ABSTRACT

Oceanographic observations from seven cruises in the inner New York Bight during 1987 - 1989 are presented. The observations were part of the 12-Mile Dumpsite Study conducted by the Environmental Processes Division of the Northeast Fisheries Center. Vertical profiles and sub-sampled listings of the temperature, salinity, and sigma-t data for each station are presented.

INTRODUCTION

The Environmental Processes Division of the Northeast Fisheries Center conducted a three-year study (July 1986-August 1989) of the measurable effects on habitat and biota caused by the cessation of sludge deposition at the 12-mile dumpsite (12 MDS) in the New York Bight. The plan for the overall 12 MDS study and its sampling design are described in Environmental Processes Division (1988).

As part of the 12 MDS study, oceanographic (temperature and salinity) data were collected on seven cruises using conductivity/temperature/depth (CTD) profiling instruments. On one cruise, oxygen data also were collected at discrete depths through the water column. Vertical profiles and sub-sampled listings of these data are presented in this report.

On three of the cruises (ALB87-02, ALB88-03, and ALB88-10) the primary objective was to deploy or recover current meter moorings for the 12 MDS study and only a few transects of CTD stations were occupied. An additional current meter recovery cruise was conducted in the fall of 1987, but because of bad weather no CTD stations were completed.

The two cruises in May-June of 1987 and 1989 used the same grid of stations to survey the water properties in the inner New York Bight. Two surveys of the area were completed on each cruise. The cruises in August of 1987 and 1989 used a different grid of stations to survey the region. Due to requirements of other sampling programs on these cruises, the entire grid of stations was not completed before portions of it were repeated. As a result, distinct surveys, separate in time, do not exist. For display purposes in this report, the stations from the August 1989 cruise have been grouped into two surveys that covered at least most of the region and which were essentially separate in time.

CRUISES

The CTD observations made on each of the seven cruises are summarized in Table 1.

Table 1. Summary of cruises collecting CTD data during the 12-mile dumpsite study

Section	Vessel	Cruise	Sampling Dates	# Stations	Coverage
A	<i>Albatross IV</i>	ALB87-02	9-11 May, 1987	20	Transects
B	<i>Albatross IV</i>	ALB87-03	13-20 May, 1987	153	2 Surveys
C	<i>Albatross IV</i>	ALB87-06	18-26 August, 1987	71	1 Survey
D	<i>Albatross IV</i>	ALB88-03	4-6 May, 1988	25	Transects
E	<i>Albatross IV</i>	ALB88-10	16-17 November, 1988	22	Transects
F	<i>Delaware II</i>	DEL89-04	6-17 June, 1989	118	2 Surveys
G	<i>Oregon II</i>	ORE89-04	12-21 August, 1989	133	2 Surveys

METHODS

Two CTD profiling instrument systems were used to collect the data presented in this report. In 1987 and 1988 a Neil Brown Instrument Systems Mark III instrument with a rosette water sampler was used. In 1989 an internally recording Sea-Bird Electronics, Inc. SBE9 instrument was used.

The Mark III CTD sampled at a rate of 15 scans per second. The data were displayed in real time and recorded on nine-track tape. In processing the data, only the down cast was used, unless it could not be retrieved or deemed unreliable. In those cases the up cast was substituted. During the up cast, water samples were collected at one or more depths to provide a quality control for the salinity data. During cruise ALB87-03, water samples were collected at up to twelve depths and analyzed by titration for dissolved oxygen content.

After a cruise, the data on the nine-track tapes were transferred to the NMFS VAX computer in Woods Hole, MA, where the data were processed to create the final, clean data. During the processing, obvious errors were removed and a latch filter was applied to create a series with increasing pressure. A lag correction was applied to compensate for the different response times of the temperature and conductivity sensors on the instrument. A depth correction was determined from the near-surface data values at each station and applied to the data for the station. The data were then averaged in 2 m intervals. The salinity of the quality control water samples was measured by a Guildline Autosal and compared with the corresponding CTD values to determine a salinity correction which was applied to the data.

The SBE9 CTD instrument sampled at a rate of eight scans per second. The data were collected and processed using the programs supplied with the instrument by Sea-Bird

Electronics, Inc. At the bottom of each cast a water sample for salinity quality control was collected using a Niskin bottle. In processing the data the pressure latch option was activated and the data were averaged in 1 m intervals. The data were then transferred to the VAX computer, where a pressure and a salinity correction were applied, as described above for the Mark III system.

The final CTD data for each cruise were stored in a NODC standard format file on the NMFS VAX computer in Woods Hole, MA.

DATA

In the following sections (A-G), the individual cruises are presented in chronological order. A plot of the station locations is shown. If the cruise involved area-wide surveys of the inner New York Bight, the surface and bottom temperature and salinity distributions for each survey are presented. Then the temperature, salinity, and density (σ_t) data in the upper 50 m of each station are plotted. Most stations were less than 50 m deep and for those that were deeper, most of the water column structure occurred in the upper 50 m. Beside the plots, a sub-sample of the data for each station is listed. For cruise ALB87-03, the only cruise with oxygen data, each depth for which an oxygen value exists is included in the listing.
