FOREWORD

The publication of this report marks the first time that the entire ice-thickness and stratigraphy data base has been edited. During the process of editing, a number of systematic errors were discovered and the incorrect data were recoded from the original field reports. All versions of these data released prior to July 1978 are superseded by this report.

ICE THICKNESS AND STRATIGRAPHY AT NEARSHORE LOCATIONS ON THE GREAT LAKES[1]

Frederick E. Sleator

Ice-thickness and stratigraphic data have been collected under a program instituted by the U.S. Lake Survey during winter 1965-66. The program is continuing under the Great Lakes Environmental Research Laboratory. The data collection network is documented and the data collection and editing procedures are described. Edited data are presented in metric units. A version of this report using standard (English) units is available.[2]

1. INTRODUCTION

A program designed to collect Great Lakes ice information was implemented by the U.S. Lake Survey during winter 1965-66. The intent of the program was to document and develop an understanding of regional ice characteristics on the Great Lakes. The information to be collected included the dates of first ice formation and ice breakup, significant events affecting the ice and the dates of their occurrence, rates of ice growth and decay, and the type, thickness, and stratigraphic structure of the ice.

It was expected that this information would be useful for winter navigation, shoreline structure engineering, studies on the effect of thermal effluents from power plants, and various other applications.

2. DATA COLLECTION NETWORK

The ice sampling sites or stations were selected primarily on the basis of climate and secondarily on the basis of geographic location and the availability of an observer. Sites were selected on inland lakes and waterways, as well as on the Great Lakes. It was assumed that the inland lakes would be relatively unaffected by wind and wave action and would freeze over completely, unlike the Great Lakes. They were intended to provide a basis for comparing ice formed on the Great Lakes with undistrubed ice formed under the same meteorological conditions.

Stations were established in all five Great Lake basins. A disproportionately large number of these stations, 45 out of 95, were in

---

[1] GLERL Contribution No. 167.

[2] NOAA Data Report ERL GLERL-1-1

the Lake Superior Basin. There were several reasons for this: Lake Superior has more ice for a longer period of time than the other lakes, making it better suited for studying ice; less was known about the ice on Lake Superior than about the ice on the other lakes; and some of the stations were established in conjunction with another project.

During the 1969-70 season the number of stations was reduced from over 90 to around 30 to cut the cost of operating the program and to eliminate some stations that were not providing useful or representative data. Most of the fluctuation in the number of stations after the 1969-70 season was due to the temporary unavailability of observers.

Each station was assigned a three digit number. The first digit indicates the lake basin in which the station was located:

100 - 199	Lake Superior
200 - 299	Lake Michigan
300 - 399	Lake Huron
400 - 499	Lake Erie
500 - 599	Lake Ontario.

Within each basin there is no particular order to the numbers. As new stations are added, they are assigned the next available number. If a station is dropped, the number is "retired" and not reused for another stations. Table 1 lists the stations (arranged by station number), their locations, and the period of record for each station. Figures 1 through 6 show the approximate location of each station. (The map scales are very small and the station symbols are large enough that pinpointing the locations is not possible.)

3. DATA COLLECTION METHODS

Once the general location for a station was chosed, the observer was instructed to select a site that normally had stable ice throughout the season. The site was to be at least 50 m off shore, preferably in deep water, and free from obstructions that might cause unusual snow drifts. Docks, mouths of rivers and streams, industrial discharge areas, and other areas likely to have unusual ice conditions were to be avoided. Once the site was selected, all of the weekly measurements were made on undisturbed ice as close to the original measurement site as possible.

To take measurements, the observer bored a hole in the ice with a hand auger and hooked a folding rule with a special "foot" attachment under the bottom of the ice. The distance from the bottom of the ice to the top of each layer of ice, slush, water, or snow was recorded. If the ice was unsafe, the observer estimated its thickness and stratigraphic structure, based either on past experience or, if possible, on nearby ice conditions. Measurements were originally made to the nearest whole inch,

but starting with the 1977-78 season, measurements were made to the nearest whole centimeter. All measurements and observations were recorded on a standard form and returned to the Great Lakes Environmental Research Laboratory.

4. REPORT FORMS

Several different report forms have been used. An example of the earliest report form, used through the 1967-68 ice season, is shown in Figure 7. This form was adequate for recording the thickness of the ice, but observers often did not include other useful information. Figure 8 shows the report form that was used from the 1968-69 through the 1973-74 ice seasons. This form requested more information about conditions that might affect the ice than the previous form, but had the apparent disadvantage of having to be interpreted and coded before the data could be keypunched and placed in a computer file. The form shown in Figure 9 was used from the 1974-75 through the 1976-77 ice seasons. It was designed to make the interpretation and coding unnecessary, but it was ambiguous. There were a variety of problems encountered by the observers in filling out the form, usually due to misinterpretation of the form itself or of the instructions. Other problems with this form were lack of compatibility with the previous forms (different codes used to indicate the same condition or event) and the use of letters rather than numbers for the visual observation codes; these had to be changed for efficient computer processing. Finally, the fact that these forms could be keypunched without being coded usually meant that these reports were edited poorly, if at all. This combination of factors resulted in a large number of improperly coded reports being placed in the computer file.

In an attempt to eliminate these problems, a new form was developed (Figure 10) combining the best characteristics of the previous forms. In addition, a precise editing and coding procedure was developed. These changes are expected to improve the reliability of the data and to reduce the amount of time between collection and processing.

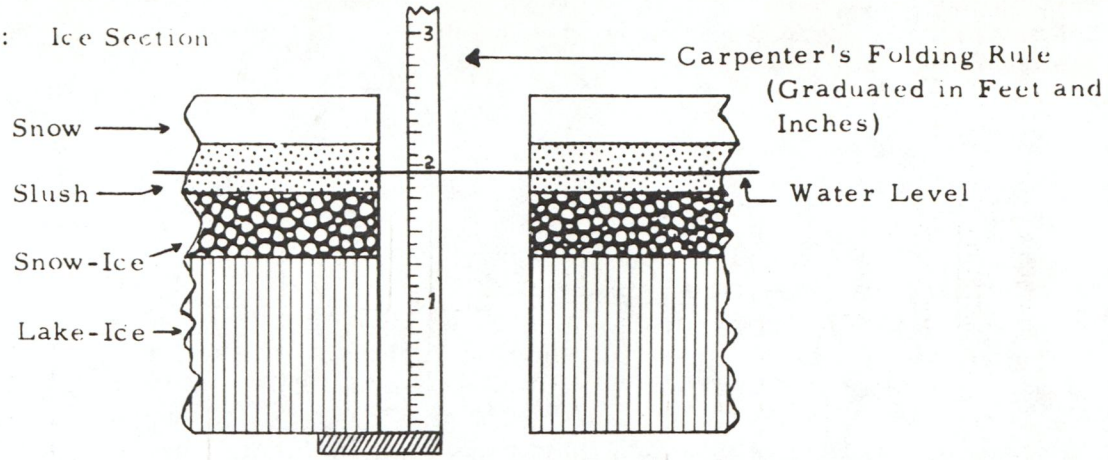

5. EDITING PROCEDURES

At the end of each season the ice-thickness reports were coded and keypunched, one report per computer card. At the start of the editing procedure, the reports were placed on file in the computer, but several problems were immediately apparent: The data were not in order; data from different seasons were formatted differently; and the data from the 1973-74 through 1976-77 seasons were coded differently than the previous data.

Several procedures were developed to correct these problems. A computer program was developed to sort the data. The station and date codes were reformatted into a 10-digit integer (station number,

Follow this procedure for determining thickness: Measure the distance from the bottom of the ice to the top of each ice or snow layer. Record this measurement to the nearest whole centimeter. If your site has ice, slush, or snow layers other than the layers indicated on the diagram, draw a sketch on the back of this sheet giving the type, position, and thickness of the layers. The example on the left below is filled in correctly. Record your observations in this same manner in the spaces to the right of the example numbers.

Mark the box describing the SNOW on top of your ice.

followed by a zero, year, month, and day), giving each report a unique identification number and allowing the reports to be put in order by station and date simultaneously. The data were then printed out by station, with each report being represented by one line on the computer printout, and printouts were checked against the original field reports. If changes were necessary the reports were re-coded and keypunched; when the checking was completed, a computer program was used to delete the incorrect reports and to insert the correct data. Most of the errors that occurred were the result of forms being improperly coded or interpreted. A large number of keypunch errors were also found.

After the data were corrected, several computer programs were used to check for incorrect formats, unusual data values, missing data, duplication of data, and other errors that might have been overlooked during the editing procedure.

The ice thickness and other measurements originally made in inches were converted to centimeters. The conversion program multiplies each value by 2.54 and a computer library subroutine called ROUND was used to round each new value to the nearest whole centimeter. In the case of .5, the value was changed to an even number; thus, 3.5 was changed to 4, 2.5 to 2.

6. DISCUSSION

Several factors must be considered when the data presented in the following appendix are used. Their relative importance will depend on what use is made of the data, but they are, in general, constraints on the data. The most obvious of these factors is the short period of record of the data base. In no case does it exceed 11 seasons and for most of the stations it is shorter. Statistical analysis of such a brief period of record might not be meaningful.

Another significant factor is that the severity of the winters in the Great Lakes region is highly variable. Winter severity can be measured in terms of accumulated freezing degree-days (FDD's). Assel and Quinn (1977) have developed a preliminary classification of winter severity for the Great Lakes based on 30 years of FDD data. Table 2 shows the severity classification for the period of record covered by the ice-thickness and stratigraphy data base. It should be noted that the ice-thickness data for some stations may not cover the full range of winter conditions and, therefore, may not accurately represent the ice conditions that are of interest to those using this data base.

Another factor is that these data were collected in nearshore areas. Ice conditions on the Great Lakes are highly variable and the data may not be valid for nearby areas or representative of offshore conditions.

Table 2. Winter Severity Classification

Area	1965-66	1966-67	1967-68	1968-69	1969-70	1970-71	1971-72	1972-73	1973-74	1974-75	1975-76	1976-77
Western Lake Superior							S*					
Eastern Lake Superior	M**				S	S		M				S
Northern Lake Michigan						S		M				S
Southern Lake Michigan						S						S
Lake Huron (all)					S	S		M				S
Lake Erie (all)					S							S
Lake Ontario (all)					S	S		M		M		S

*S = severe winter
**M = mild winter
No letter = normal winter

One further consideration is that the visual observation codes were changed after the 1973-74 ice season to make the reports more accurate. The visual observation code originally represented the amount of ice either recorded or implied by the observer. Prior to the 1974-75 season, this information was coded as follows:

1 = ice to limit of visibility
2 = shore ice
3 = no ice
4 = ice floes and/or ice field
5 = ice present.

These codes were changed for the 1974-75 season and remain as follows:

1 = open water
2 = solid ice
3 = honeycombed ice
4 = windrowed ice
5 = slush ice
6 = drifting ice
7 = ice gorge.

In spite of any shortcomings, the data have proven to be well suited for their intended purpose. They provide a good comparison of ice history, thickness, and stratigraphy in different areas of the Great Lakes. They are useful for site-specific shoreline engineering studies, and they have provided useful information for winter navigation projects and remote sensing studies. Additional data collection will eliminate most of the constraining factors mentioned above.

7. ACKNOWLEDGEMENTS

The author would like to acknowledge the contributions made by the following persons in instituting, maintaining, and in many ways contributing to the ice-thickness and stratigraphy program and to this data base: E. W. Marshall, D. R. Rondy, R. A. Assel, G. A. Leshkevich, J. E. Gales, F. H. Quinn, and S. J. Bolsenga. D. Del Proposto and A. W. Hodson provided valuable assistance in developing many of the computer programs used in organizing and editing the data base.

8. REFERENCE

Assel, R. A., and F. H. Quinn (1977): A preliminary classification of Great Lakes winter severity, 1947-1976, GLERL Open File Report, 8 pp.

APPENDIX*

ICE THICKNESS AND STRATIGRAPHY--METRIC UNITS

These data are arranged by station and season. The information following the station name is the station location in degrees and minutes of latitude and longitude.

The header printed across the top of each page is interpreted as follows:

STA = station number
YR = year
MO = month
DA = day
TI = total ice thickness in centimeters
LI = thickness of the lake ice layer in centimeters
SI = thickness of the snow ice layer in centimeters
ALD = additional layer and thickness in centimeters (see code information on following page)
WL = water level in bore hole in centimeters (from bottom of ice)
SD = snow depth in centimeters (on ice only--not on shore)
SCON = snow condition
ICON = ice condition
EDATE = event and date (day and month)
V = visual observation.

Code Information

Additional layer codes (layer above the total ice layer):

1 = snow
2 = slush
3 = snow ice
4 = lake ice
5 = water
6 = frozen rain.

Snow condition codes:

1 = wet
2 = dry
3 = packed
4 = melting
5 = fluffy
6 = crusted
7 = drifted.

*These data are available in English units in NOAA Data Report ERL GLERL-1-1

Ice condition codes:

1 = thaw holes
2 = windrowed
3 = puddled
4 = flooded
5 = cracked
6 = dry
7 = solid
8 = melting
9 = candled
10 = piled on shore
11 = broken.

Event codes:

1 = skim ice at measurement site
2 = freeze-over at measurement site
3 = shore moat
4 = breakup
5 = ice free
6 = unnatural breakup (ice breaker, etc.)
7 = measurement site moved to new location.

Visual observation codes:

1965-66 to 1973-74

1 = ice to limit of visibility
2 = shore ice
3 = no ice
4 = ice floes/ice field
5 = ice present.

1974-75 and later

1 = open water
2 = solid ice
3 = honeycombed ice
4 = windrowed ice
5 = slush ice
6 = drifting ice
7 = ice gorge.
