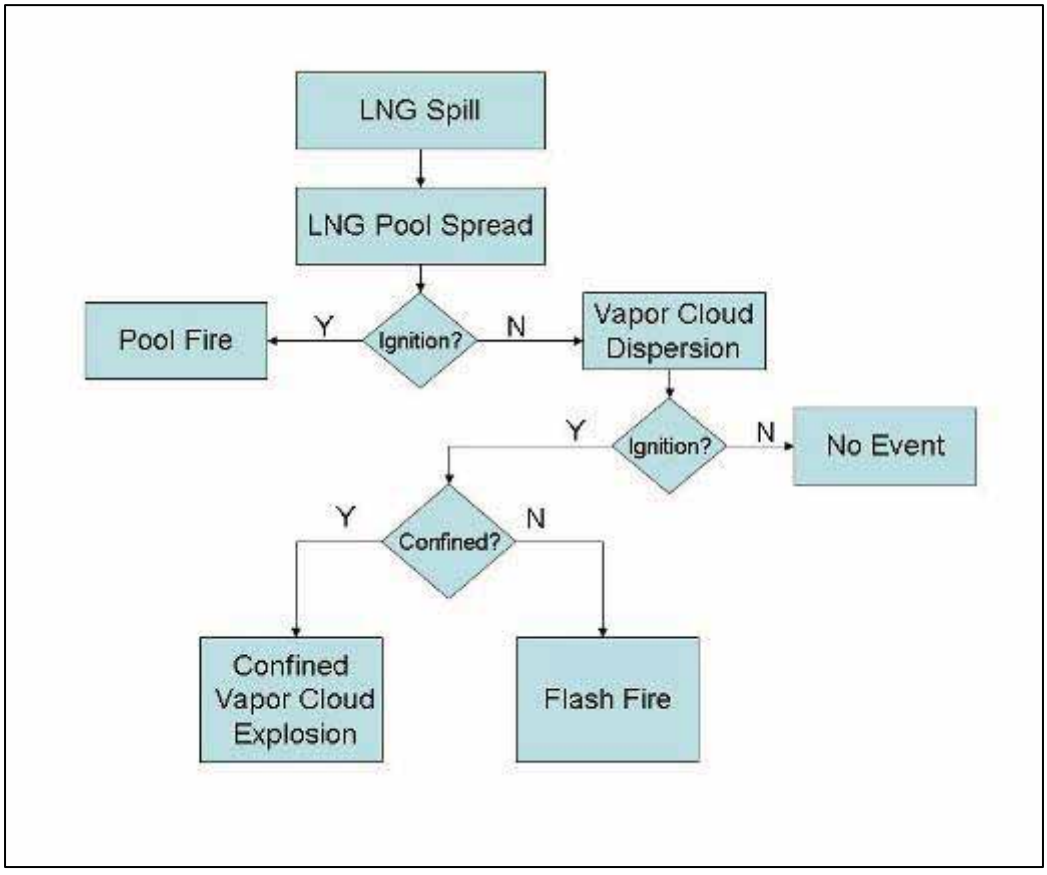
Due to the distance from the safety fairway to the DWP (11 miles to the North buoy) the likelihood of a powered collision between vessels in this defined route and the SRV was calculated to be zero. Additionally, due to the low drift speed (as well as the distance between the fairway and the DWP), no vessels from the fairway were found that had a drifting collision absorbed energy high enough to breach the inner hull of the SRV.

In addition to vessels in the defined fairway, vessels of sufficient displacement and speed were identified in the AIS dataset that passed near the DWP. Using the collision frequency calculation for randomly distributed vessels, a collision frequency of 1.4×10^{-4} collisions per year was calculated. This vessel collision frequency can also be presented as one collision that could result in an inner hull breach of the SRV every 7,100 years.

Therefore, the collision frequency for the proposed DWP considering both vessels in the safety fairway and randomly distributed around the DWP is shown in Table 6-3.

Table 6-3: Frequency of Vessel Collisions for Proposed DWP

LOCATION	FREQUENCY OF VESSEL COLLISION (PER YEAR BASIS)	FREQUENCY OF VESSEL COLLISION (YEARS PER COLLISION BASIS)
SRV at Port Dolphin DWP	1.4×10^{-4}	1 collision every 7,100 years



7.0 Consequence Analysis

This section includes a discussion of the modeling approach to the consequence analysis as well as a discussion of the modeling parameters and bounding conditions applied to the models.

7.1 Background

The scope of the consequence analysis for this IRA is to estimate the thermal radiation and flammable vapor dispersion hazards from the accidental and intentional release scenarios developed in Section 5. The impacts that are evaluated for these hazards are consistent with injuries to humans and damage to property. A large scale release is defined as any release of LNG in which the spilled LNG volume and flow rate are greater than those obtained from process systems failures (e.g., pipe or valve failures). Figure 7-1 shows the event tree following a large scale release of LNG over water.

Figure 7-1: Event Tree for a Large-scale LNG Release Over Water

Of the four potential consequences of an LNG release shown in the event tree (i.e., pool fire, flash fire, vapor cloud explosion and no event), the thermal radiation hazard zones from pool fires and the flammable vapor dispersion that defines the extent of a flash fire are specifically addressed in the IRA. These consequence types have the potential it impact the public surrounding the DWP. The reasons the other consequence types are not specifically addressed in a DWP IRA are:

- Vapor Cloud Explosion: The release of a flammable material may lead to a vapor cloud explosion if ignited. A vapor cloud explosion results from the rapid combustion of a fuel/air cloud with the flame speed approaching sonic velocity, thereby producing a blast wave. Turbulence is required for the acceleration of flame front to speeds required to produce the blast overpressure associated with an explosion. In the absence of turbulence, a flash fire will occur without any appreciable overpressure. Flame turbulence is typically formed by the interaction between the flame front and obstacles. For this DWP location, vapor cloud explosions are not considered likely, given the absence of other structures that could provide confinement of the flammable vapor cloud.
- Cryogenic: Defined as a "no event" in Figure 7-1, cryogenic contact hazards are limited to areas that can be reached by the LNG pool. Based on available pool size estimates,[40] cryogenic contact hazards are not expected to extend far enough from the proposed project to affect the public.
- Asphyxiation: Defined as a "no event" on Figure 7-1, a risk of asphyxiation from LNG vaporization may be present if the gas concentration is sufficiently high to reduce the oxygen concentration below tolerable levels. A literature review by Sandia[41] indicates minimal frequency of permanent injury to the general population for oxygen levels above 14%. As the vapor cloud disperses away from the LNG pool, the gas concentration decreases and so does the risk of asphyxiation. Since the public will not be allowed within the Safety Zone around the SRV, asphyxiation hazards to the public are not considered to be an issue in this study.

7.2 LNG Release Scenarios

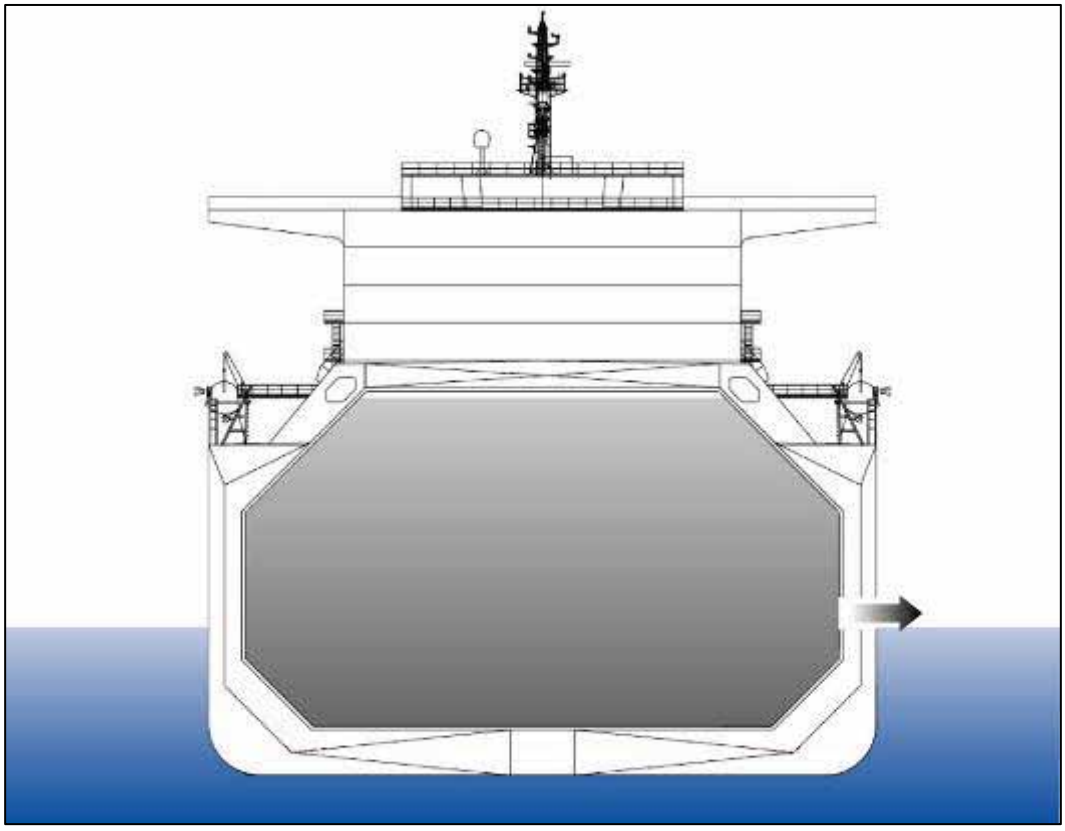
As detailed in Section 5, a subset of the release scenarios based on the HAZID process, led by AcuTech, were selected for inclusion in the risk assessment. The identified scenarios represent the worst credible scenarios, or the bounding scenarios, for inclusion in the risk assessment. These scenarios lead to large scale releases of LNG from either a 217,000 m^3 membrane-style SRV or a 215,000 m^3 Moss-style SRV, either at berth or en route to the DWP, and include:

- Membrane SRV
    - Intentional attack leading to a 16 m^2 breach in a single tank
    - Intentional attack leading to a 12 m^2 breach in two (2) tanks
    - Intentional attack leading to a 12 m^2 breach in three (3) tanks
    - Collision/allision leading to a 17 m^2 breach in a single tank

[40] SAND2004-6258.
[41] Ibid., pg. 117.

- Moss SRV
    - Intentional attack leading to a 16 m^2 breach in a single tank
    - Intentional attack leading to a 12 m^2 breach in two (2) tanks
    - Intentional attack leading to a 12 m^2 breach in three (3) tanks
    - Collision/allision leading to a 22 m^2 breach in a single tank

The scope of the consequence modeling for the above scenarios includes the separate analysis of LNG pool fire and of flammable vapor cloud dispersion for each scenario. Scenarios 3 and 7 address the potential for insulation degradation and cascading damage issues. Since the basis for these scenarios is a sustained fire degrading the insulation, immediate ignition is assumed for an intentional act that results in the breach of three cargo tanks. Therefore, the consequences for Scenario 3 and Scenario 7 are limited to thermal radiation from a resulting pool fire and the distance to LFL is not evaluated.



The outcome of the consequence assessment for each of these scenarios will be affected by the choice of the modeling tools as well as of the numerical values used for the various parameters, such as ambient conditions, that affect the modeling results. This section discusses some of the assumptions made in this study, as well as the parameter values used in the analysis, with the basis for their selection.

The scope of the consequence modeling does not include an estimate of the probability of occurrence of any one of the above four scenarios.

7.2.1 Breach Locations

The total volume of LNG spilled as well as the flow rate of LNG through a tank breach depends on the location of the breach. The LNG spill volume and flow rate are maximum for breaches at (or just above) the waterline. If the breach is below the waterline, the flow of LNG out of the tank is decreased by the backpressure caused by the water above the hole, as well as by the flow of water into the tank. Other phenomena, such as ice formation around the hole and increased LNG vaporization as the spill flows towards the water surface, are also likely to result in overall smaller LNG pools for an underwater release, and consequently, smaller hazards to the public. Therefore, the conservative approach in all scenarios considered in this study is to assume that the tank breach occurs at, or just above the waterline.

Figure 7-2: Cross-section of Typical Membrane-type SRV Tank, with Waterline Breach

7.3 Screening Calculations

A series of screening calculations were performed during this study, to aid in evaluating the effects of certain parameters on the thermal radiation and vapor dispersion hazard distances. The screening calculations were performed using DEGADIS for vapor cloud dispersion and a standard solid flame model[42] for pool fire thermal radiation. These models were used solely to identify those parameters that may be likely to have a significant effect on the outcome of a spill scenario. More sophisticated models were used for the actual hazard distance calculations for the scenarios identified in the HAZID. Therefore, the screening calculation results should not be used in lieu of, or compared with, the final results provided later in the IRA report.

7.4 Selection of Modeling Parameters

Physical parameters, such as the LNG composition and the atmospheric conditions, affect the physical mechanisms that control events such as the formation and dispersion of an LNG vapor cloud or the size, duration and intensity of an LNG pool fire. These parameters need to be defined before the consequences of a large LNG release scenario can be quantified.

[42] Beyler, C.L., "Chapter 3-11: Fire Hazard Calculations for Large, Open Hydrocarbon Fires," in SFPE Handbook of Fire Protection Engineering, 3rd Edition, P. DiNenno, ed. (Quincy, MA: National Fire Protection Association, 2002).

7.4.1 LNG Composition

LNG is typically composed primarily of methane (approximately 90 – 95%), with smaller fractions of heavier hydrocarbons (ethane, propane, butane, etc.). Methane is the most volatile compound in the LNG mixture, with a boiling temperature of approximately -261°F or -162°C (ethane, the next most volatile compound, has a boiling temperature of -87°C). The vapor cloud formed from an LNG pool over water will contain primarily methane, regardless of the LNG composition, until most of the methane has evaporated and the pool has reduced to a fraction of the original volume. If the vapor cloud is ignited, the resulting flash fire will be fueled by methane vapors. Similarly, in the event of an LNG pool fire, methane gas will be the primary fuel, regardless of LNG composition, until most of the methane has been consumed and the pool has reduced to a fraction of the original volume. This IRA will assume LNG to be composed of 100% methane for the purpose of determining the LNG physical properties to be used in the consequence models.

7.4.2 Ambient Conditions

Ambient conditions that affect the flammable vapor cloud dispersion and thermal radiation hazard distances include: air temperature and relative humidity, atmospheric stability, wind speed, and water temperature. Other parameters, such as wave height and frequency, also have an effect on the LNG pool formation and vaporization rate; however, there are no available peer-reviewed models that account for these effects. The effects of waves on the LNG pool are therefore not included in this study.

There are currently no regulations for offshore LNG terminals that specify which models and which ambient or other conditions should be used for LNG hazard calculations. Federal regulations for land-based LNG terminals list specific requirements for the ambient conditions to be used in thermal radiation and flammable vapor dispersion hazard distance calculations. These requirements can be used as reference to select the parameters for this study. For thermal radiation calculations, 49 CFR 193.2057 states that:

- The wind speed producing the maximum exclusion distances shall be used except for wind speeds that occur less than five percent of the time, based on recorded data for the area.
- The ambient temperature and relative humidity that produce the maximum exclusion distances shall be used except for values that occur less than five percent of the time, based on recorded data for the area.

For flammable vapor dispersion calculations, 49 CFR 193.2059 states that:

- Dispersion conditions are a combination of those which result in longer predicted downwind dispersion distances than other weather conditions at the site at least 90 percent of the time, based on figures maintained by the National Weather Service of the U.S. Department of Commerce, or as an alternative, where the model used gives longer distances at lower wind speeds.
- Atmospheric Stability (Pasquill-Gifford Class) “F”.

- Wind speed = 2.01 meters/sec (4.5 miles per hour, or 3.9 knots).
- Wind speed reference height of ten meters.
- Relative humidity = 50 percent.
- Atmospheric temperature = average in the region.

In order to select conservative but realistic conditions for the hazard distance analysis of the Port Dolphin DWP project, a series of screening calculations were performed. The purpose of the screening calculations was to evaluate the effect of individual parameters (such as air temperature, humidity, and wind speed) on the estimated hazard vapor dispersion and thermal radiation hazard distances. Approximately four years worth of meteorological data from buoy station No. 42013 were used to select realistic ranges of the parameters to be tested.[43] Buoy station No. 42013 is located approximately 15 nm southwest of Tampa, Florida, and thus in proximity of the proposed project.

7.4.3 Air Temperature

Calculations were performed for temperatures ranging between 13.7°C and 29.7°C (57°F and 85°F). These values respectively correspond to the 5th and 95th percentile highest temperature measured at buoy station No. 42013. These values are consistent with the ambient conditions selection criteria in 49 CFR 193, which are being used as reference for the screening calculations.

Higher temperatures were observed to give longer vapor dispersion distances, likely due to the lower density of warmer air. If the transmissivity of thermal radiation in air is assumed constant (as specified in the parametric analysis matrix – see Table 7-10), high temperatures also give slightly longer distances to selected heat flux levels. Based on these results, the air temperature assumed for this analysis is:

- Thermal Radiation Heat flux Calculations - air temperature of 29.7°C (85°F)
- Vapor Dispersion Calculations - air temperature of 29.7°C (85°F)

7.4.4 Relative Humidity

Relative humidity screening calculations were performed for values between 5% and 95%, to estimate its effects on vapor dispersion and heat flux distances. Low humidity was observed to give longer distances to selected heat flux levels, due to the lower air density.[44] The longest dispersion distance for the flammable vapor cloud was obtained for dispersion in 50% relative humidity. Based on these results, the relative humidity assumed for this analysis is:

[43] The data is currently available on the National Oceanic and Atmospheric Administration (NOAA) website (http://www.ndbc.noaa.gov/station_page.php?station=42013).
[44] Lower humidity also reduces the moisture content in the atmosphere, increasing the transmissivity of heat flux. However, this effect is not accounted for in the parametric sensitivity matrix as air transmissivity is assumed constant.

- Thermal Radiation Heat Flux Calculations – relative humidity of 5%
- Vapor Dispersion Calculations – relative humidity of 50%

7.4.5 Atmospheric Stability

Atmospheric stability affects the mixing of a dense gas cloud with ambient air. A stable atmosphere is typical of nighttime, low wind conditions, and is characterized by low ground-level turbulence. An unstable atmosphere is typical of daytime, sunny conditions that induce convective air motions that stir the lower portion of the boundary layer and increase mixing.

The effect of atmospheric stability on vapor cloud dispersion is typically a strong one: an increase in the stability of the atmosphere corresponds to a decrease in the near-ground turbulence, which decreases mixing between the dense gas cloud and the ambient air. Typically nighttime has the most stable atmosphere while the atmosphere becomes more turbulent as the day progresses due to daytime heating. While the stability class does range from A to F, no control or estimate is made to when or under what conditions a release may occur. Therefore, vapor dispersion calculations assume very stable atmospheric conditions (identified with the Pasquill-Gifford stability class "F") for conservative results.

The following is a definition of the different stability classes and the conditions for when they typically occur:

- A Stability: Extremely unstable conditions
- B Stability: Moderately unstable conditions
- C Stability: Slightly unstable conditions
- D Stability: Neutral conditions
- E Stability: Slightly stable conditions
- F Stability: Stable conditions

Table 7-1: Atmospheric Stability for Various Conditions[45]

Surface Wind Speed (m/s)	Daytime Isolation (Solar Radiation)			Nighttime Conditions (Cloud Cover)	
	Strong	Moderate	Slight	> 50%	< 50%
<2	A	A-B	B	e	F
2-3	A-B	B	C	E	F
3-4	B	B-C	C	D	E
4-6	C	C-D	D	D	D
>6	C	D	D	D	D

[45] Turner, D. Bruce. *Workbook of Atmospheric Dispersion Estimates: An Introduction to Dispersion Modeling. Second edition.* (Baca Raton, Florida: Lewis Publishers, 1994).

Atmospheric stability is not a factor in heat flux calculations, as radiation heat flux to a target is not affected by turbulence levels.

This analysis assumes the following atmospheric stability conditions for the consequence analysis:

- Thermal Radiation Heat Flux Calculations – not a factor
- Vapor Dispersion Calculations – stability class "F"

7.4.6 Wind Speed

Wind speed screening for the heat flux hazard calculations included wind speeds between 0 m/s (0 knots) and 10 m/s (19.4 knots), measured at the buoy anemometer height (2.8 m above the water). These correspond, respectively to the 5th and 95th percentile highest wind recorded at buoy station No. 42013. These values are consistent with the ambient conditions selection criteria in 49 CFR 193, which are being used as reference for the screening calculations. The screening calculations for thermal radiation hazards showed that higher wind speeds tend to give longer distances to given heat flux levels, due to the flame tilt induced by high winds. For vapor dispersion, the value of 2.01 m/s (specified in 49 CFR 193.2059) was selected as a known conservative value.[46]

Based on these results, the wind speeds assumed for this analysis are:

- Thermal Radiation Heat Flux Calculations – wind speed of 10 m/s at 2.8 meters (approximately 14.7 m/s (28.6 knots) at 10 meters)
- Vapor Dispersion Calculations – wind speed of 2.01 m/s (3.9 knots) at 10 meters

7.4.7 LNG Evaporation Rate

SAND2008-3153 performed a sensitivity study on the effect of LNG evaporation rates on thermal radiation heat flux distance from an LNG spill over water. In the study, the LNG pool regression rate was varied over a broad range that covers most of the available experimental data for large scale LNG spills. The Sandia results show that the pool regression rate has an effect on the hazard distances, as the rate of LNG evaporation directly affects the growth of the LNG pool on water. Sandia used a regression rate of $3 \cdot \times 10^{-4}$ m/s as the nominal value for the sensitivity study, which is consistent with the experimental data reported by Koopman.[47] This value has been since used by Sandia and others.[48,49]

[46] The choice of 2 m/s as the wind speed for vapor dispersion hazard calculations has been challenged in the public forum when applied to spills within impoundments. However, its validity as a conservative wind speed for spills over water remains unchallenged.

[48] Sandia National Labs, "Review of the Independent Risk Assessment of the Proposed Cabrillo Liquefied Natural Gas Deepwater Port Project," SAND2005-7339 (Albuquerque, NM: Sandia National Laboratory, 2005).
[49] ACE, "Cabrillo Port FSRU LNG Hazard Scenario Consequence Modeling, January 2006.

Screening calculations to evaluate the effects of the LNG regression rate (between $2 \cdot \times 10^{-4}$ and $5 \cdot \times 10^{-4}$ m/s) on the thermal radiation and vapor dispersion hazard distances indicated that lower vaporization rates tend to give larger hazard distances: lower vaporization rates (per unit area of LNG pool) result in larger LNG pools and therefore larger pool fires, as well as larger vapor clouds that can travel farther before dissipating below the LFL.

For unignited LNG pools, regression rates smaller than $3 \cdot \times 10^{-4}$ m/s are not consistent with most experimental data and correspond to water-to-LNG heat fluxes considered too low by several experts.[50] Therefore, consistent with previous analyses performed for large LNG spills over water, a liquid regression rate of $3 \cdot \times 10^{-4}$ m/s is used in this report for the vapor dispersion calculations.

In the absence of a generally accepted heat transfer model to calculate the vaporization rate of LNG over water, the effect of ocean water temperature variation on the LNG pool vaporization rate is neglected (the regression rate selected above does not depend on water temperature). This is a reasonable approximation, given the large temperature difference between water and LNG (on the order of 170-190°C, or 300-340°F, for the range of water temperatures recorded at buoy station No. 42013) and the non-uniform conditions that can be expected given the large area of the LNG/water interface.

7.5 Summary of Modeling Parameters

The vapor dispersion and thermal radiation hazard distance calculations in this study are performed using the parameter values listed in Table 7-2 and Table 7-3, respectively. The values of these parameters were applied consistently in the consequence analysis of all scenario specified in the IRA.

Table 7-2: Flammable Vapor Dispersion Modeling Parameters

Ambient Air Temperature	29.7°C (85°F)
Ambient Relative Humidity	50%
Wind Speed	2.0 m/s (3.9 knots) at 10 m elevation
Atmospheric Stability Class	F (Very stable)
LNG Vaporization Rate	$3 \cdot \times 10^{-4}$ m/s (0.135 kg/m^2-s)
LNG Composition	100% Methane

[50] FERC, 2004.

Table 7-3: Thermal Radiation Hazard Modeling Parameters

Ambient Air Temperature	29.7°C (85°F)
Ambient Relative Humidity	5%
Wind Speed	10 m/s (19.4 knots) at 2.8 m elevation
LNG Vaporization Rate	Parameterized (see Table 7-10)
LNG Composition	100% Methane

7.6 Threshold Criteria

7.6.1 Flammable Vapor Dispersion

A flammable vapor cloud can only be ignited if the gas concentration is between the Lower Flammability Limit (LFL) and the Upper Flammability Limit (UFL). For methane, the LFL is 5% (by volume) and the UFL is 15% (by volume). Federal regulations for land-based LNG terminals require 50% of the LFL to be used as the threshold concentration to determine the hazard distance for flammable vapor dispersion.[51] This approach effectively introduces a safety factor of two in the vapor dispersion calculations. This is reasonable when integral-type models, such as DEGADIS, are used to perform the calculations, since those models cannot account for localized effects that may allow pockets of higher concentration gas to travel farther than the bulk of the vapor cloud.

This consequence analysis uses a Reynolds-Averaged Navier-Stokes (RANS) based CFD model that is designed to account for flow perturbations that may cause non-uniform distribution of the flammable gas concentration as the vapor cloud disperses downwind. Transient simulations using RANS models provide results that are equivalent to a time-averaged solution of the flow field (the averaging time is approximately on the order of 30-60 s for the type of scenarios considered here). It has been argued that unsteady eddies, which are not captured by a RANS simulation, could extend farther than the time-averaged cloud boundary calculated by the model. However, the comparison of model predictions with experimental data (see Appendix A) showed that the model prediction is conservative by more than 10%. Therefore, it is appropriate to set the threshold concentration for flammable vapor dispersion to the LFL for methane.

7.6.2 Thermal Radiation Hazard Distance

Two different thermal radiation levels are considered of interest in the evaluation of risk to the public and property. The thermal radiation thresholds are defined as follows:

- 37.5 kW/m^2: Damage to process equipment and storage tanks for unprotected exposures based on an average 10-minute exposure duration, as well immediate fatalities
- 5 kW/m^2: Permissible level for emergency operations lasting several minutes with appropriate clothing based on an average 10-minute exposed duration and onset of second degree burns based on an average 40 second exposed duration

[51] 49 CFR 193.2057.

The results of the pool fire calculations will list the distance to each of these heat fluxes estimated from the center of the pool (i.e., from the spill location).

7.7 Effect of Tank Size and Breach Area on LNG Hazards

According to data from the applicant, two vessel types may be delivering LNG cargo to the DWP: a membrane-type SRV and a Moss-type SRV. The membrane-type vessel has five (5) separate membrane tanks, for a total cargo volume of approximately 217,000 m^3. The five tanks have different sizes, with tank No. 1 being the smallest (approximately 25,130 m^3 volume) and the other tanks (No. 2 through No. 5) being larger (approximately 48,050 m^3 volume each). These membrane-type LNGC tanks are expected to be filled to 98.5% capacity.

The Moss-type vessel has four (4) separate spherical tanks, for a total cargo volume of approximately 215,000 m^3. The four tanks are the same size with a volume of approximately 54,362 m^3 each. These Moss-type tanks are expected to be filled to 98.5% capacity. The total volume of LNG that will be spilled is equal to the volume of LNG above the hole(s) in every tank that is breached. In the scenarios considered here, the holes are assumed to be at the waterline; therefore, the total volume of LNG above the waterline will be spilled from every breached tank.

The worst-case release for the single-tank breach scenarios of the membrane-type LNGC (Scenario 1 and Scenario 4) will assume that one tank, No. 2-5, is breached. The worst-case release for the multiple-tank breach scenarios of the membrane-type LNGC (Scenario 2 and Scenario 3) will assume that two or more of tanks No. 2-5 are breached. Calculations based on the geometry of the proposed membrane-type LNGC resulted in a spilled volume equal to approximately 68% of the volume of each tank.

Since the four tanks in a Moss-type LNGC have the same diameter, it is irrelevant which tanks are assumed to be breached for any given scenario. Calculations based on the geometry of the proposed Moss-type LNGC resulted in a spilled volume equal to approximately 90% of the volume of each tank.

Scenarios 1 and 4, as well as Scenarios 5 and 8, assume single-tank breaches of similar size (16 m^2 vs. 17 m^2 for a membrane LNGC and 16 m^2 vs. 22 m^2 for a Moss LNGC). As such, the consequences associated with each pair of scenarios are expected to be very similar. Screening calculations were performed to determine whether separate simulations should be performed for Scenarios 1 and 4 (see Table 7-4) and for Scenarios 5 and 8 (see Table 7-5). Based on the screening results, it was decided that the vapor dispersion hazard distances for Scenarios 4 and 8 could be assumed as equal to those of Scenarios 1 and 5, respectively.

Table 7-4: Screening Comparison - Estimated Hazard Distances for Similar Hole Sizes of Membrane-type Tanks

	Intentional Scenario 1:	Accidental Scenario 4:	Difference
Breach Size Area (1 tank)	16 m^2	17 m^2	6.3 %
Breach Size Diameter	4.51 m	4.65 m	3.1 %
Spilled LNG Volume	32,256 m^3	32,256 m^3	0 %
Spill duration	361 s	344 s	4.9 %
Maximum pool size[52]	758 m	764 m	0.8 %
Distance to 5 kW/m^2	2,870 m	2,900 m	1.0 %
Distance to LFL	7,344 m	7,934 m	8.0 %

Table 7-5: Screening Comparison - Estimated Hazard Distances for Similar Hole Sizes of Moss-type Tanks

	Intentional Scenario 5:	Accidental Scenario 8:	Difference
Breach Size Area (1 tank)	16 m^2	22 m^2	38 %
Breach Size Diameter	4.51 m	5.29 m	17.3 %
Spilled LNG Volume	48,330 m^3	48,330 m^3	0 %
Spill duration	379 s	368 s	9.0 %
Maximum pool size[53]	886 m	890 m	0.5 %
Distance to 5 kW/m^2	3,340 m	3,360 m	0.6%
Distance to LFL	8,904 m	9,170 m	3.0 %

The three intentional breach scenarios (resulting hole sizes) are identical for the membrane-type and Moss-type SRVs. Therefore, screening calculations were performed to determine whether one type of SRV resulted in consistently greater hazard distances than the other and would serve as the bounding SRV type. Table 7-6 shows a comparison between Scenarios 1 and 5. The results indicate that the Moss-type SRV spill scenarios result in more conservative hazard distances (i.e., the spill volumes are larger and the distances to the thermal and flammable vapor dispersion endpoints are greater).

[52] Diameter, assuming a circular pool spread.
[53] Diameter, assuming a circular pool spread.

Table 7-6: Screening Comparison - Estimated Hazard Distances for Membrane-type and Moss-type Tanks

	Membrane-type Tank	Moss-type Tanks	Difference
Spilled LNG volume (1 tank)	32,256 m^3	48,330 m^3	49.8 %
Percentage (of tank volume spilled)	68.2%	90.3%	32.4 %
	Scenario 1: One tank, 16 m^2 breach	**Scenario 5: One tank, 16 m^2 breach**	
Spill duration	361 s	379 s	5.0 %
Maximum pool size[54]	758 m	886 m	16.9 %
Distance to 5 kW/m^2	2,870 m	3,340 m	16.4 %
Distance to LFL	7,344 m	8,904 m	21.2 %

The vapor dispersion CFD analysis was performed only for the bounding cases, or the most conservative hazard scenarios. Therefore, based on the screening comparisons in Table 7-4, Table 7-5, and Table 7-6, the CFD analysis was performed on the intentional scenarios applied to the Moss-type SRV(Scenarios 5 and 6). As noted previously, Scenarios 3 and 7 are based on immediate ignition and cascading damage of the SRV. Therefore, only the pool fire consequence is evaluated for these scenarios.

The pool fire hazard calculations, being performed using a faster analytical model, have been performed for each carrier type on all eight scenarios.

7.8 LNG Flow from a Tank Breach

If one or more tanks of an SRV are breached below the liquid level, LNG will flow through the breach(es). The flow of LNG through a breach is generally modeled as flow through an orifice, driven by the hydrostatic pressure of the LNG above the hole. The simplest form of the orifice model equation, which assumes atmospheric pressure at the top of the tank, is as follows:

$$Q = A C_D \sqrt{2 g h}$$

where:

- Q = volumetric flow rate (m^3/s)
- A = cross-sectional area of the breach (m^2)
- C_D = discharge coefficient
- g = acceleration due to gravity (m/s^2)
- h = LNG hydrostatic head above the breach (m)

The discharge coefficient accounts for flow reductions due to the shape of the hole; it typically ranges from approximately 0.3 (when the hole is partially obstructed) to 0.6 (for an unobstructed

[54] Diameter, assuming a circular pool spread.

hole with clean edges). The spill flow rate calculations for the vapor dispersion modeling are performed using a discharge coefficient equal to 0.6, which maximizes the LNG outflow rate and therefore represents a conservative assumption. The spill flow rate calculations for the purpose of the thermal radiation calculations are performed by varying C_D between 0.3 and 0.6, as part of the sensitivity study described below.

The hydrostatic head of LNG above the breach varies as a function of time during the spill, decreasing as LNG flows out of the tank(s). The initial hydrostatic head was calculated to be approximately 18.5 m for a membrane-type tank or 34.6 m for a Moss-type tank, assuming the tanks to be 98.5% full.

The orifice model does not take into account the actual shape of the breach, the presence of distorted metal surfaces, or the possibility that some of the LNG flowing out of the tank may not spill onto the water surface but instead fall into the ballast space between the hulls. The orifice flow model also assumes that the LNG free surface inside the tank remains at atmospheric pressure, and therefore ignores the possibility of any vacuum formation inside the tank, should flow through the vacuum breakers be overwhelmed by outflow through the breach. Therefore, the orifice flow model tends to overestimate the actual flow rate of LNG onto the water surface.

The LNG outflow model used in this study is based on calculations performed by the Federal Energy Regulatory Commission (FERC) staff.[55] The FERC model was modified to account for the non-uniform cross-section of the LNG carrier membrane tanks. The orifice flow model gives a time-dependent flow rate, which is maximum at the onset of flow and decreases monotonically as the LNG inventory is depleted. A summary of the LNG flow rates is given in Table 7-7. The LNG flow rates for all 8 scenarios are compared graphically in Figure 7-3 and Figure 7-4 for Scenarios 1-4 and Scenarios 5-8, respectively.

It should be noted that the total LNG volume spilled in Scenario 3 is one third more than Scenario 2, the individual tank breach diameters for Scenario 2 and Scenario 3 are equivalent, and the multiple tanks are emptied simultaneously. Therefore, the tanks empty in the same amount of time for Scenarios 2 and 3. A similar analogy can be made for Scenario 6 and Scenario 7.

[55] FERC, 2004.

Table 7-7: LNG Outflow for Scenarios 1-8

Scenario No.	Spilled Volume (m^3)	Maximum Flow Rate (kg/s)	Total Time to Discharge (s)
Scenario 1	32,256	77,267	361
Scenario 2	64,512	115,901	482
Scenario 3	96,769	173,851	482
Scenario 4	32,256	77,267	361
Scenario 5	48,330	105,668	379
Scenario 6	96,659	158,502	506
Scenario 7	144,989	237,753	506
Scenario 8	48,330	105,668	379

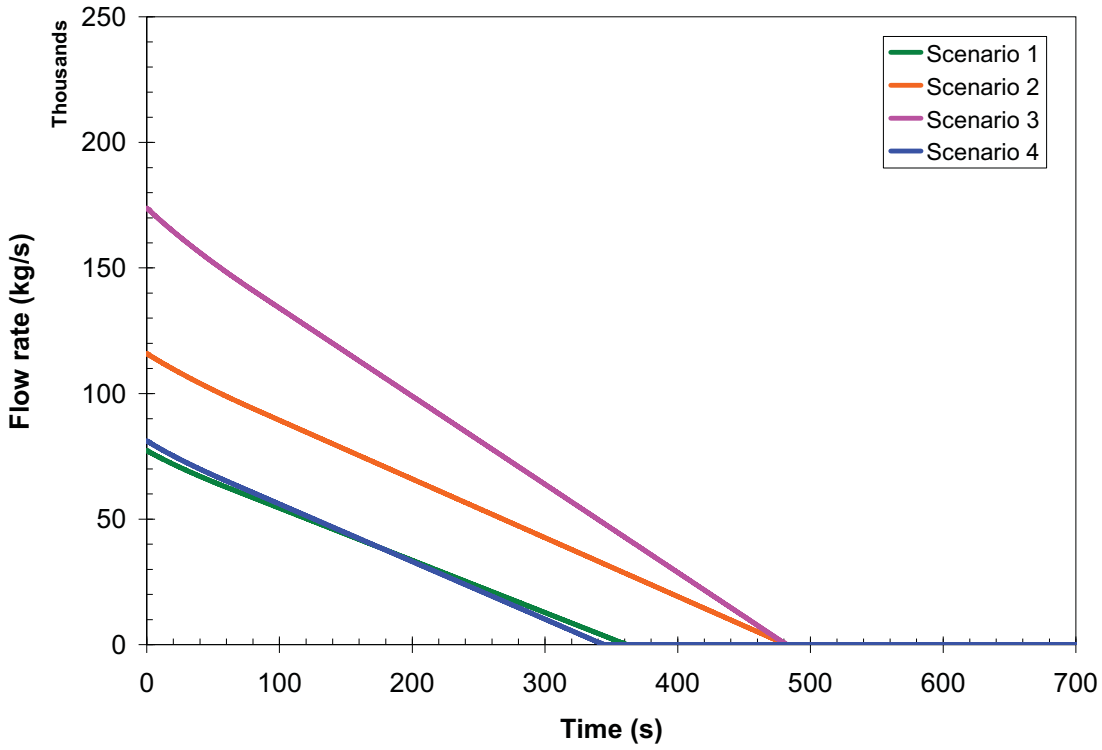

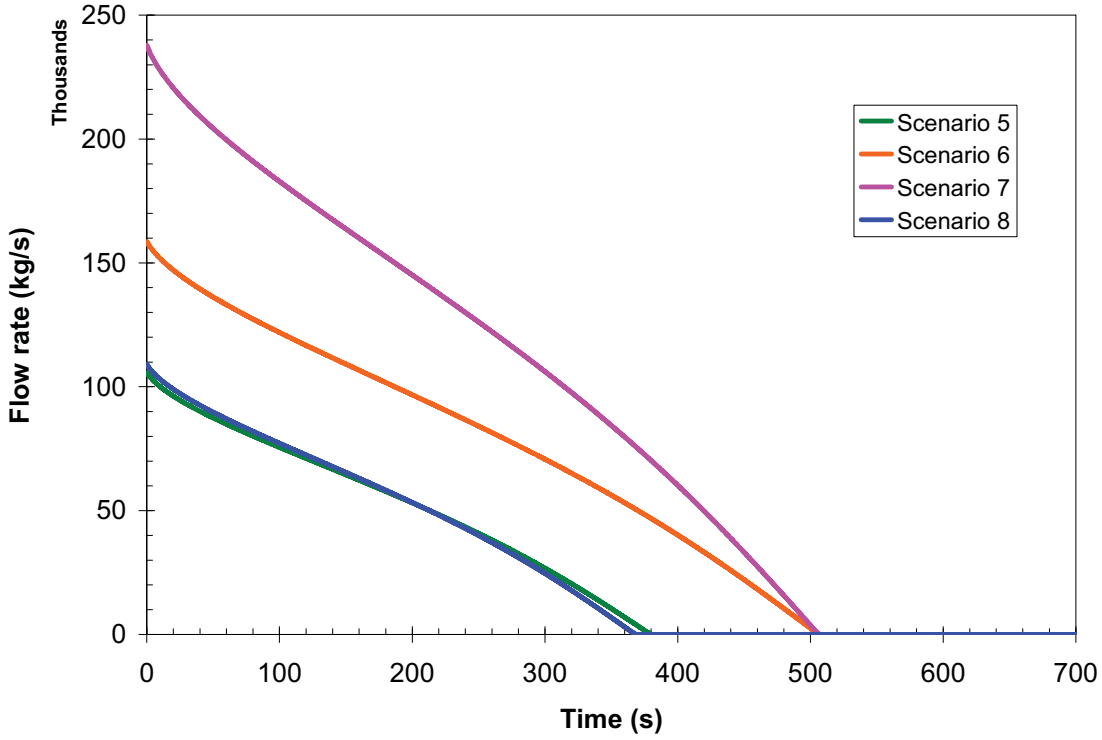

Figure 7-4: LNG flow rate for the Moss-type Scenarios 5-8

7.9 LNG Pool Spread over Water

LNG is lighter and much colder than seawater. The LNG flowing out of a tank breach and onto the water will form a floating pool. The LNG pool will spread onto the water surface and LNG will evaporate due to heat transfer from the water. The balance between LNG supply (spill flow from the tank) and removal (evaporation from the pool) determines how much LNG is in the pool as a function of time. The growth of the LNG pool also depends on the dynamic balance of forces such as inertia, gravity and friction acting on the pool.

The LNG pool spreading model proposed by FERC is used in this study.[56] The model describes the dynamic behavior of the LNG pool while LNG is flowing from the breached tank and, after the spill has stopped, until a minimum pool thickness (determined by surface tension effects) is reached and most of the LNG has evaporated. The FERC model assumes the LNG pool to have a time-dependent but uniform thickness, to remain at boiling temperature and to be subject to uniform heat transfer from the underlying water surface. The model accepts a time-varying LNG spill flow rate for the source term, which is calculated using the orifice flow model described in the previous section. A liquid regression rate of 3×10^{-4} m/s is adopted for the vaporization of LNG from an unignited pool over water as discussed in Section 7.4.7.

[56] FERC, 2004.

A summary of the LNG pool spread is given in Table 7-8. The pool results are compared graphically in Figure 7-5 and Figure 7-6 for Scenarios 1-4 and Scenarios 5-8, respectively. For the purpose of calculating the maximum pool size, as well as the maximum vapor dispersion distance, the LNG vapors are assumed to remain unignited. As discussed, Scenarios 3 and 7 are releases from a cascading failure of the LNG vessel. Since these scenarios assume immediate ignition, the results presented below are for illustration only since the distance to LFL is not evaluated.

The breach is assumed to occur on one side of the LNG carrier, so the spill begins to form a pool alongside the vessel. The size of the breach and the volume of LNG spilled are such that the pool will grow well past the stern and bow of the vessel. Therefore, the presence of the vessel is neglected for the purpose of calculating the rate of pool spread, and the pool is assumed to spread in a circle. Note that the high inertia of the pool, due to the large initial LNG flow rate, is such that the pool continues to grow until the LNG volume in the pool is depleted.

Table 7-8: LNG Pool Spread over Water, without Immediate Ignition

Scenario No.	Spilled Volume (m^3)	Discharge Duration (s)	Maximum Pool Diameter (m)	Time to Vaporize LNG Pool (s)
Scenario 1	32,256	361	758	522
Scenario 2	64,512	482	966	625
Scenario 3	96,769	482	1146	671
Scenario 4	32,256	361	758	522
Scenario 5	48,330	379	886	572
Scenario 6	96,659	506	1,130	686
Scenario 7	144,989	506	1,340	737
Scenario 8	48,330	379	886	572

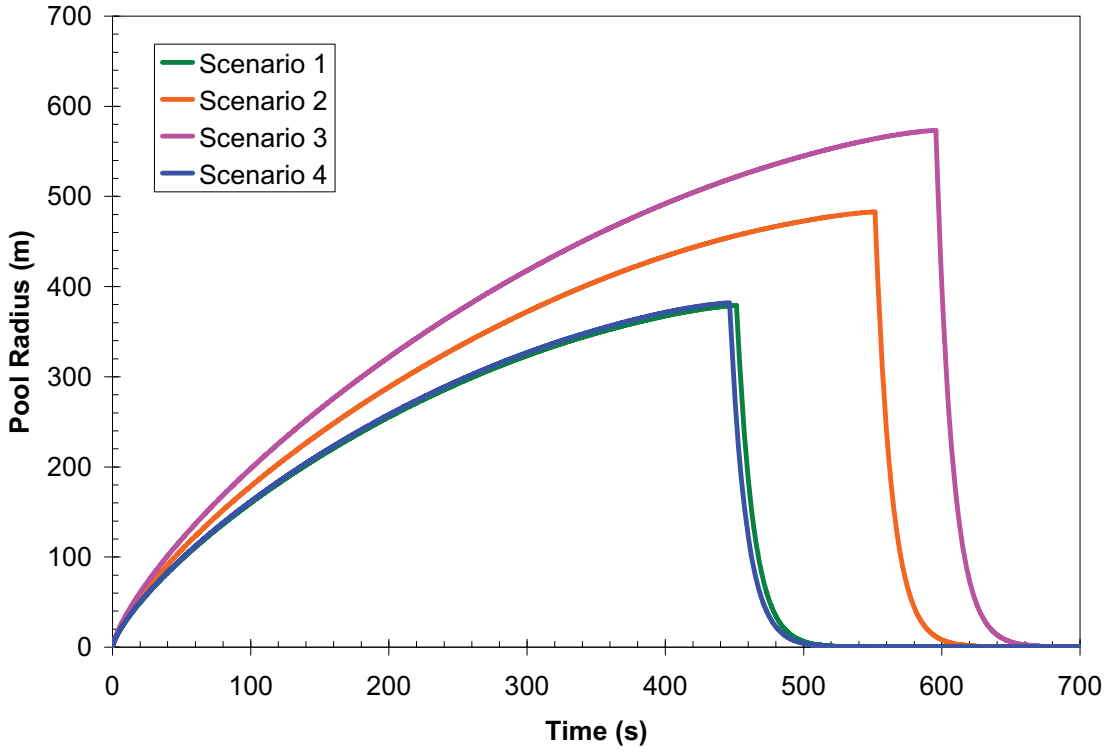

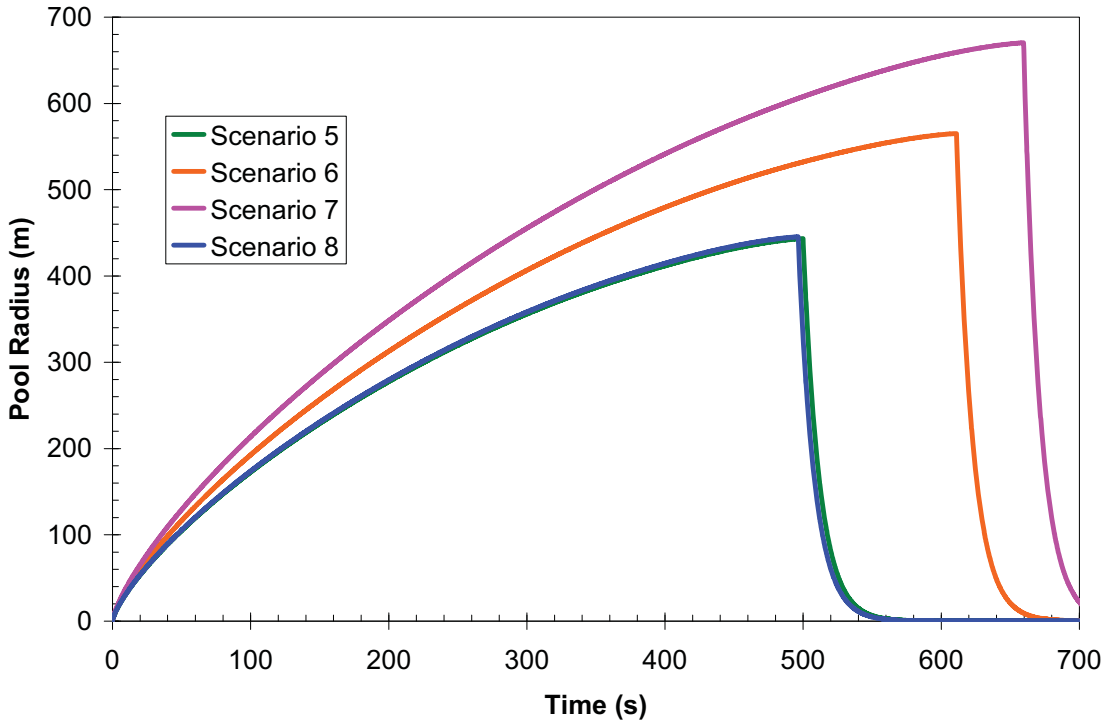

Figure 7-6: LNG pool spread over water, Moss-type Scenarios 5-8

7.10 Pool Fire Modeling

An LNG spill scenario can result in a pool fire when an LNG pool is formed onto the water surface and the vapors emanating from the pool are ignited close to the pool. The pool fire is fueled by the LNG that evaporates from the pool, as a result of heat transfer from the water underneath and the radiation from the fire above. The size of the LNG pool, and therefore the size of the pool fire, change with time as the pool spreads and recedes (see previous section). Therefore, the thermal radiation heat flux to a stationary target is a function of time, increasing when the pool expands towards the target and decreasing when the pool recedes towards the vessel. A conservative estimate of the radiation heat flux to a stationary target can be obtained by assuming the pool size to remain constant and equal to the maximum size reached by an unignited pool for a given LNG spill scenario. This conservative assumption is made in this study.

With the exception of the SRV, there are no other structures or geometric obstacles expected to be in proximity of the proposed DWP that could affect the growth of a pool fire or shield potential targets from the fire's radiation. Therefore, CFD models of the pool fire are not deemed necessary and simpler models can be used to calculate the thermal radiation hazard distances. A very common model for these scenarios is the solid flame model[57]: the fire is represented as a cylinder, whose base is equal to the area of the pool of fuel and whose height is determined from semi-empirical correlations. The radiation from the cylinder to a target depends on the emissive power of the fire surface, the transmissivity of the atmosphere, and the position of the target relative to the fire (the "view factor").

The characteristics of LNG pool fires are not known precisely. Therefore, the thermal radiation hazard distances are calculated for each scenario by performing a sensitivity analysis on several parameters, and obtaining average hazard distances based on the cases considered. As recommended by Sandia, five different parameters are included in the sensitivity analysis:

- Flame height correlation (nominal case evaluated below)
- Discharge coefficient is varied from 0.3 to 0.6 (0.6 is the nominal case)
- Burn rate (or liquid regression rate) is varied from 2×10^{-4} to 8×10^{-4} m/s (3×10^{-4} m/s is the nominal case)
- Surface emissive power is varied from 175 to 350 kW/m^2 (220 kW/m^2 is the nominal case)
- Atmospheric transmissivity is varied from 0.5 to 0.8 (0.8 is the nominal case)

To determine the nominal flame height correlation, a single release scenario was selected arbitrarily (Scenario 5 for the Moss-style LNG carrier), using the following solid flame model parameters

- Discharge coefficient = 0.6
- Burning rate = 3×10^{-4} m/s

[57] Beyler, 2002.

- Surface Emissive Power = 220 kW/m^2
- Transmissivity = 0.8

The flame height correlations that were evaluated included:

- Heskestad[58], based on many fire scenarios including burners using various fuels 5-50 cm in diameter, gasoline pool fires from 0.3 to 23 m in diameter, square pools of JP-4 fuel from 1 to 10 m, and under-ventilated wood cribs.
- Moorhouse[59] based on LNG pool fires with rectangular pools as large as 13.7 m.
- Pritchard and Binding[60] based on hydrocarbon (primarily LNG) pool fires 6-22 m in diameter.
- Thomas[61] based on wood crib fires 10 – 200 cm on a side.
- Zukoski[62] based on natural gas burners 10-50 cm in diameter.

Table 7-9 details the results of the flame height correlation analysis using the five flame height correlations, the nominal parameters for the solid flame model, and the release conditions for Scenario 5. From these results, the Moorhouse flame height correlation was selected as the nominal case. The Moorhouse correlation does not result in a flame height or thermal radiation distances that are at the upper and lower end of results range. Additionally, Moorhouse compares well with the average results of all five flame height correlations, with the Moorhouse flame height and thermal radiation distances slightly more conservative.

Table 7-9: Height Correlation Comparison

(Scenario 5 – Nominal Solid Flame Parameters)

Flame Height Correlation	Flame Height (m)	Distance (m) to 37.5 kW/m2	Distance (m) to 25 kW/m2	Distance (m) to 5 kW/m2
Heskestad	765	1,350	1,590	2,960
Moorhouse	966	1,500	1,770	3,340
Pritchard and Binding	1,181	1,630	1,950	3,720
Thomas	472	1,100	1,270	2,320
Zukoski	827	1,400	1,640	3,080
Average (of 5 correlations)	**842**	**1,410**	**1,660**	**3,110**

Given the selection of the Moorhouse flame height correlation, seven (7) sensitivity cases were evaluated for each intentional and accidental release scenario to determine the pool fire results for the IRA. Table 7-10 summarizes the numerical values of the parameters included in the pool fire sensitivity analysis.

6	0.6	3×10^{-4}	350	0.8	Moorhouse
7	0.6	3×10^{-4}	220	0.5	Moorhouse

7.10.1 Scenario 1 - Thermal Radiation Hazard Distance Results

The maximum pool size was calculated based on the Scenario 1 spill flow rate and on the parameters for each of the seven sensitivity analysis cases (Table 7-10). The maximum pool fire diameter and the hazard distances to the two selected thermal radiation hazard levels (37.5 and 5 kW/m^2) are listed in Table 7-11 and distances measured from the center of the pool. In addition to each sensitivity case, the average pool fire diameter and distance to 37.5 and 5 kW/m^2 are reported. The average pool fire diameter and thermal radiation distances are the final pool fire results for Scenario 1 reported in the IRA.

Table 7-11: Scenario 1 – Thermal Radiation Hazard Results

Case No.	Pool Diameter (m)	Distance (m) to 37.5 kW/m^2	Distance (m) to 5 kW/m^2
1	760	1,300	2,870
2	580	1,030	2,230
3	840	1,390	2,950
4	530	970	2,380
5	760	1,180	2,620
6	760	1,570	3,480
7	760	1,040	2,380
Average	**710**	**1,210**	**2,700**

7.10.2 Scenario 2 - Thermal Radiation Hazard Distance Results

The maximum pool size was calculated based on the Scenario 2 spill flow rate and on the parameters for each of the seven sensitivity analysis cases (Table 7-10). The maximum pool fire diameter and the hazard distances to the two selected thermal radiation hazard levels (37.5 and 5 kW/m^2) are listed in Table 7-12, and distances measured from the center of the pool. In addition to each sensitivity case, the average pool fire diameter and distance to 37.5 and 5 kW/m^2 are reported. The average pool fire diameter and thermal radiation distances are the final pool fire results for Scenario 2 reported in the IRA.

Table 7-12: Scenario 2 – Thermal Radiation Hazard Results

Case No.	Pool Diameter (m)	Distance (m) to 37.5 kW/m^2	Distance (m) to 5 kW/m^2
1	970	1,610	3,630
2	730	1,270	2,780
3	1,070	1,730	3,740
4	670	1,170	2,970
5	970	1,450	3,310
6	970	1,960	4,410
7	970	1,270	3,000
Average	**900**	**1,490**	**3,410**

7.10.3 Scenario 3 - Thermal Radiation Hazard Distance Results

The maximum pool size was calculated based on the Scenario 3 spill flow rate and on the parameters for each of the seven sensitivity analysis cases (Table 7-10). The maximum pool fire diameter and the hazard distances to the two selected thermal radiation hazard levels (37.5 and 5 kW/m^2) are listed in Table 7-13, and distances measured from the center of the pool. In addition to each sensitivity case, the average pool fire diameter and distance to 37.5 and 5 kW/m^2 are reported. The average pool fire diameter and thermal radiation distances are the final pool fire results for Scenario 3 reported in the IRA.

Table 7-13: Scenario 3 – Thermal Radiation Hazard Results

Case No.	Pool Diameter (m)	Distance (m) to 37.5 kW/m^2	Distance (m) to 5 kW/m^2
1	1,150	1,870	4,280
2	890	1,500	3,360
3	1,260	2,000	4,400
4	810	1,360	3,530
5	1,150	1,680	3,890
6	1,150	2,280	5,210
7	1,150	1,470	3,530
Average	**1,080**	**1,740**	**4,030**

7.10.4 Scenario 4 - Thermal Radiation Hazard Distance Results

The maximum pool size was calculated based on the Scenario 4 spill flow rate and on the parameters for each of the seven sensitivity analysis cases (Table 7-10). The maximum pool fire diameter and the hazard distances to the two selected thermal radiation hazard levels (37.5 and 5 kW/m^2) are listed in Table 7-14, and distances measured from the center of the pool. In addition to each sensitivity case, the average pool fire diameter and distance to 37.5 and 5 kW/m^2 are reported. The average pool fire diameter and thermal radiation distances are the final pool fire results for Scenario 4 reported in the IRA.

.

Table 7-14: Scenario 4 – Thermal Radiation Hazard Results

Case No.	Pool Diameter (m)	Distance (m) to 37.5 kW/m^2	Distance (m) to 5 kW/m^2
1	760	1,300	2,870
2	580	1,030	2,230
3	840	1,390	2,950
4	530	970	2,380
5	760	1,180	2,620
6	760	1,570	3,480
7	760	1,040	2,380
Average	**710**	**1,210**	**2,700**

7.10.5 Scenario 5 - Thermal Radiation Hazard Distance Results

The maximum pool size was calculated based on the Scenario 5 spill flow rate and on the parameters for each of the seven sensitivity analysis cases (Table 7-10). The maximum pool fire diameter and the hazard distances to the two selected thermal radiation hazard levels (37.5 and 5 kW/m^2) are listed in Table 7-15, and distances measured from the center of the pool. In addition to each sensitivity case, the average pool fire diameter and distance to 37.5 and 5 kW/m^2 are reported. The average pool fire diameter and thermal radiation distances are the final pool fire results for Scenario 5 reported in the IRA.

Table 7-15: Scenario 5 – Thermal Radiation Hazard Results

Case No.	Pool Diameter (m)	Distance (m) to 37.5 kW/m^2	Distance (m) to 5 kW/m^2
1	890	1,500	3,340
2	680	1,180	2,580
3	980	1,590	3,430
4	620	1,100	2,760
5	890	1,350	3,050
6	890	1,810	4,060
7	890	1,190	2,770
Average	**840**	**1,390**	**3,140**

7.10.6 Scenario 6 - Thermal Radiation Hazard Distance Results

The maximum pool size was calculated based on the Scenario 6 spill flow rate and on the parameters for each of the seven sensitivity analysis cases (Table 7-10). The maximum pool fire diameter and the hazard distances to the two selected thermal radiation hazard levels (37.5 and 5 kW/m^2) are listed in Table 7-16, and distances measured from the center of the pool. In addition to each sensitivity case, the average pool fire diameter and distance to 37.5 and 5 kW/m^2 are reported. The average pool fire diameter and thermal radiation distances are the final pool fire results for Scenario 6 reported in the IRA.

Table 7-16: Scenario 6 – Thermal Radiation Hazard Results

Case No.	Pool Diameter (m)	Distance (m) to 37.5 kW/m^2	Distance (m) to 5 kW/m^2
1	1,130	1,850	4,220
2	850	1,450	3,220
3	1,250	1,990	4,360
4	780	1,330	3,430
5	1,130	1,660	3,840

Average	**840**	**1,390**	**3,140**

7.10.9 Summary of Thermal Radiation Hazard Distances

Based on the solid flame model sensitivity results, the maximum pool fire diameter and distances to 37.5 and 5 kW/m^2 are presented in Table 7-19 for each release scenario. Scenarios 1-4 are the pool fire results for the membrane-style LNG carrier and Scenarios 5-8 are the pool fire results for the Moss-style LNG carrier. As compared with the individual scenario results, the pool fire results for the IRA are represented by the average results from the solid flame model sensitivity analysis.

Table 7-19: Distances to Selected Thermal Radiation Hazard Levels (measured from the center of the pool)

Scenario No.	Pool Diameter (m)	Distance (m) to 37.5 kW/m^2	Distance (m) to 5 kW/m^2
Scenario 1	710	1,210	2,700
Scenario 2	900	1,490	3,410
Scenario 3	1,080	1,740	4,030
Scenario 4	710	1,210	2,700
Scenario 5	840	1,390	3,140
Scenario 6	1,060	1,710	3,960
Scenario 7	1,260	1,990	4,680
Scenario 8	840	1,390	3,140

7.11 Flammable Vapor Cloud Dispersion Modeling

If the LNG vapors emanating from the LNG pool water surface are not ignited in proximity of the pool, the LNG vapors will be transported downwind. The vapor cloud is initially cold and dense, but becomes lighter as it moves away from the pool, entrains warmer air and absorbs heat from the environment. If the vapor cloud encounters a viable ignition source before the gas concentration drops below the LFL (5% by volume for methane in air), the cloud will ignite, resulting in a flash fire. Otherwise, the vapor cloud dissipates harmlessly in the atmosphere.

The commercial code Fluent was selected to simulate the dispersion of the flammable vapor cloud resulting from the evaporation of an LNG spill over water. Fluent has been used extensively in dispersion analysis and has sophisticated atmospheric turbulence models that allow it to simulate different types of boundary layer profiles. In previous simulations of dense, large volume releases of cold air performed by Exponent, Fluent results compared favorably with validated models. Before modeling the vapor dispersion from the LNG tanker spill scenarios prescribed for this study, Fluent was also tested using data from test No. 8 of the U.S. Department of Energy's Burro Tests series[63], as described in Appendix A.[64]

[63] R.P. Koopman et al., "LLNL/NWC1980 LNG spill tests. Burro Series Data Report", UCID-19075-Vol.1, Dec. 1982.

[64] This validation exercise was performed for Fluent version 6.3, which is also the version used for the consequence analysis modeling results presented in this report.

The flammable vapor dispersion results to the LFL are discussed below for the Membrane and Moss-style SRVs. Of the eight release scenarios, Scenario 3 and Scenario 7 are not evaluated for distance to LFL. The reason these scenarios have been omitted is that they represent the cascading release of three storage compartments of an SRV--Scenario 3 is a release from the membrane-style and Scenario 7 is a release from the Moss-style LNG carrier. Since these scenarios assume immediate ignition, the only potential consequence evaluated for these scenarios in the IRA is a pool fire and resultant thermal radiation.

Since the intentional and vessel collision breach sizes for both the membrane and Moss-style LNG carrier are similar for this project, only the LNG vessel style that results in the greatest flammable vapor dispersion distances (bounding case) for the intentional and accidental scenarios is reported in the IRA. From Section 7.7 it was shown that for a given release size, the Moss-style LNG carrier will results in the greatest flammable vapor dispersion distance. Therefore, only the results of the Moss-style LNG carrier are presented in this section (Scenarios 5, 6, and 8).

7.11.1 Scenario 5 - Vapor Cloud Dispersion Results

Snapshots from the simulation of the flammable vapor cloud dispersion for Scenario 5 are shown in Figure 7-7. The plots show the footprint of the 5% (by volume) gas concentration cloud, color-coded to show the thickness of the flammable cloud. The sequence of images shows the initial growth of the flammable cloud and its progressive dissipation once the LNG pool is depleted.

The downwind evolution of the LNG vapor cloud is described in Figure 7-8, which shows the maximum downwind distance to LFL as a function of time. The maximum distance reached by the flammable vapors in Scenario 5 is approximately 4,980 m from the location of the spill. The maximum distance to LFL is reached approximately 26 minutes after the initiating event.

The crosswind dispersion of the flammable vapor cloud as a function of time is shown in Figure 7-9. The maximum cloud half width is approximately 2,285 m and occurs approximately 23 minutes after the initiating event.

The LNG vapor cloud is initially cold (approximately -162°C) and heavier than air. The CFD simulation indicates that the vapor cloud remains heavier than air while in the flammable range. Figure 7-10 shows the thickness of the flammable vapor cloud as a function of time. The flammable cloud reaches approximately 110 m high, approximately 10.3 minutes after the initiating event.

Figure 7-7: Snapshots of the LFL Vapor Cloud Simulation for Scenario 5

(from left to right, top to bottom: t = 420 s; 720 s; 1020 s; 1200 s; 1380 s; 1560 s). Domain Size is 17.5 km in the X direction by 20 km in the Y direction. Cloud is color-coded according to the local cloud thickness in meters.

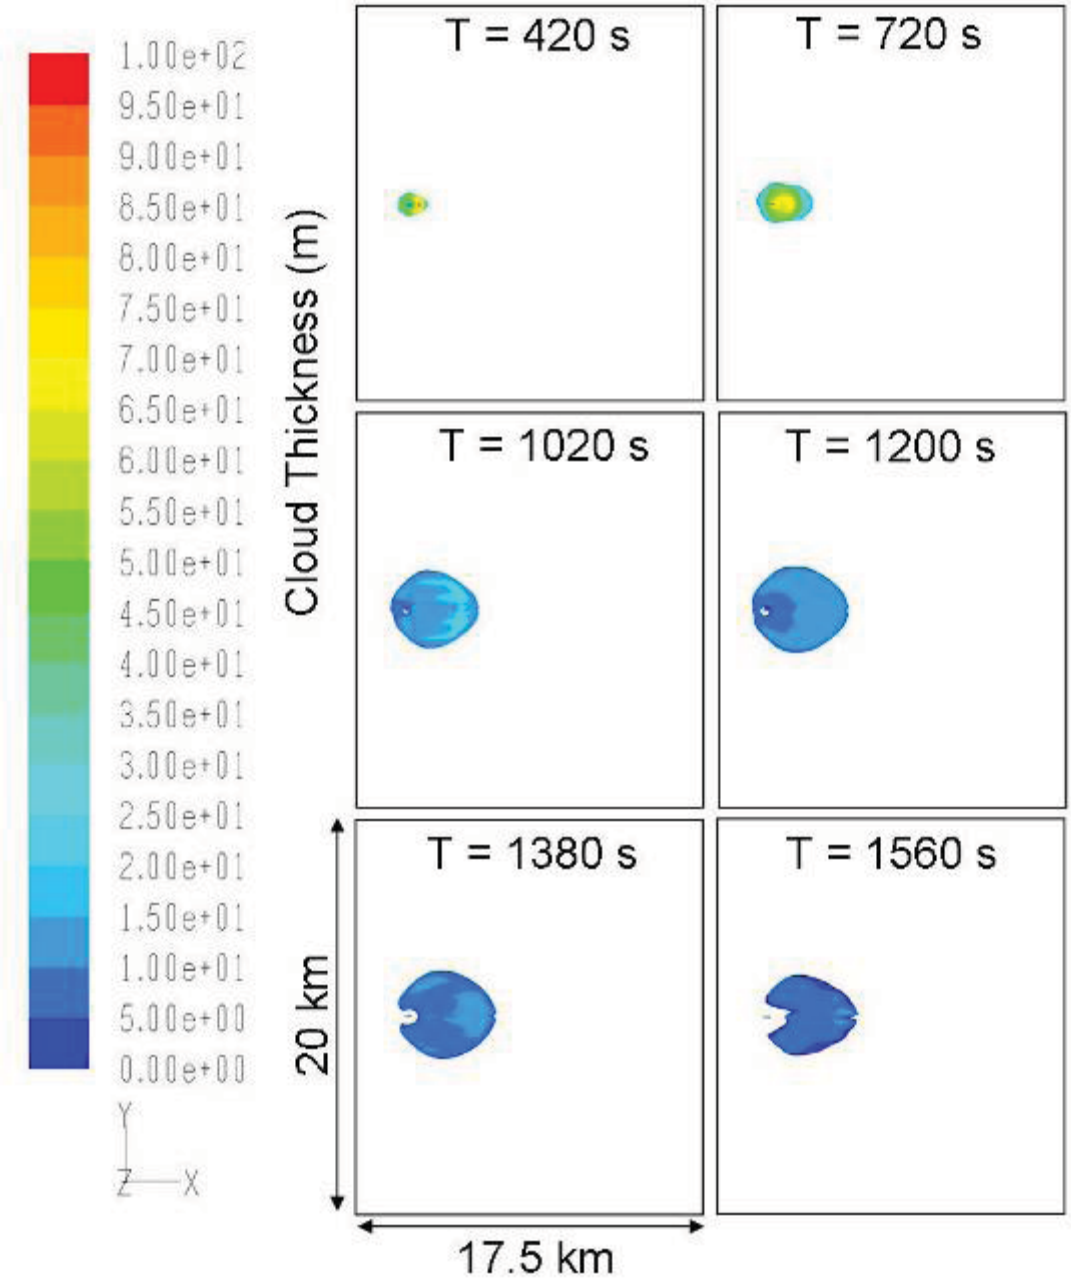

Figure 7-8: Distance to LFL as a Function of Time (Scenario 5)

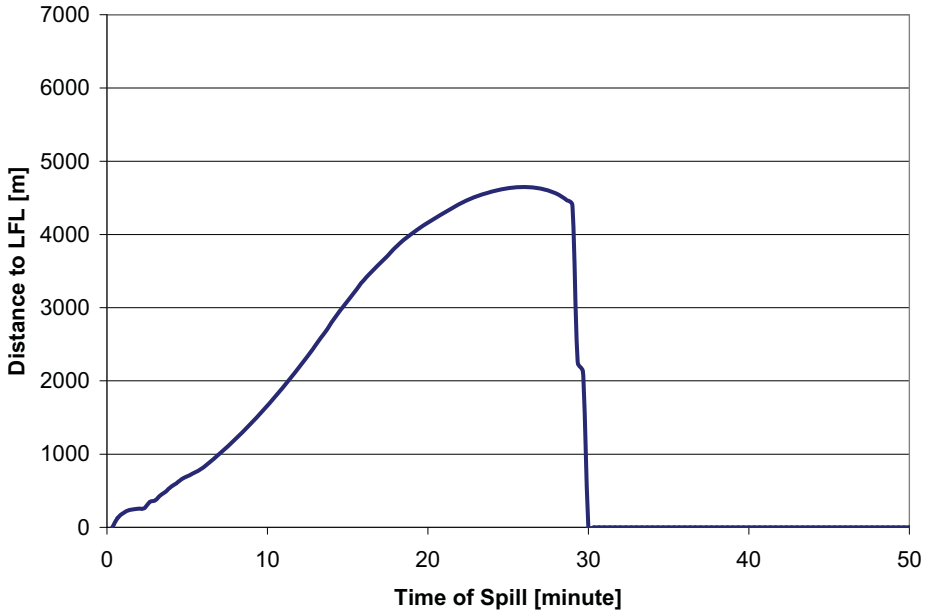

Figure 7-9: Flammable Vapor Cloud Half Width (Crosswind) as a Function of Time (Scenario 5)

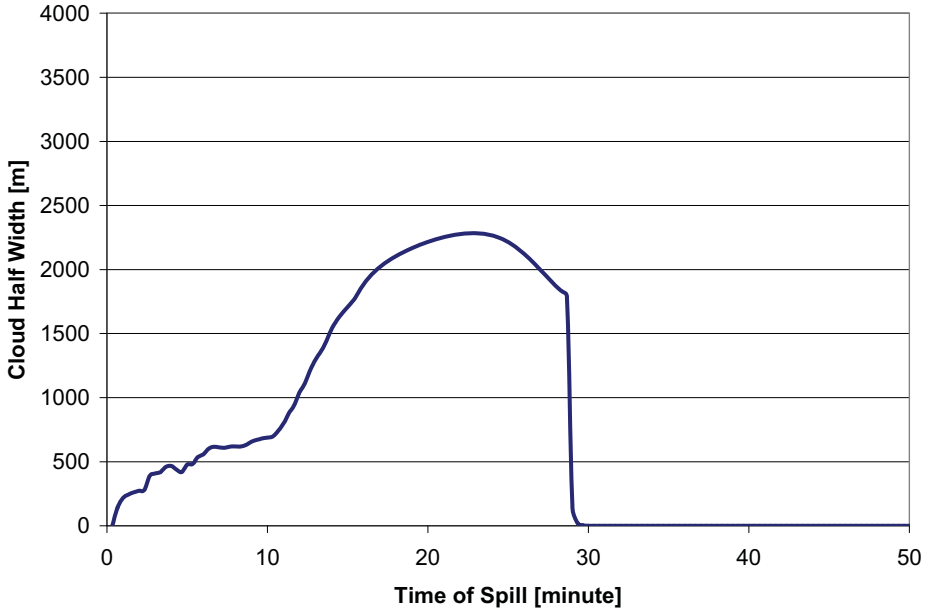

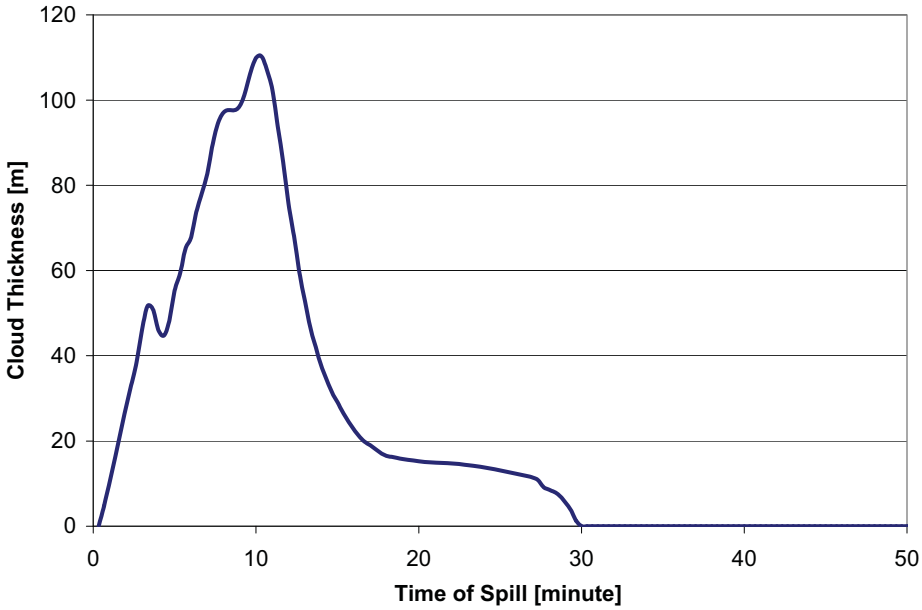

Figure 7-10: Flammable Vapor Cloud Thickness as a Function of Time (Scenario 5)

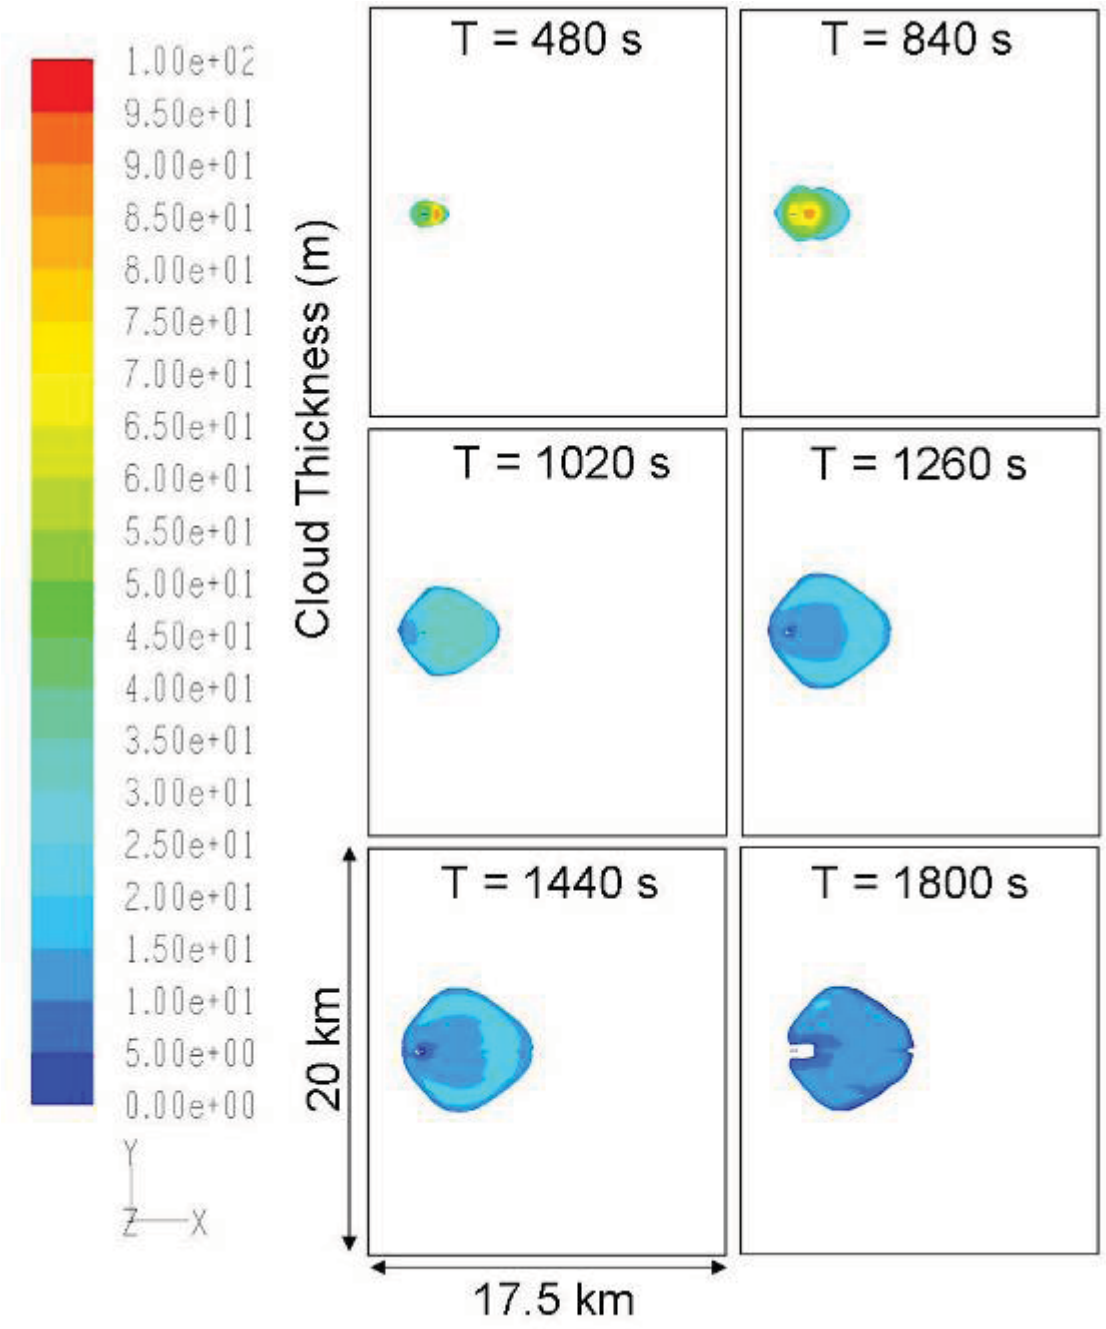
7.11.2 Scenario 6 - Vapor Cloud Dispersion Results

Snapshots from the simulation of the flammable vapor cloud dispersion for Scenario 6 are shown in Figure 7-11. The plots show the footprint of the 5% (by volume) gas concentration contour, color-coded to show the thickness of the flammable cloud. The sequence of images shows the initial growth of the flammable cloud and its progressive dissipation once the LNG pool is depleted.



The downwind evolution of the LNG vapor cloud is described in Figure 7-12, which shows the maximum downwind distance to LFL as a function of time. The maximum distance reached by the flammable vapors in Scenario 6 is approximately 6,095 m from the location of the spill. The maximum distance to LFL is reached approximately 30 minutes after the initiating event.

The crosswind dispersion of the flammable vapor cloud as a function of time is shown in Figure 7-13. The maximum cloud half width is approximately 3,205 m and occurs approximately 27 minutes after the initiating event.

The LNG vapor cloud is initially cold (approximately -162°C) and heavier than air. The CFD simulation indicates that the vapor cloud remains heavier than air while in the flammable range. Figure 7-14 shows the thickness of the flammable vapor cloud as a function of time. The flammable cloud reaches approximately 112 m high, approximately 12.3 minutes after the initiating event.

Figure 7-11: Snapshots of the LFL Vapor Cloud Simulation for Scenario 6

(from left to right, top to bottom: t = 480 s; 840 s; 1020 s; 1260 s; 1440 s; 1800 s). Domain Size is 17.5 km in the X direction by 20 km in the Y direction. Cloud is color-coded according to the local cloud thickness in meters

.

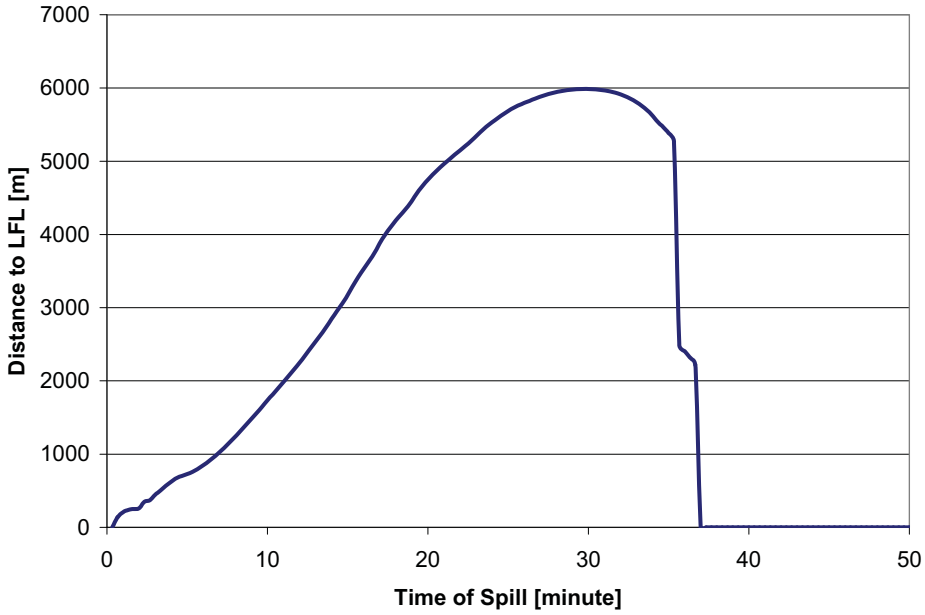

Figure 7-13: Flammable Vapor Cloud Half Width (Crosswind) as a Function of Time (Scenario 6)

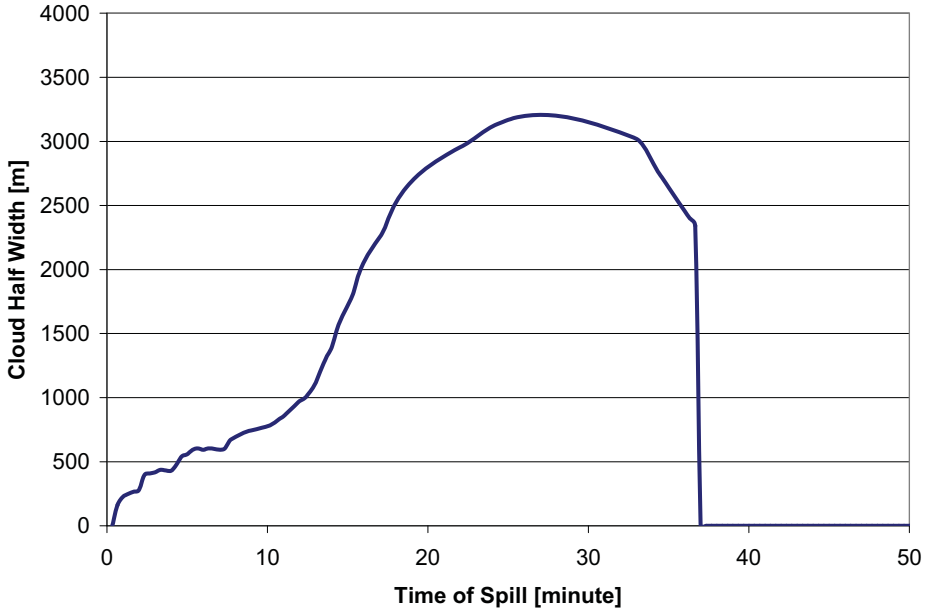

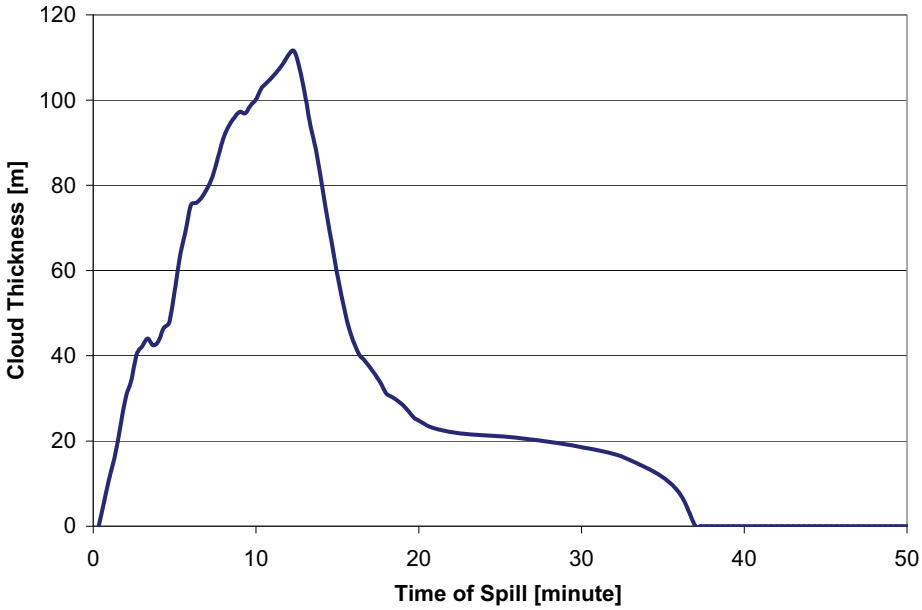

Figure 7-14: Flammable Vapor Cloud Thickness as a Function of Time (Scenario 6)

7.11.3 Scenario 8 - Vapor Cloud Dispersion Results

As discussed earlier Section 7.7, as part of the screening calculations, it was determined that the vapor dispersion hazard distance for Scenario 8 were similar to Scenarios 5, due to similar holes sizes for the intentional and accidental release scenarios. Therefore, as shown below in Table 7-20 the distances to LFL for scenario 5 and 8 are both equal to 4,980 meters.

7.11.4 Summary of Flammable Vapor Dispersion from LNG Pool on Water

The vapor cloud dispersion hazard distance was determined as the maximum downwind distance to the LFL. The vapor dispersion simulations were performed using Fluent, a commercial CFD code. Fluent was validated for this study by comparing it with experimental LNG vapor dispersion data from the Burro tests and demonstrating good agreement between the two (Appendix A). The vapor dispersion CFD analysis was performed for the most conservative hazard scenarios, specifically the intentional scenarios developed for a Moss-type SRV (Scenarios 5 and 6). The distances to LFL predicted by Fluent for these scenarios are listed in Table 7-20. Vapor dispersion distances are measured from the center of the LNG pool.

The vessel collision scenarios (Scenario 4 and 8) have consequences equal to intentional Scenarios 1 and 5 (for the respective SRV type). This is because the release size for these scenarios is comparable.

There are no flammable vapor dispersion results for the cascading failure scenarios (Scenario 3 and Scenario 7). Since these cases assume immediate ignition, the consequence of a release is a pool fire.

Table 7-20: Distances to LFL for vapor cloud dispersion from an LNG pool on water (measured from the center of the pool)

Scenario No.	Distance to LFL (meters)
Scenario 1	4,980
Scenario 2	6,095
Scenario 3	Not Evaluated (Immediate Ignition)
Scenario 4	4,980
Scenario 5	4,980
Scenario 6	6,095
Scenario 7	Not Evaluated (Immediate Ignition)
Scenario 8	4,980

8.0 IRA Results and Conclusions

The following section details the results of the consequence modeling and collision frequencies. Consequence results are depicted graphically on nautical charts.

8.1 Consequence Modeling Results

Thermal radiation hazard calculations from both pool fires and flammable vapor dispersion CFD modeling to the LFL were performed for the following LNG release scenarios:

- Intentional attack leading to a 16 m^2 breach in a single SRV tank.
- Intentional attack leading to a 12 m^2 breach in two (2) SRV tanks.
- Intentional attack leading to a 12 m^2 breach in three (3) SRV tanks.
- Vessel collision leading to a 22 m^2 breach in a single SRV tank.

Since the IRA defines and analyzes only the bounding intentional and vessel collision scenarios, the intentional scenario with the largest thermal radiation and flammable vapor dispersion results and the vessel collision scenario will be the focus of the Port Dolphin results. As detailed in Section 7 and presented below:

- Even though the membrane and Moss SRVs have different tank dimensions, the screening showed that the estimated hazard distances would be bounded by a release from the Moss-style SRV. Therefore, the consequence modeling for all release scenarios was performed for the parameters of a Moss SRV. Specifically, the result from Scenarios 5, 6, 7, and 8 have been modeled.
- Scenario 6 (Intentional attack leading to a 12 m^2 breach in two (2) SRV tanks) is the bounding intentional scenario for vapor cloud dispersion.
- Scenario 7 (Intentional attack leading to a 12 m^2 breach in three (3) SRV tanks) is the bounding intentional scenario for pool fire. Since this scenario assumes immediate ignition (there would be no vapor cloud hazard) and cascading damage, the consequences are limited to thermal radiation. As such, Scenario 7 is the bounding thermal radiation scenario and Scenario 6 in the bounding flammable vapor dispersion scenario for the intentional attacks.
- Scenario 8 results for thermal radiation and vapor cloud dispersion are presented for a vessel collision with a Moss-design SRV and can be compared to the bounding intentional scenarios (22 m^2 breach).
- Scenario 5 graphical overlays centered at the DWP are not presented in the results and conclusions as the consequence zones for this intentional scenario are smaller than for Scenario 6 and 7 (Scenario 5 is not the bounding intentional scenario).

8.1.1 Thermal Radiation Hazard Distances from Pool Fire

Thermal radiation hazard distances from a pool fire were estimated to two different heat flux levels:

- 37.5 kW/m^2: Damage to process equipment and storage tanks for unprotected exposures based on an average 10-minute exposure duration, as well immediate fatalities
- 5 kW/m^2: Permissible level for emergency operations lasting several minutes with appropriate clothing based on an average 10-minute exposed duration and onset of second degree burns based on an average 40-second exposed duration

Table 8-1 details the pool fire consequence results for the intentional (Scenario 5-7) and vessel collision (Scenario 8). This table details the number of tanks breached, release quantity (from the tank(s) breached), pool fire diameter (from the ship which is the origin of the spill), and distances to the 37.5kW/m^2 and 5kW/m^2 thermal radiation endpoints. For the Moss-style SRV the release quantity is equal to 90.3% of the storage volume in each tank involved in the scenario. This is the volume of LNG at, or above, the waterline of the SRV.

Table 8-1: Distances to Selected Thermal Radiation Hazard Levels

(distances measured from the center of the pool)

Result	Scenario 5 (Intentional)	Scenario 6 (Intentional)	Scenario 7 (Intentional)	Scenario 8 (Vessel Collision)
Breach Size, m^2	16	12	12	22
Number of Tanks	1	2	3	1
Capacity of Tank(s), m^3	54,362	108,724	163,086	54,362
Release Quantity, m^3	48,330	96,660	144,990	48,330
Thermal Radiation Hazard Maximum Distance to Endpoint (meters)				
Pool Diameter (immediate ignition)	840	1,060	**1,260**	**840**
Heat Flux > 37.5kW/m^2	1,390	1,710	**1,990**	**1,390**
Heat Flux > 5 kW/m^2	3,140	3,960	**4,680**	**3,140**

The results and conclusions for this risk analysis have considered the most conservative thermal radiation distances. These results have been highlighted in bold-face type in Table 8-1. As shown, Scenario 7 is the bounding case for the intentional scenarios.

8.1.2 Flammable Vapor Cloud Dispersion

The vapor cloud dispersion hazard distance was reported as the maximum downwind distance to the Lower Flammability Limit (LFL).

The flammable vapor cloud dispersion simulations were performed using Fluent, a commercial CFD code. Fluent was validated for this study and compared favorably with experimental LNG vapor dispersion data from the Burro tests (Appendix A). The distances to LFL predicted by

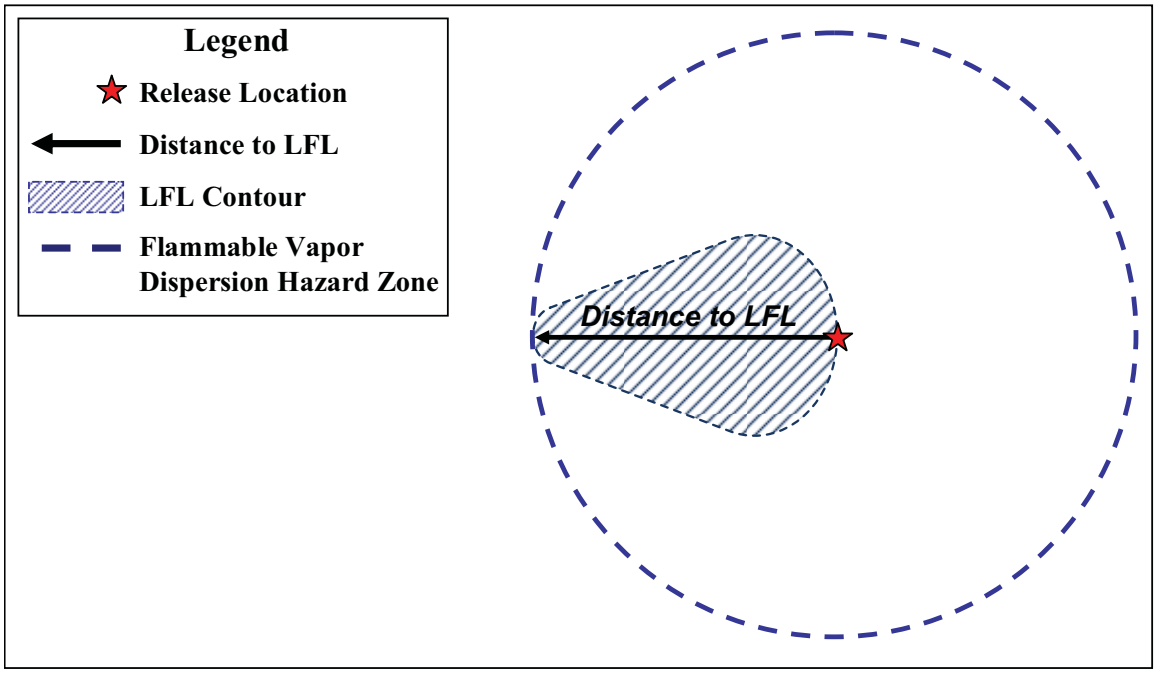
Fluent for the intentional and accidental release scenarios are detailed in Table 8-2. All distances are measured from the center of the LNG pool.

Table 8-2: Distance to LFL

(distance measured from the center of the pool)

Release Scenario	Distance to LFL (m)
Scenario 5 (Intentional)	4,980
Scenario 6 (Intentional)	6,095
Scenario 7 (Intentional)	***Immediate Ignition No Vapor Cloud Hazard***
Scenario 8 (Vessel Collision)	4,980

The major hazard of this consequence is the ignition and combustion of the flammable gas within the cloud--called a flash fire. A flash fire can result in potential impacts to the public and property. Due to the speed of the flame (as it propagates from the ignition source through the flammable range of the cloud), the impacts will be highly dependent on an individual's location (indoors vs. outdoors) and on the construction of the property exposed to the fire.



Thermal radiation effects from the vapor cloud fire can extend outside the flammable portion of the cloud and could result in a larger hazard distance as compared to the distance to LFL. But, due to the transient nature of this fire, the exposure duration from a flash fire is much shorter than exposure duration of a pool fire and is thus much shorter than the basis for the thermal radiation endpoints presented in Section 8.1.1. Assuming the flame acceleration of the flash fire is not impacted significantly by obstacles (consistent with the open nature of the DWP locations), the expected flame speed through the cloud could range from 8-17 m/s.[65] At these flame speeds, the exposure duration would not be significant, thus requiring a much higher thermal radiation exposure to result in comparable impacts to those listed in Section 8.1.1. Due to the uncertainty in the thermal radiation effects outside the flammable range of the vapor cloud, no additional thermal radiation has been considered and the hazard distances reported are limited to the distance to LFL.

For both the thermal radiation and flammable vapor dispersion consequence results, the hazard zones are presented in Section 8.3 as overlays at the DWP buoy locations. As compared to the pool fire consequence, where the thermal radiation hazard extends radially from the pool fire center (assumed to be the ship), the flammable vapor dispersion hazard will extend as a cloud dispersing in the downwind direction. Since the flammable vapor dispersion hazard zone is dependent on the wind direction at the time of release, the flammable vapor dispersion hazard zone overlays for the IRA are depicted as a circular area, with a radius equal to the maximum distance to the LFL, and centered at the spill location (assumed to be the ship). This representation of the flammable vapor hazard is independent of wind direction, illustrating the hazard from all wind directions.

[65] P.K. Raj, et al., *Experiments involving pool and vapor fires from spills of liquefied natural gas on water*, Arthur D. Little, ADA 077073, June 1979.

As shown in Figure 8-1, the actual hazard of the flammable vapor dispersion consequence is only in the downwind direction, and only within the LFL contour. The contour is the outer shape of the cloud out to a concentration equal to the LFL. As a result of the large release quantities and large pool sizes associated with the bounding cases of the IRA, the LFL contour (5% methane concentration level) does not result in a dispersion profile with a classical cigar/elliptical shape. This cloud shape is also illustrated in the CFD results in Section 7, showing that near the origin of the spill the shape of the cloud is dominated by heavy gas effects and, farther down wind the cloud transitions to the more classical dispersion profile, tapering off at the maximum LFL distance. It should be noted that the illustration in Figure 8-1 has not been drawn to scale, and only illustrates the portion of the cloud with a concentration greater than or equal to the LFL. The illustration is presented here to inform the public that while the hazard zone is overlaid as a circle in Figure 8-4 and Figure D (in the Executive Summary), not all portions within the circular hazard zone are expected to be impacted from a release.

Figure 8-1: Example Flammable Vapor Dispersion Hazard Zone
(illustrated with predominate wind direction from the east)

8.2 Ship Collision Frequency Results

The total frequency of a collision with an SRV at the DWP was calculated for two vessel types: 1) vessels in the established Port of Tampa Vessel Safety Fairway; and, 2) vessels randomly passing the DWP location. This calculation utilized vessel traffic from the AIS dataset for this project and only included those vessels with the potential to breach the inner hull of the SRV in a collision.

Due to the distance from the safety fairway to the DWP (11 miles to the North buoy) the likelihood of a powered and drifting collision in this defined route and the SRV was very unlikely. In addition to vessels in the defined fairway, vessels of sufficient displacement and speed were identified that passed near the DWP. Using the collision frequency calculation for randomly distributed vessels, a collision frequency of 1.4×10^{-4} collisions per year was calculated. This vessel collision frequency can also be presented as one collision that could result in an inner hull breach of the SRV every 7,100 years.

Therefore, the collision frequency for the proposed DWP considering both vessels in the safety fairway and randomly distributed around the DWP is shown in Table 8-3.

Table 8-3: Frequency of Vessel Collisions for Proposed DWP

LOCATION	FREQUENCY OF VESSEL COLLISION (PER YEAR BASIS)	FREQUENCY OF VESSEL COLLISION (YEARS PER COLLISION BASIS)
SRV at Port Dolphin DWP	1.4×10^{-4}	1 collision every 7, 100 years

8.3 Conclusions

The conclusions of the IRA are presented as the analysis of the following proposed Project combinations as specified by USCG:

- Alternative A: Baseline, no DWP built
- Alternative B: Port Dolphin built

If the Port Dolphin project is built (Alternative B), there is only one area where the potential hazard zones for thermal radiation and flammable vapor dispersion need to be considered and that is directly around the DWP buoys as illustrated by the consequence modeling zones. No results are shown for Alternative A (Baseline, no DWP built) as this alternative is simply the "as-is" case for the Tampa Bay area and the proposed DWP location.

The conclusions of this risk assessment are presented as the hazard zones for thermal radiation hazard and vapor cloud dispersion for the worst case bounding scenarios evaluated. The hazard zones have been presented as graphical overlays on the nautical chart for the proposed DWP project location. The results of the Port Dolphin IRA are presented without passing judgment on the merits of the applicant's proposed DWP. While the IRA evaluated the potential impacts to the public or surrounding infrastructure, it did not attempt to predict the number of estimated fatalities or injuries from these events. Also, the IRA was completed without considering any mitigation measures that could be implemented to reduce the risk of accidental or intentional release of LNG from this proposed project.

For reference, two thermal radiation endpoint levels are evaluated and presented and are defined as:

- 37.5 kW/m^2: Damage to process equipment and storage tanks for unprotected exposures based on an average 10-minute exposure duration, as well immediate fatalities
- 5 kW/m^2: Permissible level for emergency operations lasting several minutes with appropriate clothing based on an average 10-minute exposed duration and onset of second degree burns based on an average 40-second exposed duration

The pool fire calculations report the distance to each of these two thermal radiation hazard zones estimated, respectively, from the SRV release location, and measured from the center of the pool fire. The vapor cloud dispersion hazard distance was determined as the maximum downwind distance to the Lower Flammability Limit (LFL).

8.3.1 Port Dolphin DWP Area Consequence Results

This section presents the thermal radiation and flammable vapor dispersion hazard zones at the Port Dolphin DWP buoy locations. As discussed in this report, the project consists of two buoy locations (North and South) where an SRV can be moored, regasify LNG, and distribute natural gas into the subsea pipeline to shore. A summary table detailing the consequence modeling results for the bounding release scenarios (Moss-type carrier) evaluated in the risk assessment is presented in Table 8-4.

Table 8-4: Consequence Modeling Summary Results - Moss Carrier

(distances measured from the center of the pool)

Result	Scenario 6 (Intentional)	Scenario 7 (Intentional)	Scenario 8 (Collision)
Breach Size, m^2	12	12	22
Number of Tanks	2	3	1
Total Capacity of Impacted Tank(s), m^3	108,724	163,086	54,362
Release Quantity, m^3	96,660	144,990	48,330
Pool Fire Maximum Distance to Endpoint (meters)			
Pool Diameter (immediate ignition)	1,060	1,260	840
Thermal Radiation Endpoint > 37.5kW/m^2	1,710	1,990	1,390
Thermal Radiation Endpoint > 5 kW/m^2	3,960	4,680	3,140
Flammable Vapor Cloud Dispersion (No Ignition)			
Distance to LFL, m	6,095	***Immediate Ignition No Vapor Cloud Hazard***	4,980
Time for Maximum Distance, min	30		26
Cloud Peak Elevation, m	112		110

The pool fire and thermal radiation results for Scenarios 7 and 8 are shown in Figure 8-2 and Figure 8-3, respectively. These scenarios represent the bounding thermal radiation hazards for the intentional and vessel collision scenarios. In Figures 8-2 and 8-3, the consequence is shown as the radial distance overlaid and centered at the North or South buoy to the two thermal radiation hazard endpoints. The hazard zones of Scenario 7, modeled as an intentional 12 m^2 breach in three of the LNG compartments of an SRV, extend farther than the thermal radiation zones for Scenarios 8 (vessel collision). As shown in Table 8-4, the thermal radiation distances for Scenario 7 extend 1,990 meters to 37.5 kW/m^2 and 4,680 meters to 5 kW/m^2. For Scenario 8, the distances are 1,390 meters to 37.5 kW/m^2 and 3,140 meters to 5 kW/m^2. These results and graphical overlays illustrate that neither a release of LNG from an intentional event (Scenario 7) nor from a vessel collision (Scenario 8) at either the North or South buoy would impact activities at the other buoy location from a sustained fire. For Scenario 7, the 5 kW/m^2 zone extends to about 500 m to the adjacent project buoy, but the impacts to another SRV (if at the DWP) are expected to be less than the impacts defined by this hazard zone. Additionally, the thermal radiation zones from these scenarios do not impact the vessel safety fairway or the nearest landmass. However, since the thermal radiation zones extend farther than the expected Safety Zone and the ATBA, there is a potential for a release and sustained fire at the DWP to impact private or commercial marine traffic in the vicinity of the DWP.

Figure 8-4 compares the flammable vapor dispersion results for Scenarios 6 and 8, represented as the distance to the LFL overlaid at the DWP buoy locations. As compared to the pool fire consequence, where the thermal radiation hazard extends radially from the pool fire center, the flammable vapor dispersion hazard will extend as a cloud dispersing in the downwind direction. The flammable vapor dispersion hazard (distance to LFL) is illustrated as a circle, since the

cloud could disperse in any of 360 degrees, depending on the wind direction at the time of release, as illustrated in Figure 8-1.

As illustrated in Figure 8-4, the intentional scenario (Scenario 6) results in the greatest distance to LFL, and an incident at either buoy could potentially impact the other buoy location. As shown in Table 8-4, the time to reach LFL is 30 minutes for Scenario 6 and 26 minutes for Scenario 8. Assuming the wind direction was toward a second SRV at the adjacent buoy, the other SRV has an emergency buoy disconnect that can shutdown re-gasification and disconnect the SRV in 15 minutes.

Since there is a potential to impact the adjacent buoy in a flammable vapor dispersion, or flash fire consequence, continuous Oceanweather hindcast from grid point 7919 was used to develop the wind rose for the Port Dolphin DWP. The full annual wind rose is presented in tabular format in Table 8-5. The wind rose data shows that if an unignited release were to occur at the North buoy there is a 5.1% chance the wind would be blowing toward the South buoy. Similarly if the release were to occur at the South buoy there is a 6.3% change the wind would be blowing toward the North buoy. Therefore, the predominant wind direction at the DWP is not toward either buoy, but rather from the east (11.6%) and out to sea.

Regardless of wind direction, neither the vessel safety fairway nor the shoreline would be impacted from a vapor cloud release at either buoy location, but the potential to impact private or commercial marine traffic in the vicinity of the DWP from a flash fire does exist due to the extent of the hazard distance.

Table 8-5: Port of Tampa - Wind Rose Data

Appendix A - Benchmark Test for Fluent Validation

Flammable Vapor Cloud Dispersion Modeling

If the LNG vapors emanating from the LNG pool water surface are not ignited in proximity of the pool, the LNG vapors will be transported downwind. The vapor cloud is initially cold and dense, but becomes lighter as it moves away from the pool, entrains warmer air and absorbs heat from the environment. If the vapor cloud encounters a viable ignition source before the gas concentration drops below the LFL (5% by volume for methane in air), the cloud will ignite, resulting in a flash fire. Otherwise, the vapor cloud dissipates harmlessly in the atmosphere. The commercial code Fluent was selected to simulate the dispersion of the flammable vapor cloud resulting from the evaporation of an LNG spill over water. Fluent has been used extensively in dispersion analysis and has sophisticated atmospheric turbulence models that allow it to simulate different types of boundary layer profiles. In previous simulations of dense, large volume releases of cold air performed by Exponent, Fluent results compared favorably with validated models. Before modeling the vapor dispersion from the LNG tanker spill scenarios prescribed for this study, Fluent was also tested using data from test No. 8 of the U.S. Department of Energy's Burro Tests series[66], as described below.[67]

Benchmark Test for Fluent Validation

The Burro 8 test was selected as the benchmark to validate Fluent for the simulation of LNG vapor cloud dispersion over flat terrain (i.e., ocean). In the Burro 8 test, LNG was spilled onto a 58 m diameter water pond at a rate of 16 m^3/min for 107 seconds. The average wind speed during the test was 1.8 m/s (3.5 knots), and the direction of the wind was offset approximately 10 degrees with respect to the direction of the instrumentation array centerline. The LNG was allowed to vaporize and the dispersion of the vapor cloud was tracked by an array of detectors. The spill pond was surrounded by flat terrain without significant obstructions, which makes the geometry of the Burro tests similar to that of an LNG spill offshore. The terrain surrounding the Burro spill pond sloped slightly upwards, which contributed to limiting the dispersion of the vapor cloud; therefore, a simulation that does not account for the terrain slope is expected to result in longer distances to LFL.

A critical component of a CFD model of atmospheric flows is the selection of the wind, temperature and turbulence profiles. These profiles can only be imposed at one or more domain boundaries, and are then propagated throughout the domain by the CFD solver. An inadequate turbulence model will tend to smooth out the profiles imposed at the boundaries, which would effectively subject the LNG vapor cloud to a different environment than desired. The Burro 8 benchmark case was modeled with Fluent by implementing the Reynolds Stress (RS) turbulence model. The velocity and temperature profiles were imposed at the upwind boundary, to be

[66] R.P. Koopman et al., "LLNL/NWC1980 LNG spill tests. Burro Series Data Report", UCID-19075-Vol.1, Dec. 1982.
[67] This validation exercise was performed for Fluent version 6.3, which is also the version used for the consequence analysis modeling results presented in this report.

consistent with those measured during the Burro 8 test.[68] Figure A-1 shows the wind velocity profile at different locations along the simulation domain. The horizontal axis represents the wind velocity (wind blows along the X direction in the simulation domain), and the vertical axis represents the elevation above the water surface. Figure A-2 shows the temperature profile at different locations along the simulation domain. The horizontal axis represents the local temperature, and the vertical axis represents the elevation above the water surface. The off-center locations (top plots) show that both the velocity and temperature profiles remain consistent with the imposed boundary conditions throughout the domain (there is no effect from the cold plume at those locations). The locations along the plume centerline (bottom plots) show the strong effect of the cold vapor cloud on the velocity and temperature profiles.

Figure A-2: Vertical profile of air temperature at different downwind locations for Burro 8 simulation (top: 500 m off-center; bottom: along plume centerline).

Downwind Dispersion Distance

A snapshot of the flammable vapor cloud footprint from the Fluent simulation of Burro 8 is shown in Figure A-3 (for scaling purposes, the dimensions of the simulation domain in the horizontal plane are 1.2 km long by 1.0 km wide). Fluent predicted a maximum downwind distance to LFL of approximately 477 m from the spill location. Sandia reported the maximum distance to LFL in the Burro 8 test to be approximately 420 m, when the wind direction offset is taken into account. The distance to LFL calculated by Fluent over predicts the experimental data by approximately 13.5%.

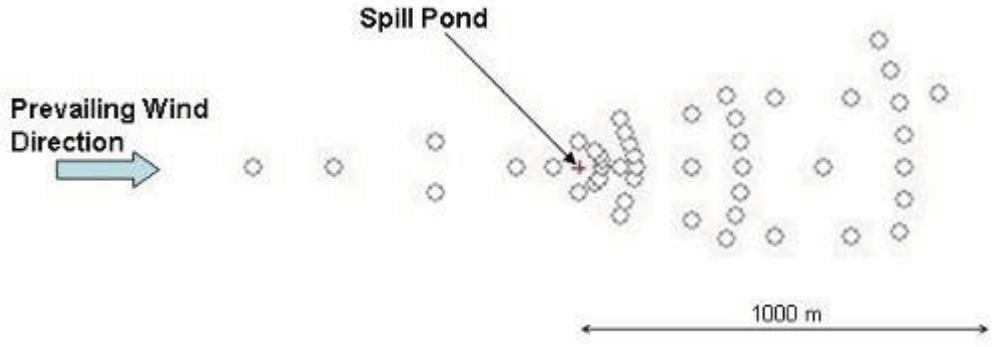

Figure A-3: Snapshot of Fluent's Burro 8 vapor dispersion simulation, showing the LFL isocontour for the vapor cloud 240 seconds into the test. The domain size is 1.2 km in the X direction by 1 km in the Y direction.

Gas Concentration at Selected Sensor Locations

The Burro test series setup included a large number of instruments, that were placed at several locations both upwind and downwind of the spill pond and measured various quantities, such as: air temperature and humidity; wind speed and direction; and gas concentration (Figure A-4).

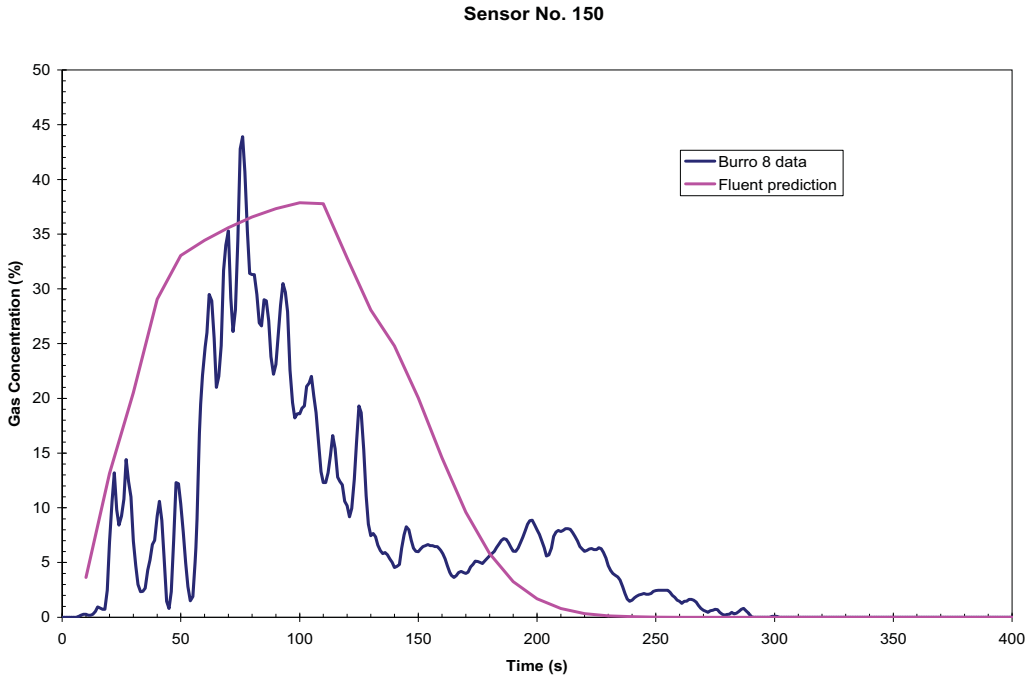

Figure A-4: Instrumentation locations for Burro 8 test.

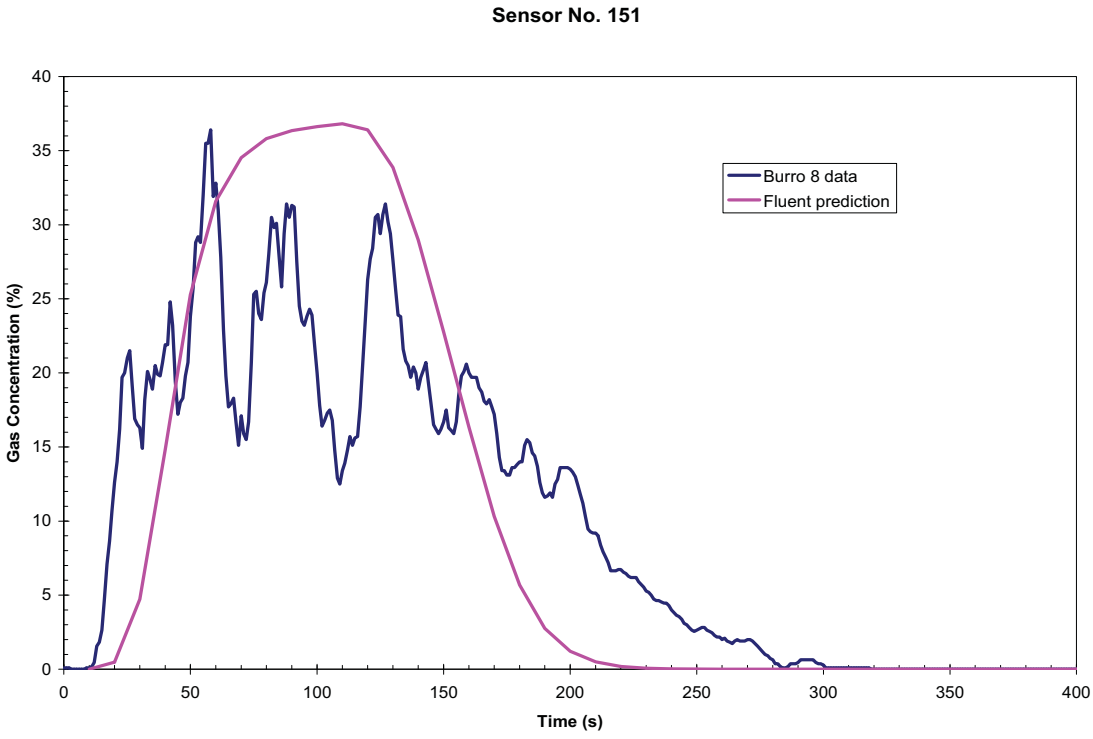
A comparison between the gas concentration measurements performed during the Burro 8 test and the values predicted by the Fluent simulation showed very good agreement at several locations, primarily near the vapor cloud centerline and at lower elevations. Figure A-5 and Figure A-6 show the comparison between experimental and predicted gas concentration traces at sensors in the near-field (approximately 57 m distance) and far-field (approximately 400 m distance). The Fluent simulation matches the near-field data very closely, both in terms of peak concentration as well as in the timing of the cloud's arrival at the sensors. The Fluent simulation also predicts the peak concentration at the far-field sensor with good accuracy, although the simulated vapor cloud reaches the far-field sensor much earlier than the experimental trace. The main reason for this discrepancy is that during the Burro 8 test the wind speed progressively decreased and the wind direction fluctuated around the mean direction, whereas the Fluent simulation assumes the wind speed and direction to remain constant; as a result, the vapor cloud is expected to reach the far-field sensors faster in the simulation than during the test.

Figure A-5:

Comparison of experimental vs. predicted gas concentration traces at sensors 150 and 151 (both approximately 57 m downwind, 1 m above ground, and 15 m apart in the crosswind direction).



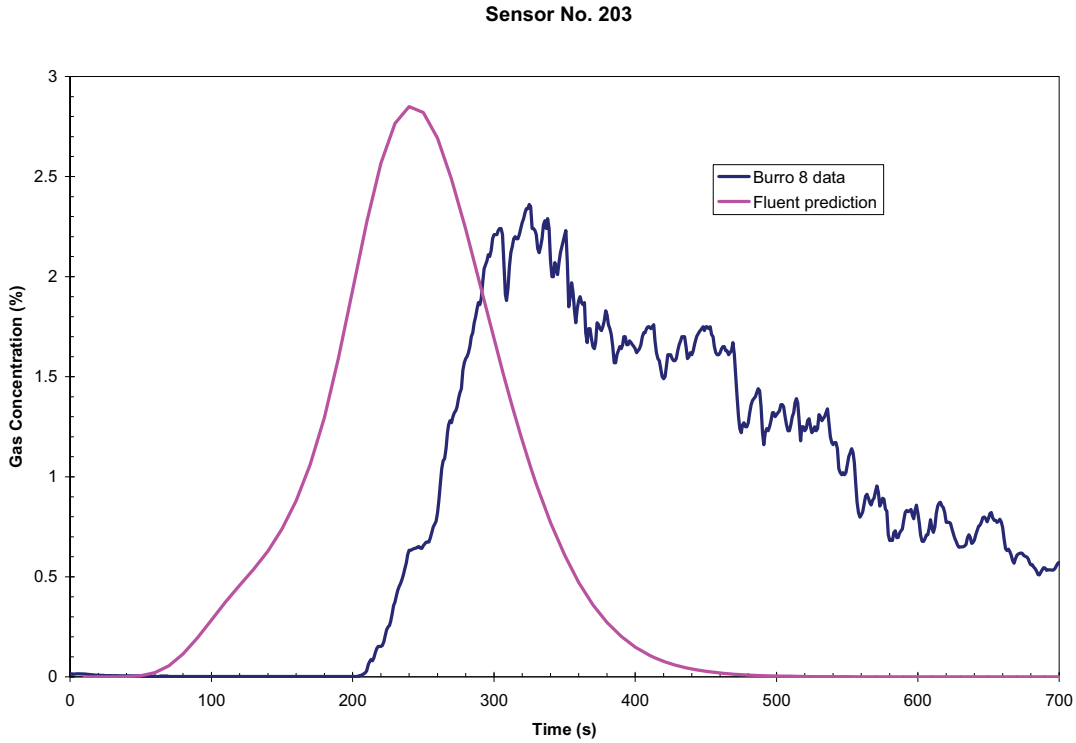


Figure A-6:

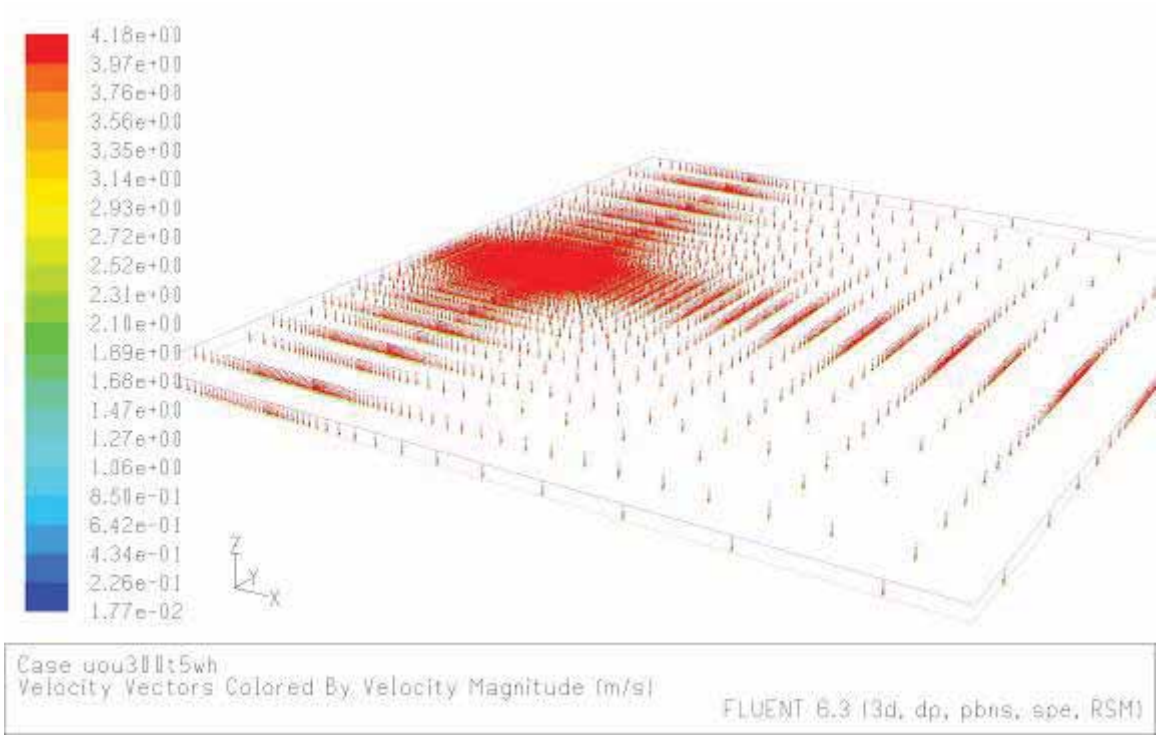
Comparison of experimental vs. predicted gas concentration traces at sensor 203 (approximately 400 m downwind, 3 m above ground and 22 m away from the cloud centerline in the crosswind direction).



CFD Model of the Vapor Cloud Dispersion Scenarios

The domain for the vapor cloud dispersion simulation is shown in Figure A-7. The wind blows from the top-left to the bottom-right faces of the domain. The simulation domain extends from 2.5 km upwind of the spill to 15 km downwind, and spans 10 km crosswind on either side of the spill location. The ceiling for the simulation domain is set to 300 m.

An atmospheric wind profile is imposed on the upwind face of the domain (top-left) and on the top surface. Symmetry boundary conditions are imposed on the crosswind boundaries. The downwind boundary is left open.

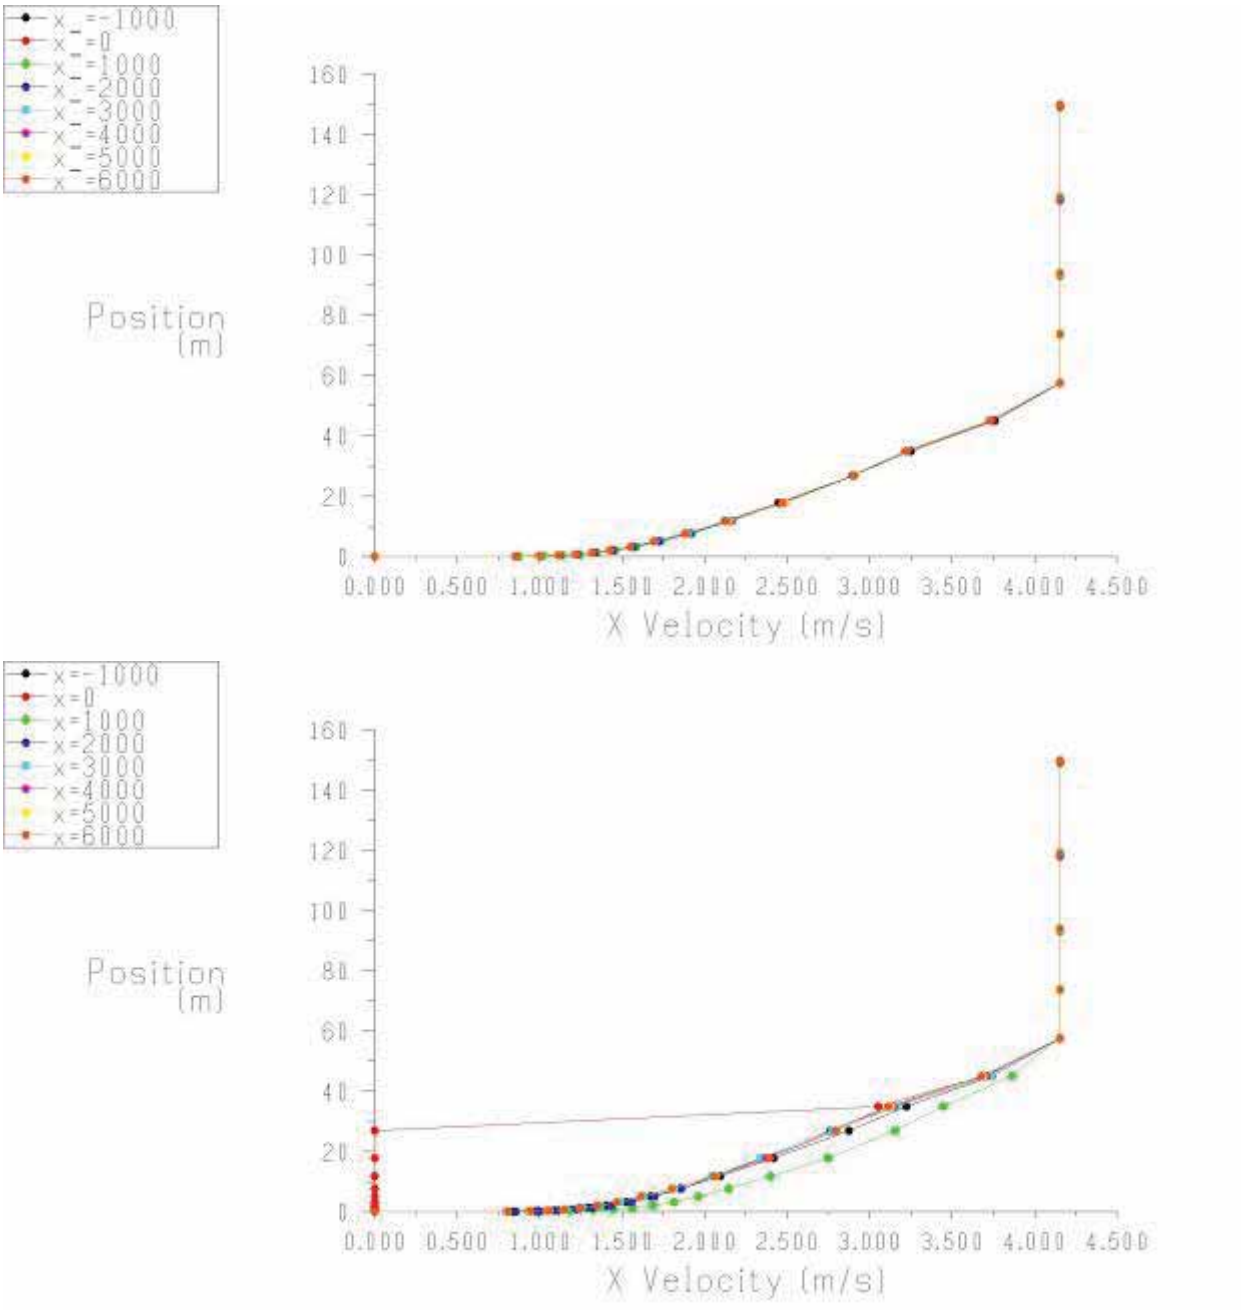
A simple outline of the LNG carrier is included in the model. According to the proposed plans, the unloading vessels will be moored to the buoy and therefore will be able to weathervane while at berth. Therefore, in the simulation the vessel is assumed to be aligned with the wind direction. The tank breach is assumed to occur at the waterline, at midship on the port side.

Figure A-7: Simulation domain for the vapor dispersion scenarios.

The velocity and temperature profiles are imposed along the upwind side of the domain. The velocity and temperature profiles are determined using the selected reference velocity and temperature (Table 7-2), as well as the Monin-Obukhov equation for Pasquill-Gifford "F" stability class.[69] Above the surface boundary layer, which is approximately 50 m high, the wind velocity is assumed to remain constant.[70] The RS turbulence model is used, as in the Burro 8 benchmark simulation. Figure A-8 shows the wind velocity profile at different locations along the simulation domain, for Scenario 5. The horizontal axis represents the wind velocity (wind blows along the X direction in the simulation domain), and the vertical axis represents the elevation above the water surface. The off-center locations (5 km crosswind from the pool mid-plane) show that the velocity profiles remain consistent with the imposed boundary conditions throughout the domain (there is no effect from the tanker at those locations). The plots along the pool mid-plane show the effect of the LNG tanker on the atmospheric profile (wind speed is approximately zero (0) up to the elevation of the tanker deck).

The source term for the vapor cloud dispersion model is represented by the LNG that vaporizes from the pool formed onto the water surface by the LNG spill. The pool spread model, described

[69] DEGADIS manual
[70] R.B. Stull, "An Introduction to Boundary Layer Meteorology", Kluwer Academic Publishers, Dordrecht, Netherlands, 1988, pg. 513



in Section 7 of the main IRA report, was used to calculate the time-dependent size of the LNG pool for each scenario. The pool growth profiles were applied as boundary conditions to the CFD simulation to provide a time-dependent source of LNG vapor. The LNG vapor was injected into the CFD simulation domain at a temperature of -162.2°C and at a rate of 0.135 kg/m^2-s (corresponding to a liquid pool regression rate of 3×10^{-4} m/s).

CFD simulations yield results that are affected, in part, by the resolution of the simulation grid. As the grid is refined, the results tend to asymptote towards a grid independent value. Therefore, each scenario was run with three progressively finer grid resolutions ('low", "medium" and "high", each producing a grid refinement factor of approximately 1.2 over the previous run), and the Richardson extrapolation method was applied to verify the convergence of the different results towards a grid-independent solution.[71] Non-uniform computational grids were used. The horizontal grid dimensions grew progressively, from a minimum of 50 m adjacent to the vessel, to a maximum of 800 m at the downwind boundary. The vertical grid dimensions started at 0.1 m at sea level and grew to 65 m at the ceiling boundary, which was at 315 m above sea level.

In Section 7 of the main IRA report the grid-independent value for the maximum distance to LFL, obtained by applying the Richardson extrapolation method to the CFD results.

Appendix K
LNG Incident History

Major LNG Incidents Involving LNG Release

Incident Date	Ship/Facility Name	Location	Ship Status	Injuries/ Fatalities	Ship/ Property Damage	LNG Spill/ Release	Incident Summary
October 1944	East Ohio Gas LNG Tank	Cleveland	NA	128 deaths	NA	NA	Tank failure and no earthen berm. Vapor cloud formed and filled the surrounding streets and storm sewer system. Natural gas in the vapor izing LNG pool ignited.
1964 and 1965	Methane Progress	Arzew, Algeria	Loading (1964); Shortly after leaving port (1965)	None	None		In 1964, a lightning strike to the forward vent riser of the Methane Progress ignited vapor which was being routinely vented through the venting system at the time. A similar occurance also occurred in early 1965. Both times, the flame was quickly extinguished by purging with nitrogen through a connection in the riser.
1965		Canvey Island, UK	Transfer operation	1 injury; serious burn		Yes	During LNG transfer, an error resulted in the release of LNG. The release became ignited, causing one person to be seriously burned.
May 1965	Jules Verne	Arzew, Algeria	Loading	No	Yes	Yes	Overflowing of a cargo tank. Resulted in a tank cover and adjacent deck fracture.
1965	Methane Princess		Disconnectin g after discharge	No	Yes	Yes	Valve leakage. Deck fractures.
1969		Portland, Oregon	Under construction	NA	Yes	Yes	An explosion occurred in an LNG tank under construction. No LNG had ever been introduced into the tank. The cause of the accident was the accidental removal of blinds from natural gas pipelines which were connected to the tank. This led to the flow of natural gas into the tank while it was being constructed.

Incident Date	Ship/Facility Name	Location	Ship Status	Injuries/ Fatalities	Ship/ Property Damage	LNG Spill/ Release	Incident Summary
1971	LNG ship Esso Brega, La Spezia LNG Import Terminal	La Spezia, Italy	Unloading LNG into the storage tank	NA	Yes	Yes	First documented LNG "rollover" incident, where two differing temperatures and densities of LNG mix. Tank developed a sudden increase in pressure, causing LNG vapor to discharge safely from the tank safety valves and vents. Tank roof slightly damaged. No ignition.
January 1972	Montreal East	Montreal, Canada	Defrosting operations	NA	NA	NA	During defrosting, a back flow of natural gas from the compressor to the nitrogen valve when the valve remained unclosed caused over-pressurization of the compressor. This led to a leak and subsequent ignition.
February 1973		Staten Island, New York	Repair on empty storage tank	Yes-37 fatalities.	Yes	No	While repairing the interior of an empty storage tank, a fire started. The increase in pressure inside the tank occurred so quickly that the concrete dome collapsed down inside the tank. 37 construction workers inside the tank were killed.
1974	Methane Progress		In port	No	Yes	No	Touched bottom at Arzew.
July 1974	Massachusetts Barge	Massachusetts	Loading	NA	NA	Yes	40 gallons of LNG leaked during loading, as a result of a power failure and the resulting automatic closure of the safety valves. The leak resulted in several fractures to the deck plates.

Incident Date	Ship/Facility Name	Location	Ship Status	Injuries/ Fatalities	Ship/ Property Damage	LNG Spill/ Release	Incident Summary
1975	Philadelphia Gas Works		NA	No	Yes	NA	Not caused by LNG. An iso-pentane intermediate heat transfer fluid leak caught fire and burned the entire vaporizer area.
1977	Arzew	Algeria	NA	1 worker frozen to death	NA	Yes	Aluminum valve failure on contact with cryogenic temperatures. Wrong aluminum alloy on replacement valve. LNG was released, but no vapor ignition occured.
September 1977	LNG Aquarius	Boatang, Indonesia	Loading	No	No	Yes	During filling, LNG overflowed through the vent mast. Possible casue was difficulties in the liquid level gauge system.
1979	Columbia Gas LNG Terminal	Cove Point, Maryland	NA	1 killed 1 seriously injured	Yes	Yes	LNG leaked through the LNG pump electrical penetration seal and entered the substation. A circuit breaker ignited the natural gas-air mixture, resulting in an explosion.
April 1979	Mostefa Ben-Boulaid Ship		Unloading	No	Yes	Yes	Valve leakage. Deck fractures.
April 1979	Pollenger Ship		Unloading	No	Yes	Yes	Valve leakage. Tank cover plate fractures.
1979	El Paso Paul Kayser Ship		At sea	No	Yes	No	Stranded. Severe damage to bottom, ballast tanks, motor was water damaged, bottom of containment system set up.

Incident Date	Ship/Facility Name	Location	Ship Status	Injuries/ Fatalities	Ship/ Property Damage	LNG Spill/ Release	Incident Summary
1980	LNG Libra		At sea	No	Yes	No	Shaft moved against rudder. Tail shaft fractured.
1980	LNG Taurus		In port	No	Yes	No	Stranded. Ballast tanks all flooded and listing. Extensive bottom damage.
1984	Melrose		At sea	No	Yes	No	Fire in engine room. No structural damage sustained – limited to engine room.
1985	Gradinia		In port	No	Not reported	No	Steering gear failure. No details of damage reported.
1985	Isabella		Unloading	No	Yes	Yes	Cargo valve failure. Cargo overflow. Deck fractures.
1989	Tellier		Loading	No	Yes	Yes	Broke moorings. Hull and deck fractures.
1990	Bachir Chihani		At sea	No	Yes	No	Sustained structural cracks allegedly stressing and fatigue in inner hull.

Incident Date	Ship/Facility Name	Location	Ship Status	Injuries/ Fatalities	Ship/ Property Damage	LNG Spill/ Release	Incident Summary
2002	LNG ship Norman Lady	East of the Strait of Gibraltar	At sea	No	Yes	No	Collision with a U.S. Navy nuclear-powered attack submarine, the U.S.S Oklahoma City. In ballast condition. Ship suffered a leakage of seawater into the double bottom dry tank area.

Note: There have been no reported incidents involving LNG shipping and shipping port and terminals since 2002.

THIS PAGE INTENTIONALLY LEFT BLANK

RECORD OF DECISION
ISSUANCE OF LETTERS OF AUTHORIZATION TO PORT DOLPHIN ENERGY LLC TO TAKE MARINE MAMMALS INCIDENTAL TO CONSTRUCTION AND OPERATION OF A DEEPWATER LIQUEFIED NATURAL GAS PORT

National Oceanic and Atmospheric Administration
National Marine Fisheries Service
Office of Protected Resources
Silver Spring, Maryland

As required by the National Environmental Policy Act (NEPA), this document comprises the National Oceanic and Atmospheric Administration's (NOAA) National Marine Fisheries Service's (NMFS) Record of Decision (ROD) for issuance of 5-year regulations and letters of authorization (LOAs) pursuant to section 101(a)(5)(A) of the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1361 *et seq.*) to the Port Dolphin Energy LLC (Port Dolphin) for the taking, by Level B harassment, of small numbers of two species of marine mammals incidental to construction and operation of a deepwater liquefied natural gas (LNG) port in the Gulf of Mexico offshore from Tampa Bay, Florida.

Introduction

In February, 2011, NMFS received a complete application from Port Dolphin requesting a 5-year rulemaking and issuance of subsequent LOAs, under section 101(a)(5)(A) of the MMPA, to take small numbers of two species of marine mammals, by Level B harassment, incidental to construction and operation of a deepwater LNG port in the Gulf of Mexico offshore from Tampa Bay, Florida. The 5-year regulations and LOAs would cover construction of the port, expected to require approximately one year, and four subsequent years of port operations, from approximately June 2013 through May 2018.

The U.S. Coast Guard and Maritime Administration (lead federal agencies responsible for licensing of the deepwater port) prepared a *Final Environmental Impact Statement on Port Dolphin LLC Deepwater Port License Application* (FEIS). The NMFS Office of Protected Resources (PR) has reviewed the information contained in the FEIS and determined that the FEIS accurately and completely describes the proposed action alternative, reasonable additional alternatives, and the potential impacts on marine mammals, endangered species, and other marine life that could be impacted by the proposed action and the other alternatives.

Because noise generated during construction and operation of the port has the potential to disrupt the behavior patterns of marine mammals in the vicinity, an incidental take authorization is warranted under the MMPA. Therefore, NMFS participated as a cooperating agency in the preparation of the Draft and Final EISs, and this ROD has been prepared in accordance with NMFS' decision-making requirements under NEPA and is intended to: (a) state the NMFS decision, present the rationale for its selection, and describe its implementation; (b) identify the alternatives considered in reaching the decision; and (c) state whether all practicable means to avoid or minimize environmental harm from implementation of the selected alternative have been adopted (40 CFR 1505.2).

Section 101(a)(5)(A) of the MMPA (16 U.S.C. 1361 *et seq.*) directs the Secretary of Commerce to allow, upon request, the incidental, but not intentional, taking of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if certain findings are made and regulations are prescribed setting forth the permissible methods of taking pursuant to the specified activity, other means of effecting the least practicable adverse impact on the species or stock and its habitat, and requirements pertaining to the monitoring and reporting of such taking. Under the MMPA, permission shall be granted if NMFS finds that the taking will have a negligible impact on the species or stock(s), will not have an unmitigable adverse impact on the availability of the species or stock(s) for subsistence uses. NMFS has defined "negligible impact" in 50 CFR 216.103 as "...an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival."

Decision to Be Made

This ROD documents the decision by NOAA NMFS to issue 5-year regulations and LOAs to Port Dolphin for harassment of marine mammals incidental to construction and operation of the port, based on the FEIS, Port Dolphin's application for an authorization, NMFS' analysis, and comments received on the proposed rulemaking. The final rule and LOAs are specific to the proposed action alternative in the FEIS. This ROD is based on and incorporates the FEIS, Port Dolphin's application for an authorization under the MMPA, and all of NMFS' analytical documents prepared for this action.

Pursuant to the requirements of NEPA, a notice of intent to prepare an EIS was published in the *Federal Register* on July 12, 2007. The action proponents conducted public scoping and released a notice of availability of a draft EIS for public comment on April 18, 2008. Comments submitted during this period, as well as at public hearings, were considered during the development of the FEIS. After careful review of the proposed measures and the associated analyses in the FEIS and the public comments that NMFS received on the proposed rulemaking *Federal Register* notice, NMFS has decided to finalize the rulemaking and issue an LOA to Port Dolphin, provided that mitigation, monitoring, and reporting requirements described below and analyzed in the FEIS are incorporated.

Alternatives Considered by NMFS

NMFS' proposed action (issuance of a final rule and LOAs to Port Dolphin) would establish a framework for authorizing the take of marine mammals incidental to a subset of the activities analyzed in the EIS that are anticipated to result in the take of marine mammals, i.e., activities that produce underwater sound. Thus, these components of the proposed action are the subject of NMFS' proposed MMPA regulatory action. The EIS contains a thorough analysis of the environmental consequences of Port Dolphin's proposed action on the human environment, including specific sections addressing the effects of underwater sound on marine mammals and describing mitigation measures designed specifically for marine mammals.

NMFS was a cooperating agency in the development of the EIS. This allowed NMFS to ensure that the necessary information and analyses were included in the EIS to support NMFS'

proposed action and allow for adoption of the document for NMFS' NEPA purposes. In adopting the EIS, NMFS considered two alternatives, as well as the No Action Alternative. The following briefly summarizes these alternatives:

Alternative 1: NMFS issues a final rule and LOAs authorizing take of marine mammals incidental to activities described in Port Dolphin's preferred alternative, with the mitigation, monitoring and reporting measures presented in the EIS.

Alternative 2: NMFS issues a final rule and LOAs authorizing take of marine mammals incidental to activities described in Port Dolphin's preferred alternative, but with additional mitigation requirements for marine mammals, potentially including additional measures developed by NMFS or suggested to NMFS via public comment on the proposed rulemaking.

No Action: NMFS would not issue a final rule and LOAs to Port Dolphin for the take of marine mammals incidental to activities described in the preferred alternative.

Alternatives Considered in the EIS

The Deepwater Port Act of 1974 requires the Secretary of Transportation to approve, approve with conditions, or deny a deepwater port license application. Consistent with NEPA, in determining the provisions of the license, the Secretary of Transportation must also consider alternative means to construct and operate a deepwater port. Alternatives for a natural gas deepwater port can extend to matters such as its specific location, methods of construction, and technologies for regasifying LNG. Considering alternatives helps to avoid unnecessary impacts and allows analysis of reasonable ways to achieve the stated purpose. Consistent with NEPA, the FEIS considered impacts to marine mammals and their habitats associated with each alternative considered.

Screening of alternatives was conducted in several steps. First, the conceptual design of the deepwater Port was considered and two designs were selected for evaluation: a submerged turret loading (STL) buoy system with special purpose SRV and a floating storage and regasification unit (FSRU). A three-phase assessment was then conducted to narrow the potential alternative sites. After site alternatives were identified, alternate routes for the pipelines necessary to interconnect with the existing natural gas transmission structure were evaluated. Finally, specific technology choices, such as vaporization technology, anchoring methods, and construction methods, were evaluated.

Upon application of the screening criteria, alternatives that were eliminated from detailed consideration included Port design concepts, some regasification technologies, design features, and construction methods. Alternatives evaluated in detail in the EIS are the STL and FSRU port concepts, two vaporization technologies, two alternatives for siting of the port, three natural gas pipeline route alternatives (i.e., a Proposed Site and Route, a Southern Site and Route, and the Offshore Interconnection with Gulfstream Pipeline), and the No Action Alternative. Alternatives evaluated in detail in the EIS are summarized below:

No Action Alternative: The No Action Alternative is required by CEQ regulations as a baseline against which the impacts of the Proposed Action are compared. Under the No Action

Alternative, the EIS considers the possible satisfaction of demand through increased use of other types of energy sources (e.g., fossil fuels, nuclear, alternative energy).

Deepwater port design: There are six basic deepwater port design concepts that have been developed by industry and are currently considered commercially available for use as an offshore LNG import port; all six port concepts include use of subsea natural gas pipelines to transport regasified LNG from the port to the existing onshore pipeline system. The EIS evaluates in detail the STL and FSRU design concepts while rejecting gravity-based structures, fixed and floating platforms, and artificial islands as unsuitable for the purpose and need.

Port location: According to the Purpose and Need, the Project is intended to supply natural gas to the west-central Florida market and surrounding areas, and therefore only locations that meet these fundamental criteria can be considered. Initial regional site-screening evaluation identified five areas within the region where it would be reasonable and feasible to locate an SRV facility, including north of Tampa Bay; the St. Petersburg area; off of Tampa Bay; off of Sarasota; and near the Caloosahatchee River area near Fort Myers. Following a secondary suitable area analysis, only the Tampa Bay area was deemed suitable and carried forward as the preferred alternative for detailed evaluation.

Pipeline routes: Following identification of the preferred port location, a site-specific analysis identified alternative site locations and associated pipeline route corridors. These are the proposed (preferred) site and route alternative, proposed site and offshore interconnection with Gulfstream Pipeline alternative, northern site and route alternative, and southern site and route alternative. The northern alternative was deemed unsuitable and was not carried forward for detailed analysis.

Anchoring methods: There are a variety of available anchoring systems for installation of the buoy mooring anchors. Embedment anchors, drilled and grouted anchors, suction piles, driven piles, and gravity anchors were considered. Only suction piles and driven piles (preferred) were carried forward for detailed analysis.

SRV propulsion: The EIS identified gas-fired propulsion steam boilers, gas-fired turbines, slow-speed diesel propulsion, and high-speed diesel propulsion. Only the steam boiler and high-speed diesel alternatives were carried forward.

Vaporization technologies: There are three available heating methods used to vaporize LNG: burning part of the vaporized LNG, using the surrounding seawater to warm the LNG, or using the surrounding air to warm the LNG. Burning part of the LNG with no use of ambient seawater is generally referred to as a closed-loop system, while using the surrounding seawater in a once-through system to warm the LNG is generally referred to as an open-loop system. Use of ambient air to warm LNG is referred to generally as ambient air vaporization. There are several commercially tested vaporization systems currently used as heat exchangers to vaporize LNG: submerged combustion vaporizers (SCVs), shell-and-tube vaporizers (STVs), open rack vaporizers (ORVs), and ambient air vaporization (AAV) equipment with or without backup heating systems (usually SCVs). Vaporization systems can be configured in numerous ways to use one or more of the available heat sources to vaporize LNG. The EIS evaluates in detail use of

a closed-loop STV technology (appropriate for use with the STL port design concept) and use of an AAV system (appropriate for use with the FSRU port design concept).

Marine life exclusion systems: SRVs will be required to obtain engine cooling water via sea chests below the waterline. The proposed (preferred) design provides for a through slot intake of 0.25 inches with a velocity of less than or equal to the recommended velocity of 0.15 m/s, and provides for exclusion of most juvenile fish. Alternative technologies were deemed unsuitable for the purpose and need, and only the preferred alternative was carried forward for detailed evaluation.

Biocide systems: Biocide systems are used for seawater required for engine cooling and ballast control. However, the installed biocide system will not be used while SRVs are at the port. Therefore, there would be no use or discharge of biocide while at the port and no alternative biocide systems were evaluated. Any alternatives to not using the system while at the port would involve greater environmental impacts.

Pipeline construction methods: Conventional pipeline construction methods include alternatives for the placement of the pipeline in offshore and onshore areas, and alternatives in offshore vessels used to connect pipeline sections into a continuous pipe and lay the pipeline on the seafloor. Alternative methods to bury the pipeline include dredging, plowing, jetting, and directional drilling. Dredging, plowing, and directional drilling were carried forward for detailed evaluation.

Environmentally Preferred Alternative(s)

CEQ regulations require that an agency identify the environmentally preferred alternative when preparing a ROD for actions considered in an EIS. The Council on Environmental Quality has advised that such an alternative is to be based solely on the physical and biological impacts of the proposed action on the resources in question and not the social or economic impacts of the action. The FEIS determines that the Proposed Action (Preferred Alternative) is the environmentally preferred action alternative. The Proposed Action would have the least impact on the human environment based on the analyses of location and construction design and schedule.

Rationale for Selection of the Preferred Alternative

The decision is to issue a final rule and LOAs to Port Dolphin for the take of marine mammals incidental to the construction and operation of the deepwater LNG port. This decision is made based on the evaluations in the FEIS and in consideration of NMFS' statutory responsibilities under the MMPA, as well as in compliance with the Endangered Species Act (ESA), Magnuson-Stevens Fishery Conservation and Management Act, Coastal Zone Management Act, and other laws and implementing regulations as fully analyzed in the FEIS.

Based upon review of the Proposed Action and all other alternatives, NMFS has determined that the impact of construction and operation of the port may result, at worst, in a temporary modification in behavior of small numbers of certain species of marine mammals that may be in close proximity to construction operations, or in close proximity to the facility during subsequent years of operations. These activities are expected to result in some local, short-term

displacement resulting in no more than a negligible impact on the affected species or stocks of marine mammals. These impacts will be reduced to effect the least practicable adverse impact by incorporation of the mitigation and monitoring measures summarized below. No injuries or mortalities of marine mammals are expected to result from this activity.

NMFS participated as a cooperating agency in the preparation of the FEIS to ensure that the potential impacts to marine mammals and their habitat were fully considered in the evaluation of the environmental consequences of the proposed action and alternatives. Any of the proposed alternatives would be conducted in a manner that would be expected to result in only temporary Level B (behavioral) harassment of two marine mammal species. However, the Project as presented for NMFS consideration in Port Dolphin's application represents the environmentally preferable action alternative (Preferred Alternative) when evaluated in accordance with the NEPA and in consideration of the MMPA. Although NMFS evaluated an alternative that would require additional mitigation measures, those measures are not feasible for implementation, and therefore would not meet the purpose and need of the proposed action.

There has been substantial opportunity for public review and comment in association with preparation of the EIS, as well as through the MMPA incidental take authorization process. The scoping period began with the publication of a Notice of Intent in the *Federal Register* on July 12, 2007. The scoping period included one public scoping meeting. The draft EIS was responsive to comments received, and was made available for public review and comment on April 18, 2008 through a Notice of Availability published in the *Federal Register*. During the review period, one public meeting was held and a total of 34 formal comments were received. No comments were received on the EIS that are related to NMFS' action.

In addition, NMFS received public comment on the proposed rulemaking *Federal Register* notice from the Marine Mammal Commission (MMC). The MMC made several recommendations, including some additional mitigation measures. While NMFS agreed with certain recommendations from the MMC, additional mitigation measures were deemed unnecessary, as the measures agreed upon by NMFS and Port Dolphin and required under the terms of the final rule and LOAs would effect the least practicable impact on the affected species or stock. The numbers of incidental take analyzed in Port Dolphin's application, as well as the numbers in the final rulemaking *Federal Register* notice, are small relative to the relevant stock sizes. NMFS responded to these comments more fully in the final rulemaking *Federal Register* notice of issuance. NMFS has made the decision to finalize the rulemaking and issue the LOA after careful review of these comments.

Mitigation Measures and Monitoring

In accordance with the MMPA, an extensive series of mitigation and monitoring measures were analyzed in the FEIS and will be required as part of the 5-year regulations and LOA. These measures will effect the least practicable adverse impact on the affected species or stock of marine mammals under NMFS jurisdiction. The mitigation, monitoring, and reporting requirements that will be included in the 5-year regulations and LOA are summarized below, and were developed by NMFS in cooperation with Port Dolphin to achieve the least practicable adverse impact to marine mammal species or stocks and consider all practicable means to avoid or minimize harm to resources under NMFS jurisdiction:

Visual Monitoring Program
For each component of the activity with the potential to cause the incidental take of marine mammals, Port Dolphin will establish zones of acoustic influence to be monitored by professional observers. These zones will include harassment zones, within which the presence of marine mammals will be recorded and noted as instances of behavioral harassment, and shutdown zones. Shutdown zones correspond with areas where underwater sound could result in acoustic injury of marine mammals, and activity will cease if marine mammals approach these zones in order to prevent such an occurrence. Monitoring of activities will take place throughout the time required to complete the activity.

Sound Attenuation Devices
Sound attenuation devices would be utilized during all impact pile driving operations. Port Dolphin plans to use a bubble curtain as mitigation for in-water sound during construction activities. Bubble curtains absorb sound, attenuate pressure waves, exclude marine life from work areas, and control the migration of debris, sediments and process fluids.

Vessel Strike Avoidance Measures
Construction and support vessels will follow the NMFS Vessel Strike Avoidance Measures and Reporting for Mariners. Standard measures would be implemented to reduce the risk associated with vessel strikes.

Line and Cable Entanglement Avoidance Measures
Best Management Practices (BMPs) would be implemented to prevent entanglement in any lines or cables or siltation barriers used in any construction area. For example, lines, cables, and in-water barriers would not be made of any materials in which a protected species can become entangled (e.g., monofilament), would be properly secured, and would be regularly monitored to avoid protected species entrapment.

Marine Debris and Waste Management Protocols
BMPs would be implemented to prevent potential impacts to protected species from debris discarded within any construction area, including mandatory marine debris training.

Reporting
Required reporting on Port Dolphin's activities and implementation of these mitigation measures will be submitted to NMFS, and will include reporting of data collected during acoustic monitoring required to verify sound source levels and site-specific acoustic propagation characteristics used to evaluate potential effects to marine mammals. The report will include observations of all marine mammal behavior, including potential reactions to the activities.

Conclusions
Through adoption of the FEIS and as documented in this ROD, NMFS has fulfilled the requirements of NEPA to consider the objectives of the proposed action and analyze a reasonable range of alternatives that adequately address the objectives of the proposed action. Furthermore, NMFS has analyzed the associated environmental consequences and impacts of the alternatives and identified mitigation and monitoring measures to address, to the extent practicable, those

consequences and impacts. NMFS has also considered public comments on promulgation of regulations and issuance of LOAs. Consequently, NMFS concludes that issuance of the 5-year regulations and LOAs for the take of marine mammals incidental to construction and operation of Port Dolphin in the Gulf of Mexico is warranted under the MMPA, as long as the mitigation, monitoring, and reporting requirements described above are implemented.

Further information regarding this ROD may be obtained by contacting Ben Laws, NOAA NMFS PR, 1315 East-West Highway, Silver Spring, MD 20910, (301) 427-8425.
