This Technical Memorandum series is used for documentation and timely communication of preliminary results, interim reports, or similar special-purpose information. Although the memoranda are not subject to complete formal review, editorial control, or detailed editing, they are expected to reflect sound professional work.

NOTICE

The National Marine Fisheries Service (NMFS) does not approve, recommend or endorse any proprietary product or material mentioned in this publication. No reference shall be made to NMFS or to this publication furnished by NMFS, in any advertising or sales promotion which would imply that NMFS approves, recommends, or endorses any proprietary product or proprietary material mentioned herein or which has as its purpose any intent to cause directly or indirectly the advertised product to be used or purchased because of this NMFS publication.

This report should be cited as follows:

Hartel, K.E. and T. Nakabo. 2002. Preliminary guide to the identification of the early life history stages of draconettid fishes of the western central North Atlantic. NOAA Technical Memorandum NMFS-SEFSC-472, 4 p.

W. J. Richards, Editor. NOAA Fisheries, 75 Virginia Beach Drive, Miami, FL

This report will be posted on the Bethune Cookman College NOAA Cooperative web site later in 2002 at URL: <http://www4.cookman.edu/NOAA/> and will also appear on the SEFSC web site at URL: <http://www.sefsc.noaa.gov/> It will be a chapter entitled Draconettidae in the "Guide to the early life history stages of fishes of the western central North Atlantic".

Draconetts are relatively small, somewhat elongate fishes that lack scales, have large eyes and a strong, pointed, retrose-spine on both the opercle and subopercle. The first dorsal fin has three robust spines. Along with the Callionymidae, they are currently placed in the perciforme suborder Callionymoidei.

There are about 12 species world wide (Fricke, 1992), with only two occurring in the Atlantic. *Centrodraco acanthopoma* (Regan, 1904) is widespread (especially as pelagic pre settlement juveniles at sizes between 8.6 to 25mm SL). Post-larvae are found far from the shelf and range to 60°W off the U. S. east coast. Records show a distribution from about 10°N to 40°N in the western North Atlantic. Post larvae (between 19 and 25 mm SL) are most often taken between 200 and 500 meters in mid-water trawls (MCZ material). Post settlement individuals are found at depths between 380 and 600 meters (Fricke, 1992). The second species *C. oregonus* (Briggs and Berry,

1959) is only known from a relatively small area off northeastern South America between 1 and 2°N. We have seen a 36mm SL pelagic juvenile of what is probably a third Atlantic species from the eastern Atlantic (MCZ 85926, Fig. B). This species is more elongate than *C. acanthopoma*, has a series of 4 dermal tabs or papillae on each side of the body, a smaller eye, longer pelvic fins, and fine stellate pigmentation.

Adult *C. acanthopoma* can be distinguished from *C. oregonus* since their second dorsal spine is the longest rather than the first and because they lack longitudinal strips on the body that are present in *C. acanthopoma*.

Draconetts reach 40 to 140 mm TL as adults and are reddish in color. Neither the eggs, or pre-flexion are known for either species. Post-flexion larvae of *C. acanthopoma* are well known but eggs and pre-flexion larvae are also unknown. Little else is known about their biology.

MERISTICS

Vertebrae:	
Precaudal	8
Caudal	15-16
Total	23-24
Number of Fin Spines and Rays:	
First Dorsal	III
Second Dorsal	14-15
Total	17-18
Anal	13
Pectoral	20-27
Pelvic	I,5
Caudal	
Principal	8 branched
Secondary	2 upper & 2 lower, unbranched but segmented

LIFE HISTORY

Range: North Atlantic 11-40°N
 Habitat: Adults benthic in 380-600 m.
 ELH Pattern:
 Spawning: unknown
 Season: unknown

LITERATURE

Fricke, R. 1992; Nakabo, T. 1982;
 Nakabo, T. & K.E. Hartel 2000;
 Parin, N.V. 1982.

EARLY LIFE HISTORY

EGGS: unknown

LARVAE:

Length at Transformation: <8.6 mm SL
 Length of gut: Short, reaching D₂ origin.
 Sequence of Fin Development: All fin elements developed in the smallest known specimen at 8.6mm. Pectoral on small pedicle and pelvic fin short at this size. Pelvic fins adult proportions by 15mm SL.
 Pigmentation: The 8.6 mm specimen is unpigmented except for a dark longitudinal band on the middle of the caudal fin.
 Diagnostic Characters: three robust dorsal spines; a single spine on both opercle and preopercle; moderately elongate body.

ILLUSTRATIONS

C. acanthopoma - Postflexion larvae, 8.6 mm, ARC H-4061, drawn by Hartel and Nakabo (from Leis and Carson-Ewart 2000).
Centrodraco sp. A – Pelagic juvenile, 36 mm, MCZ 85926, 15°N 26°W, drawn by Nakabo and Hartel.
